OCTANOL–WATER PARTITION COEFFICIENTS

The octanol–water partition coefficient, *P*, is a widely used parameter for correlating biological effects of organic substances. It is a property of the two-phase system in which water and 1-octanol are in equilibrium at a fixed temperature and the substance is distributed between the water-rich and octanol-rich phases. *P* is defined as the ratio of the equilibrium concentration of the substance in the octanol-rich phase to that in the water-rich phase, in the limit of zero concentration. In general, *P* tends to be large for compounds with extended non-polar structures (such as long chain or multi-ring hydrocarbons) and small for compounds with highly polar groups. Thus *P* (or, in its more common form of expression, log *P*) provides a measure of the lipophilic vs. hydrophilic nature of a compound, which is an important consideration in assessing the potential toxicity. A discussion of methods of measurement and accuracy considerations for log *P* may be found in Reference 1.

This table gives selected values of log *P* for about 450 organic compounds, including many of environmental importance. All values refer to a nominal temperature of 25 °C. The source of each value is indicated in the last column. These references contain data on many more compounds than are included here.

Compounds are listed by molecular formula following the Hill convention. To locate a compound by name or CAS Registry Number when the molecular formula is not known, use the table "Physical Constants of Organic Compounds" in Section 3 and its indexes to determine the molecular formula.

SOLUBILITY PRODUCT CONSTANTS

The solubility product constant K_{sp} is a useful parameter for calculating the aqueous solubility of sparingly soluble compounds under various conditions. It may be determined by direct measurement or calculated from the standard Gibbs energies of formation $\Delta_f G°$ of the species involved at their standard states. Thus if $K_{sp} = [M^+]^m, [A^-]^n$ is the equilibrium constant for the reaction

$$M_mA_n(s) \rightleftharpoons mM^+(aq) + nA^-(aq),$$

where M_mA_n is the slightly soluble substance and M^+ and A^- are the ions produced in solution by the dissociation of M_mA_n, then the Gibbs energy change is

$$\Delta G° = m\,\Delta_f G°\,(M^+,aq) + n\,\Delta_f G°\,(A^-,aq) - \Delta_f G°\,(M_mA_n, s)$$

The solubility product constant is calculated from the equation

$$\ln K_{sp} = -\Delta G°/RT$$

The first table below gives selected values of K_{sp} at 25 °C. Many of these have been calculated from standard state thermodynamic data in References 1 and 2; other values are taken from publications of the IUPAC Solubility Data Project (References 3 to 7).

The above formulation is not convenient for treating sulfides because the S^{-2} ion is usually not present in significant concentrations (see Reference 8). This is due to the hydrolysis reaction

$$S^{-2} + H_2O \rightleftharpoons HS^- + OH^-$$

which is strongly shifted to the right except in very basic solutions. Furthermore, the equilibrium constant for this reaction, which depends on the second ionization constant of H_2S, is poorly known. Therefore it is more useful in the case of sulfides to define a different solubility product K_{spa} based on the reaction

$$M_mS_n(s) + 2H^+ \rightleftharpoons mM^+ + nH_2S\,(aq)$$

Values of K_{spa}, taken from Reference 8, are given for several sulfides in the auxiliary table following the main table. Additional discussion of sulfide equilibria may be found in References 7 and 9.

SOLUBILITY OF HYDROCARBONS IN SEAWATER

Concern about pollution of the oceans has stimulated measurements of the solubility of organic compounds in seawater. This table gives the solubility of several hydrocarbons in seawater. The data are derived from a review in the IUPAC Solubility Data Series (Reference 1).

Solubility is expressed in this table as parts per million by mass, i.e.,

$$S/\text{ppm(mass)} = 10^6 \times w_2 = 10^6 \times m_2/(m_1 + m_2)$$

where m_1 and m_2 are the masses of solvent (seawater) and solute, respectively, under saturation conditions, and w_2 is the mass fraction. Since the solubilities in this table are very low, the value of S is effectively the mass of hydrocarbon in grams per 1000 kg of seawater.

The temperature and salinity of each measurement are given in the table. Salinity is a standardized measure of the concentration of dissolved salts, as explained in the table "Properties of Seawater" in Section 14. Salinity values in the open oceans at mid-latitude typically fall between 34 and 36.

Reference 1 gives details of the method of measurement and an indication of the reliability of the measurements.

SOLUBILITY OF ORGANIC COMPOUNDS IN PRESSURIZED HOT WATER

Liquid water at elevated temperatures and pressures, but still in the subcritical region, is of interest as a solvent in various laboratory and industrial processes. In effect, this means water at a temperature between about 100 °C and 373 °C, the critical temperature, and at pressures up to 400 bar or greater. Since the dielectric constant of water decreases with increasing temperature, the solubility of many compounds, especially non-polar compounds, increases dramatically at higher temperature. The fact that solubility can be fine-tuned by controlling temperature and pressure makes pressurized hot water a useful tool in various extraction and reaction processes.

This table gives a sample of the variations of solubility with temperature and pressure for several compounds, mostly hydrocarbons. The solubility is expressed in both mole fraction of solute, x_2, and mass percent, $100w_2$, where w_2 is the mass fraction. More information is available in the references.

SOLUBILITY CHART

Abbreviations: **W**, soluble in water; **A**, insoluble in water but soluble in acids; **w**, sparingly soluble in water but soluble in acids; **a**, insoluble in water and only sparingly soluble in acids; **I,** insoluble in water and acids; **d**, decomposes in water. * Indicates two modifications of the salt.

Properties of Cryogenic Fluids 6-164
Properties of Liquid Helium 6-165
Properties of Refrigerants 6-166
Properties of Gas Clathrate Hydrates 6-169
Ionic Liquids 6-174
Density and Specific Volume of Mercury 6-178
Thermal Properties of Mercury 6-179
Melting Curve of Mercury 6-180
Vapor Pressure of Mercury 6-181
Surface Tension of Common Liquids 6-182
Surface Tension of Aqueous Mixtures 6-186
Permittivity (Dielectric Constant) of Liquids 6-187
Permittivity (Dielectric Constant) of Gases 6-209
Azeotropic Data for Binary Mixtures 6-210
Viscosity of Gases 6-229
Viscosity of Liquids 6-231
Viscosity of Carbon Dioxide Along the Saturation Line 6-236
Viscosity and Density of Aqueous Hydroxide Solutions 6-237
Viscosity of Liquid Metals 6-238
Thermal Conductivity of Gases 6-241
Thermal Conductivity of Liquids 6-243
Diffusion in Gases 6-248
Diffusion of Gases in Water 6-250
Diffusion Coefficients in Liquids at Infinite Dilution 6-251

THERMOPHYSICAL PROPERTIES OF WATER AND STEAM

Eric W. Lemmon

These tables summarize the thermophysical properties of water and steam at equilibrium as accepted by the International Association for the Properties of Water and Steam (www.iapws.org) for general and scientific use. The thermodynamic properties are calculated from the equation of state of Wagner and Pruss (Ref. 6). The reference state for these tables is the liquid at the triple point, at which the internal energy and entropy are taken as zero. These tables refer to states at 1 bar (100 kPa) pressure with temperatures in °C in the first section; liquid and gaseous states at equilibrium as a function of temperature in the second section; and properties along isobars in the third section. The tabulated properties are pressure (P), density (ρ), enthalpy (H), entropy (S), isochoric heat capacity (C_v), isobaric heat capacity (C_p), speed of sound (u), viscosity (η), thermal conductivity (λ), and static dielectric constant (D). In the saturation tables, the first line of identical temperatures is for the liquid state and the second line is for the vapor state. A duplicate entry in the isobar section indicates a phase transition (liquid-vapor) at that temperature; property values are then given for both phases. These are identified by the high densities in the liquid and the low densities in the vapor. The temperature scale is ITS-90. Additional calculations at state points not listed below can be obtained by using the NIST Standard Reference Data program REFPROP (Ref. 5) or the water-specific program Steam (Ref. 2).

The uncertainty in density of the equation of state is 0.0001% at 1 atm in the liquid phase, and 0.001% at other liquid states at pressures up to 10 MPa and temperatures to 423 K. In the vapor phase, the uncertainty is 0.05% or less. The uncertainties rise at higher temperatures and/or pressures, but are generally less than 0.1% in density except at extreme conditions. The uncertainty in pressure in the critical region is 0.1%. The uncertainty of the speed of sound is 0.15% in the vapor and 0.1% or less in the liquid, and increases near the critical region and at high temperatures and pressures. The uncertainty in the isobaric heat capacity is 0.2% in the vapor and 0.1% in the liquid, with increasing values in the critical region and at high pressures. The uncertainties of saturation conditions are 0.025% in vapor pressure, 0.0025% in saturated liquid density, and 0.1% in saturated vapor density. The uncertainties in the saturated densities increase substantially as the critical region is approached.

VAPOR PRESSURE AND OTHER SATURATION PROPERTIES OF WATER

Eric W. Lemmon

This table summarizes the vapor pressure, enthalpy (heat) of vaporization, and surface tension of water as accepted by the International Association for the Properties of Water and Steam (www.iapws.org) for general and scientific use. The vapor pressure and heat of vaporization are calculated from the equation of state of Wagner and Pruss (Ref. 1). The temperature scale is ITS-90. Additional calculations at state points not listed below can be obtained by using the NIST Standard Reference Data program REFPROP (www.nist.gov/srd/nist23.htm) or the water-specific program Steam (www.nist.gov/srd/nist10.htm).

STANDARD DENSITY OF WATER

This table gives the density ρ of water in the temperature range from 0 °C to 100 °C at a pressure of 101325 Pa (one standard atmosphere). Temperatures are given on the ITS-90 scale. From 0 °C to 40 °C the values are taken from the publication in Reference 1 and refer to standard mean ocean water (SMOW), free from dissolved salts and gases. SMOW is a standard water sample of high purity and known isotopic composition. Methods of correcting for different isotopic compositions are discussed in Ref. 2. The remaining values are calculated from the NIST REFPROP program, Ref. 3, which obtains thermodynamic properties from the equation of state of Wagner and Pruss given in Ref. 4.

PROPERTIES OF SATURATED LIQUID D_2O

Allan H. Harvey

Properties of saturated liquid heavy water, D_2O, are given in this table as a function of temperature from the melting point to the critical point. The vapor pressure was calculated from the formulation of Harvey and Lemmon (Ref. 2). The other properties were generated from the NIST REFPROP program (Ref. 1) and are consistent with formulations adopted for general and scientific use by The International Association for the Properties of Water and Steam (IAPWS). The background for the equation of state used for density and heat capacity is given by Hill et al. (Ref. 3), and the background for the transport property correlations is given by Matsunaga and Nagashima (Ref. 4). The unpublished surface tension correlation and the other IAPWS formulations may be found on the IAPWS Web site (http://www.iapws.org). The temperature scale is ITS-90. Additional calculations at state points not listed below can be obtained by using the REFPROP program (http://www.nist.gov/srd/nist23.htm). The properties are

P: vapor pressure
ρ: density
C_p: isobaric heat capacity
η: viscosity
λ: thermal conductivity
σ: surface tension

PROPERTIES OF ICE AND SUPERCOOLED WATER

Allan H. Harvey

The common form of ice at ambient pressure is hexagonal ice, designated as ice Ih (see phase diagram in Section 12). The data given here refer to that form, at standard atmospheric pressure (101.325 kPa). Data have been taken from the references indicated, which in most cases are formulations based on critical evaluation of available experimental data. Most properties are sensitive to the method of preparation of the sample, because air and other gases are sometimes occluded. For this reason, there is often disagreement among values in the literature. For all properties except the dielectric constant of ice, the cited reference contains information on the uncertainty of the property.

VAPOR PRESSURE OF ICE

The values of the vapor (sublimation) pressure of ice Ih were calculated from the equation recommended by the International Association for the Properties of Water and Steam (IAPWS) in 2008. See Refs. 1 and 2 for details on the uncertainty in different temperature ranges. The first entry in the table is the triple point of water, whose pressure has an uncertainty of 0.010 Pa.

MELTING POINT OF ICE AS A FUNCTION OF PRESSURE

This table gives the melting temperature of ice at various pressures, calculated from the equation for the ice Ih – liquid water phase boundary recommended by the International Association for the Properties of Water and Steam (IAPWS) in 2008. See Refs. 1 and 2 for information on the solid/liquid transitions for high-pressure forms of ice. IAPWS gives the following locations for the triple points where equilibrium exists among two ice forms and liquid water:

ice I – ice III	208.566 MPa	−21.985 °C
ice III – ice V	350.1 MPa	−16.986 °C
ice V – ice VI	632.4 MPa	0.16 °C
ice VI – ice VII	2216 MPa	81.85 °C

PERMITTIVITY (DIELECTRIC CONSTANT) OF WATER AT VARIOUS FREQUENCIES

The permittivity of liquid water in the radiofrequency and microwave regions can be represented by the Debye equation (References 1 and 2):

$$\varepsilon' = \varepsilon_\infty + \frac{\varepsilon_s - \varepsilon_\infty}{1+\omega^2\tau^2}$$

$$\varepsilon'' = \frac{(\varepsilon_s - \varepsilon_\infty)\omega\tau}{1+\omega^2\tau^2}$$

where $\varepsilon = \varepsilon' + i\,\varepsilon''$ is the (complex) relative permittivity (i.e., the absolute permittivity divided by the permittivity of free space $\varepsilon_0 = 8.854 \cdot 10^{-12}$ F m^{-1}). Here ε_s is the static permittivity (see Reference 3 and the table "Thermophysical Properties of Water and Steam" in this Section); ε_∞ is a parameter describing the permittivity in the high frequency limit; τ is the relaxation time for molecular orientation; and $\omega = 2\pi f$ is the angular frequency. The values in this table have been calculated from parameters given in Reference 2:

	0 °C	25 °C	50 °C
ε_∞	5.7	5.2	4.0
τ/ps	17.67	8.27	4.75

Other useful quantities that can be calculated from the values in the table are the loss tangent:

$$\tan\delta = \varepsilon''/\varepsilon'$$

and the absorption coefficient α which describes the power attenuation per unit length ($P = P_0\, e^{-\alpha l}$):

$$\alpha = \frac{\pi f \varepsilon''}{c\sqrt{\varepsilon'}}$$

and c is the speed of light. The last equation is valid when $\varepsilon''/\varepsilon' << 1$.

THERMOPHYSICAL PROPERTIES OF AIR

Eric W. Lemmon

These tables summarize the thermophysical properties of air in the liquid and gaseous states as calculated from the pseudo-pure fluid equation of state of Lemmon et al. (2000). The first table refers to liquid and gaseous air at equilibrium as a function of temperature. The tabulated properties are the bubble-point pressure (i.e., pressure at which boiling begins as the pressure of the liquid is lowered); the dew-point pressure (i.e., pressure at which condensation begins as the pressure of the gas is raised); density (ρ); enthalpy (H); entropy (S); isochoric heat capacity (C_v); isobaric heat capacity (C_p); speed of sound (u); viscosity (η); and thermal conductivity (λ). The first line of identical temperatures is the bubble-point (liquid) and the second line is the dew point (vapor). The normal boiling point of air, i.e., the temperature at which the bubble-point pressure reaches 1 standard atmosphere (1.01325 bar), is 78.90 K (–194.25 °C).

The second table gives the properties of air along various isobars. An entry with non-integer temperatures in the isobar section indicates a phase transition (liquid–vapor) at these temperatures; property values are then given for both phases. These are identified by the high densities in the liquid and the low densities in the vapor. Additional calculations at state points not listed below can be obtained by using the NIST program REFPROP (http://www.nist.gov/srd/nist23.htm).

In the range from the solidification point to 873 K at pressures to 70 MPa, the estimated uncertainty of density values calculated with the equation of state is 0.1%. The estimated uncertainty of calculated speed-of-sound values is 0.2%, and that for calculated heat capacities is 1%. At temperatures above 873 K and 70 MPa, the estimated uncertainty of calculated density values is 0.5%, increasing to 1.0% at 2000 K and 2000 MPa.

[a] Freezing point for the liquid state.

THERMOPHYSICAL PROPERTIES OF FLUIDS

Eric W. Lemmon

These tables give thermodynamic and transport properties of a variety of fluids, as generated from the equations of state presented in the references below. The properties tabulated are pressure (P), density (ρ), enthalpy (H), entropy (S), isochoric heat capacity (C_v), isobaric heat capacity (C_p), speed of sound (u), viscosity (η), thermal conductivity (λ), and static dielectric constant (D). All extensive properties are given on a mass basis. Not all properties are included for every substance. The references should be consulted for information on the uncertainties.

Values are given first along the saturation line. The first two points are the properties at the triple point. The final line gives the properties at the critical point. Two lines are given for each temperature (except at the critical point); the first line gives the values of the liquid phase (note the high density) and the second line gives the values of the vapor phase (at low densities). Following the saturation tables, values are given as a function of temperature for several isobars. A duplicate entry in the isobar section indicates a phase transition (liquid–vapor) at that temperature; property values are then given for both phases. The phase can be determined by noting the sharp decrease in density between two successive temperature entries; all lines above this point refer to the liquid phase, and all lines below refer to the gas phase. If there is no sharp discontinuity in density, all data in the table refer to the supercritical region (*i.e.*, the isobar is above the critical pressure). If the first temperature in the isobars is not an integer, this state point refers to the properties of the liquid at the melting line.

All temperatures are given on ITS-90, except those for oxygen (Ref. 16) and helium (Ref. 13), where the source equations of state still use the IPTS-68 temperature scale. Nitrogen, oxygen, and argon use a reference state based on zero enthalpy in the gas phase at 0 K; parahydrogen, helium, methane, and ethane use a reference state of zero enthalpy and entropy at the saturated liquid state at the normal boiling point; and propane and carbon dioxide use a reference state of 200 kJ kg^{-1} and 1 kJ kg^{-1} K^{-1}, respectively, at –40 °C. Additional calculations at state points not listed below and for fluids not contained here can be obtained at the NIST Chemistry WebBook website (webbook.nist.gov/chemistry/fluid/), or by using the NIST Standard Reference Data program REFPROP (Ref. 9).

THERMOPHYSICAL PROPERTIES OF SELECTED FLUIDS AT SATURATION

Eric W. Lemmon

These tables give thermodynamic and transport properties of a variety of fluids, as generated from the equations of state presented in the references below. The properties tabulated are pressure (P), density (ρ), enthalpy (H), entropy (S), isochoric heat capacity (C_v), isobaric heat capacity (C_p), speed of sound (u), viscosity (η), thermal conductivity (λ), and static dielectric constant (D). All extensive properties are given on a mass basis. Not all properties are included for every substance. The references should be consulted for information on the uncertainties. Values are given along the saturation line. The first two lines give the properties at the triple point (except for R-1234yf). The final line gives the properties at the critical point. Two lines are given for each temperature (except at the critical point); the first line gives the values of the liquid phase (note the high density), and the second line gives the values of the vapor phase (at low densities). Ammonia uses a reference state based on zero energy and entropy at the triple point; benzene, carbon monoxide, ethylene, hydrogen sulfide, sulfur dioxide, and toluene use a reference state of zero enthalpy and entropy at the saturated liquid state at the normal boiling point; butane, isobutane, ethanol, propylene, R-134a, R-1234yf, and sulfur hexafluoride use a reference state of 200 kJ kg^{-1} and 1 kJ kg^{-1} K^{-1} at –40 °C. Additional calculations at state points not listed below and for fluids not contained here can be obtained at the NIST Chemistry WebBook website (http://webbook.nist.gov/chemistry/fluid/), or by using the NIST Standard Reference Data program REFPROP (http://www.nist.gov/srd/nist23.cfm).

VIRIAL COEFFICIENTS OF SELECTED GASES

Henry V. Kehiaian

This table gives second virial coefficients of about 110 inorganic and organic gases as a function of temperature. Selected data from the literature have been fitted by least squares to the equation

$$B / \mathrm{cm^3 mol^{-1}} = \sum_{i=1}^{n} a(i)[(T_0 / T) - 1]^{i-1}$$

where T_0 = 298.15 K. The table gives the coefficients $a(i)$ and values of B at fixed temperature increments, as calculated from this smoothing equation.

The equation may be used with the tabulated coefficients for interpolation within the indicated temperature range. It should not be used for extrapolation beyond this range.

Compounds are listed in the modified Hill order (see Introduction), with carbon-containing compounds following those compounds not containing carbon.

A useful compilation of virial coefficient data from the literature may be found in the reference.

VAN DER WAALS CONSTANTS FOR GASES

The van der Waals equation of state for a real gas is

$$(P + n^2a/V^2)(V - nb) = nRT$$

where P is the pressure, V the volume, T the temperature, n the amount of substance (in moles), and R the gas constant. The van der Waals constants a and b are characteristic of the substance and are independent of temperature. They are related to the critical temperature and pressure, T_c and P_c, by

$$a = 27R^2T_c^2/64P_c \quad b = RT_c/8P_c$$

This table gives values of a and b for some common gases. Most of the values have been calculated from the critical temperature and pressure values given in the table "Critical Constants" in this section. Van der Waals constants for other gases may easily be calculated from the data in that table.

To convert the van der Waals constants to SI units, note that 1 bar L^2/mol^2 = 0.1 Pa m^6/mol^2 and 1 L/mol = 0.001 m^3/mol.

MEAN FREE PATH AND RELATED PROPERTIES OF GASES

In the simplest version of the kinetic theory of gases, molecules are treated as hard spheres of diameter d which make binary collisions only. In this approximation the mean distance traveled by a molecule between successive collisions, the mean free path l, is related to the collision diameter by:

$$l = \frac{kT}{\pi\sqrt{2}Pd^2}$$

where P is the pressure, T the absolute temperature, and k the Boltzmann constant. At standard conditions (P = 100,000 Pa and T = 298.15 K) this relation becomes:

$$l = \frac{9.27 \cdot 10^{27}}{d^2}$$

where l and d are in meters.

Using the same model and the same standard pressure, the collision diameter can be calculated from the viscosity η by the kinetic theory relation:

$$\eta = \frac{2.67 \cdot 10^{-20}(MT)^{1/2}}{d^2}$$

where η is in units of μPa s and M is the molar mass in g/mol. Kinetic theory also gives a relation for the mean velocity v of molecules of mass m:

$$\bar{v} = \left(\frac{8kT}{\pi m}\right)^{1/2} = 145.5(T/M)^{1/2}\ \text{m/s}$$

Finally, the mean time τ between collisions can be calculated from the relation $\tau\bar{v} = l$.

The table below gives values of l, $\bar{v}$, and τ for some common gases at 25 °C and atmospheric pressure, as well as the value of d, all calculated from measured gas viscosities (see References 2 and 3 and the table "Viscosity of Gases" in this section). It is seen from the above equations that the mean free path varies directly with T and inversely with P, while the mean velocity varies as the square root of T and, in this approximation, is independent of P.

A more accurate model, in which molecular interactions are described by a Lennard-Jones potential, gives mean free path values about 5% lower than this table (see Reference 4).

CRITICAL CONSTANTS OF ORGANIC COMPOUNDS

Chris D. Muzny, Vladimir Diky, Andrei Kazakov, Robert D. Chirico, and Michael Frenkel

The parameters of the liquid-gas critical point are important constants in determining the behavior of fluids. This table lists the critical temperature, pressure, and molar volume, as well as the normal boiling point, for over 850 organic substances. The properties and their units are:

- T_b: Normal boiling point in K at a pressure of 101.325 kPa (1 atmosphere); an "s" following the value indicates a sublimation point (temperature at which the solid is in equilibrium with the gas at a pressure of 101.325 kPa)
- T_c: Critical temperature in K
- P_c: Critical pressure in MPa
- V_c: Critical molar volume in $cm^3\ mol^{-1}$

The listed values of the critical constants are critically evaluated using the NIST ThermoData Engine, TDE (Ref. 1), designed to implement the dynamic data evaluation concept (Refs. 2–5). This concept requires large electronic databases capable of storing essentially all relevant experimental data known to date with detailed descriptions of metadata and uncertainties. The combination of these electronic databases with expert-system software, designed to automatically generate recommended property values based on available experimental and predicted data, leads to the ability to produce critically evaluated data dynamically or "to order." The evaluated data have been generated only for compounds for which experimental data for critical properties are available. Group contribution methods such as Joback-Reed (Ref. 6), Constantinou-Gani (Ref. 7), Marrero-Pardillo (Ref. 8), and Wilson-Jasperson (Ref. 9) as well as quantitative structure-property relationship (QSPR) methods (Ref. 5) were used within the TDE environment to validate available experimental data. Each recommended value in the table is characterized with a combined expanded uncertainty (Ref. 10) (level of confidence, approximately 95%) listed in parentheses. Only references to original experimental data actually used by TDE to generate critically evaluated data are indicated for each compound. Compounds are listed alphabetically by name.

The values of the normal boiling temperatures provided in the table along with the combined expanded uncertainities listed in parentheses have also been critically evaluated using TDE. Additional details on the determination of the normal boiling temperatures using TDE can be found in the Physical Constants of Organic Compounds table in Section 3. The remaining values of the normal boiling temperatures (without uncertainities) are taken from the compilation presented in the 91st Edition of the CRC *Handbook of Chemistry and Physics*.

CRITICAL CONSTANTS OF INORGANIC COMPOUNDS

The parameters of the liquid-gas critical point are important constants in determining the behavior of fluids. This table lists the critical temperature, pressure, and molar volume, as well as the normal boiling point, for over 140 inorganic substances. The properties and their units are:

- T_b: Normal boiling point in K at a pressure of 101.325 kPa (1 atmosphere); an "s" following the value indicates a sublimation point (temperature at which the solid is in equilibrium with the gas at a pressure of 101.325 kPa)
- T_c: Critical temperature in K
- P_c: Critical pressure in MPa
- V_c: Critical molar volume in $cm^3\ mol^{-1}$

The number of digits given for T_b, T_c, and P_c indicates the estimated accuracy of these quantities; however, values of T_c greater than 750 K may be in error by 10 K or more. Although most V_c values are given to three figures, they cannot be assumed accurate to better than a few percent. All values are experimentally determined except for a few values, indicated by an asterisk*, that are based on extrapolations. Methods of measurement are described and critiqued in Reference 1. Compounds are listed alphabetically by name.

SUBLIMATION PRESSURE OF SOLIDS

This table gives the sublimation (vapor) pressure of some representative solids as a function of temperature. Entries include simple inorganic and organic substances in their solid phase below room temperature, as well as polycyclic organic compounds which show measurable sublimation pressure only at elevated temperatures. Substances are listed by molecular formula in the Hill order. Values marked by * represent the solid–liquid–gas triple point. Note that some pressure values are in pascals (Pa) and others are in kilopascals (kPa). For conversion, 1 kPa = 7.506 mmHg = 0.0098692 atm.

VAPOR PRESSURE

This table gives vapor pressure data for about 1800 inorganic and organic substances. In order to accommodate elements and compounds ranging from refractory to highly volatile in a single table, the temperature at which the vapor pressure reaches specified pressure values is listed. The pressure values run in decade steps from 1 Pa (about 7.5 μm Hg) to 100 kPa (about 750 mm Hg). All temperatures are given in °C.

The data used in preparing the table came from a large number of sources; the main references used for each substance are indicated in the last column. Since the data were refit in most cases, values appearing in this table may not be identical with values in the source cited. The temperature entry in the 100 kPa column is close to, but not identical with, the normal boiling point (which is defined as the temperature at which the vapor pressure reaches 101.325 kPa). Although some temperatures are quoted to 0.1 °C, uncertainties of several degrees should generally be assumed. Values followed by an "e" were obtained by extrapolating (usually with an Antoine equation) beyond the region for which experimental measurements were available and are thus subject to even greater uncertainty.

Compounds are listed by molecular formula following the Hill convention. Substances not containing carbon are listed first, followed by those that contain carbon. To locate an organic compound by name or CAS Registry Number when the molecular formula is not known, use the table "Physical Constants of Organic Compounds" in Section 3 and its indexes to determine the molecular formula. The indexes to "Physical Constants of Inorganic Compounds" in Section 4 can be used in a similar way.

More extensive and detailed vapor pressure data on selected important substances appear in other tables in this section of the *Handbook*. These substances are flagged by a symbol following the name as follows:

* See "Vapor Pressure of Fluids at Temperatures below 300 K"
** See "IUPAC Recommended Data for Vapor Pressure Calibration"
*** See "Vapor Pressure of Ice" and "Vapor Pressure and other Saturation Properties of Water"

The following notations appear after individual temperature entries:

s — Indicates the substance is a solid at this temperature.
e — Indicates an extrapolation beyond the region where experimental measurements exist.
i — Indicates the value was calculated from ideal gas thermodynamic functions, such as those in the *JANAF Thermochemical Tables* (see Reference 8).

VAPOR PRESSURE OF FLUIDS AT TEMPERATURES BELOW 300 K

This table gives vapor pressures of 67 important fluids in the temperature range 2 to 300 K. Helium (^{4}He), hydrogen (H_2), and neon (Ne) are covered on this page. The remaining fluids are listed on subsequent pages by molecular formula in the Hill order (see Introduction). The data have been taken from evaluated sources; references are listed at the end of the table.

Pressures are given in kilopascals (kPa). Note that:

1 kPa = 7.50062 Torr
100 kPa = 1 bar
101.325 kPa = 1 atm

"s" following an entry indicates that the compound is solid at that temperature.

VAPOR PRESSURE OF SATURATED SALT SOLUTIONS

This table gives the vapor pressure of water above saturated solutions of some common salts at ambient temperatures. Data on pure water are given on the last line for comparison.

The references provide additional information on water activity, osmotic coefficient, and enthalpy of vaporization.

RECOMMENDED DATA FOR VAPOR-PRESSURE CALIBRATION

Eric W. Lemmon

These precise vapor pressure values are recommended as secondary standards. Values are given in kPa (1 kPa = 0.0098692 atm = 7.5006 Torr). References for water and CO_2 are given in the *Thermophysical Properties of Fluids* table.

ENTHALPY OF VAPORIZATION

The molar enthalpy (heat) of vaporization $\Delta_{vap}H$, which is defined as the enthalpy change in the conversion of one mole of liquid to gas at constant temperature, is tabulated here for about 950 inorganic and organic compounds. Values are given, when available, both at the normal boiling point t_b, referred to a pressure of 101.325 kPa (760 mmHg), and at 25 °C.

The values in this table were measured either by calorimetric techniques or by application of the Claperyon equation to the variation of vapor pressure with temperature. See Reference 1 for a discussion of the accuracy of different experimental techniques and methods of estimating enthalpy of vaporization at other temperatures. Several of the references present empirical techniques for correlating enthalpy of vaporization with molecular structure.

Compounds are listed by systematic name, with compounds not containing carbon preceding those that do contain carbon. To locate a compound by molecular formula or CAS Registry Number, use the indexes to the table "Physical Constants of Organic Compounds" in Section 3, which point to the entry in that table from which the name can be determined.

ENTHALPY OF FUSION

This table lists the molar enthalpy (heat) of fusion, $\Delta_{fus}H$, of over 1100 inorganic and organic compounds. All values refer to the enthalpy change at equilibrium between the liquid phase and the most stable solid phase at the phase transition temperature. Most values of $\Delta_{fus}H$ are given at the normal melting point t_m. However, a "t" following the entry in the melting point column indicates a triple–point temperature, where the solid, liquid, and gas phases are in equilibrium. Temperatures are given on the ITS–90 scale.

A * following an entry indicates that the value includes the enthalpy of transition between crystalline phases whose transformation occurs within 1 °C of the melting point.

Substances are listed by name, either an IUPAC systematic name or, in the case of drugs and other complex compounds, a common synonym. Inorganic compounds, including metal salts of organic acids, are listed first, followed by organic compounds. The molecular formula in the Hill convention is included.

Name	Molecular formula	t_m/°C	$\Delta_{fus}H$/ kJ mol^{-1}
Inorganic compounds (including salts of organic acids)			
Actinium	Ac	1050	12.0
Aluminum	Al	660.323	10.71
Aluminum bromide	$AlBr_3$	97.5	11.25
Aluminum chloride	$AlCl_3$	192.6	35.35
Aluminum fluoride	AlF_3	2250 t	98
Aluminum iodide	AlI_3	188.28	15.90
Aluminum oxide (α)	Al_2O_3	2054	111.1
Aluminum sulfide	Al_2S_3	1100	66
Americium	Am	1176	14.39
Ammonia	H_3N	–77.73	5.66
Ammonium chloride	ClH_4N	520.1	10.6
Ammonium fluoride	FH_4N	238	12.6
Ammonium iodide	H_4IN	551	21
Ammonium nitrate	$H_4N_2O_3$	169.7	5.86
Antimony (gray)	Sb	630.628	19.79
Antimony(III) bromide	Br_3Sb	97	14.6
Antimony(III) chloride	Cl_3Sb	73.4	12.97
Antimony(III) fluoride	F_3Sb	287	22.8
Antimony(III) iodide	I_3Sb	171	22.8
Antimony(III) oxide (valentinite)	O_3Sb_2	655	54
Antimony(III) sulfide	S_3Sb_2	550	47.9
Argon	Ar	–189.34	1.18
Arsenic (gray)	As	817	24.44
Arsenic(III) bromide	$AsBr_3$	31.1	11.7
Arsenic(III) chloride	$AsCl_3$	–16	10.1
Arsenic(III) fluoride	AsF_3	–5.9	10.4
Arsenic(III) iodide	AsI_3	141	21.8
Arsenic(III) oxide (claudetite)	As_2O_3	314	18
Arsenic(V) oxide	As_2O_5	730	60
Arsenic(III) selenide	As_2Se_3	377	40.8
Arsenic(III) sulfide	As_2S_3	312	28.7
Arsenic sulfide	As_4S_4	307	25.4
Arsenic(III) telluride	As_2Te_3	375	46.0
Barium	Ba	727	7.12
Barium bromide	$BaBr_2$	857	32.2
Barium carbonate	$CBaO_3$	1555 (high pres.)	40
Barium chloride	$BaCl_2$	961	15.85
Barium fluoride	BaF_2	1368	23.36
Barium hydride	BaH_2	1200	25
Barium hydroxide	BaH_2O_2	408	16
Barium iodide	BaI_2	711	26.5
Barium oxide	BaO	1973	46
Barium sulfate	BaO_4S	1580	40
Barium sulfide	BaS	2227	63
Beryllium	Be	1287	7.895
Beryllium bromide	$BeBr_2$	508	18
Beryllium carbide	CBe_2	2127	75.3
Beryllium chloride	$BeCl_2$	415	8.66
Beryllium fluoride	BeF_2	552	4.77
Beryllium iodide	BeI_2	480	20.92
Beryllium nitride	Be_3N_2	2200	111
Beryllium oxide	BeO	2578	86
Beryllium sulfate	BeO_4S	1127	6
Bismuth	Bi	271.406	11.106
Bismuth oxide	Bi_2O_3	825	14.7

Name	Molecular formula	t_m/°C	$\Delta_{fus}H$/ kJ mol^{-1}
Bismuth sulfide	Bi_2S_3	777	78.2
Bismuth tribromide	$BiBr_3$	219	21.7
Bismuth trichloride	$BiCl_3$	234	23.6
Bismuth trifluoride	BiF_3	649	21.6
Bismuth triiodide	BiI_3	408.6	39.1
Boric acid	BH_3O_3	170.9	22.3

COMPRESSIBILITY AND EXPANSION COEFFICIENTS OF LIQUIDS

This table gives data on the variation of the density of some common liquids with pressure and temperature. The pressure dependence is described to first order by the isothermal compressibility coefficient κ defined as

$$\kappa_T = -(1/V)\,(\partial V/\partial P)_T$$

where V is the volume, and the temperature dependence by the cubic expansion coefficient α,

$$\alpha_V = (1/V)\,(\partial V/\partial T)_P$$

Substances are listed by molecular formula in the Hill order. More precise data on the variation of density with temperature over a wide temperature range can be found in Reference 1.

TEMPERATURE AND PRESSURE DEPENDENCE OF LIQUID DENSITY

Ivan Cibulka

This table records parameters of the Tait equation (Refs. 1,2) that gives the ratio between the density at pressure P, $\rho(T,P)$, relative to the density at a reference pressure, $\rho(T,P_{ref})$, at the same temperature T:

$$\frac{\rho(T,P)}{\rho(T,P_{ref})} = \frac{1}{1-C(T)\ln\left\{\dfrac{B(T)+P}{B(T)+P_{ref}}\right\}},$$

$$C(T) = a_1 + b_1(T/\mathrm{K}) + c_1(T/\mathrm{K})^2, \qquad (1)$$

$$B(T)/\mathrm{MPa} = a_2 + a_3(T/\mathrm{K}) + a_4(T/\mathrm{K})^2 + a_5(T/\mathrm{K})^3 + a_6(T/\mathrm{K})^4$$

Parameters a_i (i = 1, ..., 6) and b_1, c_1 were adjusted to selected experimental data using the weighted least-squares method. Parameters b_1 and c_1 are zero for most substances, and therefore their values are given in footnotes for those few substances where the statistical significance was justified. The reference pressure is P_{ref} = 0.101325 MPa at temperatures either at or below the normal boiling point temperature (T_{nbp}) and $P_{ref} = P_{sat}(T)$ (saturated vapor pressure) at temperatures $T > T_{nbp}$. Ranges of validity of the equation (T_{min}, T_{max}, P_{max}) are derived from ranges of experimental data; the minimal pressure of validity is taken as P_{ref}, *i.e.*, interpolation between P_{ref} and lowest experimental pressure is allowed. The upper limit of application is the freezing line (if not limited by the ranges of validity). To avoid any large-scale extrapolation, the validity ranges are rectangular areas $(T_{max} - T_{min})P_{max}$. If in particular temperature interval(s) the maximum experimental pressure exceeded the given value of P_{max}, then the maximum pressure given in the table is denoted by (r) which means that the validity range given in the table is a rectangular subset of the non-rectangular experimental T, P range. In a few cases P_{max} is given as a ratio where the first value corresponds to T_{min} and the second one to T_{max}, *i.e.*, the validity range has approximately a trapezoidal shape. Values of parameters were taken from the papers (Refs. 3–10) where detailed information on the fits, experimental data, and application ranges is available. The numerical values of the parameters are different from those reported in papers (Refs. 3–10) since the forms of polynomials $C(T)$ and $B(T)$ differ. Besides, the parameters recorded in the table below must not necessarily correspond to those in Refs. 3–10 since some fits were updated using newly published experimental data.

In the second line for each substance, the parameters of the smoothing function for the density at reference pressure $\rho(T,P_{ref})$ are given. The functions are either the polynomial expansion,

$$\rho(T,P_{ref})/(\mathrm{kg\,m^{-3}}) = \sum_{i=1}^{N_p} a_i (T/\mathrm{K})^{(i-1)} \qquad (2)$$

or the expansion,

$$\rho(T,P_{ref}) = \rho_c\left[1 + \sum_{i=1}^{N_p} a_i (1-T_r)^{(i/3)}\right], \quad T_r = T/T_c \qquad (3)$$

where N_p is the number of adjustable parameters. Values of the critical density ρ_c and the critical temperature T_c used for the fits using Eq. 3 are also recorded in the table. Parameters were mostly taken from Refs. 3–10, those for 1-alkanols C_1 to C_{10} and n-alkanes C_5 to C_{16} are from Ref. 11. Data used for the fits were predominantly recommended values published in the TRC Thermodynamic Tables (Refs. 12,13), sometimes combined with the original experimental data or, in a few cases, the original experimental data were correlated.

RMSD is a relative root-mean-square deviation (in per cent) between experimental values of density and those calculated from the particular function (Tait Eq. 1 or Eqs. 2, 3);

$$RMSD/\% = 100\left\{\frac{1}{N}\sum_{i=1}^{N}\left(\frac{\rho_{exp}-\rho_{calc}}{\rho_{exp}}\right)^2\right\}^{1/2}$$

where N is the number of experimental values included in the fit.

If the maximum temperature T_{max} of validity of the Tait equation is greater than the normal boiling point temperature T_{nbp}, then parameters of the Wagner equation in the form of either

$$P_{sat}(T) = P_c \exp\left[\frac{a_1(1-T_r) + a_2(1-T_r)^{1.5} + a_3(1-T_r)^{2.5} + a_4(1-T_r)^5}{T_r}\right] \qquad (4)$$

or

$$P_{sat}(T) = P_c \exp\left[\frac{a_1(1-T_r) + a_2(1-T_r)^{1.5} + a_3(1-T_r)^3 + a_4(1-T_r)^6}{T_r}\right] \qquad (5)$$

where $T_r = T/T_c$ are recorded in the third line for each substance. Values of the critical pressure P_c and critical temperature T_c used in Eqs. 4 and 5 are also recorded in the table (values of the critical temperature may differ a little from those recorded for the function, Eq. 3). Parameters of Eqs. 4 and 5 were taken mostly from the papers by McGarry (Ref. 14) and Ambrose and Walton (Ref. 15); in a few cases, the fits were performed using original experimental data or in combination with the recommended values from the TRC Thermodynamic Tables (Refs. 12,13).

The two right-hand-most columns gives values of the isothermal compressibility coefficient, $\kappa_T = -(1/V)(\partial V/\partial P)_T = (1/\rho)(\partial\rho/\partial P)_T$, and the isobaric cubic expansion coefficient, $\alpha_p = (1/V)(\partial V/\partial T)_p = -(1/\rho)(\partial\rho/\partial T)_p$, calculated for T = 298.15 K and P = 0.101325 MPa from the Tait Eq. 1 and from the $\rho(T, P_{ref})$ equation, respectively. In a very few cases when the lower temperature limit of the Tait equation T_{min} is greater than 298.15 K, the extrapolated values of isothermal compressibility are given.

[o] $b_1 = -1.105 \cdot 10^{-5}$

VOLUMETRIC PROPERTIES OF AQUEOUS SODIUM CHLORIDE SOLUTIONS

This table gives the following properties of aqueous solutions of NaCl as a function of temperature and concentration:

Specific volume v (reciprocal of density) in cm^3/g
Isothermal compressibility $\kappa_T = -(1/v)(\partial v/\partial P)_T$ in GPa^{-1}
Cubic expansion coefficient $\alpha_v = (1/v)(\partial v/\partial T)_P$ in kK^{-1}

All data refer to a pressure of 100 kPa (1 bar). The reference gives properties over a wider range of temperature and pressure.

PROPERTIES OF CRYOGENIC FLUIDS

Eric W. Lemmon

This table gives physical and thermodynamic properties of ten cryogenic fluids. The properties are:

M	Molar mass
T_t	Triple-point temperature
P_t	Triple-point pressure
ρ_t (l)	Liquid density at the triple point
$\Delta_{fus}H$ @ T_t	Enthalpy of fusion at the triple point
T_b	Normal boiling point at a pressure of 101.325 kPa (760 mmHg)
$\Delta_{vap}H$ @ T_b	Enthalpy of vaporization at the normal boiling point
ρ @ T_b	Density at the normal boiling point for the liquid (l) or vapor (v)
C_p @ T_b	Heat capacity at constant pressure at the normal boiling point for the liquid (l) or vapor (v)
u @ T_b	Speed of sound at the normal boiling point for the liquid (l) or vapor (v)
T_c	Critical temperature
P_c	Critical pressure
ρ_c	Critical density

All properties except the heat of fusion are calculated from the REFPROP program, see Reference 4. Temperatures are listed on the ITS-90 scale, except those values for neon and oxygen that are obtained from older equations of state based on the IPTS-68 temperature scale. The references for all fluids except air, helium, neon, krypton, and xenon are given in the *Thermophysical Properties of Fluids* table. The properties of hydrogen are given for the para form of the molecule (see the Leachman et al. reference for details).

The triple-point temperature of air is the solidification temperature of the liquid (see Reference 2 for details). The boiling-point temperature for air is the bubble-point temperature (i.e., the temperature at which boiling begins as the pressure of the liquid is lowered). The dew-point (vapor) properties of air at 101.325 kPa are calculated at a temperature of 81.72 K; the liquid and vapor properties of these two state points are not in equilibrium. The triple-point properties of helium are given at the temperature of the lambda line (change from normal-to-superfluid helium) for the saturated-liquid state.

PROPERTIES OF LIQUID HELIUM

The following data were obtained by a critical evaluation of all existing experimental measurements on liquid helium, using a fitting procedure described in the reference. All values refer to liquid helium at saturated vapor pressure; temperatures are on the ITS-90 scale. Several properties show a singularity at the lambda point (2.1768 K).

p: vapor pressure
ρ: density
C_s: molar heat capacity
$\Delta_{vap}H$: molar enthalpy of vaporization
ε: relative permittivity (dielectric constant)
σ: surface tension
α_V: cubic expansion coefficient
η: viscosity
λ: thermal conductivity

PROPERTIES OF REFRIGERANTS

This table gives physical properties of compounds that have been used as working fluids in traditional refrigeration systems or are under consideration as replacements in newer systems. Some are also used as solvents and blowing agents. Many of the compounds listed are believed to be less harmful to the environment than the traditional halocarbon refrigerants.

Compounds are listed by their ASHRAE standard refrigerant designations (Reference 1), which appear in the first column. These codes are often prefixed by symbols such as CFC- (for chlorofluorocarbon), HCFC- (for hydrochlorofluorocarbon), or simply R- (for refrigerant). The "R" number assigned to refrigerants is specified by ANSI/ASHRAE Standard 34. This system is most useful for the hydrocarbons and halocarbons with one to three carbons; for such molecules the chemical composition can be determined from the number and vice versa. The first digit on the far right is the number of fluorine atoms in the compound. The second digit from the right is one more than the number of hydrogen atoms. The third digit from the right is one less than the number of carbon atoms; for single-carbon compounds, this digit is omitted. The fourth digit from the right is equal to the number of unsaturated carbon–carbon bonds; for saturated compounds, this digit is omitted. The number of bromine and iodine atoms is indicated, if needed, by appending "Bn" or "In" to the digits specified by the above rules, where "n" is the number of bromine or iodine atoms. All atoms not specified by the above are assumed to be chlorine. Appended lowercase letter(s) designate different isomers. Additional rules are used to specify cyclic compounds, ethers, inorganic fluids (R700- and R7000-series), miscellaneous organic compounds (R600-series), and blends (R400- and R500-series).

The properties tabulated are

- t_m normal melting point in °C
- t_b normal boiling point in °C (at 101.325 kPa or 760 mmHg)
- t_c critical temperature in °C
- TLV Threshold Limit Value, which is the maximum safe concentration in air in the workplace, expressed as the time-weighted average (TWA) in parts per million by volume, over an 8-hr workday and 40-hr workweek.

Many of the critical temperatures and normal boiling points have been calculated from the equations of state described in References 9 and 10. These values differ slightly in some cases (generally no more than about 0.1 °C) from values elsewhere in this book, but the differences are probably within the experimental uncertainty. Further references and additional data on the critical properties may be found in the table "Critical Constants" in this Section.

PROPERTIES OF GAS CLATHRATE HYDRATES

Carolyn A. Koh and E. Dendy Sloan

Gas clathrate hydrates (also known as gas hydrates) are crystalline inclusion compounds composed of hydrogen-bonded water cavities (host) which encage small gas (guest) molecules. Generally, a maximum of one guest molecule occupies each water cavity. Typical guest molecules that form gas hydrates are methane, ethane, carbon dioxide, and propane (see gas hydrate phase equilibria data in Table II). The structural and physical properties of gas hydrates are given in Tables Ia and Ib. Data have been taken from the references indicated.

Table Ia. Gas Hydrate Structural Properties (Ref. 1)

Structure	**sI**		**sII**		**sH**		
Crystal system	Cubic		Cubic		Hexagonal		
Space group	Pm3n (No. 223)[b]		Fd3m (No. 227)[b]		P6/mmm (No. 191)[b]		
Lattice description	Primitive		Face centered		Hexagonal		
Lattice parameters[a]	a = 12 Å $\alpha = \beta = \gamma = 90^o$		a = 17.3 Å $\alpha = \beta = \gamma = 90^o$		a = 12.2 Å, c = 10.1 Å $\alpha = \beta = 90^o$, $\gamma = 120^o$		
Ideal unit cell formula	$6(5^{12}6^2)\cdot 2(5^{12})\cdot 46H_2O$		$8(5^{12}6^4)\cdot 16(5^{12})\cdot 136H_2O$		$1(5^{12}6^8)\cdot 3(5^{12})\cdot 2(4^35^66^3)\cdot 34H_2O$		
Cavity	Small	Large	Small	Large	Small	Medium	Large
Description	5^{12}	$5^{12}6^2$	5^{12}	$5^{12}6^4$	5^{12}	$4^35^66^3$	$5^{12}6^8$
Number of cavities/unit cell	2	6	16	8	3	2	1
Average cavity radius[c] **(Å)**	3.95	4.33	3.91	4.73	3.94[d]	4.04[d]	5.79[d]
H_2O molecules/cavity[e]	20	24	20	28	20	20	36

[a] Lattice parameters are a function of temperature, pressure, and guest composition. Typical average values given.
[b] Space group reference numbers from the International Tables of Crystallography.
[c] The average cavity radius will vary with temperature, pressure, and guest composition.
[d] From the atomic coordinates measured using single crystal x-ray diffraction on 2,2-dimethylpentane·5(Xe,H_2S)·34H_2O at 173 K (Ref. 2). The Rietveld refinement package, GSAS was used to determine the atomic distances for each cage oxygen to the cage center.
[e] Number of oxygen atoms at the periphery of each cavity.

Table Ib. Physical Properties of sI, sII Hydrates Compared to Ice, Ih (Ref. 1,3,4,5)

Property	**Ice**	**sI**	**sII**
Dielectric constant at 273 K	94	~58	~58
H_2O reorientation time at 273 K (μs)	21	~10	~10
H_2O diffusion jump time (μs)	2.7	>200	>200
Isothermal Young's modulus at 268 K (10^9 Pa)	9.5	8.4[est]	8.2[est]
Poisson's ratio	0.3301[f]	0.31403[f]	0.31119[f]
Bulk modulus (GPa)	9.097[f]	8.762[f]	8.482[f]
Shear modulus (GPa)	3.488[f]	3.574[f]	3.6663[f]
Compressional velocity, V_p (m/s)	3870.1[f]	3778[f]	3821.8[f]
Shear velocity, V_s (m/s)	1949[f]	1963.6	2001.14[g]
Linear thermal expansion at 200 K (K^{-1})	56 x 10^{-6}	77 x 10^{-6}	52 x 10^{-6}
Thermal conductivity (W $m^{-1}K^{-1}$) at 263 K	2.18±0.01[h]	0.51±0.01[h]	0.50±0.01[h]
Adiabatic bulk compression at 273 K (GPa)	12	14[est]	14[est]
Heat capacity (J $kg^{-1}K^{-1}$)	1700±200[h]	2080	2130±40[h]
Refractive index (632.8 nm, –3 °C)	1.3082 (Ref. 9)	1.346 (Ref. 9)	1.350 (Ref. 9)
Density (g/cm^3)	0.91[j]	0.94	1.291[k]

[f] At 253–268 K, 22.4–32.8 MPa (ice, Ih), 258–288 K, 27.1–62.1 MPa (CH_4, sI), 258–288 K, 30.5–91.6 MPa (CH_4–C_2H_6, sII), Ref. 6.
[g] At 258–288 K, 26.6–62.1 MPa, Ref. 7.
[h] At 248–268 K (ice, Ih), 253–288 K (CH_4, sI), 248–265.5 K (THF, sII), Ref. 8.
[j] Fractional occupancy (calculated from a theoretical model) in small (S) and large (L) cavities: sI = CH_4: 0.87 (S) and CH_4: 0.973 (L); sII = CH_4: 0.672 (S), 0.057 (L); C_2H_6: 0.096 (L) only; C_3H_8: 0.84 (L) only.
[k] Calculated for 2,2-dimethylpentane·5(Xe,H_2S)·34H_2O, Ref. 2; est = estimated.

Table II: Phase Equilibria Data of Gas Clathrate Hydrates

This table gives measured phase equilibria data of sI and sII gas clathrate hydrates (see Table I for gas hydrate structure and physical property data). The temperature and pressure conditions at which gas hydrates are stable are listed here for typical guest molecules (Tables IIa–d). For example, data for methane hydrate show that at 277.1 K methane hydrate will dissociate at pressures below 3.81 MPa.

Table IIa. Methane Hydrate (Ref. 1)

IONIC LIQUIDS

Ionic liquids are a class of organic salts with relatively low melting points. The term usually implies a melting point of 100 °C or lower, and many are liquid at room temperature. They offer several advantages as solvents, such as very low vapor pressure, good thermal stability, and nonflammable behavior. For these reasons they are attractive as constituents of environmentally friendly chemical processes.

This table lists some of the ionic liquids that have been studied. The following properties are given:

Mol. Form. — molecular formula in the Hill convention
CASRN — Chemical Abstracts Service Registry Number
Mol. Wt. — molecular weight (relative molar mass)
t_m — normal melting point in °C; the notation "gl" indicates a glass–liquid transition, rather than a crystal–liquid transition
ρ — density in g/cm^3. The superscript indicates the temperature in °C; if there is no superscript, room temperature can be assumed.
η — viscosity in mPa s. The superscript indicates the temperature in °C; if there is no superscript, room temperature can be assumed.

The phase behavior of ionic liquids can be complicated. Some are crystalline at low temperatures and show a sharp transition from crystal to liquid state (a true melting point) as the temperature is raised, but others exist as a glass at low temperatures and convert to a liquid at the glass–liquid transition temperature, denoted by a small change in heat capacity. Still others are glasses at very low temperatures, transform to crystals as the temperature is raised, and finally become liquid at a still higher temperature. See Reference 3 for a discussion of the types of phase behavior.

DENSITY AND SPECIFIC VOLUME OF MERCURY

The data in this table have been adjusted to the ITS-90 temperature scale. The uncertainty in density values is 0.0003 g/mL between −20 and −10 °C; 0.0001 or less between −10 and 200 °C; and 0.0002 between 200 and 300 °C.

THERMAL PROPERTIES OF MERCURY

Lev R. Fokin

The first of these tables gives the molar heat capacity at constant pressure of liquid and gaseous mercury as a function of temperature. To convert to specific heat in units of J/g K, divide these values by 200.59, the atomic weight of mercury.

	C_p/(J/mol K)

The final table gives the cubic thermal expansion coefficient α, the isothermal compressibility coefficient κ_T, and the speed of sound u for liquid mercury as a function of temperature. These properties are defined as follows:

$$\alpha = \frac{1}{v}\left(\frac{\partial v}{\partial T}\right)_p \qquad \kappa_T = -\frac{1}{v}\left(\frac{\partial v}{\partial P}\right)_T \qquad u^2 = \left(\frac{\partial P}{\partial \rho}\right)_s \qquad \rho = v^{-1}$$

where v is the specific volume (given in the table on the preceding page).

MELTING CURVE OF MERCURY

The solid–liquid phase boundary of mercury provides a convenient means of calibrating pressures up to 1 GPa in the neighborhood of room temperature. The best representation of this curve is given by:

$$p/\text{GPa} = 1.932845 \cdot 10^{-2} d + 1.8333 \cdot 10^{-6} d^2 + 5.9791 \cdot 10^{-8} d^3$$

where $d = t/°\text{C} - 38.8344$. Temperature is on the ITS-90 scale, and the relation is valid for pressures up to about 1.2 GPa. The following table is calculated from this equation.

p* vs. *t		***t* vs. *p***	
***t*/°C**	***p*/GPa**	***p*/GPa**	***t*/°C**

VAPOR PRESSURE OF MERCURY

The following table gives the vapor pressure of mercury in kilopascals (100 kPa = 1 bar) from the triple point (234.3156 K) to the critical point (1764 K). The data are generated from the formulation of Huber, Laesecke, and Friend in Reference 1, which is based on a critical evaluation of all the published data on mercury vapor pressure and related thermodynamic properties. The estimated uncertainty in the vapor pressure is:

−38 to −10 °C	3%
0 to 130 °C	1%
140 to 350 °C	0.15%
360 to 620 °C	0.5%
630 to 1491 °C	5%

Most of the entries in this table carry one significant figure beyond the estimated accuracy.

Note that the table refers to mercury vapor in equilibrium with liquid mercury, in the absence of air or other gases.

SURFACE TENSION OF COMMON LIQUIDS

The surface tension γ of about 200 liquids is tabulated here as a function of temperature. Values of γ are given in units of millinewtons per meter (mN/m), which is equivalent to dyn/cm in c.g.s. units. The values refer to a nominal pressure of one atmosphere (about 100 kPa) except in cases where the indicated temperature is above the normal boiling point of the substance; in those cases, the applicable pressure is the saturation vapor pressure at the temperature in question.

The uncertainty of the values is 0.1 to 0.2 mN/m or less in most cases. Values at temperatures between the points tabulated can be obtained by linear interpolation to a good approximation.

Substances are listed by molecular formula in the modified Hill order, with substances not containing carbon appearing before those that do contain carbon. A more extensive compilation of surface tension may be found in Reference 1.

SURFACE TENSION OF AQUEOUS MIXTURES

The composition dependence of the surface tension of binary mixtures of several compounds with water is given in this table. The data are tabulated as a function of the mass percent of the non-aqueous component. Data for methanol, ethanol, 1-propanol, and 2-propanol are taken from Reference 1, which also gives values at other temperatures.

PERMITTIVITY (DIELECTRIC CONSTANT) OF LIQUIDS

Christian Wohlfarth

The permittivity of a substance (often called the dielectric constant) is the ratio of the electric displacement D to the electric field strength E when an external field is applied to the substance. The quantity tabulated here is the relative permittivity, which is the ratio of the actual permittivity to the permittivity of a vacuum; it is a dimensionless number.

The table gives the static relative permittivity ε_r, i.e., the relative permittivity measured in static fields or at low frequencies where no relaxation effects occur. The fourth column of the table lists the value of ε_r at the temperature specified in the third column, usually 293.15 or 298.15 K. Otherwise, the temperature closest to 293.15 K was chosen, or (as it is the case for many of the substances included here) ε_r is given at the only temperature for which data are available.

The static permittivity refers to nominal atmospheric pressure as long as the corresponding temperature is below the normal boiling point. Otherwise, at temperatures above the normal boiling point, the pressure is understood to be the saturated vapor pressure of the substance considered.

For substances where information on the temperature dependence of the permittivity is available, the table gives the coefficients of a simple polynomial fitting of permittivity to temperature with an equation of the form

$$\varepsilon_r(T) = a + bT + cT^2 + dT^3$$

where T is the absolute temperature in K. Since the parameter d was used in only a few cases where the quadratic fit was not satisfactory, only a, b, and c are listed as columns in the table, while the d values are given at the end of this introduction. For all other substances, $d = 0$. The temperature range of the fit is given in the last column. The coefficients of the fitting equation can be used to calculate dielectric constants within the fitted temperature range but should not be used for extrapolation outside this range. The user who needs dielectric constant data with more accuracy than can be provided by this equation is referred to Reference 1, which gives the original data together with their literature source.

Substances are listed by molecular formula in modified Hill order, with substances not containing carbon preceding those that do contain carbon.

* Indicates that the isomer was not specified in the original reference.

** Indicates a compound for which the cubic term is needed:

Ethanol	d = –0.15512E-05
N-Methylacetamide	d = –0.12998E-04
1,2-Propylene glycol	d = –0.32544E-05
1-Butanol	d = –0.48841E-06
2-Butanol	d = –0.89512E-06
2-Methyl-1-propanol	d = –0.45229E-06
2-Methyl-2-propanol	d = –0.25968E-05
N-Butylacetamide	d = –0.48716E-05

PERMITTIVITY (DIELECTRIC CONSTANT) OF GASES

This table gives the relative permittivity ε (often called the dielectric constant) of some common gases at a temperature of 20 °C and pressure of one atmosphere (101.325 kPa). Values of the permanent dipole moment μ in Debye Units (1 D = 3.33564×10^{-30} C m) are also included.

The density dependence of the permittivity is given by the equation

$$\frac{\varepsilon - 1}{\varepsilon + 2} = \rho_m \left(\frac{4\pi N \alpha}{3} + \frac{4\pi N \mu^2}{9kT} \right)$$

where ρ_m is the molar density, N is Avogadro's number, k is the Boltzmann constant, T is the temperature, and α is the molecular polarizability. Therefore, in regions where the gas can be considered ideal, ε − 1 is approximately proportional to the pressure at constant temperature. For nonpolar gases (μ = 0), ε −1 is inversely proportional to temperature at constant pressure.

The number of significant figures indicates the accuracy of the values given. The values of ε for air, Ar, H_2, He, N_2, O_2, and CO_2 are recommended as reference values; these are accurate to 1 ppm or better.

The second part of the table gives the permittivity of water vapor in equilibrium with liquid water as a function of temperature (derived from Reference 4).

AZEOTROPIC DATA FOR BINARY MIXTURES

J. Gmehling, J. Menke, J. Krafczyk, K. Fischer, J.-C. Fontaine, and H. V. Kehiaian

Binary homogeneous (single-phase) liquid mixtures having an extremum (maximum or minimum) vapor pressure P at constant temperature T, as a function of composition, are called azeotropic mixtures, or simply azeotropes. The composition is usually expressed as mole fractions, where x_1 for component 1 in the liquid phase and y_1 for component 1 in the vapor phase are identical. Mixtures that do not show a maximum or minimum are called zeotropic. A maximum (minimum) of the $P(x_1)$ or $P(y_1)$ curves corresponds to a minimum (maximum) of the boiling temperature T at constant P, plotted as a function of x_1 or y_1 [see $T(x_1)$ and $T(y_1)$ curves, Types I and III, in Fig. 1]. Azeotropes in which the pressure is a maximum (temperature is a minimum) are often called positive azeotropes, while pressure-minimum (temperature-maximum) azeotropes are called negative azeotropes. The coordinates of an azeotropic point are the azeotropic temperature T_{Az}, pressure P_{Az}, and the vapor-phase composition $y_{1,Az}$, which is the same as the liquid-phase composition $x_{1,Az}$.

In the two-phase liquid-liquid region of partially miscible (heterogeneous) mixtures, the vapor pressure at constant T (or the boiling temperature at constant P) is independent of the global composition x_1 of the two coexisting liquid phases between the equilibrium compositions x_1' and x_1'' ($x_1' < x_1''$).

The constant vapor pressure (boiling temperature) above the two-phase region of certain partially miscible mixtures is usually larger (smaller) than the vapor pressure (boiling temperature) at any other liquid-phase composition in the homogeneous region. In this case, the vapor-phase composition is inside the miscibility gap. Mixtures of this type are called heteroazeotropic mixtures, or simply heteroazeotropes. (Fig. 1, Type II), as opposed to the other types of azeotropes, called homoazeotropes.

Only in a few cases partially miscible mixtures present a positive or negative azeotropic point in the single-phase region, outside the miscibility gap, similar to the azeotropic points of homogeneous mixtures (Fig. 1, Types IV and VI).

A few binary mixtures, for example the system perfluorobenzene + benzene, may present two azeotropic points at constant temperature (pressure), a positive and a negative one. They are called double azeotropic mixtures, or simply double azeotropes. (Fig. 1, Type V).

The knowledge of the occurrence of azeotropic points in binary and higher systems is of special importance for the design of distillation processes. The number of theoretical stages of a distillation column required for the separation depends on the separation factor α_{12}, i.e., the ratio of the K_i-factors ($K_i = y_i/x_i$) of the components i (i = 1, 2). The required separation factor can be calculated with the following simplified relation (Reference 1):

$$\alpha_{12} = K_1/K_2 = (y_1/x_1)/(y_2/x_2) = (\gamma_1 P_1^s)/(\gamma_2 P_2^s) \qquad (1)$$

where γ_i is the activity coefficient of component i in the liquid phase and P_i^s is the vapor pressure of the pure component i.

In distillation processes, only the difference between the separation factor and unity ($\alpha_{12} - 1$) can be exploited for the separation. If the separation factor is close to unity, a large number of theoretical stages is required for the separation. If the binary system to be separated shows an azeotropic point ($\alpha_{12} = 1$), the separation is impossible by ordinary distillation, even with an infinitely large number of stages.

Following eq. (1) azeotropic behavior will always occur in homogeneous binary systems when the vapor pressure ratio P_1^s/P_2^s is equal to the ratio of the activity coefficients γ_2/γ_1.

Various thermodynamic methods based on g^E-models (Wilson, NRTL, UNIQUAC) or group contribution methods (UNIFAC, modified UNIFAC, ASOG, PSRK) can be used for either calculating or predicting the required activity coefficients for the components under given conditions of temperature and composition (Reference 2).

Because of the importance of azeotropic data for the design of distillation processes, compilations have been available in book form for quite some time (References 3-7). The most recent printed data collection was published in 1994 (Reference 8). A revised and extended version appeared in 2004 (Reference 9).

A collection of approximately 47,400 zeotropic and azeotropic data sets, compiled from 6600 references, are stored in a comprehensive computerized data bank (Reference 10). The references from the above-mentioned compilations and from the vapor-liquid equilibrium part of the Dortmund Data Bank (Reference 11) were supplemented by references found from CAS online searches, private communications, data from industry, etc.. Over 24,000 zeotropic data and over 20,000 azeotropic data are available for binary systems. Nearly 90% of the binary azeotropic data show a pressure maximum. In most cases (ca. 90%) these are homogeneous azeotropes, and in approximately 7–8% of the cases heterogeneous azeotropes are reported. Less than 10% of the data stored show a pressure minimum. Approximately 21,000 of the data sets stored were published after 1970.

The table below provides information about azeotropes for 808 selected binary systems. Compounds are listed in the modified Hill order, with carbon-containing compounds following those compounds not containing carbon. In columns 1 and 2 are the molecular formulas of components 1 and 2 written in the Hill convention. In column 3 the names of the components are given, either a systematic IUPAC name or a name in ubiquitous use. Columns 4, 5, and 6 contain the azeotropic coordinates of the mixtures: temperature T_{Az}, pressure P_{Az}, and vapor-phase composition $y_{1,Az}$. The explanation of the type of azeotrope (column 7) is given by the following codes:

- O: homogeneous azeotrope in a completely miscible system
- L: homogeneous azeotrope in a partially miscible system
- E: heterogeneous azeotrope
- X: pressure maximum
- N: pressure minimum
- D: double azeotrope
- C: system contains a supercritical compound

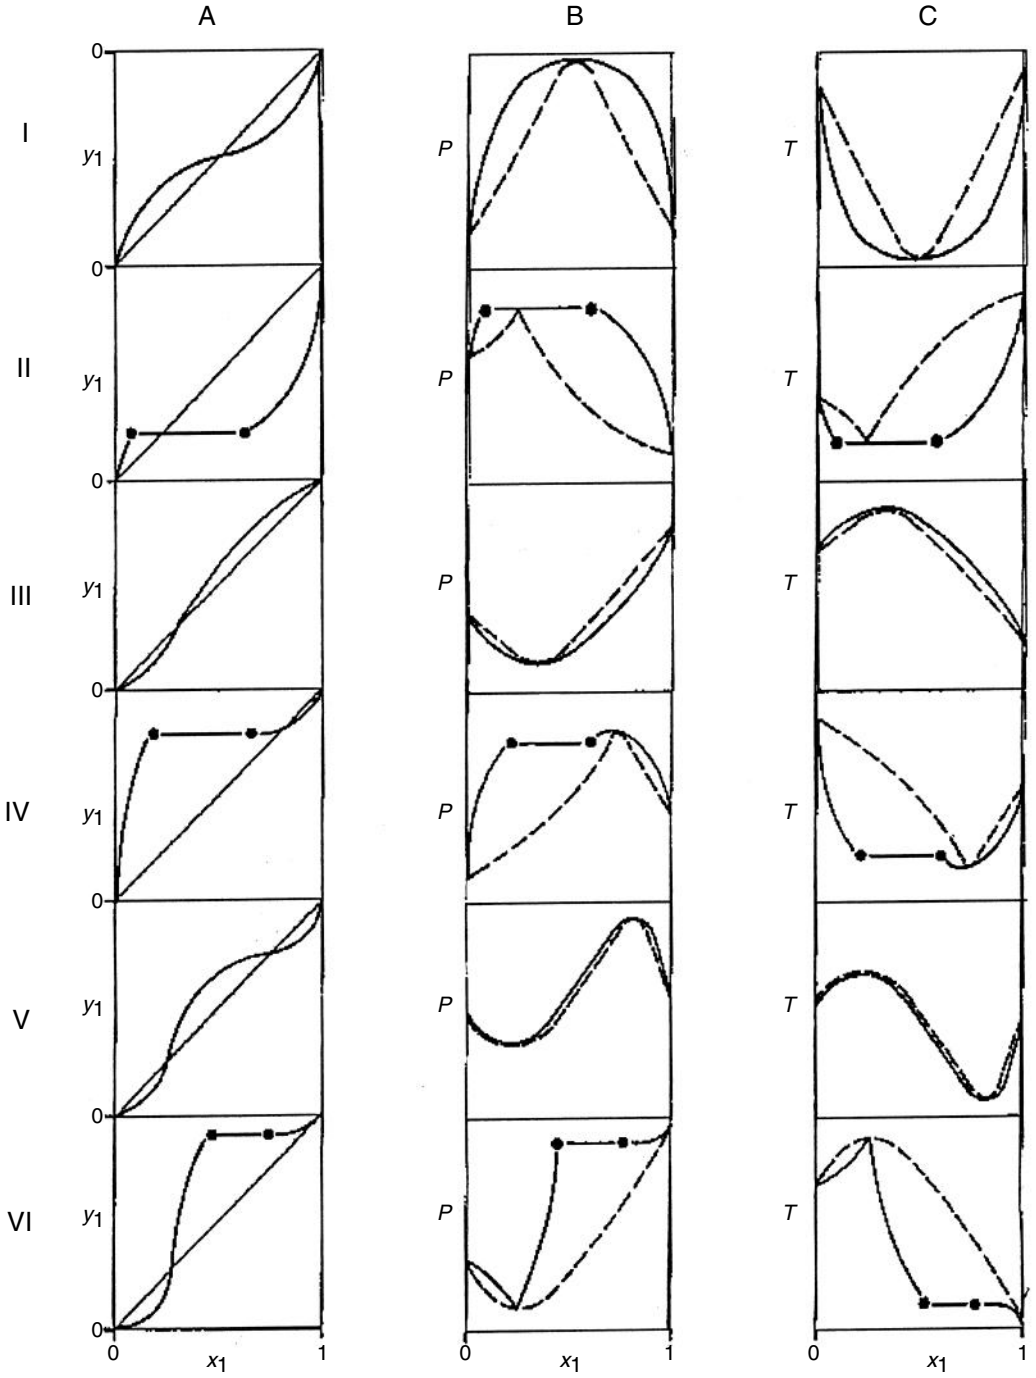

Figure 1 Different types of binary azeotropic systems: I — homogeneous pressure-maximum azeotrope in a completely miscible system (OX); II — heterogeneous pressure-maximum azeotrope (EX); III — homogeneous pressure-minimum azeotrope in a completely miscible system (ON); IV — homogeneous pressure-maximum azeotrope in a partially miscible system (LX); V–D: double azeotrope (OND, OXD); VI — homogeneous pressure-minimum azeotrope in a partially miscible system (LN). A — $y_1(x_1)$; B — $P(x_1)$ and $P(y_1)$; C — $T(x_1)$ and $T(y_1)$. Continuous line — (x_1); Dashed line — (y_1).

VISCOSITY OF GASES

Marcia L. Huber and Allan H. Harvey

The following table gives the viscosity of some common gases as a function of temperature. Unless otherwise noted, the viscosity values refer to a pressure of 100 kPa (1 bar). The notation $P = 0$ indicates that the low-pressure limiting value is given. The difference between the viscosity at 100 kPa and the limiting value is generally less than 2%. Uncertainties for the viscosities of gases in this table are generally less than 3%; uncertainty information on specific fluids can be found in the references. Viscosity is given in units of μPa s; note that 1 μPa s = 10^{-5} poise. Substances are listed in the modified Hill order (see Introduction).

		Viscosity in μPa s						
		100 K	200 K	300 K	400 K	500 K	600 K	Ref.
	Air	7.1	13.3	18.5	23.1	27.1	30.8	1
Ar	Argon ($P = 0$)	8.1	15.9	22.7	28.6	33.9	38.8	2, 3*, 4*
BF_3	Boron trifluoride		12.3	17.1	21.7	26.1	30.2	5

VISCOSITY OF LIQUIDS

The absolute viscosity of some common liquids at temperatures between –25 and 100 °C is given in this table. Values were derived by fitting experimental data to suitable expressions for the temperature dependence. The substances are arranged by molecular formula in the modified Hill order (see Preface). All values are given in units of millipascal seconds (mPa s); this unit is identical to centipoise (cp).

Viscosity values correspond to a nominal pressure of 1 atmosphere. If a value is given at a temperature above the normal boiling point, the applicable pressure is understood to be the vapor pressure of the liquid at that temperature. A few values are given at a temperature slightly below the normal freezing point; these refer to the supercooled liquid.

The accuracy ranges from 1% in the best cases to 5 to 10% in the worst cases. Additional significant figures are included in the table to facilitate interpolation.

VISCOSITY AND DENSITY OF AQUEOUS HYDROXIDE SOLUTIONS

The viscosity and density of aqueous hydroxide solutions at 25 °C are tabulated here as a function of concentration. Viscosity is given in millipascal second, which is equal to the c.g.s. unit centipoise (cP). The last entry in each column refers to the saturated solution.

VISCOSITY OF LIQUID METALS

This table gives the viscosity of several liquid metals as a function of temperature. Experimental data from some of the references was smoothed to produce the table. Viscosity is given in millipascal second (mPa s), which equals the c.g.s. unit centipoise (cP).

THERMAL CONDUCTIVITY OF GASES

Marcia L. Huber and Allan H. Harvey

The following table gives the thermal conductivity of some common gases as a function of temperature. Unless otherwise noted, the thermal conductivity values refer to a pressure of 100 kPa (1 bar) or to the saturation vapor pressure if that is less than 100 kPa. The notation $P = 0$ indicates that the low-pressure limiting value is given. The difference between the thermal conductivity at 100 kPa and the limiting value is generally less than 1%. Uncertainties for the thermal conductivities of gases in this table are generally less than 3%; uncertainty information on specific fluids can be found in the references. Thermal conductivity is given in units of mW m^{-1} K^{-1}. Substances are listed in the modified Hill order.

		Thermal conductivity in mW m^{-1} K^{-1}						
		100 K	**200 K**	**300 K**	**400 K**	**500 K**	**600 K**	**Ref.**
	Air	9.5	18.5	26.4	33.5	39.9	46.0	1

THERMAL CONDUCTIVITY OF LIQUIDS

This table gives the thermal conductivity of about 275 liquids at temperatures between –25 and 100 °C. Values refer to nominal atmospheric pressure; when an entry is given for a temperature above the normal boiling point of the liquid, the pressure is understood to be the saturation vapor pressure at that temperature. Reference 1 contains data on many of these liquids at high pressures. Data on halocarbon refrigerants over a wide range of temperature and pressure may be found in Reference 6.

Values given to three decimal places (i.e., to 0.001 W/m K) have an uncertainty of 2% to 5%. Values given to 0.0001 W/m K should be accurate to 1% or better.

Substances are arranged by molecular formula in Hill order, except that compounds not containing carbon precede those that do contain carbon.

DIFFUSION IN GASES

This table gives binary diffusion coefficients D_{12} for a number of common gases as a function of temperature. Values refer to atmospheric pressure. The diffusion coefficient is inversely proportional to pressure as long as the gas is in a regime where binary collisions dominate. See Reference 1 for a discussion of the dependence of D_{12} on temperature and composition.

The first part of the table gives data for several gases in the presence of a large excess of air. The remainder applies to equimolar mixtures of gases. Each gas pair is ordered alphabetically according to the most common way of writing the formula. The listing of pairs then follows alphabetical order by the first constituent.

DIFFUSION OF GASES IN WATER

This table gives values of the diffusion coefficient, *D,* for diffusion of several common gases in water at various temperatures. For simple one-dimensional transport, the diffusion coefficient describes the time–rate of change of concentration, d*c*/d*t,* through the equation

$$dc/dt = D\, d^2c/dx^2$$

where *x* is, for example, the perpendicular distance from a gas–liquid interface. The values below have been selected from the references indicated; in some cases data have been refitted to permit interpolation in temperature.

Gas–liquid diffusion coefficients are difficult to measure, and large differences are found between values obtained by different authors and through different experimental methods. See References 1 and 2 for a discussion of measurement techniques.

DIFFUSION COEFFICIENTS IN LIQUIDS AT INFINITE DILUTION

This table lists diffusion coefficients D_{AB} at infinite dilution for some binary liquid mixtures. Values are given at 25 °C when available; it should be noted that the diffusion coefficient generally increases by 10% to 20% for a 10 °C increase above ambient temperature.

Solvents are listed in alphabetical order, as are the solutes within each solvent group.

PROPERTIES OF AMINO ACIDS

This table gives selected properties of some important amino acids and closely related compounds. The first part of the table lists the 20 "standard" amino acids that are the basic constituents of proteins. The second part includes other amino acids and related compounds of biochemical importance. Within each part of the table the compounds are listed by name in alphabetical order. Structures are given in the following table.

Symbol: Three-letter symbol for the standard amino acids
M_r: Molecular weight
t_m: Melting point
pK_a , pK_b , pK_c , pK_d: Negative of the logarithm of the acid dissociation constants for the COOH and NH_2 groups (and, in some cases, other groups) in the molecule (at 25 °C)
pI: pH at the isoelectric point
S: Solubility in water in units of grams of compound per kilogram of water; a temperature of 25 °C is understood unless otherwise stated in a superscript. When quantitative data are not available, the notations sl.s. (for slightly soluble), s. (for soluble), and v.s. (for very soluble) are used.
V_2^0: Partial molar volume in aqueous solution at infinite dilution (at 25 °C)

Data on the enthalpy of formation of many of these compounds are included in the table "Standard Thermodynamic Properties of Chemical Substances" in Section 5 of this *Handbook*. Absorption spectra and optical rotation data can be found in Reference 3. Partial molar volume is taken from Reference 5; other thermodynamic properties, including solubility as a function of temperature, are given in References 3 and 5. Most of the p*K* values come from References 1, 6, and 7.

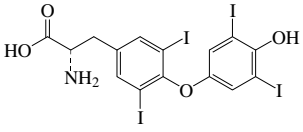
Taurine

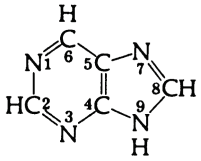


L-Thyroxine

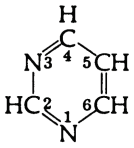
PROPERTIES OF PURINE AND PYRIMIDINE BASES

This table lists some of the important purine and pyrimidine bases that occur in nucleic acids. The pK_a values (negative logarithm of the acid dissociation constant) are given for each ionization stage. The last column gives the aqueous solubility S at the indicated temperature in units of grams per 100 grams of solution.

The numbering system in the rings is:



Purine



Pyrimidine

Common name	Systematic name	Mol. form.	Mol. wt.	pK_a values			S/mass % (temp.)
Pyrimidines							
Cytosine	4-Amino-2-hydroxypyrimidine	$C_4H_5N_3O$	111.10	4.60	12.16		0.73 (25 °C)
5-Methylcytosine	4-Amino-2-hydroxy-5-methylpyrimidine	$C_5H_7N_3O$	125.13	4.6	12.4		0.45 (25 °C)
5-Hydroxymethylcytosine	4-Amino-2-hydroxy-5-hydroxymethylpyrimidine	$C_5H_7N_3O_2$	141.13	4.3	13		
Uracil	2,4-Dihydroxypyrimidine	$C_4H_4N_2O_2$	112.09	0.5	9.5	>13	0.27 (25 °C)
Thymine	5-Methyluracil	$C_5H_6N_2O_2$	126.11	9.94	>13		0.35 (25 °C)
Orotic acid	Uracil-6-carboxylic acid	$C_5H_4N_2O_4$	156.10	2.4	9.5	>13	0.18 (18 °C)
Purines							
Adenine	6-Aminopurine	$C_5H_5N_5$	135.14	<1	4.3	9.83	0.104 (25 °C)
Guanine	2-Amino-6-hydroxypurine	$C_5H_5N_5O$	151.13	3.3	9.2	12.3	0.0068 (40 °C)
7-Methylguanine	7-Methyl-2-amino-6-hydroxypurine	$C_6H_7N_5O$	165.16	3.5	9.9		
Isoguanine	6-Amino-2-hydroxypurine	$C_5H_5N_5O$	151.13	4.5	9.0		0.006 (25 °C)
Xanthine	2,6-Dioxopurine	$C_5H_4N_4O_2$	152.11	0.8	7.4	11.1	0.05 (20 °C)
Hypoxanthine	6-Hydroxypurine	$C_5H_4N_4O$	136.11	2.0	8.9	12.1	0.07 (19 °C)
Uric acid	2,6,8-Trihydroxypurine	$C_5H_4N_4O_3$	168.11	5.4	11.3		0.002 (20 °C)

THE GENETIC CODE

This table gives the correspondence between a messenger RNA codon and the amino acid that it specifies. The symbols for bases in the codon are:

U: uracil
C: cytosine
A: adenine
G: guanine

The amino acid symbols are given in the table entitled "Structures of Common Amino Acids." A chain-initiating codon is indicated by **init** and a chain-terminating codon by **term**.

Example: UCA codes for **Ser**, UAC codes for **Tyr**, etc.

	Second position				
First position	**U**	**C**	**A**	**G**	**Third position**
U	Phe	Ser	Tyr	Cys	U
	Phe	Ser	Tyr	Cys	C
	Leu	Ser	**term**	**term**	A
	Leu	Ser	**term**	Trp	G
C	Leu	Pro	His	Arg	U
	Leu	Pro	His	Arg	C
	Leu	Pro	Gln	Arg	A
	Leu	Pro	Gln	Arg	G
A	Ile	Thr	Asn	Ser	U
	Ile	Thr	Asn	Ser	C
	Ile	Thr	Lys	Arg	A
	Met (**init**)	Thr	Lys	Arg	G
G	Val	Ala	Asp	Gly	U
	Val	Ala	Asp	Gly	C
	Val	Ala	Glu	Gly	A
	Val (**init**)	Ala	Glu	Gly	G

PROPERTIES OF FATTY ACIDS AND THEIR METHYL ESTERS

This table gives the names and selected properties of some important fatty acids and their methyl esters. It includes most of the acids that are significant constituents of naturally occurring oils and fats. Compounds are listed first by number of carbon atoms and, secondly, by the degree of unsaturation. Both the systematic name and the common or trivial name are given, as well as the Chemical Abstracts Service Registry Number and the shorthand acid code that is frequently used. The first number in this code gives the number of carbon atoms; the number following the colon is the number of unsaturated centers (mainly double bonds). The location and orientation of the unsaturated centers follow. The symbols used are: c = *cis*; t = *trans*; a = acetylenic center; e = ethylenic center at end of chain; ep = *epoxy*. Thus 9c,11t indicates a double bond with *cis* orientation at the No. 9 carbon and another with *trans* orientation at the No. 11 carbon. More details on the codes can be found in Reference 1.

The table gives the molecular weight and melting point of the acid and the melting and boiling points of the methyl ester of the acid when available. A superscript on the boiling point indicates the pressure in mmHg (torr); if there is no superscript, the value refers to one atmosphere (760 mmHg). The references cover many other fatty acids beyond those listed here and give additional properties.

We are indebted to Frank D. Gunstone for advice on the content of the table.

PROPERTIES OF FATTY ACID METHYL AND ETHYL ESTERS RELATED TO BIOFUELS

Robert D. Chirico and Michael Frenkel

These tables provide critically evaluated properties and sources of experimental data for fatty acid methyl esters and ethyl esters found in biofuels. All listed property values are based on experimental results reported in Refs. 1 to 103. Critical evaluation was carried out dynamically with the *NIST ThermoData Engine* (TDE) software (Ref. 104). The software algorithms have been described in the literature (see Refs. 105 to 110).

The table of properties lists the common name, molecular formula, Chemical Abstracts Service Registry Number (CASRN), acid code, normal melting temperature (mp/°C), density of the liquid phase at 25 °C and 50 °C near pressure p = 0.1 MPa (ρ^{25} and ρ^{50} expressed in kg × m^{-3}), vapor pressure p_{sat} at the temperatures 100 °C and 150 °C (p_{sat}^{100} and p_{sat}^{150} in Pa), the normal boiling temperature (bp/°C), heat capacity of the liquid phase at 25 °C and 50 °C near pressure p = 0.1 MPa (C_p^{25} and C_p^{50} in J × K^{-1} × mol^{-1}), and viscosity of the liquid at 25 °C and 50 °C near pressure p = 0.1 MPa (η^{25} and η^{50} in mPa × s). In some cases, property values for the liquid cannot be evaluated at 25 °C because the compound is solid at this temperature. In such cases, values are given at 40 °C, as indicated with a superscript "40." All normal boiling temperatures are estimates based on extrapolation of vapor pressures measured at lower temperatures. The acid code is a common shorthand used in the field. The first number represents the number of carbon atoms in the parent fatty acid, and the second number indicates the number of double bonds present. Values in parentheses are the estimated expanded uncertainties (0.95 level of confidence) (see Refs. 111 to 113) for the property values. A discussion of uncertainty terminology with particular application to thermodynamic and transport properties is given in Ref. 114.

The second table provides up to five data sources reporting experimental measurements of the indicated property. Generally, these are the most important sources that were used in the critical evaluation process. The numbers correspond to those in the reference list.

Compounds	Molecular Formula	CASRN	Acid code	mp °C	ρ^{25} kg m^{-3}	ρ^{50} kg m^{-3}	p_{sat}^{100} Pa	p_{sat}^{150} Pa	bp °C	C_p^{25} J mol^{-1} K^{-1}	C_p^{50} J mol^{-1} K^{-1}	η^{25} mPa s	η^{50} mPa s

COMPOSITION AND PROPERTIES OF COMMON OILS AND FATS

This table lists some of the most common naturally occurring oils and fats. The list is separated into those of plant origin, fish and other marine life origin, and land animal origin. The oils and fats consist mainly of esters of glycerol (i.e., triglycerides) with fatty acids of 10 to 22 carbon atoms. The four fatty acids with the highest concentration are given for each oil; concentrations are given in weight percent. Because there is often a wide variation in composition depending on the source of the oil sample, a range (or sometimes an average) is generally given. More complete data on composition, including minor fatty acids, sterols, and tocopherols, can be found in the references.

The acids are labeled by the codes described in the previous table, "Properties of Fatty Acids and Their Methyl Esters," which gives the systematic and common names of the acids. Thus 18:2 9c,12c indicates a C_{18} acid with two double bonds in the 9 and 12 positions, both with a *cis* configuration (*cis,cis*-9,12-octadecadienoic acid, or linoleic acid).

The density and refractive index of the oils are typical values; superscripts indicate the temperature in °C.

Notes:

- The composition figure given for oleic acid (18:1 9c) often includes low levels of other 18:1 isomers.
- In some oils where a concentration is given for 18:2 9c,12c (linoleic acid), other isomers of 18:2 may be included.
- Likewise, where a concentration is given for 18:3 9c,12c,15c (α-linolenic acid), other isomers of 18:3 may be included.
- The acid 20:5 6c,9c,12c,15c,17c, which is prevalent in many fish oils, is often abbreviated as 20:5 ω-3 or 20:5 n-3.

The assistance of Frank D. Gunstone in preparing this table is gratefully acknowledged.

[a] Jojoba oil consists primarily of wax esters of the acids listed here and long-chain alcohols.
[b] Kapok oil also contains up to 15% cyclopropene acids.
[c] Stillingia oil also contains 5–10% *trans,cis*-2,4-decadienoic acid (stillingic acid, 10:2 2t,4c).
[d] Capelin oil also contains about 10% 16:1.

CARBOHYDRATE NAMES AND SYMBOLS

The following table lists the systematic names and symbols for selected carbohydrates and some of their derivatives. The symbols for monosaccharide residues and derivatives are recommended by IUPAC for use in describing the structures of oligosaccharide chains. A more complete list can be found in the reference.

Common name	Symbol	Systematic name
Abequose	Abe	3,6-Dideoxy-D-*xylo*-hexose
N-Acetyl-2-deoxyneur-2-enaminic acid	Neu2en5Ac	
N-Acetylgalactosamine	GalNAc	
N-Acetylglucosamine	GlcNAc	
N-Acetylneuraminic acid	Neu5Ac	
Allose	All	*allo*-Hexose
Altrose	Alt	*altro*-Hexose
Apiose	Api	3-*C*-(Hydroxymethyl)-*glycero*-tetrose
Arabinitol	Ara-ol	Arabinitol
Arabinose	Ara	*arabino*-Pentose
Arcanose		2,6-Dideoxy-3-*C*-methyl-3-*O*-methyl-*xylo*-hexose
Ascarylose		3,6-Dideoxy-L-*arabino*-hexose
Boivinose		2,6-Dideoxy-D-gulose
Chalcose		4,6-Dideoxy-3-*O*-methyl-D-*xylo*-hexose
Cladinose		2,6-Dideoxy-3-*C*-methyl-3-*O*-methyl-L-*ribo*-hexose
Colitose		3,6-Dideoxy-L-*xylo*-hexose
Cymarose		6-Deoxy-3-*O*-methyl-*ribo*-hexose
3-Deoxy-D-*manno*-oct-2-ulosonic acid	Kdo	
2-Deoxyribose	dRib	2-Deoxy-*erythro*-pentose
2,3-Diamino-2,3-dideoxy-D-glucose	GlcN3N	
Diginose		2,6-Dideoxy-3-*O*-methyl-*lyxo*-hexose
Digitalose		6-Deoxy-3-*O*-methyl-D-galactose
Digitoxose		2,6-Dideoxy-D-*ribo*-hexose
3,4-Di-*O*-methylrhamnose	$Rha3,4Me_2$	
Ethyl glucopyranuronate	Glc*p*A6Et	
Evalose		6-Deoxy-3-*C*-methyl-D-mannose
Fructose	Fru	*arabino*-Hex-2-ulose
Fucitol	Fuc-ol	6-Deoxy-D-galactitol
Fucose	Fuc	6-Deoxygalactose
β-D-Galactopyranose 4-sulfate	β-D-Gal*p*4*S*	
Galactosamine	GalN	2-Amino-2-deoxygalactose
Galactose	Gal	*galacto*-Hexose
Glucitol	Glc-ol	
Glucosamine	GlcN	2-Amino-2-deoxyglucose
Glucose	Glc	*gluco*-Hexose
Glucuronic acid	GlcA	
N-Glycoloylneuraminic acid	Neu5Gc	
Gulose	Gul	*gulo*-Hexose
Hamamelose		2-*C*-(Hydroxymethyl)-D-ribose
Idose	Ido	*ido*-Hexose
Iduronic acid	IdoA	
Lactose	Lac	β-D-Galactopyranosyl-(1→4)-D-glucose
Lyxose	Lyx	*lyxo*-Pentose
Maltose		α-D-Glucopyranosyl-(1→4)-D-glucose
Mannose	Man	*manno*-Hexose
2-*C*-Methylxylose	Xyl2*C*Me	
Muramic acid	Mur	2-Amino-3-*O*-[(R)-1-carboxyethyl]-2-deoxy-D-glucose
Mycarose		2,6-Dideoxy-3-*C*-methyl-L-*ribo*-hexose
Mycinose		6-Deoxy-2,3-di-*O*-methyl-D-allose
Neuraminic acid	Neu	5-Amino-3,5-dideoxy-D-*glycero*-D-*galacto*-non-2-ulosonic acid

Common name	Symbol	Systematic name
Panose		α-D-Glucopyranosyl-(1→6)-α-D-glucopyranosyl-(1→4)-D-glucose
Paratose		3,6-Dideoxy-D-*ribo*-hexose
Primeverose		β-D-Xylopyranosyl-(1→6)-D-glucose
Psicose	Psi	*ribo*-Hex-2-ulose
Quinovose	Qui	6-Deoxyglucose
Raffinose		β-D-Fructofuranosyl-α-D-galactopyranosyl-(1→6)-α-D-glucopyranoside
Rhamnose	Rha	6-Deoxymannose
Rhodinose		2,3,6-Trideoxy-L-*threo*-hexose
Ribose	Rib	*ribo*-Pentose
Ribose 5-phosphate	Rib5*P*	
Ribulose	Ribulo (Rul)	*erythro*-Pent-2-ulose
Rutinose		α-L-Rhamnopyranosyl-(1→6)-D-glucose
Sarmentose		2,6-Dideoxy-3-*O*-methyl-D-*xylo*-hexose
Sedoheptulose		D-*altro*-Hept-2-ulose
Sorbose	Sor	*xylo*-Hex-2-ulose
Streptose		5-Deoxy-3-*C*-formyl-L-lyxose
Sucrose		β-D-Fructofuranosyl-α-D-glucopyranoside
Tagatose	Tag	*lyxo*-Hex-2-ulose
Talose	Tal	*talo*-Hexose
Turanose		α-D-Glucopyranosyl-(1→3)-D-fructose
Tyvelose	Tyv	3,6-Dideoxy-D-*arabino*-hexose
Xylose	Xyl	*xylo*-Pentose
Xylulose	Xylulo (Xul)	*threo*-Pent-2-ulose

STANDARD TRANSFORMED GIBBS ENERGIES OF FORMATION FOR BIOCHEMICAL REACTANTS

Robert N. Goldberg and Robert A. Alberty

This table contains values of the standard transformed Gibbs energies of formation $\Delta_f G'^\circ$ for 130 biochemical reactants. Values of $\Delta_f G'^\circ$ are given at pH 7.0, the temperature 298.15 K, and the pressure 100 kPa for three ionic strengths: I = 0, I = 0.1 mol/L and I = 0.25 mol/L. The table can be used for calculating apparent equilibrium constants K' and standard apparent reduction potentials E'° for biochemical reactions. Such a listing is more compact than tabulating the actual apparent equilibrium constants or standard apparent reduction potentials, which would require a very large number of reactant–product combinations. In the table, all reactants are in aqueous solution unless indicated otherwise.

A biochemical reactant is a sum of species. For example, ATP consists of an equilibrium mixture of the aqueous species ATP^{4-}, $HATP^{3-}$, H_2ATP^{2-}, $MgATP^{2-}$, etc. Similarly, phosphate refers to the equilibrium mixture of the aqueous species PO_4^{3-}, HPO_4^{2-}, $H_2PO_4^-$, H_3PO_4, $MgHPO_4$, etc. Biochemical reactions are written using biochemical reactants in terms of an apparent equilibrium constant K', which is distinct from the standard equilibrium constant K. This subject is discussed in an IUPAC report (see Reference 1 below).

The apparent equilibrium constant K' and the standard transformed Gibbs energy change $\Delta_r G'^\circ$ for a biochemical reaction can be calculated from the $\Delta_f G'^\circ$ values by using the relationship

$$-RT \ln K' = \Delta_r G'^\circ = \Sigma \nu'_i \, \Delta_f G'^\circ,$$

where the summation is over all of the biochemical reactants. The quantity ν'_i is the stoichiometric number of reactant i (ν'_i is positive for reactants on the right side of the equation and negative for reactants on the left side); R is the gas constant. As an example, the hydrolysis reaction of ATP is

$$ATP + H_2O(l) = ADP + phosphate.$$

At pH 7.00 and I = 0.25 M, $\Delta_r G'^\circ$ and K' are calculated as follows:

$$\Delta_r G'^\circ = \{-1424.70 - 1059.49 - (-2292.50 - 155.66)\} \cdot (\text{kJ mol}^{-1}) = -36.03 \text{ kJ mol}^{-1}$$

$$K' = \exp[-(-36030 \text{ J mol}^{-1})/\{(8.3145 \text{ J mol}^{-1} \text{ K}^{-1}) \cdot (298.15 \text{ K})\} = 2.05 \cdot 10^6$$

An example involving a biochemical half-cell reaction is

$$\text{acetaldehyde(aq)} + 2\ e^- = \text{ethanol(aq)}.$$

At 298.15 K, pH 7.00, and I = 0, the standard apparent reduction potential E'° can be calculated as follows

$$E'^\circ = -(1/nF) \cdot \{\Delta_f G'^\circ(\text{ethanol}) - \Delta_f G'^\circ(\text{acetaldehyde})\},$$

where n is the number of electrons in the half-cell reaction and F is the Faraday constant. Then,

$$E'^\circ = [-1/(2 \cdot 9.6485 \cdot 10^4 \text{ C mol}^{-1})] \cdot (58.10 \cdot 10^3 \text{ J mol}^{-1} - 20.83 \cdot 10^3 \text{ J mol}^{-1}) = -0.193 \text{ V}$$

APPARENT EQUILIBRIUM CONSTANTS FOR ENZYME-CATALYZED REACTIONS

Robert N. Goldberg

This table contains values of apparent equilibrium constants K' for selected enzyme-catalyzed reactions at specified temperatures T and pHs. In those cases where the ionic strength I and/or the pMg (pMg = $-\log_{10}[Mg^{2+}]$) have been reported, the values of these quantities are given. The Enzyme Commission numbers [Ref. 1] of the enzymes that were used to catalyze the reactions are also given.

There are two fundamentally different types of equilibrium constants. This is illustrated by the following example for the hydrolysis of adenosine 5′-triphosphate (ATP) to adenosine 5′-diphosphate (ADP) and phosphate:

$$\text{ATP} + \text{H}_2\text{O} = \text{ADP} + \text{phosphate} \qquad (1)$$

The apparent equilibrium constant for the overall biochemical reaction (1) is

$$K' = [\text{ADP}][\text{phosphate}]/([\text{ATP}]c^{\circ}) \qquad (2)$$

The biochemical reactants ATP, ADP, and phosphate each exist in several different ionized and metal bound forms. For example, ATP is an equilibrium mixture of the species ATP^{4-}, $HATP^{3-}$, H_2ATP^{2-}, $MgATP^{2-}$, $MgHATP^{-}$, Mg_2ATP^{0}. Additional species would also have to be considered if Ca^{2+} were present. Thus, ATP has often been denoted in the literature as ΣATP or as $(ATP)_{tot}$. When it is clear that one is dealing with total amounts of substances, it is not necessary to use either the Σ or "tot." Thus, these designations are not used in this table. In the above equation, c° = 1 mol dm^{-3}; it is included to make K′ dimensionless. The standard transformed Gibbs energy of reaction $\Delta_r G'^{\circ}$ at specified conditions of temperature T, pressure P, ionic strength I, pH, and pMg can be calculated from K':

$$\Delta_r G'^{\circ} = -RT \ln K' \qquad (3)$$

The molar gas constant, R, is equal to 8.314 472 J K^{-1} mol^{-1}. $\Delta_r G'^{\circ}$ and the apparent equilibrium constant, K', can be used to calculate the position of equilibrium of overall biochemical reactions.

It is also possible to choose a chemical reference reaction that involves selected solute species:

$$ATP^{4-} + H_2O = ADP^{3-} + HPO_4^{2-} + H^{+} \qquad (4)$$

The equilibrium constant for this reference reaction is

$$K = [ADP^{3-}][HPO_4^{2-}][H^{+}]/\{[ATP^{4-}](c^{\circ})^2\} \qquad (5)$$

Equations and algorithms that relate these two different types of equilibrium constants have been published [Refs. 2–4]. To calculate the equilibrium constant K for the reference reaction from the apparent equilibrium constant K', or vice versa, one needs the equilibrium constants for the binding of H^+ and for the relevant metal ions to ATP^{4-}, ADP^{3-}, and HPO_4^{2-}.

To avoid confusion between the two different types of equilibrium constants (K' and K) and to avoid ambiguity about whether specific species or sums of species are intended, the word "ammonia," for example, rather than NH_3 or NH_4^+, is used for total ammonia, and chemical formulas are used for specific chemical species. Other substances such as carbon dioxide (CO_2, HCO_3^-, and CO_3^{2-}), and phosphate ($H_2PO_4^-$, HPO_4^{2-}, and PO_4^{3-}) are treated in the same manner. Exceptions are made for water, which is always written as H_2O, and for gaseous hydrogen and oxygen, which are written as $H_2(g)$ and $O_2(g)$, respectively.

For symmetrical reactions, there is no concern about the units used to calculate the value of an equilibrium constant. However, care must be exercised for reactions that are not symmetrical. In such cases, the units "mol dm^{-3}" have been used for all concentrations. As stated above, a c° (1 mol dm^{-3}) is then used to make all equilibrium constants dimensionless.

All substances are assumed to be in aqueous solutions unless specified otherwise.

Values of $\Delta_r G'^{\circ}$ and K' can also be calculated for many biochemical reactions by using the table "Standard Transformed Gibbs Energies of Formation for Biochemical Reactants" in Section 7 of this Handbook.

Abbreviations

ADP	adenosine 5′-diphosphate
AMP	adenosine 5′-monophosphate
ATP	adenosine 5′-triphosphate
CoA	coenzyme A
GDP	guanosine 5′-diphosphate
GMP	guanosine 5′-monophosphate
GTP	guanosine 5′-triphosphate
IDP	inosine 5′-diphosphate
IMP	inosine 5′-monophosphate
ITP	inosine 5′-triphosphate
NAD_{ox}	β-nicotinamide-adenine dinucleotide, oxidized form
NAD_{red}	β-nicotinamide-adenine dinucleotide, reduced form
$NADP_{ox}$	β-nicotinamide-adenine dinucleotide phosphate, oxidized form
$NADP_{red}$	β-nicotinamide-adenine dinucleotide phosphate, reduced form
UDP	uridine 5′-diphosphate
UTP	uridine 5′-triphosphate

THERMODYNAMIC QUANTITIES FOR THE IONIZATION REACTIONS OF BUFFERS IN WATER

Robert N. Goldberg, Nand Kishore, and Rebecca M. Lennen

This table contains selected values for the pK, standard molar enthalpy of reaction $\Delta_r H°$, and standard molar heat-capacity change $\Delta_r C°_p$ for the ionization reactions of 64 buffers many of which are relevant to biochemistry and to biology.[1] The values pertain to the temperature T = 298.15 K and the pressure p = 0.1 MPa. The standard state is the hypothetical ideal solution of unit molality. These data permit one to calculate values of the pK and of $\Delta_r H°$ at temperatures in the vicinity $\{T \approx (274\ \text{K to}\ 350\ \text{K})\}$ of the reference temperature θ = 298.15 K by using the following equations[2]

$$\Delta_r G°_T = -RT \ln K_T = \ln(10)\cdot RT\cdot \mathrm{p}K_T, \quad (1)$$

$$R\ln K_T = -(\Delta_r G°_\theta/\theta) + \Delta_r H°_\theta \{(1/\theta) - (1/T)\} + \Delta_r C°_{p\theta} \{(\theta/T) - 1 + \ln(T/\theta)\}, \quad (2)$$

$$\Delta_r H°_T = \Delta_r H°_\theta + \Delta_r C°_{p\theta} (T - \theta). \quad (3)$$

Here, $\Delta_r G°$ is the standard molar Gibbs energy change and K is the equilibrium constant for a reaction; R is the gas constant (8.314 472 J K^{-1} mol^{-1}). The subscripts T and θ denote the temperature to which a quantity pertains, the subscript p denotes constant pressure, and the subscript r denotes that the quantity refers to a reaction. Combination of equations (1) and (2) yields the following equation that gives pK as a function of temperature:

$$\mathrm{p}K_T = -\{R\cdot\ln(10)\}^{-1}[-\{\ln(10)\cdot RT\cdot \mathrm{p}K_\theta/\theta\} + \Delta_r H°_\theta \{(1/\theta) - (1/T)\} + \Delta_r C°_{p\theta} \{(\theta/T) - 1 + \ln(T/\theta)\}]. \quad (4)$$

The above equations neglect higher order terms that involve temperature derivatives of $\Delta_r C°_p$. Also, it is important to recognize that the values of pK and $\Delta_r H°$ effectively pertain to ionic strength I = 0. However, the values of pK and $\Delta_r H°$ are almost always dependent on the ionic strength and the actual composition of the solution. These issues are discussed in Reference 1, which also gives an approximate method for making appropriate corrections.

CAPS	3-(Cyclohexylamino)-1-propanesulfonic acid	221.3	10.4	9.7–11.1

[a] pK_a = 9.0 for the second dissociation stage.

TYPICAL pH VALUES OF BIOLOGICAL MATERIALS AND FOODS

This table gives typical pH ranges for various biological fluids and common foods. All values refer to 25 °C.

Biological Materials	
Blood, human	7.35–7.45
Blood, dog	6.9–7.2
Spinal fluid, human	7.3–7.5
Saliva, human	6.5–7.5
Gastric contents, human	1.0–3.0
Duodenal contents, human	4.8–8.2
Feces, human	4.6–8.4
Urine, human	4.8–8.4
Milk, human	6.6–7.6
Bile, human	6.8–7.0

Foods	
Apples	2.9–3.3
Apricots	3.6–4.0
Asparagus	5.4–5.8
Bananas	4.5–4.7
Beans	5.0–6.0
Beers	4.0–5.0
Beets	4.9–5.5
Blackberries	3.2–3.6
Bread, white	5.0–6.0
Butter	6.1–6.4
Cabbage	5.2–5.4
Carrots	4.9–5.3
Cheese	4.8–6.4
Cherries	3.2–4.0
Cider	2.9–3.3
Corn	6.0–6.5
Crackers	6.5–8.5
Dates	6.2–6.4
Eggs, fresh white	7.6–8.0
Flour, wheat	5.5–6.5
Gooseberries	2.8–3.0
Grapefruit	3.0–3.3
Grapes	3.5–4.5
Hominy (lye)	6.8–8.0
Jams, fruit	3.5–4.0
Jellies, fruit	2.8–3.4
Lemons	2.2–2.4
Limes	1.8–2.0
Maple syrup	6.5–7.0
Milk, cows	6.3–6.6
Olives	3.6–3.8
Oranges	3.0–4.0
Oysters	6.1–6.6
Peaches	3.4–3.6
Pears	3.6–4.0
Peas	5.8–6.4
Pickles, dill	3.2–3.6
Pickles, sour	3.0–3.4
Pimento	4.6–5.2
Plums	2.8–3.0
Potatoes	5.6–6.0
Pumpkin	4.8–5.2
Raspberries	3.2–3.6
Rhubarb	3.1–3.2
Salmon	6.1–6.3
Sauerkraut	3.4–3.6
Shrimp	6.8–7.0
Soft drinks	2.0–4.0
Spinach	5.1–5.7
Squash	5.0–5.4
Strawberries	3.0–3.5
Sweet potatoes	5.3–5.6
Tomatoes	4.0–4.4
Tuna	5.9–6.1
Turnips	5.2–5.6
Vinegar	2.4–3.4
Water, drinking	6.5–8.0
Wines	2.8–3.8

STRUCTURE AND FUNCTIONS OF SOME COMMON DRUGS

This table lists the names, categories, therapeutic uses, and chemical structures of selected drugs. The generic (chemical) name of each drug is given, along with some of the trade names under which it is sold. When available, physical properties are given in italics in the fourth column. The structure given refers to the active drug, but many of these are packaged as salts or other derivatives. The drugs have been selected to represent a variety of categories; most are widely used throughout the world.

The list is divided into therapeutic categories; within each category the listing is alphabetical by generic name. The index that follows the table can be used to locate a drug by either generic or trade name.

	Generic Name	Trade Names	Category and Properties	Applications	Structure
			Antiallergic Agents		
1	Albuterol	Proventil; Ventolin; Volmax	β_2-Andrenergic receptor agonist	Treatment of troubled breathing caused by asthma, emphysema, and other lung diseases	2	Budesonide	Budeson; Budamax; Rhinocort; Pulmicort; Inflammide	Glucocorticoid *mp 226 °C*	Management of asthma and treatment of inflammatory bowel disease	3	Cetirizine	Zyrtec	Histamine H_1-receptor antagonist	Treatment of seasonal allergies and hives	4	Fexofenadine	Carboxyterfenadine; Allegra; Telfast	Histamine H_1-receptor antagonist	Treatment of allergic rhinitis	5	Fluticasone	Flovent (as propanoate); Flonase (as propanoate); Advair (with salmeterol)	Anti-inflammatory glucocorticoid	Treatment of asthma & rhinitis	6	Loratadine	Claritin; Claratyne; Alavert	Long-acting antihistamine *mp 132 °C*	Relief of allergy symptoms	
	Generic Name	Trade Names	Category and Properties	Applications	Structure
7	Montelukast	Singulair	Leukotriene LTD_4 receptor antagonist	Control of asthma and relief of seasonal allergies	8	Salmeterol	Serevent	β_2-Adrenergic receptor agonist	Treatment of asthma & chronic obstructive pulmonary disease	9	Tiotropium bromide	Spiriva	Long-acting antimuscarinic bronchodilator	Treatment of chronic obstructive pulmonary disease					Antibiotics	
10	Amikacin	Amikin; Biclin; Chemacin; Flexilite; Negasin	Aminoglycoside antibiotic	Treatment of serious infections resistant to other antibiotics	11	Amoxicillin	Amoxil; Isimoxin; Ospamox	β-Lactam/penicillin	Treatment of a broad spectrum of bacterial infections	12	Azithromycin	Zithromax; Vinzam; Zmax; Azitrocin	Azalide/macrolide antibiotic *mp 155 °C*	Treatment of bacterial skin, ear, and respiratory infections	13	Cefaclor	Ceclor; Kefolar; Panacef; Panoral	β-Lactam/ cephalosporin	Treatment of bacterial infections, pneumonia, and urinary tract infections	14	Ciprofloxacin	Cipro; Ciproxin; Ciprobay; Flociprin; Uniflox	Fluoroquinoline/ broad-spectrum antibiotic *mp 256 °C*	Treatment of urinary & respiratory tract infections, anthrax, and sexually-transmitted diseases	
	Generic Name	Trade Names	Category and Properties	Applications	Structure
15	Doxycycline	Vibramycin; Adoxa; Doryx; Liviatin; Deoxymykoin	Tetracycline/ broad-spectrum antibiotic	Treatment of urinary tract, respiratory tract, and eye infections; anthrax, syphilis, cholera, etc.	16	Erythromycin	E-Mycin; Erythrocin; Ilosone	Macrolide antibiotic *mp 191 °C*	Treatment of bacterial infections, including diphtheria, pertussis, rheumatic fever, venereal disease, etc.	17	Isoniazid	Laniazid	Antimycobacterial agent *mp 171 °C*	Treatment of tuberculosis; reduction of tremors from multiple sclerosis	18	Linezolid	Zyvox	Oxazolidinone *mp 182 °C*	Treatment of serious Gram-positive infections resistant to other antibiotics	19	Trimethoprim	Triprim; Proloprim; Monotrim	Dihydrofolate reductase inhibitor *mp 199 °C*	Treatment of urinary tract infections, diarrhea, and ear infections				Antidiabetic Drugs		
20	Glipizide	Glucotrol; Glydiazinamide; Glibenese; Minodiab	Potassium channel blocker/sulfonylurea *mp 208 °C*	Treatment of type 2 diabetes by stimulating insulin secretion in pancreas β-cells	21	Metformin	Glucophage; Diabex; Diaformin; Fortamet	Antidiabetic biguanide	Treatment of type 2 diabetes by enhancing transport of glucose into muscle cells	
22	Pioglitazone	Actos	Peroxisome proliferator-activated receptor *mp 174 °C*	Treatment of type 2 diabetes by increasing glucose metabolism and insulin sensitivity	
	Generic Name	Trade Names	Category and Properties	Applications	Structure
23	Rosiglitazone	Avandia	Thiazolidinedione	Treatment of type 2 diabetes by increasing insulin sensitivity. Possible adverse effects on patients with heart problems.	24	Sitagliptin	Januvia	Dipeptidyl peptidase IV inhibitor	Treatment of type 2 diabetes by enhancing the body's ability to lower elevated glucose levels				Anti-Inflammatory Agents		
25	Acetylsalicylic acid	Aspirin	NSAID	Pain and fever relief; anticlotting agent	26	Celecoxib	Celebrex; Onsenal	NSAID (COX-2 inhibitor) *mp158 °C*	Treatment of osteoarthritis and rheumatoid arthritis	27	Ibuprofen	Advil	NSAID (cyclooxygenase inhibitor) *mp 76 °C*	Relief of inflammation and pain	28	Meloxicam	Mobic; Metacam; Metacain	NSAID (cyclooxygenase inhibitor) *mp 254 °C*	Treatment of osteoarthritis and rheumatoid arthritis	29	Naproxen	Aleve; Naprelan; Anaprox; Naprogesic	NSAID *mp 155 °C*	Relief of inflammation and pain	30	Prednisone	Meticorten; Deltasone	Adrenocortical steroid; anti-inflammatory agent; immunosuppressant	Treatment of asthma and other inflammatory diseases				Anti-Ulcer Drugs		
31	Cimetidine	Tagamet; Cimetimax; Gastromet; Peptimax	Histamine H_2-receptor antagonist *mp 142 °C*	Treatment of peptic ulcer, gastrointestinal bleeding, and gastroesophageal reflux disease	32	Lansoprazole	Prevacid; SoluTab; Prevpac; Zoton; Prezal	Proton pump inhibitor *mp 180 °C*	Treatment of duodenal ulcers & gastroesophageal reflux disease	
	Generic Name	Trade Names	Category and Properties	Applications	Structure
33	Omeprazole	Prilosec; Nexium (Mg salt); Losec; Mepral; Mopral; Zoltum	Proton pump inhibitor *mp 156 °C*	Treatment of peptic ulcer, dyspepsia, and gastroesophageal reflux disease	34	Pantoprazole	Protonix; Pantozol; Rifun	Proton pump inhibitor	Treatment of gastric acid-related conditions	35	Ranitidine	Zantac; Azantac; Melfax; Rantec; Sostril; Taural	Histamine H_2-receptor antagonist *mp 70 °C*	Treatment of peptic ulcer, gastrointestinal bleeding, and gastroesophageal reflux disease				Antiviral and Antifungal Agents		
36	Acyclovir	Zovirax; Zovir; Avirax; Mirolex	Viral DNA synthesis inhibitor *mp 225 °C*	Treatment of cold sores, genital herpes, chicken pox, etc.	37	Amphotericin	Fungizone; Amfostet; Amphozone	Polyene macrolide antifungal agent *mp 170 °C*	Intravenous treatment of systemic fungal infections	38	Efavirenz	Sustiva	Non-nucleoside HIV reverse transcriptase inhibitor *mp 131 °C*	Treatment of HIV-1 infections (as part of combination therapy)	39	Fluconazole	Diflucan; Biozolene; Elazor; Triflucan	Cytochrome P450 14α-demethylase inhibitor *mp 139 °C*	Treatment and prevention of superficial & systemic fungal infections	40	Lamivudine	Epivir; Heptodin; Zeffix	HIV reverse transcriptase inhibitor	Treatment of hepatitis B and human immunodeficiency virus	
	Generic Name	Trade Names	Category and Properties	Applications	Structure
41	Nevirapine	Viramune	Non-nucleoside HIV reverse transcriptase inhibitor *mp 250 °C*	Treatment of HIV infections (as part of combination therapy)	42	Oseltamivir	Tamiflu	Neuraminidase inhibitor *Foam*	Prevention & treatment of influenza A and B	43	Ribavirin	Virazole; Rebetol; Copegus; Ribasphere; Viratek; Cotronak	Nucleoside antimetabolite *mp 175 °C*	Treatment of hepatitis C	44	Terbinafine	Lamisil	Squalene epoxidase inhibitor	Treatment of fungal infections of the skin & nails	45	Zalcitabine	Hivid	Pyrimidine nucleoside reverse transcriptase inhibitor	Treatment of HIV infection & AIDS	46	Zidovudine	Retrovir; AZT; Azidothymidine; Zidovir	Pyrimidine nucleoside reverse transcriptase inhibitor *mp 121 °C*	Treatment of HIV infection & prevention of mother-to-child transmission				Cancer Chemotherapy Drugs		
47	Anastrozole	Arimidex	Aromatase inhibitor; antineoplastic agent *mp 81 °C*	Treatment of breast cancer in postmenopausal women	48	Bicalutamide	Casodex	Antiandrogen *mp 180 °C*	Treatment of advanced prostate cancer	
	Generic Name	Trade Names	Category and Properties	Applications	Structure
49	Bortezomib	Velcade	Proteasome inhibitor	Treatment of lymphomas and multiple myeloma	50	Capecitabine	Xeloda	Antimetabolite	Treatment of breast & colon cancer	51	Carboplatin	Paraplatin; Carboplat; Erbakar; Nonoplat	Platinum-based anticancer agent	Treatment of ovarian cancer	52	Cyclo-phosphamide	Cytoxan; Neosar; Cytophosphan; Endoxan; Clafen	Oxazaphosphorine alkylating agent ("Nitrogen mustard") *mp 143 °C*	Treatment of lymphomas & leukemias, multiple myeloma, and other cancers	53	Docetaxel	Taxotere	Antineoplastic agent *mp 232 °C*	Treatment of ovarian, breast and bronchial carcinomas	54	Fluorouracil	Efudex; Carac; Fluoroplex; Adrucil	Thymidylate synthesis inhibitor *mp 243 °C*	Constituent of several antineoplastic combinations	55	Gemcitabine	Gemzar (as hydrochloride)	Antineoplastic and antiviral agent *mp 290 °C*	Treatment of lung and pancreatic tumors	56	Imatinib	Gleevec; Glivec	Protein kinase inhibitor *mp 212 °C*	Treatment of myelogenous leukemia and gastrointestinal tumors	
	Generic Name	Trade Names	Category and Properties	Applications	Structure
57	Irinotecan	Camptosar; Camptetin; Topotecin	Topoisomerase I inhibitor	Treatment of colorectal cancer	58	Paclitaxel	Taxol; Abraxane; Yewtaxan	Microtubule-stabilizing agent *mp 214 °C*	Treatment of ovarian, breast, and lung cancer	59	Sunitinib	Sutent	Tyrosine kineases inhibitor	Treatment of gastrointestinal & kidney tumors	60	Tamoxifen	Nolvadex; Soltamox; Tamaxin; Tamoplex; Valodex	Selective estrogen receptor modulator *mp 97 °C*	Treatment of breast cancer				Cardiovascular Agents		
61	Aliskiren	Tekturna; Rasilex	Renin inhibitor	Treatment of hypertension	62	Amlodipine	Norvasc	Calcium channel blocker	Treatment of hypertension, atrial fibrillation, and angina	63	Atenolol	Tenormin	β-blocker *mp 147 °C*	Treatment of hypertension and excessive heart rate	64	Carvedilol	Coreg; Dilatrend; Eucardic	Calcium channel blocker; β-adrenoceptor blocker	Treatment of heart failure and hypertension	65	Clopidogrel	Plavix; Isocover; Meilax; Tipidyl	Antiplatelet agent	Prevention of blood clots after stroke or myocardial infarction	
	Generic Name	Trade Names	Category and Properties	Applications	Structure
66	Digoxin	Lanoxin; Davoxin; Digacin; Dilanacin; Rougoxin; Digosin; Cordioxil	Cardiac glycoside *mp 249 °C*	Treatment of congestive heart failure	67	Enalaprilat	Vasotec	Angiotensin-converting enzyme inhibitor; antihypertensive agent *mp 150 °C*	Treatment of hypertension, atherosclerosis, and congestive heart failure	68	Glycerol trinitrate	Nitroglycerin	Cardiac stimulant and vasodilator	Treatment of angina and congestive heart failure	69	Irbesartan	Aprovel; Avapro; Avalide (in combination with hydrochlorothiazide	Angiotensin II AT_1-receptor antagonist *mp 180 °C*	Treatment of hypertension and diabetes-related kidney disease	70	Lisinopril	Acecomb; Alapril; Carace; Novatec; Novazyd; Vivatec; Zestoretic; Zestril	Angiotensin-converting enzyme inhibitor; antihypertensive agent *mp 159 °C*	Treatment of hypertension	71	Losartan	Cozaar; Hyzaar (with hydrochlorothiazide)	Angiotensin II AT_1-receptor antagonist *mp 184 °C*	Treatment of congestive heart failure and hypertension	72	Metoprolol	Lopressor; Toprol XL	β-Adrenergic blocker	Treatment of angina and hypertension	73	Telmisartan	Micardis	Angiotensin II (AT_1) receptor antagonist *mp 262 °C*	Treatment of hypertension	
	Generic Name	Trade Names	Category and Properties	Applications	Structure
74	Terazosin	Hytrin; Itrin; Hytrinex; Magnurol; Teraprost; Vasocard; Uroflo; etc.	Antihypertensive agent (α_1-adrenoceptor antagonist)	Treatment of hypertension and benign prostatic hyperplasia	75	Warfarin	Coumadin	Anticlotting agent *mp 161 °C*	Reduction of possibility of stroke or coronary				Cholesterol-Lowering Drugs		
76	Atorvastatin	Lipitor; Caduet (in combination with amlodipine)	HMG-CoA reductase inhibitor (statin)	Reduction of LDL cholesterol levels by inhibiting cholesterol biosynthesis	77	Ezetimibe	Zetia	Selective cholesterol absorption inhibitor *mp 165 °C*	Reduction of LDL cholesterol levels by inhibiting dietary cholesterol absorption	78	Nicotinic acid	Niacin	Lipoprotein synthesis inhibitor	Reduction of LDL cholesterol levels	79	Pravastatin	Pravochol	HMG-CoA reductase inhibitor (statin)	Reduction of LDL cholesterol levels by inhibiting cholesterol biosynthesis	80	Simvastatin	Zocor; Vytorin (combination with Ezetimibe)	HMG-CoA reductase inhibitor (statin) *mp 136 °C*	Reduction of LDL cholesterol levels by inhibiting cholesterol biosynthesis				Depression and Anxiety Drugs		
81	Bupropion	Wellbutrin; Amfebutamone; Zyban	Dopamine reuptake inhibitor *Pale yellow oil*	Antidepressant; smoking cessation aid	82	Diazepam	Valium; Stesolid; Seduxen; Antenex; Calmpose; Livotensin	Benzodiazepine central nervous system depressant *mp 125 °C*	Treatment of anxiety, seizures, muscular spasms, and insomnia	
	Generic Name	Trade Names	Category and Properties	Applications	Structure
83	Donepezil	Aricept	Acetylcholine esterase inhibitor	Treatment of Alzheimer's disease	84	Fluoxetine	Prozac; Sarafem; Adofen; Fontex; Lorien	Selective serotonin reuptake inhibitor	Treatment of depression, panic attacks, and obsessive-compulsive disorder	85	Levodopa	L-Dopa; Larodopa; Bendopa; Veldopa	Precursor to the neurotransmitter dopamine *mp 277 °C*	Treatment of Parkinson's disease	86	Paroxetine	Paxil; Seroxat; Tagonis; Aropax; Motivan	Selective serotonin reuptake inhibitor	Treatment of depression, panic attacks, and obsessive-compulsive disorder	87	Phenobarbital	Luminal; Fenemal; Gardenal; Barbivis	Anticonvulsant *mp 174 °C*	Epilepsy control; also used as a sedative	88	Sertraline	Zoloft; Lustral; Serad; Serlain; Tatig	Selective serotonin reuptake inhibitor	Treatment of depression, panic attacks, and obsessive-compulsive disorder	89	Tiagabine	Gabitril	GABA reuptake inhibitor; anticonvulsant	Treatment of epileptic seizures	90	Venlafaxine	Effexor; Trewilor; Vandral; Dobupal	Selective serotonin & norepinephrine reuptake inhibitor	Treatment of anxiety and panic disorders					Osteoporosis Drugs	
91	Alendronic acid	Fosamax; Adronat; Alendros; Dronal	Farnesyl pyrophosphate synthase inhibitor	Prevention and treatment of osteoporosis and Paget's disease	
	Generic Name	Trade Names	Category and Properties	Applications	Structure
92	Calcitriol	Rocaltrol; Calcijex	Calcium and phosphate metabolism regulator *mp 170 °C*	Treatment of rickets and osteoporosis	93	Raloxifene	Evista (as hydrochloride)	Selective estrogen receptor modulator	Prevention and treatment of osteoporosis	94	Risedronic acid	Actonel (as Na salt); Optinate	Calcium regulator	Treatment of osteoporosis & Paget's disease				Pain Relief Drugs		
95	Acetamino-phen	Tylenol; APAP; Paracetamol; Hedrex; Tramil	Analgesic/antipyretic *mp 170 °C*	Relief of musculoskeletal, neuralgic, and other types of pain	96	Fentanyl	Duragesic; Actiq; Fentora; Sublimaze	Opioid μ-receptor agonist *mp 87.5 °C*	Treatment of severe pain; spinal and epidural anesthesia	97	Gabapentin	Neurotin; Aclonium	Anticonvulsant/ analgesic; CNS depressant *mp 164 °C*	Treatment of neuralgia, pain from shingles, migraine, and epilepsy	98	Lidocaine	Xylocaine; Xylocard; Lidamantle	Aminoamide anesthetic/ antiarrhythmic agent	Local anesthetic for dental procedures	99	Morphine	Avinza; Contin; Kadian; Roxanol; Meconium; Morfine	Opioid analgesic *mp 255 °C*	Pain management, especially in malignant diseases	100	Thiopental	Pentothal; Penthiobarbital; Thiopentone	Short-acting barbiturate/ anesthetic	Induction of presurgical anesthesia	
	Generic Name	Trade Names	Category and Properties	Applications	Structure
101	Sumatriptan	Imitrex; Imigrane; Megrelan; Permicran; Sumadol	Selective 5-HT_{1D} receptor agonist	Treatment of severe migraine headaches				Reproductive and Urinary System Drugs		
102	Finasteride	Proscar; Propecia; Andozac; Finastid; Procure; Urprosan	5α Reductase inhibitor *mp 252 °C*	Treatment of benign prostatic hyperplasia and male hair loss	103	Mestranol	Devocin; Norinyl; Ovastol; Tranel	Estrogen, used in combination as oral contraceptive *mp 151 °C*	Prevention of unplanned pregnancy	104	Mifepristone	Mifeprex; Mifegyne; Corlux; RU 486	Progesterone receptor modulator *mp 150 °C*	Termination of pregnancy	105	Sildenafil	Viagra; Revatio	Cyclic GMP phosphodiesterase inhibitor	Treatment of erectile dysfunction and pulmonary hypertension	106	Tamsulosin	Flomax; Amsulosin; Harnal; Omix	Prostate selective α_1-adrenoceptor antagonist	Treatment of benign prostatic hyperplasia	107	Testosterone	Androderm; Androgel; Testrim; Striant	Anabolic steroid hormone	Treatment of male hypogonadism	
Index

The index below lists the trade and generic names for the drugs in this table; the generic names are in bold face. Each entry is referred to by its generic name and the identification number in the table. An asterisk* beside the trade name indicates a product that is a combination of two drugs.

Name	Generic Name
Abraxane	Paclitaxel (58)
Acecomb	Lisinopril (70)
Acetaminophen	Acetaminophen (95)
Acetylsalicylic acid	Acetylsalicylic acid (25)
Aclonium	Gabapentin (97)

Name	Generic Name
Actiq	Fentanyl (96)
Actonel	Risedronic acid (94)
Actos	Pioglitazone (22)
Acyclovir	Acyclovir (36)
Adofen	Fluoxetine (84)

Name	Generic Name
Adoxa	Doxycycline (15)
Adronat	Alendronic acid (91)
Adrucil	Fluorouracil (54)
Advair*	Fluticasone (5)
Advil	Ibuprofen (27)
Alapril	Lisinopril (70)
Alavert	Loratadine (6)
Albuterol	Albuterol (1)
Alendronic acid	Alendronic acid (91)
Alendros	Alendronic acid (91)
Aleve	Naproxen (29)
Aliskiren	Aliskiren (61)
Allegra	Fexofenadine (4)
Amfebutamone	Bupropion (81)
Amfostet	Amphotericin (37)
Amikacin	Amikacin (10)
Amikin	Amikacin (10)
Amlodipine	Amlodipine (62)
Amoxicillin	Amoxicillin (11)
Amoxil	Amoxicillin (11)
Amphotericin	Amphotericin (37)
Amphozone	Amphotericin (37)
Amsulosin	Tamsulosin (106)
Anaprox	Naproxen (29)
Anastrozole	Anastrozole (47)
Andozac	Finasteride (102)
Androderm	Testosterone (107)
Androgel	Testosterone (107)
Antenex	Diazepam (82)
APAP	Acetaminophen (95)
Aprovel	Irbesartan (69)
Aricept	Donepezil (83)
Arimidex	Anastrozole (47)
Aropax	Paroxetine (86)
Aspirin	Acetylsalicylic acid (25)
Atenolol	Atenolol (63)
Atorvastatin	Atorvastatin (76)
Avalide*	Irbesartan (69)
Avandia	Rosiglitazone (23)
Avapro	Irbesartan (69)
Avinza	Morphine (99)
Avirax	Acyclovir (36)
Azantac	Ranitidine (35)
Azidothymidine	Zidovudine (46)
Azithromycin	Azithromycin (12)
Azitrocin	Azithromycin (12)
AZT	Zidovudine (46)
Barbivis	Phenobarbital (87)
Bendopa	Levodopa (85)
Bicalutamide	Bicalutamide (48)
Biclin	Amikacin (10)
Biozolene	Fluconazole (39)
Bortezomib	Bortezomib (49)
Budamax	Budesonide (2)
Budeson	Budesonide (2)

Name	Generic Name
Budesonide	Budesonide (2)
Bupropion	Bupropion (81)
Caduet*	Atorvastatin (76)
Calcijex	Calcitriol (92)
Calcitriol	Calcitriol (92)
Calmpose	Diazepam (82)
Camptetin	Irinotecan (57)
Camptosar	Irinotecan (57)
Capecitabine	Capecitabine (50)
Carac	Fluorouracil (54)
Carace	Lisinopril (70)
Carboplat	Carboplatin (51)
Carboplatin	Carboplatin (51)
Carboxyterfenadine	Fexofenadine (4)
Carvedilol	Carvedilol (64)
Casodex	Bicalutamide (48)
Ceclor	Cefaclor (13)
Cefaclor	Cefaclor (13)
Celebrex	Celecoxib (26)
Celecoxib	Celecoxib (26)
Cetirizine	Cetirizine (3)
Chemacin	Amikacin (10)
Cimetidine	Cimetidine (31)
Cimetimax	Cimetidine (31)
Cipro	Ciprofloxacin (14)
Ciprobay	Ciprofloxacin (14)
Ciprofloxacin	Ciprofloxacin (14)
Ciproxin	Ciprofloxacin (14)
Clafen	Cyclophosphamide (52)
Claratyne	Loratadine (6)
Claritin	Loratadine (6)
Clopidogrel	Clopidogrel (65)
Contin	Morphine (99)
Copegus	Ribavirin (43)
Cordioxil	Digoxin (66)
Coreg	Carvedilol (64)
Corlux	Mifepristone (104)
Cotronak	Ribavirin (43)
Coumadin	Warfarin (75)
Cozaar	Losartan (71)
Cyclophosphamide	Cyclophosphamide (52)
Cytophosphan	Cyclophosphamide (52)
Cytoxan	Cyclophosphamide (52)
Davoxin	Digoxin (66)
Deltasone	Prednisone (30)
Deoxymykoin	Doxycycline (15)
Devocin	Mestranol (103)
Diabex	Metformin (21)
Diaformin	Metformin (21)
Diazepam	Diazepam (82)
Diflucan	Fluconazole (39)
Digacin	Digoxin (66)
Digosin	Digoxin (66)
Digoxin	Digoxin (66)
Dilanacin	Digoxin (66)

Name	Generic Name
Dilatrend	Carvedilol (64)
Dobupal	Venlafaxine (90)
Docetaxel	Docetaxel (53)
Donepezil	Donepezil (83)
Doryx	Doxycycline (15)
Doxycycline	Doxycycline (15)
Dronal	Alendronic acid (91)
Duragesic	Fentanyl (96)
E-Mycin	Erythromycin (16)
Efavirenz	Efavirenz (38)
Effexor	Venlafaxine (90)
Efudex	Fluorouracil (54)
Elazor	Fluconazole (39)
Enalaprilat	Enalaprilat (67)
Endoxan	Cyclophosphamide (52)
Epivir	Lamivudine (40)
Erbakar	Carboplatin (51)
Erythrocin	Erythromycin (16)
Erythromycin	Erythromycin (16)
Eucardic	Carvedilol (64)
Evista	Raloxifene (93)
Ezetimibe	Ezetimibe (77)
Fenemal	Phenobarbital (87)
Fentanyl	Fentanyl (96)
Fentora	Fentanyl (96)
Fexofenadine	Fexofenadine (4)
Finasteride	Finasteride (102)
Finastid	Finasteride (102)
Flexilite	Amikacin (10)
Flociprin	Ciprofloxacin (14)
Flomax	Tamsulosin (106)
Flonase	Fluticasone (5)
Flovent	Fluticasone (5)
Fluconazole	Fluconazole (39)
Fluoroplex	Fluorouracil (54)
Fluorouracil	Fluorouracil (54)
Fluoxetine	Fluoxetine (84)
Fluticasone	Fluticasone (5)
Fontex	Fluoxetine (84)
Fortamet	Metformin (21)
Fosamax	Alendronic acid (91)
Fungizone	Amphotericin (37)
Gabapentin	Gabapentin (97)
Gabitril	Tiagabine (89)
Gardenal	Phenobarbital (87)
Gastromet	Cimetidine (31)
Gemcitabine	Gemcitabine (55)
Gemzar	Gemcitabine (55)
Gleevec	Imatinib (56)
Glibenese	Glipizide (20)
Glipizide	Glipizide (20)
Glivec	Imatinib (56)
Glucophage	Metformin (21)
Glucotrol	Glipizide (20)
Glycerol trinitrate	Glycerol trinitrate (68)

Name	Generic Name
Glydiazinamide	Glipizide (20)
Harnal	Tamsulosin (106)
Hedrex	Acetaminophen (95)
Heptodin	Lamivudine (40)
Hivid	Zalcitabine (45)
Hytrin	Terazosin (74)
Hytrinex	Terazosin (74)
Hyzaar*	Losartan (71)
Ibuprofen	Ibuprofen (27)
Ilosone	Erythromycin (16)
Imatinib	Imatinib (56)
Imigrane	Sumatriptan (101)
Imitrex	Sumatriptan (101)
Inflammide	Budesonide (2)
Irbesartan	Irbesartan (69)
Irinotecan	Irinotecan (57)
Isimoxin	Amoxicillin (11)
Isocover	Clopidogrel (65)
Isoniazid	Isoniazid (17)
Itrin	Terazosin (74)
Januvia	Sitagliptin (24)
Kadian	Morphine (99)
Kefolar	Cefaclor (13)
L-Dopa	Levodopa (85)
Lamisil	Terbinafine (44)
Lamivudine	Lamivudine (40)
Laniazid	Isoniazid (17)
Lanoxin	Digoxin (66)
Lansoprazole	Lansoprazole (32)
Larodopa	Levodopa (85)
Levodopa	Levodopa (85)
Lidamantle	Lidocaine (98)
Lidocaine	Lidocaine (98)
Linezolid	Linezolid (18)
Lipitor	Atorvastatin (76)
Lisinopril	Lisinopril (70)
Liviatin	Doxycycline (15)
Livotensin	Diazepam (82)
Lopressor	Metoprolol (72)
Loratadine	Loratadine (6)
Lorien	Fluoxetine (84)
Losartan	Losartan (71)
Losec	Omeprazole (33)
Luminal	Phenobarbital (87)
Lustral	Sertraline (88)
Magnurol	Terazosin (74)
Meconium	Morphine (99)
Megrelan	Sumatriptan (101)
Meilax	Clopidogrel (65)
Melfax	Ranitidine (35)
Meloxicam	Meloxicam (28)
Mepral	Omeprazole (33)
Mestranol	Mestranol (103)
Metacain	Meloxicam (28)
Metacam	Meloxicam (28)

Name	Generic Name
Metformin	Metformin (21)
Meticorten	Prednisone (30)
Metoprolol	Metoprolol (72)
Micardis	Telmisartan (73)
Mifegyne	Mifepristone (104)
Mifeprex	Mifepristone (104)
Mifepristone	Mifepristone (104)
Minodiab	Glipizide (20)
Mirolex	Acyclovir (36)
Mobic	Meloxicam (28)
Monotrim	Trimethoprim (19)
Montelukast	Montelukast (7)
Mopral	Omeprazole (33)
Morfine	Morphine (99)
Morphine	Morphine (99)
Motivan	Paroxetine (86)
Naprelan	Naproxen (29)
Naprogesic	Naproxen (29)
Naproxen	Naproxen (29)
Negasin	Amikacin (10)
Neosar	Cyclophosphamide (52)
Neurotin	Gabapentin (97)
Nevirapine	Nevirapine (41)
Nexium	Omeprazole (33)
Niacin	Nicotinic acid (78)
Nicotinic acid	Nicotinic acid (78)
Nitroglycerin	Glycerol trinitrate (68)
Nolvadex	Tamoxifen (60)
Nonoplat	Carboplatin (51)
Norinyl	Mestranol (103)
Norvasc	Amlodipine (62)
Novatec	Lisinopril (70)
Novazyd	Lisinopril (70)
Omeprazole	Omeprazole (33)
Omix	Tamsulosin (106)
Onsenal	Celecoxib (26)
Optinate	Risedronic acid (94)
Oseltamivir	Oseltamivir (42)
Ospamox	Amoxicillin (11)
Ovastol	Mestranol (103)
Paclitaxel	Paclitaxel (58)
Panacef	Cefaclor (13)
Panoral	Cefaclor (13)
Pantoprazole	Pantoprazole (34)
Pantozol	Pantoprazole (34)
Paracetamol	Acetaminophen (95)
Paraplatin	Carboplatin (51)
Paroxetine	Paroxetine (86)
Paxil	Paroxetine (86)
Penthiobarbital	Thiopental (100)
Pentothal	Thiopental (100)
Peptimax	Cimetidine (31)
Permicran	Sumatriptan (101)
Phenobarbital	Phenobarbital (87)
Pioglitazone	Pioglitazone (22)

Name	Generic Name
Plavix	Clopidogrel (65)
Pravastatin	Pravastatin (79)
Pravochol	Pravastatin (79)
Prednisone	Prednisone (30)
Prevacid	Lansoprazole (32)
Prevpac	Lansoprazole (32)
Prezal	Lansoprazole (32)
Prilosec	Omeprazole (33)
Procure	Finasteride (102)
Proloprim	Trimethoprim (19)
Propecia	Finasteride (102)
Proscar	Finasteride (102)
Protonix	Pantoprazole (34)
Proventil	Albuterol (1)
Prozac	Fluoxetine (84)
Pulmicort	Budesonide (2)
Raloxifene	Raloxifene (93)
Ranitidine	Ranitidine (35)
Rantec	Ranitidine (35)
Rasilex	Aliskiren (61)
Rebetol	Ribavirin (43)
Retrovir	Zidovudine (46)
Revatio	Sildenafil (105)
Rhinocort	Budesonide (2)
Ribasphere	Ribavirin (43)
Ribavirin	Ribavirin (43)
Rifun	Pantoprazole (34)
Risedronic acid	Risedronic acid (94)
Rocaltrol	Calcitriol (92)
Rosiglitazone	Rosiglitazone (23)
Rougoxin	Digoxin (66)
Roxanol	Morphine (99)
RU 486	Mifepristone (104)
Salmeterol	Salmeterol (8)
Sarafem	Fluoxetine (84)
Seduxen	Diazepam (82)
Serad	Sertraline (88)
Serevent	Salmeterol (8)
Serlain	Sertraline (88)
Seroxat	Paroxetine (86)
Sertraline	Sertraline (88)
Sildenafil	Sildenafil (105)
Simvastatin	Simvastatin (80)
Singulair	Montelukast (7)
Sitagliptin	Sitagliptin (24)
Soltamox	Tamoxifen (60)
SoluTab	Lansoprazole (32)
Sostril	Ranitidine (35)
Spiriva	Tiotropium bromide (9)
Stesolid	Diazepam (82)
Striant	Testosterone (107)
Sublimaze	Fentanyl (96)
Sumadol	Sumatriptan (101)
Sumatriptan	Sumatriptan (101)
Sunitinib	Sunitinib (59)

Name	Generic Name
Sustiva	Efavirenz (38)
Sutent	Sunitinib (59)
Tagamet	Cimetidine (31)
Tagonis	Paroxetine (86)
Tamaxin	Tamoxifen (60)
Tamiflu	Oseltamivir (42)
Tamoplex	Tamoxifen (60)
Tamoxifen	Tamoxifen (60)
Tamsulosin	Tamsulosin (106)
Tatig	Sertraline (88)
Taural	Ranitidine (35)
Taxol	Paclitaxel (58)
Taxotere	Docetaxel (53)
Tekturna	Aliskiren (61)
Telfast	Fexofenadine (4)
Telmisartan	Telmisartan (73)
Tenormin	Atenolol (63)
Teraprost	Terazosin (74)
Terazosin	Terazosin (74)
Terbinafine	Terbinafine (44)
Testosterone	Testosterone (107)
Testrim	Testosterone (107)
T**hiopental**	Thiopental (100)
Thiopentone	Thiopental (100)
Tiagabine	Tiagabine (89)
Tiotropium bromide	Tiotropium bromide (9)
Tipidyl	Clopidogrel (65)
Topotecin	Irinotecan (57)
Toprol XL	Metoprolol (72)
Tramil	Acetaminophen (95)
Tranel	Mestranol (103)
Trewilor	Venlafaxine (90)
Triflucan	Fluconazole (39)
Trimethoprim	Trimethoprim (19)
Triprim	Trimethoprim (19)
Tylenol	Acetaminophen (95)
Uniflox	Ciprofloxacin (14)
Uroflo	Terazosin (74)
Urprosan	Finasteride (102)
Valium	Diazepam (82)
Valodex	Tamoxifen (60)

Name	Generic Name
Vandral	Venlafaxine (90)
Vasocard	Terazosin (74)
Vasotec	Enalaprilat (67)
Velcade	Bortezomib (49)
Veldopa	Levodopa (85)
Venlafaxine	Venlafaxine (90)
Ventolin	Albuterol (1)
Viagra	Sildenafil (105)
Vibramycin	Doxycycline (15)
Vinzam	Azithromycin (12)
Viramune	Nevirapine (41)
Viratek	Ribavirin (43)
Virazole	Ribavirin (43)
Vivatec	Lisinopril (70)
Volmax	Albuterol (1)
Vytorin*	Simvastatin (80)
Warfarin	Warfarin (75)
Wellbutrin	Bupropion (81)
Xeloda	Capecitabine (50)
Xylocaine	Lidocaine (98)
Xylocard	Lidocaine (98)
Yewtaxan	Paclitaxel (58)
Zalcitabine	Zalcitabine (45)
Zantac	Ranitidine (35)
Zeffix	Lamivudine (40)
Zestoretic	Lisinopril (70)
Zestril	Lisinopril (70)
Zetia	Ezetimibe (77)
Zidovir	Zidovudine (46)
Zidovudine	Zidovudine (46)
Zithromax	Azithromycin (12)
Zmax	Azithromycin (12)
Zocor	Simvastatin (80)
Zoloft	Sertraline (88)
Zoltum	Omeprazole (33)
Zoton	Lansoprazole (32)
Zovir	Acyclovir (36)
Zovirax	Acyclovir (36)
Zyban	Bupropion (81)
Zyrtec	Cetirizine (3)
Zyvox	Linezolid (18)

CHEMICAL CONSTITUENTS OF HUMAN BLOOD

This table lists typical concentrations of some of the chemical constituents of human blood. The table covers elements and compounds of relatively low molecular weight. References 1 and 4 give extensive information on enzymes, hormones, vitamins, and other blood constituents.

The values given for the normal range refer to healthy adults who have not been exposed to unusual environmental agents. In keeping with IUPAC practice, all values refer to a volume of one liter, and thus are stated in units of g/L, mg/L, µg/L or mmol/L. Many clinical test results, especially in the United States, are reported on a deciliter (dL) rather than a liter basis; thus the values in this table should be divided by 10 to place them on a dL basis. The symbols S (for serum), P (plasma), and WB (whole blood) in the second column indicate the nature of the blood sample to which the values apply. In some cases only a single mean value has been reported, rather than a range; these are given in italics.

The total volume of blood in a 100 kg (220 lb) adult is 7.5 L for a male and 6.7 L for a female. The corresponding volume of plasma is 4.4 L and 4.3 L, respectively (Reference 1).

Values from Reference 1 are so-called "reference values" against which clinical tests of blood chemistry are compared. In these cases the "normal range" is understood to include about 95% of the population. The remaining 5% may show values outside the normal range without necessarily implying a medical problem. Note that these reference values may vary slightly from one testing laboratory to another, depending on the detailed test procedure.

Accurate measurements on trace elements are very difficult to make, and wide variations can be found in the literature. Preferred measurement methods are discussed in References 2 and 6. Values for the trace elements can also vary from one country to another, depending on dietary or environmental factors. Thus cadmium levels tend to be higher in Japan because of the prevalence of seafood in the diet, and lead levels are higher in regions where lead additives are still used in gasoline. Variations with gender, age, geography, and occurrence of diseases are reviewed in Reference 6.

The Critical Values column gives levels that deviate far enough from the normal range to suggest a probable medical issue. Such values from Reference 3 are the Biological Exposure Indexes (BEI) that are specified by the American Council of Government Industrial Hygienists (ACGIH) as danger signals for the levels of pollutants in the workplace.

Uric acid (females)	S	mg/L	13	60		1
Valine	S,P	mg/L	24	37		4

* Measured as the percent of hemoglobin bound to CO. Typical value for heavy smokers is 5%–10%. Major symptoms begin around 30%, and respiratory failure sets in at >60%.

** This is the desirable upper limit. Values between 2000 and 2400 mg/L are considered borderline high.

CHEMICAL COMPOSITION OF THE HUMAN BODY

The elemental composition of the "standard man" of mass 70 kg is given below.

Element	Amount (g)	Percent of total body mass
Oxygen	43,000	61
Carbon	16,000	23
Hydrogen	7000	10
Nitrogen	1800	2.6
Calcium	1000	1.4
Phosphorus	780	1.1
Sulfur	140	0.20
Potassium	140	0.20
Sodium	100	0.14
Chlorine	95	0.12
Magnesium	19	0.027
Silicon	18	0.026
Iron	4.2	0.006
Fluorine	2.6	0.0037
Zinc	2.3	0.0033
Rubidium	0.32	0.00046
Strontium	0.32	0.00046
Bromine	0.20	0.00029
Lead	0.12	0.00017
Copper	0.072	0.00010
Aluminum	0.061	0.00009
Cadmium	0.050	0.00007
Boron	<0.048	0.00007
Barium	0.022	0.00003
Tin	<0.017	0.00002
Manganese	0.012	0.00002
Iodine	0.013	0.00002
Nickel	0.010	0.00001
Gold	<0.010	0.00001
Molybdenum	<0.0093	0.00001
Chromium	<0.0018	0.000003
Cesium	0.0015	0.000002
Cobalt	0.0015	0.000002
Uranium	0.00009	0.0000001
Beryllium	0.000036	
Radium	$3.1 \cdot 10^{-11}$

NUTRIENT VALUES OF FOODS

The U. S. Department of Agriculture maintains the USDA National Nutrient Database for Standard Reference, which contains over 7000 food items with data on the energy content, minerals, vitamins, and other properties of nutritional interest. The table here includes about 600 common foods extracted from that database. The properties listed are the energy content (in effect, the enthalpy of combustion); the content of carbohydrates, proteins, and lipids (fats); the cholesterol content; and the amount of sodium, potassium, calcium, magnesium, iron, copper, zinc, manganese, phosphorus, and selenium. All values are given for a 100 gram sample of the food.

To conform with common practice in nutritional science, the energy content is given in kilocalories. For conversion to kilojoules, this number should be multiplied by 4.184. For conversion to the avoirdupois units frequently used in the United States, note that:

1 oz = 28.35 g (thus the 100 g basis in this table is approximately 3.5 oz)
1 lb = 453.6 g

The full USDA database covers specific proprietary brands of many processed foods, and it includes vitamin content as well as the minerals given in this table.

Section 8
Analytical Chemistry

Abbreviations and Symbols Used in Analytical Chemistry 8-1
Basic Instrumental Techniques of Analytical Chemistry 8-6
Analytical Standardization and Calibration 8-9
Figures of Merit 8-14
Mass- and Volume-Based Concentration Units 8-15
Detection of Outliers in Measurements 8-16
Properties of Carrier Gases for Gas Chromatography 8-18
Common Symbols Used in Gas and Liquid Chromatographic Schematic Diagrams 8-19
Properties of Common Cross-Linked Silicone Stationary Phases 8-21
Detectors for Gas Chromatography 8-22
Varieties of Hyphenated Gas Chromatography with Mass Spectrometry 8-24
Solid-Phase Microextraction Sorbents 8-26
Gas Chromatographic Retention Indices 8-28
Eluotropic Values of Solvents on Octadecylsilane and Octylsilane 8-30
Detectors For Liquid Chromatography 8-31
Solvents for Ultraviolet Spectrophotometry 8-32
Correlation Table for Ultraviolet Active Functionalities 8-33
Wavelength-Wavenumber Conversion Table 8-36
Middle-Range Infrared Absorption Correlation Charts 8-39
Common Spurious Infrared Absorption Bands 8-45
Nuclear Spins, Moments, and Other Data Related to NMR Spectroscopy 8-46
Properties of Important NMR Nuclei 8-49
Proton NMR Absorption of Major Chemical Families 8-50
Proton NMR Correlation Chart for Major Organic Functional Groups 8-56
Proton NMR Shifts of Common Organic Solvents 8-57
^{13}C-NMR Absorptions of Major Functional Groups 8-64
^{13}C NMR Chemical Shifts of Common Organic Solvents 8-65
^{15}N-NMR Chemical Shifts of Major Chemical Families 8-66
Natural Abundance of Important Isotopes 8-68
Common Mass Spectral Fragmentation Patterns of Organic Compound Families 8-69
Common Mass Spectral Fragments Lost 8-71
Major Reference Masses in the Spectrum of Heptacosafluorotributylamine (Perfluorotributylamine) 8-72
Mass Spectral Peaks of Common Organic Solvents 8-73
Common Spurious Signals Observed in Mass Spectrometers 8-80
Reduction of Weighings in Air to Vacuo 8-81
Standards for Laboratory Weights 8-82
Indicators for Acids and Bases 8-84
Preparation of Special Analytical Reagents 8-85
Organic Analytical Reagents for the Determination of Inorganic Ions 8-90
Precipitation of Sulfides 8-103
pH Range for Precipitation of Metal Hydroxides and Oxides 8-104

ABBREVIATIONS AND SYMBOLS USED IN ANALYTICAL CHEMISTRY

Abbreviations Used in Analytical Chemistry

A	peak area; surface area of solid granular adsorbent; eddy diffusion term in the Van Deemter equation
AAA	absolute activation analysis
AAD	atomic absorption detector
AAS	atomic absorption spectroscopy
AC	alternating current, affinity chromatography
ACP	alternating current plasma
ADXPS	angular dependent X-ray photoelectron spectroscopy
AED	atomic emission detector
AEM	analytical electron microscope (microscopy)
AES	Auger electron spectroscopy, atomic emission spectroscopy
AFID	alkali flame ionization detector
AFM	atomic force microscopy
AFS	atomic force spectroscopy
AIS	average of individual samples
AL	action level
AM	amplitude modulation
AMS	accelerator mass spectrometry
AN	area normalization
ANRF	area normalization with response factors
AOTF	acousto-optical tunable filter
AP	analytical pyrolysis
APCI	atmospheric pressure chemical ionization
APD	azimuthal photoelectron diffraction
API	atmospheric pressure ionization
APSTM	analytical photon scanning tunneling microscope
APT	attached proton test
ARAES	angle resolved Auger electron spectroscopy
ARF	absolute response factor
ARM	atomic resolution microscopy
ARPES	angle resolved photoelectron spectroscopy
ARUPS	angle resolved ultraviolet photoelectron spectroscopy
ASE	accelerated solvent extraction
AsFIFFF	asymmetrical flow field flow fractionation
ATD	above-threshold dissociation
ATI	above-threshold ionization
ATR	attenuated total reflection
BB	band broadening
BE	magnetic sector – electric sector tandem mass spectrometer (note: also called a MIKE spectrometer)
BEE	magnetic sector – electric sector – electric sector mass spectrometer
BET	Brunauer-Emmett-Teller (adsorption isotherm)
BIFL	burst integrated fluorescence lifetime
BIS	Bremsstrahlung isochromat spectroscopy
BL	bioluminescence
BLRF	bispectral luminescence radiance factor
BQQ	magnetic sector – double quadrupole mass spectrometer BTOF
BTOF	magnetic sector – time of flight tandem mass spectrometer
CAD	collision activated dissociation
CAR	continuous addition of reagent
CARS	coherent anti-Stokes Raman spectroscopy
CCC	counter-current chromatography
CCD	charge-coupled device
CCT	constant current topography
CD	circular dichroism
CE	capillary electrophoresis, counter electrode
CEC	capillary electrokinetic chromatography, capillary electrochromatography
CED	cohesive energy density
CFA	continuous flow analysis
CF-FAB	continuous flow-fast atom bombardment
CFM	chemical force microscopy
CGE	capillary gel electrophoresis
CHEMFET	chemical-sensing field effect transistor
CI	chemical ionization
CID	collision induced dissociation
CIEF	capillary isoelectric focusing
CITP	capillary isotachophoresis
CL	chemiluminescence
CLLE	continuous liquid-liquid extraction
CMA	cylindrical mirror analyzer
COSY	correlation spectroscopy
CPAA	charged particle activation analysis
CP/MAS	cross polarization/magic angle spinning
CRDS	cavity ring-down spectroscopy
CRF	chromatographic response function
CRM	certified reference material
CT	cryogenic trapping
CTD	charge transfer device
CV	cyclic voltammetry
CV-AAS	cold vapor atomic absorption spectrometry
CVD	chemical vapor deposition
CW	continuous wave
CZE	capillary zone electrophoresis
DA	diode array
DAD	diode array detector (UV-Vis)
DADI	direct analysis of daughter ions
DBE	double bond equivalent
DC	direct current
DCI	desorption chemical ionization
DCP	direct-current plasma
DEP	differential electrolytic potentiometry
DEPT	distortionless enhancement by polarization transfer
DETA	dielectric thermal analysis
DIN	direct injection nebulizer
DLI	direct liquid introduction
DLS	dynamic light scattering
DMA	dynamic mechanical analysis
DME	dropping mercury electrode
DNMR	dynamic nuclear magnetic resonance
DPP	differential pulse polarography
DRIFT	diffuse-reflectance infrared Fourier transform
DSC	differential scanning calorimetry
DTA	differential thermal analysis
DTC	differential thermal calorimetry
EAES	electron-excited Auger electron spectroscopy
EB	electric sector – magnetic sector tandem mass spectrometer
EBE	electric sector – magnetic sector-electric sector tandem mass spectrometer
EC	electrochemical
ECD	electron capture detector

ECMS	electron capture mass spectrometry
ECNIMS	electron capture negative ionization mass spectrometry
EDL	electrodeless discharge lamp
EDS	energy-dispersive spectrometer
EDXRF	energy-dispersive X-ray fluorescence
EELS	electron energy-loss spectroscopy
EFFF	electric field flow fractionation
EGA	evolved gas analysis
EIA	enzyme-linked immunoassay
EI(I)	electron impact (ionization)
EIMS	electron impact mass spectrometry
ELCD	electrolytic conductivity detector
ELISA	enzyme-linked immunosorbent assay
ELSD	evaporative light scattering detector
EM	electron microscopy
EMIRS	electrochemically modulated IR spectroscopy
EOF	electro-osmotic flow
EPL	enhanced photoactivated luminescence
EPMA	electron-probe microanalysis
EPR	electron paramagnetic resonance
EPXMA	electron-probe x-ray microanalysis
EQL	estimated quantitation limit
ERD	elastic recoil detection
ESA	electrostatic analyzer
ESCA	electron spectroscopy for chemical analysis
ESEM	environmental scanning electron microscope
ESI	electro-spray ionization
ESP	electrospray
ESR	electron spin resonance
ETA	electrothermal analyzer, emanation thermal analysis
EXAFS	extended X-ray absorption fine structure
FAA	flame atomic absorption
FAAS	flame atomic absorption spectroscopy
FABMS	fast-atom bombardment mass spectrometry
FAES	flame atomic emission spectroscopy
FAFS	flame atomic fluoroescence spectroscopy
FAM	field analytical method
FAS	flame absorption spectroscopy
FD	field desorption
FD/FI	field desorption/field ionization
FES	flame emission spectroscopy
FFEM	freeze-fracture electron microscopy
FFF	field flow fractionation
FFFF	flow field flow fractionation
FFM	friction force microscopy
FFS	flame fluorescence spectroscopy
FFT	fast Fourier transform
FGC	fast gas chromatography
FI	flow injection, field ionization
FIA	flow injection analysis
FIB	focused ion beam
FID	flame ionization detector, free-induction decay
FIM	field ion microscopy
FlFFF	flow field flow fractionation
FNAA	fast neutron activation analysis
FOCS	fiber optic chemical sensor
FPD	flame photometric detector
FSOT	fused silica open tubular (column)
FT	Fourier transform
FT-ICR	Fourier transform ion cyclotron resonance
FT-IR	Fourier transform infrared (often "FT/IR," "FTIR," "FT IR")
FT-IRRAS	FT-IR reflection-absorption spectroscopy
FT-MS	Fourier transform mass spectrometry
FWHM	full-width half-maximum
GC	gas chromatography
GC-IR	gas chromatography–infrared
GCMS	gas chromatography mass spectrometry
GDL	glow discharge lamp
GDMS	glow discharge mass spectrometry
GE	gel electrophoresis, gradient elution
GEMBE	gradient elution moving boundary electrophoresis
GFAAS	graphite furnace atomic absorption spectroscopy
GLC	gas-liquid chromatography
GPC	gel permeation chromatography
GS	Gram-Schmidt (algorithm)
GSC	gas-solid chromatography
GSED	gaseous secondary electron detector
HCL	hollow cathode lamp
HCOT	helically coiled open tubular (column)
HDC	hydrodynamic chromatography
HETCOR	heteronuclear correlation
HETP	height equivalent of (a) theoretical plate(s)
HG	hydride generation
HIC	hydrophoric interaction chromatography
HMBC	heteronuclear multiple-bond correlation
HPAC	high-performance affinity chromatography
HPIAC	high-performance immunoaffinity chromatography
HPLC	high-performance liquid chromatography, high-pressure liquid chromatography
HPTLC	high-performance thin-layer chromatography
HRCGC	high-resolution capillary gas chromatography
HRGC	high-resolution gas(-liquid) chromatography
HS	head space
HSA	hemispherical analyzer
HSC	heteronuclear shift correlation
HSQC	heteronuclear single quantum coherence
IA	isocratic analysis
IAC	immunoaffinity chromatography
IAES	ion-excited Auger electron spectroscopy
IC	ion chromatography
ICP	inductively coupled plasma
ICP-OES	ICP optical emission spectrometry
ICR	ion cyclotron resonance
IDMS	isotope dilution mass spectrometry
IEC	ion-exchange chromatography
IEF	isoelectric focusing
IF	intermediate frequency
IGC	inverse gas chromatography
ILDA	intensified linear diode array
IMAC	immobilized metal-ion affinity chromatography
INADEQUATE	incredible natural abundance double-quantum transfer experiment
INEPT	insensitive nuclei enhancement by polarization transfer
INAA	instrumental neutron activation analysis
IP	ion pairing
IPC	ion-pair chromatography
IPG	immobilized pH gradient
IPMA	ion probe microanalysis
IR	infrared (spectrophotometry)
IRN	indicator radionuclide(s)
IRS	internal reflection spectroscopy
ISCA	ionization spectroscopy for chemical analysis
ISE	ion selective electrode
ISP	ion spray
ISS	ion scattering spectrometry

LAMMS	laser micro mass spectrometry
LARIMS	laser atomization resonance ionization mass spectrometry
LARIS	laser atomization resonance ionization spectroscopy
LASER	light amplification by stimulated emission of radiation
LBB	Lambert-Beer-Bouguer law
LC	liquid chromatography
LC-LS	multidimensional liquid chromatography
LDMS	laser desorption mass spectrometry
LDR	linear dynamic range
LEAFS	laser-excited atomic fluorescence spectrometry
LED	light-emitting diode
LEED	low energy electron diffraction
LEEM	low energy electron microscopy
LEI	laser-enhanced ionization
LESS	laser-excited Shpol'skii spectroscopy
LFM	lateral force microscopy
LIDAR	light detection and ranging
LIFD	laser-induced fluorescence detection
LIMS	laboratory information management system
LLC	liquid-liquid chromatography
LLD	lower-limit detection
LLE	liquid-liquid extraction
LNRI	laser non-resonant ionization
LO	local oscillator
LOC	lab on a chip
LOD	limit of detection
LPDA	linear photodiode array
LPSIRS	linear potential-sweep IR reflectance spectroscopy
LRI	laser resonance ionization
LRMA	laser Raman microanalysis
LSC	liquid-solid chromatography
LSE	liquid-solid extraction
LTP	low-temperature phosphorescence
MAE	microwave assisted extraction
MALDI	matrix-assisted laser desorption source
MAS	magic angle spinning
MCD	magnetic circular dichroism
MCP	microchannel plate
MDGC	multidimensional gas chromatography
MDL	method detection limit
MDM	minimum detectable mass
MDQ	minimum detectable quantity
MEIS	medium energy ion scattering
MEKC	micellar electrokinetic chromatography
MFM	magnetic force microscopy
MID	multiple ion detection
MIKE	mass analyzed ion kinetic energy mass spectrometry
MIP	microwave induced plasma, mercury intrusion porosimetry
MIRS	multiple internal reflection spectroscopy
MLC	micellar liquid chromatography
MLLSQ	multiple linear least squares
MMF	minimum mass fraction
MMLLE	microporous membrane liquid-liquid extraction
MPD	microwave plasma detector
MPI	multiphoton ionization
MRDL	maximum residual disinfectant level (in water analysis)
MRI	magnetic resonance imaging
MS	mass spectrometry
MS-MS	tandem mass spectrometry
MSPD	matric solid-phase dispersion
MSRTP	micelle-stabilized room-temperature phosphorescence
MWD	microwave (assisted) digestion
NAA	neutron activation analysis
NCIMS	negative chemical ionization mass spectrometry
NDP	neutron depth profiling
NEXAFS	near edge x-ray absorption fine structure
NHE	normal-hydrogen electrode
NICI	negative ion chemical ionization
NIR	near-infrared, near-IR
NIRA	near-infrared reflectance analysis
nm	nanometer
NMR	nuclear magnetic resonance
NOE (nOe)	nuclear Overhauser effect
NOESY	nuclear Overhauser effect spectroscopy
NPD	nitrogen-phosphorus detector, normal photoelectron diffraction
NPLC	normal phase liquid chromatography
ODMR	optically detected magnetic resonance
ODS	octadecylsilane
OES	optical emission spectrometry, optical emission spectroscopy
OID	optoelectronic imaging device
OMA	optical multichannel analyzer
OPO	optical parametric oscillator
OPTLC	over-pressured thin-layer chromatography
ORD	optical rotary dispersion
OTE	optically transparent electrodes
PA	proton affinity
PAA	photon activation analysis
PAGE	polyacrylamide gel electrophoresis
PAH	polycyclic aromatic hydrocarbon
PAS	photoacoustic spectroscopy
PB	particle beam
PC	paper chromatography
PCA	principal component analysis
PCR	polymerase chain reaction
PCS	photon correlation spectroscopy
PCSE	partially coherent solvent evaporation
PD	plasma desorption
PDA	photodiode array
PDHID	pulsed discharge helium ionization detector
PDMS	plasma desorption mass spectrometry, polydimethyl siloxane
PED	pulsed electrochemical detection, plasma emission detector, photoelectron diffraction
PES	photoelectron spectroscopy
PET	positron emission tomography
PFIA	process flow injection analysis
PGC	packed-column gas chromatography
pH	negative logarithm of hydrogen ion concentration
PICI	positive ion chemical ionization
PID	photoionization detector
PIXE	particle-induced X-ray emission
p*K*	negative logarithm of an equilibrium constant
PLE	pressurized liquid extraction
PLOT	porous-layer open tubular
PMT	photomultiplier tube
ppb	parts per billion
ppm	parts per million
ppt	parts per thousand, parts per trillion
PSD	position sensitive detector

PTFE	polytetrafluoroethylene
PTR	proton transfer reaction (in mass spectrometry)
PTV	programmable temperature vaporizer
PVD	pulsed voltammetric detection, physical vapor deposition
QCL	quantum cascade laser
QCM	quartz crystal microbalance
QCM	quartz-crystal microbalance
QFAA	quartz furnace atomic adsorption
QIT	quadrupole ion trap
qNMR	quantitative nuclear magnetic resonance
QQQ, QqQ, Q1qQ3	triple quadrupole mass spectrometer
QTH	quartz tungsten halogen
QTOF	tandem quadrupole time of flight mass spectrometer
RAA	running annual average
RBS	Rutherford backscattering spectrometry
REELS	reflection electron energy loss spectrometry
RES	reflection electron spectrometry
RF	radio frequency
RHEED	reflection high energy electron diffraction
RI	refractive index, retention index
RIC	reconstructed ion chromatogram
RID	refractive-index detector
RIMS	resonance ionization mass spectrometry
RIS	range of individual samples, resonance ionization spectroscopy
RM	reference material
RNAA	radiochemical neutron activation analysis
ROA	Raman optical activity
ROESY	rotating frame nuclear Overhauser effect spectroscopy
RPLC	reversed-phase liquid chromatography
RRDE	rotating ring-disk electrode
RS	Raman spectroscopy
RSF	relative sensitivity factor
RTIL	room-temperature ionic liquid
RTP	room-temperature phosphorescence
S/N	signal-to-noise ratio
SAE	sonication assisted extraction
SAM	scanning Auger microscopy, self-assembly monolayers
SANS	small-angle neutron scattering
SAW	surface acoustic wave
SAXS	small-angle X-ray scattering
SBSE	stirbar sorptive extraction
SCE	standard calomel electrode, saturated calomel electrode
SCF	supercritical fluid
SCOT	support-coated open tubular
SDD	silicon drift detector
SdFFF	sedimentation field flow fractionation
SEC	size-exclusion chromatography
SEM	scanning electron microscope
SERS	surface-enhanced Raman spectroscopy
SFC	supercritical-fluid chromatography
SFE	supercritical-fluid extraction
SFFF	sedimentation field flow fractionation
SF-MS	sector field mass spectrometry
SFS	synchronous fluorescence spectroscopy
SHE	standard hydrogen electrode
SIA	sequential injection analysis
SIDA	stable isotope dilution assay
SIMS	secondary ion mass spectrometry
SIRIS	sputter initiated resonance ionization spectroscopy
SMCL	secondary maximum contaminant level (in water analysis)
SMDE	static mercury drop electrode
SNIFTIRS	subtractively normalized interfacial FT-IR spectroscopy
SNMS	sputtered neutral mass spectrometry
SPAES	spin-polarized Auger electron spectroscopy
SPE	solid-phase extraction
SPME	solid-phase microextraction
SPR	surface plasmon resonance
SRE	stray radiant energy
SRM	standard reference material
SSMS	spark source mass spectrometry
SSRTF	solid-surface room-temperature fluorescence
SSRTP	solid-surface room-temperature phosphorescence
STEM	scanning transmission electron microscope
STM	scanning tunneling microscope
SVE	solvent vapor exit
SWE	supercritical water extraction
TCD	thermal-conductivity detector
TCT-GC-MS	thermal cold trap gas chromatography mass spectrometry
TD	thermodilatometry
TDL	tunable diode laser
TEA	thermal energy analyzer
TED	thermionic emission detector
TEELS	transmission electron energy loss spectrometry
TEM	transmission electron microscope
TET	thermometric enthalpimetric titration
TFFF	thermal field flow fractionation
TGA	thermogravimetric analysis
TGA-IR	thermogravimetric analysis– infrared
THEED	transmission high energy electron diffraction
ThFFF	thermal field flow fractionation
TIC	total ion current chromatogram, tentatively identified compound
TIMS	thermoionization mass spectrometry
TLC	thin-layer chromatography
TLE	thin-layer electrode
TLM	thermal lens microscopy
TLV	threshold limit value
TMA	thermomechanical analysis
TMS	tetramethylsilane
TOCSY	total correlation spectroscopy
TOF	time-of-flight
TOF-MS	time-of-flight mass spectrometry
TSP	thermospray
UHV	ultrahigh vacuum
USE	ultrasonic extraction
UV	ultraviolet
UVPES, UPS	ultraviolet photoelectron spectroscopy
UV-VIS, UV-Vis	ultraviolet-visible
VAR	variable angle reflectance
Vis	visible (radiation)
VOC	volatile organic compound(s)
VOX	volatile organic halogens
VUV	vacuum ultraviolet
W	Wein filter (used in mass spectrometry)
WCOT	wall-coated open tubular

WDS	wavelength dispersive spectrometer
WWCOT	whisker-wall coated open tubular (column)
WWPLOT	whisker-wall (coated) porous layer open tubular (column)
WWSCOT	whisker-wall support-coated open tubular (column)
XAES	X-ray excited Auger electron spectroscopy, X-ray adsorption edge spectrometry
XANES	X-ray absorption near-edge spectroscopy
XPS	X-ray photoelectron spectroscopy
XRD	X-ray diffraction
XRF	X-ray fluorescence
XRFS	X-ray fluorescence spectroscopy
XRS	X-ray spectroscopy
ZAF	Z (element number) absorption fluorescence

Symbols Used in Analytical Chemistry

a	Auger yield, fine structure constant
a_0	Bohr radius
A	absorbance
A	peak asymmetry factor
B	magnetic field strength
$[c]$	concentration of component c
d_p	particle diameter (HPLC stationary phase)
D_{ab}	diffusion coefficient
e	electron elementary charge
ε	extinction coefficient
E	energy
E_b	binding energy
E_{ea}	electron affinity
E_i	ionization energy
E	electrode potential
ν	frequency
γ	gyromagnetic ratio
n	refractive index
h	Planck constant
H	enthalpy, plate height
I_0	incident intensity
J	coupling constant
k	coverage factor
k'	capacity factor
m/z	mass-to-elementary-charge ratio (mass spectrometry)
Q_{crit}	Q value (outlier test)
q	quadrupole parameter (mass spectrometry)
r	correlation coefficient
R	resolution
R_∞	Rydberg constant
ρ	density
s	standard deviation
s^2	variance
δ	chemical shift
δ^*	solubility parameter
τ	true value of a measured quantity
τ_{crit}	Chauvanet's criterion (outlier test)
$t_{1/2}$	half life
t_M	mobile-phase hold up
t_R	retention time
t_R^0	specific retention time
T	transmittance
$T1$	spin-lattice relaxation time
$T2$	spin-spin relaxation time
$\bar{u}$	carrier phase velocity
V_M	carrier hold-up volume
V_R	retention volume
V_R^0	specific retention volume
λ	wavelength, thermal conductivity

BASIC INSTRUMENTAL TECHNIQUES OF ANALYTICAL CHEMISTRY

Thomas J. Bruno

The following section provides brief descriptions of the major instrumental methods of chemical analysis. Please note that these paragraphs are general descriptions and are not meant to convey a comprehensive knowledge on these topics. The reader is referred to one of many excellent texts on instrumental methods of chemical analysis for additional details.

Gas Chromatography (GC): A separation method in which the sample or solute is vaporized (usually in a solvent, but sometimes neat or free of solvent) and passed through a medium under the influence of a carrier gas. The medium is called the stationary phase, in contrast to the carrier gas, which is mobile. The most common modern stationary phases are based on open tubular or capillary columns, in which the separation medium coats the inside periphery of a tube (typically tenths of millimeters in inside diameter) that is between 25 m and 60 m long. Older media are packed columns, consisting of packed beds, which are still used for gas analysis. In these applications, a solid sorbent is very common, and this is called gas-solid chromatography. Some open tubular columns are available with solid sorbents as well. Interactions of the solute with the separation medium affect the separation of the components of the mixture. A wide variety of detectors are available for general or specific applications. One of the most useful combinations is gas chromatography coupled with mass spectrometry (GC-MS). Solutes amenable to analysis by GC are usually of moderate volatility and a relative molecular mass usually not exceeding 400. The most common stationary phases are cross-linked polymers based on dimethyl polysiloxane, the backbone of which can be derivatized with ligands to provide specific interactions. It is also possible to incorporate stereogenic (chiral) stationary phases as well.

Liquid Chromatography (LC, HPLC): A separation method in which a sample or solute (usually in a solvent, but sometimes neat or free of solvent) is passed through a medium under the influence of a carrier liquid. The medium is called the stationary phase, in contrast to the carrier, which is the mobile phase. Unlike gas chromatography, where the carrier gas plays little role other than mass transfer, the mobile phase in liquid chromatography is a controllable variable whose polarity and other properties are varied, in addition to the interactions with the stationary phase, to affect separation. The stationary phase in liquid chromatography is usually a micrometer-size particle packed bed that requires a high-pressure solvent system to cause mass flow. Liquid chromatographic systems have therefore been called high-pressure liquid chromatography (HPLC), although the acronym is usually taken to mean high-performance liquid chromatography. Many variations of the method have been developed for specific analysis. For example, gel permeation chromatography is an adaptation used for the separation of polymers. Affinity chromatography is similar in concept to gel permeation chromatography, but uses the specific interactions between an antibody and an antigen. The use of stereogenic (or chiral) stationary phases is also an important development, especially in the analysis of pharmaceuticals.

Thin-Layer Chromatography (TLC): A separation method in which a stationary phase (typically a polar adsorbent such as alumina or silica gel) coated on a sheet of plastic, aluminum, or glass is used with a mobile phase usually consisting of a solvent or mixture of solvents in a beaker. The solute is applied as a blotted spot just above the end of the adsorbent-coated plate, and then the end is immersed into the solvent (but not so far as to immerse the solute spot). Commercial plates are robust, plastic sheets that can be cut to the desired size. In earlier applications, filter paper has been used in TLC, giving rise to the term "paper chromatography." This is rarely used today. Solvent is then drawn up through the adsorbent coating by capillary action. Separation results from a combination of interactions with the adsorbent and solvent. Commonly, the separated components are rendered visible by spraying stains or reactants on the plate after separation has been completed. It is also common to view the "developed" plate under an ultraviolet lamp, to visualize spots that may be fluorescent.

Supercritical Fluid Chromatography (SFC) and Supercritical Fluid Extraction (SFE): A separation technology similar to other extraction and chromatographic methods, but in which the mobile phase is actually a fluid in its supercritical fluid state. A supercritical fluid is a fluid that is held above its critical temperature and pressure, and for which no application of additional pressure can result in the development of a liquid phase. Supercritical fluids are unique in that while they possess liquid-like densities, the mass transfer behavior is superior to that of liquids. Supercritical fluid chromatography remains a niche method that is applicable to pharmaceuticals and other high relative molecular mass solutes. Supercritical extraction, on the other hand, is more widely used as a sample preparation method, especially in pharmaceutical analyses, polymers, and environmental analyses.

Electrophoresis: A family of separation methods based on the motion induced in particles by an applied, uniform electric field. The most common application of electrophoresis is gel electrophoresis, in which sample (typically proteins, amino acids, nucleic acids, etc.) is applied to a channel that is formed in a cross-linked polymer, usually polyacrylamide or agarose (the gel). The speed at which the individual species move through the gel under the influence of the field is determined largely by the size of the species, as expressed by the mass-to-charge ratio. After separation, the individual species usually appear as discrete bands that may be better visualized by staining with ethidium bromide, silver, or Coomassie Brilliant Blue dye. Other related

and more specific techniques include isoelectric focusing, pulsed-field gel electrophoresis, immunoelectrophoresis, and isotachophoresis.

Mass Spectrometry (MS): An analytical technique in which charged particles or radical ions are produced from a sample by either electron impact (bombardment with a stream of electrons) or chemical ionization (interaction with a small charged ion). Analysis on the basis of the mass-to-charge ratio is performed on fragments of the molecule that develop after the initial ionization. The method is very useful for mass determination, and structure determination on the basis of the induced fragmentation pattern. The charged fragments can be separated or analyzed by a magnetic sector, a quadrupole, an ion trap, by time of flight, or by cyclotroning. When coupled to separation techniques such as gas or liquid chromatography, a nearly universal qualitative detection capability is provided. Structure determination can be performed by comparison to well know fragmentation patterns or characteristics. When a mass spectrometer is capable of high mass resolution (0.0001 RMM units), a nearly unequivocal identification of a compound formula is possible. While direct interfaces and gas chromatographs are the most common sample introduction techniques, many others are available for specific applications. Matrix-assisted laser desorption/ionization (MALDI) is often used in time-of-flight instruments, and is especially useful for analysis of biopolymers. Inductively coupled plasma ionization is capable of producing mass spectra of high sensitivity for many metals and some nonmetals. When coupled to liquid chromatography instrumentation, thermospray and electrospray methods have been used with HPLC for analytes that are not amenable to gas chromatography separation.

Ultraviolet Spectophotometry (UV, UV-Vis): A spectroscopic technique that focuses on electronic transitions in the visible and ultraviolet regions of the electromagnetic spectrum used for excitation and detection. The practical ultraviolet region extends from 190 nm to 400 nm in wavelength. The UV region can be divided into subranges: near-UV: 300 nm to 400 nm, mid-UV: 300 nm to 200 nm, far-UV: 200 nm to 122 nm, and vacuum-UV: 200 nm to 100 nm. Other divisions are possible, but these are less important for analytical chemistry. The visible region, so called because of the response of human vision, extends from about 390 nm to 750 nm in wavelength. Although it is possible to use ultraviolet visible spectrophotometry for structure determination, it is most often used as a quantitative tool. The wavelength-structure correlations are not as detailed, nor the spectra as sharp, as with other spectroscopic methods such as infrared spectrophotometry. The utility of UV-Vis absorptions for many organic compounds has led to this instrument being adapted as a detector for liquid chromatography. Related to ultraviolet spectrophotometry are fluorescence spectroscopic methods. In these methods, the energy emitted is at a different wavelength (usually longer, of lower energy) than the incident radiation, and this is typically detected perpendicular to the incident excitation beam. This makes fluorescence spectroscopy more sensitive than UV-Vis spectroscopy. This type of instrument is also incorporated as a detector for liquid chromatography.

Infrared Spectrophotometry (IR, FTIR): A spectroscopic technique that focuses on molecular vibrations (with a concurrent change in dipole moment) in the infrared (IR) region of the electromagnetic spectrum for excitation and detection. This region is further divided into three separate but overlapping ranges. The near-infrared (high energy IR, approximately 12 500 cm^{-1} to 4 000 cm^{-1}, 0.8 μm to 2.5 μm wavelength) is used to study overtone or harmonic vibrations. The mid-infrared (mid-range energy IR, approximately 4 000 cm^{-1} to 400 cm^{-1}, 2.5 μm to 25 μm wavelength) is used to study the fundamental vibrations and associated rotational-vibrational combinations. The far-infrared (low energy IR, approximately 400 cm^{-1} to 10 cm^{-1}, 25 μm to 1000 μm wavelength) is adjacent to the microwave region and is used to study rotational transitions. Most modern instruments use the Fourier transform (FT) technique to record the spectrum over all wavelengths, rather than by scanning through the wavelengths. The absorbances of the IR radiation are associated with specific chemical moieties, and a study of the spectra can be used to aid in structure determination. One often uses structure correlation charts to aid in assignment of absorbance bands. An analysis of the intensity of the absorptions can also be used for quantitative analysis.

Raman Spectroscopy: A vibrational spectroscopic method that arises from the inelastic scattering of monochromatic radiation by molecules that undergo a change in polarizability during the vibration. This is in contrast to infrared spectrophotometry, in which a change in the dipole moment occurs during the vibration. When radiation (typically light from a laser in the visible, near-infrared, or near-ultraviolet range) is scattered, a small fraction of the scattered radiation is observed to have a different frequency (the Raman effect). The variations of Raman spectroscopy are used to locate functional groups or chemical bonds in molecules. There are several variations in the approach to Raman spectroscopy. In resonance Raman spectroscopy, the excitation wavelength is matched to an electronic transition of the molecule, enhancing the vibrational modes. In coherent anti-Stokes Raman spectroscopy (CARS), two laser beams are used to generate a coherent anti-Stokes frequency beam. In surface-enhanced Raman spectroscopy (SERS), surface plasmons (a quantum of plasma oscillation) on a silver or gold colloid on a surface (such as a mirror) are excited by the laser, resulting in an increase in the electric fields surrounding the metal.

Nuclear Magnetic Resonance Spectrometry (NMR): A spectroscopic method that takes advantage of the fact that magnetic nuclei (nuclei with an odd number of protons and/or neutrons, having an intrinsic magnetic moment and angular momentum), when placed in a magnetic field, will absorb pulses of electromagnetic radiation and then radiate this energy back out for detection. For these nuclei, the energy and signal intensity are proportional to the applied magnetic field. The power of NMR results from the ability to probe the molecular environment around a particular nucleus, thus making it a favorite tool of the organic chemist. This is done by measurement of the chemical shift (or frequency) of an absorption, and by the analysis of splitting patterns, which are caused by the influence of adjacent nuclei. New high-field, high-sensitivity instruments have given this technique more applications in analytical chemistry. The most commonly studied nuclei are ^{1}H (proton, the most NMR-sensitive isotope after the radioactive ^{3}H) and ^{13}C. With high-field instruments, additional nuclei are accessible: ^{2}H, ^{10}B, ^{11}B, ^{14}N, ^{15}N, ^{17}O, ^{19}F, ^{23}Na, ^{29}Si, ^{31}P, ^{35}Cl, ^{113}Cd, ^{129}Xe, and ^{195}Pt.

Purge-and-Trap Sampling: Purge-and-trap sampling represents a family of methods that are used to capture the headspace above a condensed phase for subsequent analysis, most often for complex mixtures, environmental samples, etc. The headspace is the vapor space that develops above any condensed (solid or liquid) phase. Thermodynamics assures us that the concentration of a particular analyte found in the headspace will be different than that found in the condensed phase, but often the relationship is predictable. The value in the method comes from the simplicity; sample preparation is usually far simpler than the cleanup that is typically required for many complex mixtures. Purge-and-trap methods fall into two general categories: static and dynamic. The dynamic method typically uses a sweep gas to continuously purge vapor analytes into a cold (cryogenic) trap or an adsorbent. Modern dynamic purge-and-trap methods include porous-layer open tubular (PLOT) column cryoadsorption, which uses a combined adsorbent and cryotrapping on a high efficiency platform. Static methods typically employ a syringe to pressurize the headspace above a condensed phase, followed by uptake of the pressurized headspace into a trap. A modern static method (that usually is done without pressurization) is solid-phase microextraction (SPME). This method utilizes a fiber coated with a stationary phase (similar to stationary phases used for gas and liquid chromatography) at the end of a wire mounted in a syringe needle.

Atomic Absorption Spectroscopy (AAS) and Atomic Emission Spectroscopy (AES): Two related spectroscopic methods applied primarily to the analysis of inorganic compounds. Atomic absorption procedures use the absorption of optical radiation (light) by free atoms in the gaseous state. The light can be produced by a hollow cathode lamp, an electrodeless discharge lamp, or a deuterium lamp. The light is absorbed by the analyte during an electronic transition, the wavelength of which corresponds to only one element in the analyte, and the width of an absorption line is of the order of only a few picometers. This method can be used for the quantitative determination (on the basis of a calibration curve) of approximately 70 different elements in solution or directly in solid samples. Atomic emission spectroscopy (AES) uses the light emitted by a vaporized sample in a flame, plasma, arc, spark, or laser, at a particular wavelength, to determine the atomic spectrum (for determination of the elemental composition) and to determine the quantity of an element in a sample. The wavelength of the atomic spectral line gives the identity of the element while the intensity of the emitted light is proportional to the number of atoms of the element. No single source, as described above, is optimal for a given sample, and it is the choice of source that distinguishes the various techniques.

Thermal Analysis (TA) Methods: A family of analytical techniques in which various properties of a sample are examined as a function of changing temperature at a particular rate of change. For chemical analysis, the most common thermal analysis techniques include differential thermal analysis (DTA) and thermogravimetric analysis (TGA). In chemical analysis, TGA is used to determine a mass change as a function of temperature. This is used to determine decomposition or degradation temperatures, moisture content of materials (although Karl Fisher coulombic titrimetry is also used for this), the level of inorganic and organic components in materials, decomposition points of explosives, and solvent residues in materials. DTA, on the other hand, monitors a temperature change rather than a mass change and is used for determination of phase transitions. In this respect, it is useful as a complementary technique to probe the energetics of decomposition, moisture loss, etc. Other thermal analysis methods, such as differential scanning calorimetry (DSC), are not primarily analytical tools but rather thermophysical property measurement tools.

X-Ray Methods: A family of techniques that utilize radiation in the x-ray region, with wavelengths between 0.01 nm to 10 nm (corresponding to frequencies in the 3×10^{16} Hz to 3×10^{19} Hz range) to analyze for the presence of elements in a sample. In x-ray fluorescence spectroscopy (XRFS), short wavelength x-rays are used to excite secondary or fluorescent x-rays from a sample. The wavelength of x-rays used to excite the sample must be shorter than the expected fluorescence wavelength. The sample is typically presented as a powdered solid on a glass plate. Spectra are generated by changing the incident angle between the source and the sample with a device called a goniometer. The fluorescent signals obtained are very precise and specific, and can rival wet chemical methods for the identification of elements. Auger electron spectroscopy (AES) is a surface analysis method that measures the electrons emitted from a surface by electron bombardment of the surface. This method is considered to be in the same family as x-ray methods because during electron bombardment, the surface can lose energy either by electron emission (the Auger effect, via Auger electron emission) or x-ray emission. These methods are in contrast to x-ray diffraction methods, in which a crystal structure measurement is desired.

Flow Injection Analysis (FIA): An analytical protocol that seeks to replace the manual "test tube and beaker" aspects of wet chemical analysis by injecting an analyte in a flowing stream of a carrier reactant. As the analyte flows with the reactant stream, it diffuses into the reactant and product forms. Ultimately, the product zone, under the influence of the moving reactant, is passed into a detector section. The detection devices can consist of the same wide variety as is used in HPLC. The major advantage of flow injection analysis is the automation and decreased uncertainty associated with sampling and reagent addition. Strict control of reagent concentration, flow rate, and analyte volume is possible. Modern applications of FIA include the sequential addition of analyte and reactant in a stream so that the two are "stacked" in an inert carrier. They then mix by the parabolic flow profile of a laminar flowing stream in a tube. This arrangement can be miniaturized within a sampling valve, forming the so-called lab-in-a-valve approach.

ANALYTICAL STANDARDIZATION AND CALIBRATION

Thomas J. Bruno

Overview

Most modern instrumental techniques used in analytical chemistry produce an output or signal that is not absolute; the signal or peak is not a direct quantitative measure of concentration or target analyte quantity. Thus, to perform quantitative analysis, one must convert the raw output from an instrument (information) into a quantity (knowledge). This is done by standardizing or calibrating the raw response from an instrument (Refs. 1-4). Here, we briefly summarize the most common methods applied in analytical chemistry, recognizing that this is a very large field. We note that the common use of the term "standardization" is not to be confused with the application of standard methods as specified by regulatory or consensus standard organizations.

Samples

In all of the discussion to follow, we assume that the sample has been properly drawn from the parent population material, and properly prepared. Clearly, the most precise analytical methods and the most painstaking calibration methods are useless if applied to a sample that does not represent reality. Nevertheless, the term "sampling," which describes the process of obtaining the sample (from the population material), implies the existence of a sampling uncertainty (arising mainly from population material heterogeneity) (Refs. 5 and 6). Thus, the analytical result is an estimate of what would be obtained from the parent population material. The theory, concepts, and nomenclature regarding samples and sampling constitute a complex, statistically based, subspecialty of analytical chemistry well beyond the scope presented here. We begin with some simplified definitions (Ref. 7):

Amount of Substance: The amount of substance is the fundamental quantity of material measured in the number of moles.

Analyte: The analyte is the target component or compound in the sample for which one desires a measurement.

Aliquot: An aliquot is a known fraction of a homogeneous mass or volume.

Bias: As applied to sampling, bias refers to a systematic displacement, error, uncertainty. or mistake caused by a flaw in the sampling procedure.

Convenience sample: A sample chosen on the basis of accessibility, expediency, cost, efficiency, or other reason not directly concerned with sampling parameters.

Determination: The determination is the entire analytical procedure or method performed on a test portion.

Matrix: The matrix is the background or carrier material of the sample that includes all components except the analyte(s) of interest.

Phase: The phase describes the physical state of a substance: primarily solid, liquid, gas, but this term might include more detailed descriptions to include supercritical fluid, plasma, etc. Note that the term "vapor" typically refers to a gas phase above and in equilibrium with a condensed phase (often called the headspace in chemical analysis).

Population Material: The population material is the entirety of the bulk material from which the sample is drawn. This might be a plot of earth, a warehouse full of sugar, or a tank of jet fuel.

Quantity: The quantity refers to the mass or volume of a substance.

Random Sample: A sample selected so that any portion of the sample has an equal or known chance of being chosen for measurement.

Representative Sample: A sample resulting from a sampling process that can be expected to adequately reflect the properties of interest of the parent population. A representative sample may be a random sample. The degree of representativeness of the sample is limited by cost or convenience.

Selective sample: A sample that is deliberately chosen by using a sampling plan that eliminates materials with certain characteristics or selects only a material with other relevant characteristics desired for an analysis.

Test Portion: The test portion is the actual material removed from a sample for analysis.

Umpire sample: A sample taken, prepared, and stored in an agreed upon manner for the purpose of settling a dispute, arrived at by agreement that will include the test method and procedure, serving as the basis for acceptance, rejection, or economic adjustment. This is sometimes called a referee sample.

Test Portion: The test portion is the actual material removed from a sample for analysis.

Unknown: The unknown is a term that describes the target measurement or unknown quantity that is desired for the analyte, or the analyte itself.

Sampling uncertainty is that part of the total uncertainty in an analytical procedure or determination that results from using only a fraction of the population material. In this respect, sampling by any method is an extrapolation process. Since the sampling uncertainty is usually ignored for an individual analysis on an individual test portion, the sampling uncertainty is considered as being due entirely to the variability of the test portion. It is therefore assessed, when necessary, by replication of the sampling from the parent population material, and statistically isolating the uncertainty thus introduced by analysis of the variance. Typically, the problems associated with liquid population material are less complex but must not be ignored. Sample stratification, concentration and thermal gradients, poor mixing, and gradients associated with flow are all real effects that must be considered. Sampling uncertainty is often minimized by field and laboratory processing, with procedures that can include mixing, reduction, coning and quartering, riffling, milling, and grinding.

Another aspect that must be considered subsequent to sampling is sample preservation and handling. The integrity of the sample must be preserved during the inevitable delay between sampling and analysis. Sample preservation may include the addition of preservatives or buffer solutions, pH adjustment, use of an inert gas "blanket," and cold storage or freezing.

Calibration and Standardization

External Standard Methods

The external standard method can be applied to nearly all instrumental techniques, within the general limits discussed here, and the specific limitations that may be applicable with individual techniques. This method is conceptually simple; the user constructs a calibration curve of instrumental response with prepared mixtures containing the analyte(s) over a range of concentrations, an example of which is shown in Fig. 1a. Thus, the curve represents the raw instrumental response of the analyte as a function of analyte concentration or amount. Each point on this plot must be measured several times so that the repeatability can be assessed. Only random uncertainty should be observed in the replicates; trends of increasing or decreasing response (hysteresis) must be remedied by identifying the source and adjusting the method accordingly. The calibration solutions should be randomized (that is, measured in random order). Although called a calibration "curve," ideally the signal versus concentration plot is linear, or substantially linear (that is, areas of nonlinearity are unimportant, otherwise they are localized, minor, and properly treated by the measurement technique). In some cases, the response may be linearizable (for example, by calculating the logarithm of the raw response). If a curve shows nonlinearity in an area that is important for the analysis, one must measure more concentrations (data points) in the region of curvature.

In practice, the line that results from the calibration is fit with an appropriate model, and the desired value for the unknown concentration is calculated. The curve can be used graphically if approximation suffices. Mixtures prepared for external standard calibration can contain one or many analytes. Once a calibration curve is prepared, it can often be used for some time period, provided such a procedure has been previously validated (that is, the stability of the standards and the instrument over the time of use has been assessed). Otherwise, it is best to measure the unknown and the standards within a short period of time. Moreover, if any major change is made to the instrumentation (changing a detector or detector parameters, changing a chromatographic column, etc.), the standards must be re-measured.

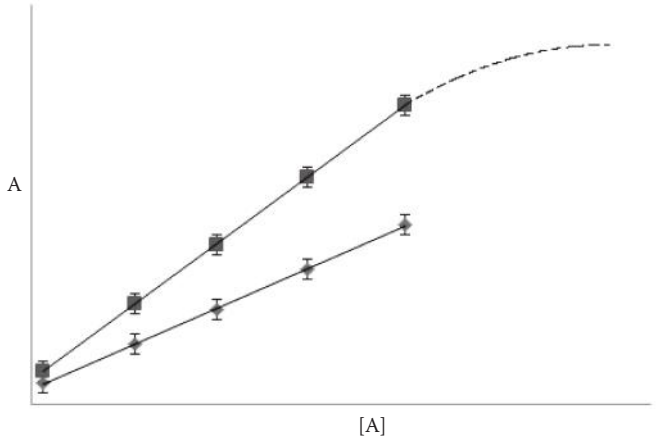

Fig. 1a: An example calibration curve prepared by use of the external standard method. The instrument response is represented by *A*, and the concentration resulting in that response is [A]. While curves for two analytes are shown, in principle, one can plot as many analytes as desired. While five points per analyte have been shown, one can measure as many as required. Note that a region of nonlinearity is shown in the latter part of the curve for one of the components. One would require a larger number of points to adequately represent and fit any nonlinear areas.

To successfully use the method, the standard mixtures must be in a concentration range that is comparable to that of the unknown analyte, and ideally should bracket the unknown. Multiple measurements of each standard mixture should be made to establish repeatability of points on the curve. Many instrumental methods have operation ranges (frequency, temperature, etc.) in which the uncertainty is minimized, so components and concentrations for standard mixtures must respect this. The standard mixtures should be in the same matrix as the unknown, and the matrix must not interfere with the unknown or other standard mixture components. Any pretreatment of the unknown must also be reflected in the standard mixtures. As with any calibration method, components in the standard mixtures must be available at a high (or at least known) purity, they must be stable during preparation, and must be soluble in the required matrix. Unless the physical phenomenon of a measurement is well understood, extrapolation beyond the curve is not recommended (and indeed is usually strongly discouraged); nevertheless, extrapolation is occasionally done in practice. In those cases, one must be cautious, report exactly how the extrapolation was done, and assess any increase in uncertainty that may result. Note that the curve might not extrapolate through the origin. This is usually the result of adsorption (of components on container walls), carryover hysteresis, absorption (of components in seals or septa), or component degradation or evaporation.

A major consideration with external standardization is that typically, the sample size (for example, the injection volume in chromatography) must be maintained constant for standard mixtures and the unknowns. If the sample size varies slightly, it is often possible to apply a correction to the raw signal. One should not attempt to generate a calibration curve by varying the sample size (that is, for example, injecting increasing volumes into a gas chromatograph). This caution does not preclude serial dilution methods (see below), in which multiple solutions are generated for separate measurement. Other issues that can hinder successful application of the external standards method include instrumental aspects that might not be readily apparent. In chromatographic methods, for example, one can overload the column or detector. In older instruments, settings of signal attenuation were typically made manually, while in newer instruments, this may occur through software, sometimes without operator interaction or knowledge.

Note, *inter alia,* that in Fig. 1a (and indeed all the examples presented here), the uncertainty is only indicated for the variable on the *y*-axis. In reality, we must recognize that there is uncertainty for the values plotted on the *x*-axis as well, but we often only treat the largest uncertainty, or the uncertainty that is most important for our application. Note, also, that it is critical to maintain the integrity of standards; decomposition, degradation, moisture uptake, etc., will adversely affect the validity of the calibration.

Abbreviated External Standard Methods

In many situations in chemical analysis, a full calibration curve is not prepared because of the complexity, time, or cost. In such situations, abbreviated external standard methods are often used. Under no circumstances can an abbreviated method be used if the raw signal response is nonlinear. Moreover, these methods are not generally appropriate for analyses in regulatory, forensic, or health care environments where the consequences can be far-reaching.

Single Standard

This method uses a simple proportion approach to standardize an instrument response. It can be used only when the system

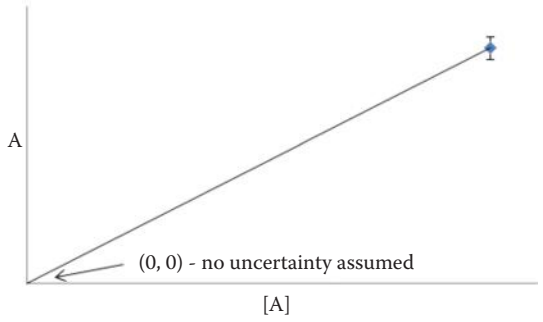

Fig. 1b: An example of a single-point calibration curve. The instrument response is represented by *A*, and the concentration resulting in that response is [A]. The origin (0,0) is assigned as part of the curve, and is assumed to have no uncertainty.

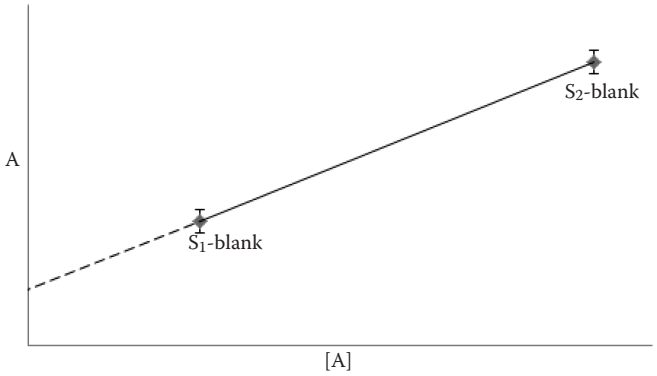

Fig. 1c: An example of two standards plus a blank calibration curve. The blank is subtracted from each of the standards. The instrument response is represented by *A*, and the concentration resulting in that response is [A].

has no constant, determinate error or bias*, and when the reagents used give a zero blank response (that is, the instrument response from the matrix and measurement system only, without the analyte). A standard should be prepared such that the concentration is close to that of the unknown. One then calculates the concentration of the unknown, [X], as:

$$[X] = (A_x/A_s)\,[S] \quad (1)$$

where A_x is the instrument response of the unknown, A_s is the instrument response of the standard, and [S] is the concentration of the standard.

Single Standard Plus Assumed Zero

This method, illustrated schematically in Fig. 1b, assumes that the blank reading will be zero. One uses a two-point calibration in which the origin is included as the first point. It is important to ensure, by experiment or experience, that such a method is adequate to the task.

Single Standard Plus Blank

If the analytical method has no determinate error or bias, but does produce a finite blank value, then one must also perform a blank measurement, which is subtracted from the instrument response of the standard and the unknown. Then the same procedure (Eq. 1) is used as for the single standard. If multiple samples are to be measured, it is important to measure the blank between each measurement.

Two Standards Plus Blank

When the analytical method has both a determinate error (or bias), and a finite blank value, at least three calibrations must be made: two standards and one blank. The standard concentrations are typically prepared widely spaced in concentration, and the higher concentration should be chosen to represent the limit of linearity of the instrument or method. If this is not practical, the higher concentration should simply be the highest expected concentration of the analyte (unknown). This method is illustrated schematically in Fig. 1c. If multiple samples are to be measured, it is important to measure the blank between each measurement.

Internal Normalization Method

As mentioned above, the raw signal from an analytical instrument is typically not an absolute measure of concentration of the analyte(s), because the instrument may respond differently to each component. In some cases, such as with chromatographic methods, it is possible to apply response factors, determined from a standard mixture containing all constituents of the unknown sample, for standardization (Ref. 8). The standard mixture is gravimetrically prepared (with known mass percents for each component), and the instrument response is measured, for example as chromatographic areas. The total mass percent and the total area percent each sum to 100. One calculates the ratio of each mass percent to each area, choosing one component as the reference, which is assigned a response factor of unity. To obtain the response factors of all the other components, one divides its (mass%-to-area ratio) with that of the reference. This is done for all components, producing a response factor for all components, except of course for the reference, defined as unity. When the unknown sample is measured, the response factor is multiplied by each raw area, and the resulting area percent provides the normalized mass percent of each component in the unknown.

This method corrects for minor variations in sample size (earlier defined as the test portion), although large differences in sample size must be avoided so that one is assured of consistent instrument performance. Although the method corrects for the different responses of samples, large differences must be avoided. This also means that the detector must respond linearly to the concentrations of each component, even if the concentrations are very different. This may require dilution or concentration of the sample in some situations. In chromatographic applications, all components of a mixture must be analyzed and standardized, since normalization must be performed on the entire sample.

Some techniques, such as gas chromatography with flame ionization detection and thermal conductivity detection, have well defined physical phenomena associated with output signals. With these techniques, there are some limited, published response factor data that can be used in an approximate way to standardize the response from these devices.

In Situ Standardization

While it is rare that an analytical method can be calibrated by use of a single solution, some instances of spectrophotometry and electroanalytical methods can qualify. To use this method one sequentially and incrementally adds known masses of standard analytes to a solution, with an instrument response being measured after each addition. This procedure can only be used if the analytical method itself does not change the analyte concentration

* Determinate error and bias are related terms that describe uncertainty that arises from a fixed cause, and that can, in principle, be eliminated if recognized. Determinate error (or systematic error) is most often associated with a measurement, while bias can be associated with either a measurement or with the sampling procedure.

(nondestructive) and does not lead to a loss of solution volume. A solid crystalline analyte is an example. One must also minimize changes in solution volume over the course of the standardization.

Standard Addition Methods

Samples presented for analysis often are contained in complex matrices with many impurities that may interact with the analyte, potentially enhancing or diminishing a signal from an instrumental technique. In such cases, the preparation of an external standard calibration curve will be impossible, because it might be very difficult to reproduce the matrix. In these cases, the standard addition method may be used. A standard solution containing the target analyte is prepared and added to the sample, thus accounting for the unknown impurities and their effects. While the quantity of target analyte in the target sample is unknown, the added quantity is known, and its incremental additive effect on the instrument signal can be measured. Then, the quantity of the unknown analyte is determined by what is effectively an extrapolation. In practice, the volume of the standard solution added is kept small to avoid dilution of the unknown impurities by no more than 1% of the total signal. This method can only be used if there is a verified linear relationship between the signal and quantity of analyte. If a determinate error is present, then the slope of the line must be known. Moreover, the sample cannot contain any components that can respond as the analyte (that is, masquerade).

Single Standard Addition

In the simplest case, one addition of analyte is made after first measuring the response of the analyte in the unknown sample. Thus, two measurements are required:

$$A_{xo} = m[X_0] \quad (2)$$

$$A_{xi} = m([X_o] + [S]), \quad (3)$$

where A_{xo} is the instrument response of the analyte in the unknown sample, $[X_0]$ is the concentration in the unknown sample, and A_{xi} is the instrument response upon the addition of the standard, [S] (additive in equation because X and S are the same compound). The assumed slope is the proportionality constant, m. The two equations are solved simultaneously for $[X_0]$. This technique is very rapid and economical, but there are serious drawbacks. There is no built in check for mistakes on the part of the analyst, there is no means to average random uncertainties, and there is no way to detect interference (mentioned above as masquerade).

Multiple Standard Addition

This standard addition method alleviates some of the problems inherent in single standard addition. Here, the unknown sample is first measured in the instrument. Then that sample is "spiked" with incrementally increasing concentrations of the analyte, generating a curve such as that shown in Fig. 1d. The curve should extrapolate to zero signal at zero concentration. The concentration of the analyte in the unknown is read or calculated from the abscissa (x-axis).

Internal Standard Methods

An internal standard is a compound added to a sample at a known concentration, the purpose of which is to exhibit a similar signal when measured in an instrument, but be distinguishable from the signal of the desired analyte. It provides the highest level of reliability in quantitation by chromatographic methods, and is not affected by large differences in sample size (Ref. 8). Unlike

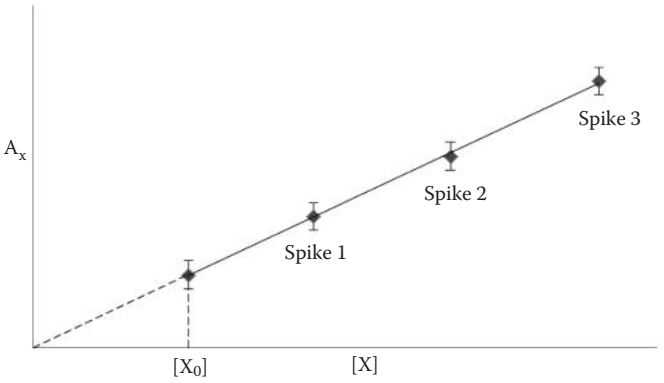

Fig. 1d: An example of calibration by multiple standard addition. Three additions (spikes) of the analyte X are shown, as is the extrapolation to the unknown concentration, X_0.

the internal normalization method, it is not necessary to elute or measure all the components of the sample, one need focus only on the component(s) of interest. In atomic spectrometry, this method is not affected by changes in gas flow rates, sample aspiration rates, and flame suppression or enhancement. Another situation in which this method is valuable is when the sample matrix is either unknown or very complex, precluding the preparation of external standards.

Multiple Internal Standards

A set of calibration solutions is prepared by mass, containing the target analyte, X, and a standard that is not present in the unknown sample, A. The instrument response (for example, a chromatographic area) is measured for each calibration solution, and a plot is made to establish linearity as in Fig. 1a. The ordinate axis is the ratio of the response of the unknown analyte component, A_x, to the response of the chosen standard, A_s. The abscissa is the ratio of mass of X to the mass of S for that standard mixture. Once the linearity is confirmed in the concentration range of interest, the unknown is spiked with a known mass of S, the instrument response is measured, and the area ratio A_x/A_s is calculated. Either the graph or a fit of the data on Fig. 1e is then used to determine the corresponding mass fraction, from which the mass of X may be determined. Note that the calculations could be simplified if the same mass per volume of the

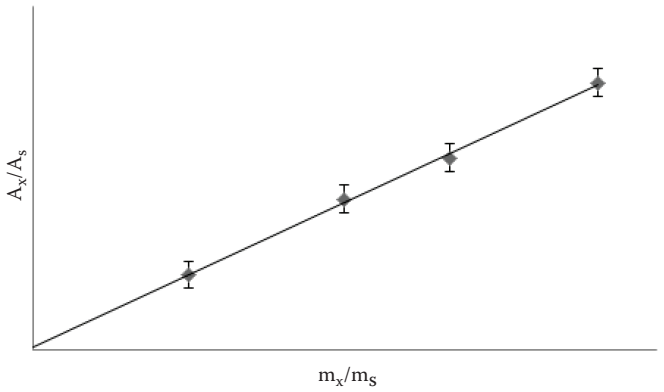

Fig. 1e: An example of the multiple internal standard method. The ordinate (y) axis is the ratio of the response of the unknown analyte component, A_x, to the response of the chosen standard, A_s. The abscissa (x) axis is the ratio of mass of X to the mass of S for that standard mixture.

internal standard is added to both the unknown samples and the calibration standards.

Single Internal Standard

In practice, once the linearity is established for a given mixture, it is no longer necessary to use multiple standards, although this is the most precise method. Subsequent to the verification of linearity, one standard solution can be used to fix the slope, provided it is close in concentration to that of the target analyte. In this case, the mass of the unknown can be found from:

$$X/S = (A_x/A_s)(1/R), \tag{4}$$

where X is the mass of the unknown analyte in the sample, S is the mass of the added internal standard in the sample, A_x and A_s are the instrument responses (areas) of the unknown and internal standard, respectively. R is a ratio determined from the standard solution prepared with both X and S: (mass, unknown analyte/mass, internal standard)/(signal, unknown analyte/signal, internal standard) = R.

$$\left(\frac{\left(\frac{\text{mass, unknown analyte}}{\text{mass, internal standard}} \right)}{\left(\frac{\text{signal, unknown analyte}}{\text{signal, internal standard}} \right)} \right) = R \tag{5}$$

Since R is the slope of the calibration curve discussed above, once linearity is established, one solution suffices. There are many conditions that must be fulfilled in order to use the internal standard method, and it is rare that all of them can actually be met. Indeed, in practice, one tries to meet as many as possible, but those that are mandatory are italicized. The compound chosen *must not be present* already in the unknown. The compound chosen *must be separable from the analyte* present in the unknown. An exception occurs when an isotopically labeled standard is used, in conjunction with mass discrimination or radioactive counting detection. In a chromatographic measurement, this is typically at least baseline resolution, although this would be a minimally acceptable degree of separation. On the other hand, the unknown analyte peak and the internal standard peak should be close to each other (temporally) on the chromatogram. The compound chosen *must be miscible* with the solvent at the temperature of reagent preparation and measurement. The compound chosen must not react chemically with the sample or solvent, or interfere in any way with the analysis. It is critical to maintain the integrity of standards; decomposition, degradation, moisture uptake, etc., will adversely affect the validity of the calibration. In the case of a chromatographic measurement, the same applies to interactions with the stationary phase. The compound chosen must be chemically similar (for example, in functionality, thermophysical properties) to the analyte. If such a compound is not available (for example, in a chromatographic measurement), an appropriate hydrocarbon should be chosen as a surrogate. The standard solution should be prepared at a similar concentration as in the unknown matrix; ratio correction of large differences is no substitute for an appropriate concentration. In a chromatographic measurement, the compound chosen must elute as closely as possible to the analyte, and should not be the last peak to elute (the final peak often shows different geometry such as tailing). The compound chosen must be sufficiently nonvolatile to allow for storage as needed. When there is the potential for the unknown analyte to be lost by adsorption, absorption, or some other interaction with the matrix or container, a compound called a carrier is sometimes added in large excess. The carrier is similar, chemically and physically, to the unknown analyte, but easily separated from it. Its purpose is to saturate or season the matrix and prevent analyte loss.

Serial Dilution

Serial dilution is less a standardization method as it is a method of generating solutions to be used for standardizations. Nevertheless, its importance and utility, as well as the popularity of its application, warrants mention in this section. A serial dilution is the stepwise dilution of a substance, observant of a specified, constant progression, usually geometric (or logarithmic). One first prepares a known volume of stock solution of a known concentration, followed by withdrawing some small fraction of it to another container or vial. This subsequent container is then filled to the same volume as the stock solution with the same solvent or buffer. The process is then repeated for as many standard solutions as are desired. A ten-fold serial dilution could be 1 M, 0.1 M, 0.01 M, 0.001 M, etc. A ten-fold dilution for each step is called a logarithmic dilution or log-dilution, a 3.16 fold ($10^{0.5}$ fold) dilution is called a half-logarithmic dilution or half-log dilution, and a 1.78 fold ($10^{0.25}$ fold) dilution is called a quarter-logarithmic dilution or quarter-log dilution. In practice, the ten-fold dilution is the most common. The serial dilution procedure is not only used in chemical analysis but also in serological preparations in which cellular materials such as bacteria are diluted. A critical aspect of serial dilution is that the initial solution concentration must be prepared and determined with great care, since any mistake here will be propagated into all resulting solutions.

Traceability

Analytical measurements and certifications often contain a statement of traceability. Traceability describes the "result or measurement whereby it can be related to appropriate standards, generally international or national standards, through an unbroken chain of comparisons (Ref. 9)." Traceability typically includes the application of a reference material (RM) or a standard reference material (SRM) for instrument calibration before standardization for the analytes of interest. The **true value** of a measured quantity (τ) cannot typically be determined. The true value is defined as characterizing a quantity that is perfectly defined. It is an ideal value which could be arrived at only if all causes of measurement uncertainty were eliminated, and the entire population was sampled.

FIGURES OF MERIT

Thomas J. Bruno

In the interpretation of results from a particular technique, one often must evaluate the performance of the measurement on the basis of objective measures that are called figures of merit. The following table provides a description of the more common figures of merit used in analytical chemistry. Even more important than the evaluation of performance is the validation of metrology and the assessment of validation. The same terms used as figures of merit are critical in the validation process. Since many standardization bodies will issue their own definitions regarding these terms, it is not practical to be inclusive; the reader must be aware that other terms may sometimes be substituted for those used here.

Parameter or Metric	Definition	Comments
Accuracy	The deviation of a measured value from the true value (τ), which cannot typically be determined, but which is often approached by use of a standard method under standard conditions.	Can be expressed as: $\text{accuracy} = (x_{av} - \tau)/\tau$, where x_{av} is the mean of a series of measurements.
Precision	The reproducibility of a series of replicate measurements, typically under the same operating conditions in a relatively short period of time.	High precision does not imply high accuracy; reproducibility and repeatability often are used interchangeably, but the former typically refers to precision between two instruments or laboratories.
Sensitivity	Typically the ability to distinguish between small differences in concentration between samples at a desired confidence level.	Often specified by response to a *de facto* or consensus standard; a simple measure is the slope of a calibration curve adjusted for recovery in the sampling process.
Limit of Detection (LOD)	The lowest measureable concentration of an analyte by use of a particular metrology at a desired confidence level.	Typically defined as a response that is some multiplicative factor of the noise level; specified signal to noise ratios of 2 to 4 are typical; as with sensitivity, must adjust for recovery in sample preparation processes.
Linear dynamic range (LDR)	The linear range of a calibration curve obtainable with a particular metrology and analyte.	Within the LDR, the difference in response for two concentrations of a given compound is proportional to the difference in concentration of the two samples.
Selectivity (α)	The ability to distinguish the signal of an analyte from the signal of interferences, the matrix or degradants.	Typically expressed as a ratio, such as the ratio of capacity factors in chromatography; sometimes called specificity.
Analysis Speed	The time required for sample preparation and measurement.	Sometimes necessary to include data processing time.
Throughput	The number of samples that can be run in a given time.	Related to ease of automation, below.
Ease of Automation	The ability of a measurement to be performed without operator attention.	Related to throughput, above, since high throughput typically requires automation. and minimal operator attention.
Ruggedness	The response of an instrument or technique to adverse conditions.	Adverse conditions include extremes in temperature, humidity, dust; includes rough handling; closely related to reproducibility, since it carries similar information content; distinguished from robustness, which is the ability of an instrument to remain unaffected by a small but intentional change in operating parameter, and still perform within specification.
Portability	The ability to use an instrument in other than a fixed location or installation	Can include the ability to use a device in the field in addition to the laboratory.
Environmental Acceptability	The efficiency in terms of low waste generation, low power consumption	Also described as sustainability, and often focused on the minimization of use of hazardous substances.
Economics	The sum of costs required to operate the sample preparation, analysis, and data processing steps of a measurement.	Typically includes the costs of equipment, supplies, labor, utilities and insurance; labor cost must consider the skill level required of personnel.

MASS- AND VOLUME-BASED CONCENTRATION UNITS

Thomas J. Bruno and Paris D. N. Svoronos

A variety of concentration units are used in analytical chemistry, and the most common are provided in this table (Ref. 1). The reference below provides additional details.

Parts per Million

Parts per Million		Percent
1 ppm	=	0.0001 %
10 ppm	=	0.001 %
100 ppm	=	0.01 %
1 000 ppm	=	0.1 %
10 000 ppm	=	1.0 %
100 000 ppm	=	10.0 %
1 000 000 ppm	=	100.0 %

Parts per Billion

Parts per Billion		Percent
10	=	0.000 001 %
100	=	0.000 01 %
1 000	=	0.000 1 %
10 000	=	0.001 %
100 000	=	0.01 %
1 000 000	=	0.1 %

Parts per Trillion

Parts per Trillion		Percent
100	=	1×10^{-8} %
10 000	=	0.000 001 %
1 000 000	=	0.000 1 %
100 000 000	=	0.01 %

Because the mass of one liter of water is approximately one kg, mg/L units of dilute aqueous solution are nearly equal to ppm units. The precise equivalence is obtained by dividing by the density, ρ:

$$\text{ppm} = (\text{mg/L})/\rho$$

where the solution density, ρ, is in g cm^{-3}. Some sources will substitute specific gravity for density in the above equation. The specific gravity is the ratio of the solution density to that of the density of pure water at 4 °C. Since the density of pure water at 4 °C is very nearly 1 g cm^{-3}, the specific gravity is numerically equal (within an uncertainty of 25 ppm) to the solution density when the latter is expressed in units of g cm^{-3}.

Concentration Units Nomenclature

The following table provides guidance in the use of base-10 concentration units (presented in the three preceding tables), since there are differences in usage worldwide.

Number	Number of Zeros	Name (Scientific Community)	Name (United Kingdom, France, Germany)
1000.	3	thousand	thousand
1 000 000.	6	million	million
1 000 000 000.	9	billion	milliard, or thousand million
1 000 000 000 000.	12	trillion	billion
1 000 000 000 000 000.	15	quadrillion	thousand billion

Molar-Based Concentration Units

Molarity*, M:	(moles of solute)/(liters of solution)
Molality, *m*:	(moles of solute)/(kilograms of solvent)
Normality, N:	(equivalents* of solute)/(liters of solution)
Formality, F:	(moles of solute)/(kilograms of solution)

To convert from ppm to formality units:

F = ppm/(1000 *RMM*), where *RMM* is the relative molecular mass of the solute *i*

To convert from ppm to molality units:

$$m = [\text{ppm}/(1000\ RMM)]\ [1/(1 - tds/1\ 000\ 000)]$$

where *tds* is the total dissolved solids in ppm in the solution

To convert from ppm to molarity units:

$$\text{M} = [\text{ppm}/(1000\ RMM)]\ \rho$$

where ρ is the solution density

* This unit is temperature dependent.

DETECTION OF OUTLIERS IN MEASUREMENTS

Thomas J. Bruno and Paris D. N. Svoronos

The field of outlier detection and treatment is considerable, and a rigorous mathematical discussion is well beyond any treatment that is possible here. Moreover, the practice in the treatment of analytical results is usually simplified, since the number of observations is often not very large. The two most common methods used by analysts to detect outliers in measured data are versions of the Q-test (Refs. 1–3, 6) and Chauvenet's criterion (Refs. 4–6), both of which assume that the data are sampled from a population that is normally distributed.

Q-Test

To perform the Q-test, one calculates the Q value given by:

$$Q = Q_{gap}/R$$

where Q_{gap} is the difference between the suspected outlier and the measured value closest to it, and R is the range of all the measured values in the data set. One then compares the calculated Q value with the critical Q values in the following table:

Number of Observations	Q_{crit}, 90% Confidence Level	Q_{crit}, 95% Confidence Level	Q_{crit}, 99% Confidence Level
3	0.941	0.970	0.994
4	0.765	0.829	0.926
5	0.642	0.710	0.821
6	0.560	0.625	0.740
7	0.507	0.568	0.680
8	0.468	0.526	0.634
9	0.437	0.493	0.598
10	0.412	0.466	0.568

If the calculated value of Q is greater than the appropriate value of Qcrit, then the value is a suspected outlier.

Chauvenet's Criterion

To perform Chauvenet's test on a set of measurements, one first must calculate the mean and standard deviation of the data. Then one calculates:

$$\tau = (x_i - x_{ave})/\sigma$$

where x_i is the suspected outlier, x_{ave} is the mean of all the measurements, and σ is the standard deviation. One then compares the calculated value of τ with τ_{crit} in the following table:

Number of Observations, N	τ_{crit}
5	1.65
6	1.73
7	1.81
8	1.86
9	1.91
10	1.96
15	2.12
20	2.24
25	2.33
50	2.57
100	2.81
150	2.93
200	3.02
500	3.29
1000	3.48

If the calculated value of τ is greater than the value of τ_{crit}, then the value is a suspected outlier.

For numbers of observations between those given in the table, especially for a large number of observations, one may use the following plot to estimate the value of Chauvenet's τ_{crit}:

PROPERTIES OF CARRIER GASES FOR GAS CHROMATOGRAPHY

The following is a list of carrier gases sometimes used in gas chromatography, with properties relevant to the design of chromatographic systems. All data refer to normal atmospheric pressure (101.325 kPa). Additional properties related to the carrier gas, including split ratio, pressure drop in capillary columns, the Martin-James compressibility factor, and the Giddings plate height correction factor can be found in Ref. 2.

M_r: Molecular weight (relative molar mass)
ρ_{25}: Density at 25 °C in g L^{-1}
λ: Thermal conductivity in mW m^{-1} °C^{-1}
η: Viscosity in μPa s (equal to 10^{-3} cP)
c_p: Specific heat at 25 °C in J g^{-1} °C^{-1}

PROPERTIES OF COMMON CROSS-LINKED SILICONE STATIONARY PHASES

Thomas J. Bruno and Paris D. N. Svoronos

Modern gas chromatography is most often performed with high efficiency capillary (open tubular) columns coated with a cross-linked polymeric stationary phase. We provide chromatographic data on the two most common cross-linked phases (Ref. 1). These data are useful for the interpretation of chromatograms, and for quality control and assurance. The retention indices presented in these tables were measured at 120 °C isothermally. Retention indices are temperature dependent; the temperature dependence of the Kovats' indices have been studied for many compounds (Ref. 2). For more extensive information on other cross-linked phases, other silicone phases, mesogenic phases, and solid sorbents, the reader is advised to consult Ref. 1.

Phase: 5% Phenyl Dimethylpolysiloxane

Temperature Ranges:

–60 °C to 325 °C isothermally, –60 °C to 350 °C programmed for < 0.32 mm I.D. columns
–60 °C to 300 °C isothermally, –60 °C to 320 °C programmed for 0.53 mm I.D. columns
–60 °C to 260/280 °C for >2.0 µm films

Similar Phases:

DB-5, Ultra-2, SPB-5, CP-Sil 8 CB, Rtx-5, BP-5, OV-5, 007-2 (MPS-5), SE-52, SE-54, XTI-5, PTE-5, HP-5MS, ZB-5, AT-5, MDN-5

Notes: This phase is probably the most commonly used stationary phase in gas chromatography, because it combines boiling point separation with a minor contribution of a specific interaction; typically used as the first phase in any method development; versatile for hydrocarbons and more polar compounds.

Probe Compound	McReynolds Constant	McReynolds Code	Kovats Retention Index
Hexane			600
1-Butanol	66	y'	656
Benzene	31	x'	684
2-Pentanone	61	z'	688
Heptane			700
1,4-Dioxane	64	L	718
2-Methyl-2-pentanol	41	H	731
1-Nitropropane	93	u'	745
Pyridine	62	s'	761
Octane			800
Iodobutane	22	J	840
2-Octyne	35	K	876
Nonane			900
Decane			1000

Phase: Dimethylpolysiloxane

Temperature Range:

–60 °C to 325 °C for normal operations, periodic operation to 350 °C can be used to facilitate column clean-up
–60 °C to 260/280 °C for >2.0 µm films

Similar Phases:

DB-1, OV-1, HP-1, DB-1ms, HP-1ms, Rtx-1, Rtx-1ms, CP-Sil 5 CB Low Bleed/MS, MDN-1, AT-1

Notes: Useful for the separation of hydrocarbons, pesticides, PCBs, phenols, sulfur compounds, flavors and fragrances, and some amines; columns are typically stable and low bleed; a good all-purpose column used to begin method development protocols.

Detector	Limit of Detection	Linearity	Selectivity	Comments
Thermal conductivity detector (TCD, katharometer)	1×10^{-10} g propane (in helium carrier gas)	1×10^{6}	Universal response, concentration detector	Ultimate sensitivity depends on analyte thermal conductivity difference with carrier gas Since thermal conductivity is temperature dependent, response depends on cell temperature Wire selection depends on chemical nature of analyte Helium is recommended as carrier and make-up gas. When analyzing mixtures containing hydrogen, one can use a mixture of 8.5% (mass/mass) hydrogen in helium
Gas density balance detector (GADE)	1×10^{-9} g, H_2 with SF_6 as carrier gas	1×10^{6}	Universal response, concentration detector	Response and sensitivity are based on difference in relative molecular mass of analyte with that of the carrier gas; approximate calibration can be done on the basis of relative density The sensing elements (hot wires) never touch sample, thus making GADE suitable for the analysis of corrosive analytes such as acid gases; gold sheathed tungsten wires are most common Best used with SF_6 as a carrier gas, switched between nitrogen when analyses are required Detector can be sensitive to vibrations, and should be isolated on a cushioned base
Flame ionization detector (FID)	1×10^{-11} g to 1×10^{-10} g	1×10^{7}	Organic compounds with C-H bonds	Ultimate sensitivity depends on the number of C-H bonds on analyte Nitrogen is recommended as carrier gas and make-up gas to enhance sensitivity Sensitivity depends on carrier, make-up and jet gas flow-rates Column must be positioned 1 mm to 2 mm below the base of the flame tip Jet gases must be of high purity
Nitrogen-phosphorous detector (NPD, thermionic detector, alkali flame ionization detector)	4×10^{-13} g to 1×10^{-11} g of nitrogen compounds 1×10^{-13} g to 1×10^{-12} g of phosphorous compounds	1×10^{4}	10^{5} to 10^{6} by mass selectivity of N or P over carbon	Does not respond to inorganic nitrogen such as N_2 or NH_3 Jet gas flow rates are critical to optimization Response is temperature dependent Used for trace analysis only, and is very sensitive to contamination Avoid use of phosphate detergents or leak detectors Avoid tobacco use nearby Solvent-quenching is often a problem
Electron capture detector (ECD)	5×10^{-14} g to 1×10^{-12} g	1×10^{4}	Selective for compounds with high electron affinity, such as chlorinated organics; concentration detector	Sensitivity depends on number of halogen atoms on analyte Used with nitrogen or argon/methane (95/5, mass/mass) carrier and make-up gases Carrier and make-up gases must be pure and dry The radioactive ^{63}Ni source is subject to regulation and periodic inspection

Detector	Limit of Detection	Linearity	Selectivity	Comments
Flame photometric detector (FPD)	2×10^{-11}g of sulfur compounds, 9×10^{-13}g of phosphorous compounds	1×10^3 for sulfur compounds 1×10^4 for phosphorous compounds	10^5 to 1 by mass selectivity of S or P over carbon	Hydrocarbon quenching can result from high levels of CO_2 in the flame Self-quenching of S and P analytes can occur with large samples Gas flows are critical to optimization Response is temperature dependent Condensed water can be a source of window fogging and corrosion
Photoionization detector (PID)	1×10^{-12} g to 1×10^{-11}g	1×10^7	Depends on ionization potentials of analytes	Used with lamps with energies of 10.0 eV to 10.2 eV Detector will have response to ionizable compounds such as aromatics and unsaturated organics, some carboxylic acids, aldehydes, esters, ketones, silanes, iodo- and bromoalkanes, alkylamines and amides, and some thiocyanates
Sulfur chemilumenescence detector (SCD)	1×10^{-12}g of sulfur in sulfur compounds	1×10^4	10^7 by mass selectivity of S over carbon	Equimolar response to all sulfur compounds to within 10% Requires pure hydrogen and oxygen combustion gases Instrument generates ozone *in situ*, which must be catalytically destroyed at detector outlet Catalyst operates at 950 °C to 975 °C Detector operated at reduced pressure (10^{-3} Pa)
Electrolytic conductivity detector (ECD, Hall detector)	10×10^{-13} g to 1×10^{-12} g of chlorinated compounds, 2×10^{-12} g of sulfur compounds, 4×10^{-12} g of nitrogen compounds	1×10^6 for chlorinated compounds, 10^4 for sulfur and nitrogen compounds	10^6 by mass selectivity of Cl over carbon, 10^5 to 10^6 by mass selectivity of S and N over carbon	Only high purity solvents should be used Carbon particles in conductivity chamber can be problematic Frequent cleaning and maintenance is required Often used in conjunction with a photoionization detector For chlorine, use hydrogen as the reactant gas and n-propanol as the electrolyte For nitrogen or sulfur, hydrogen or oxygen can be used as reactant gas, and water or methanol as the electrolyte Ultrahigh purity reactant gases are required
Ion mobility detector (IMD)	1×10^{-12} g	1×10^3 to 1×10^4	10^3	Amenable to use in handheld instruments Linear dynamic range of 10^3 for radioactive sources and 10^5 for photo-ionization sources Selectivity depends on mobility differences of ions Has been used for a wide variety of compounds including amino acids, halogenated organics, explosives The radioactive ^{63}Ni source is subject to regulation and periodic inspection
Mass selective detector (MSD, mass spectrometer, MS)	1×10^{-11} g (single ion monitoring) 1×10^{-8} g (scan mode)	1×10^5	Universal	Quadrupole, multiple quadrupole, ion trap, time of flight, and magnetic sector instruments available (see separate table entitled: "Varieties of Hyphenated Gas Chromatography with Mass Spectrometry") Must operate under moderate vacuum (1×10^{-4} Pa) Requires a molecular jet separator to operate with packed columns Amenable to library searching for qualitative identification Requires tuning of electronic optics over the entire m/e range of interest
Infrared detector (IRD)	1×10^{-9} g of a strong infrared absorber	1×10^3	Universal for compounds with mid-infrared active functionality	A costly and temperamental instrument that requires high purity carrier gas, a nitrogen purge of optical components (purified air will, in general, not be adequate) Must be isolated from vibrations Presence of carbon dioxide is a typical impurity band at 2200 cm^{-1} to 2300 cm^{-1} Requires frequent cleaning and optics maintenance Amenable to library searching for qualitative identification
Atomic emission detector (AED)	1×10^{-13} g to 2×10^{-11} g of each element	1×10^3 to 1×10^4	10^3 to 10^5, element to element	Requires the use of ultra high purity carrier and plasma gases Plasma produced in a microwave cavity operated at 2450 MHz Scavenger gases (H_2, O_2) are used as dopants Photodiode array is used to detect emitted radiation

VARIETIES OF HYPHENATED GAS CHROMATOGRAPHY WITH MASS SPECTROMETRY

Thomas J. Bruno

Because of the very powerful and common application of mass spectrometry with gas chromatography, the various technologies warrant more detailed consideration (Refs. 1 to 4). The following table provides basic information on the capabilities and applicability of the most common approaches. Clearly, the use of the single quadrupole is by far the most prevalent and economical method, but the other techniques are important and advantageous. We exclude methods that are typically not interfaced with gas chromatographic separations and that are highly specific in research settings (such as ion cyclotron mass spectrometry, and combined quadrupoles beyond the triple quad, and the various hybrid sector-quad-time of flight-ion trap combinations) that are used in fundamental ion chemistry research. We also exclude magnetic sector instruments that are seldom used with chromatography.

Method (with accepted acronyms and abbreviations)	Modes	Advantages	Limitations
Gas Chromatography Mass Spectrometry GC-MS (single quadrupole, SQ)	Scan, selected ion monitoring (SIM) and Scan/SIM	Relatively simple and relatively inexpensive; compound identification by library search; dynamic range = 10^5, but typically limited to >10^4; mass/charge range = 10^3 to 10^4, resolution (at m/z = 1000) 10^3 to 10^4 for most ions; well-developed hardware and software; used in standard protocols.	Co-elution of compounds compromise library identifications; often user must interpret fragmentation patterns; SIM mode provides higher sensitivity but for target ions only, sensitivity decreases with increasing number of SIM ions; Scan/SIM methods must balance scan and SIM sensitivity requirements.
Gas Chromatography-Mass Spectrometry GC-MS (ion trap, IT)	Scan or selected ion monitoring (SIM); tandem MS-MS; gas or liquid chemical ionization	High sensitivity, compact design; tandem mass spectrometry is possible; dynamic range = 10^4, but typically limited to < 10^4; mass/charge range = 10^4 to 10^5, resolution (at m/z = 1000) 10^4; well-developed hardware and software; used in standard protocols.	Space charge effects can lead to relatively poor dynamic range, however, for "clean" samples, the dynamic range can be as high as single quadrupole units; specific libraries are limited; SIM is for target ions only with a sensitivity lower than that obtainable by a SIM analysis via single quadrupole, above; MS-MS analyses are limited to approximately 120 to 150 compounds per analysis; MS-MS analysis is typically slower than that done with a tandem MS-MS (process is done in time rather than space).
Gas Chromatography (time of flight) Mass Spectrometry, low resolution GC-TOF	Scan or selected ion monitoring	Identification possible with good chromatographic separations, dynamic range = 10^4, mass/charge range = 10^5, resolution (at m/z = 1000) 10^3 to 10^4	Unit mass resolution limits identification capability; libraries are limited; if chromatographic separation is poor, comprehensive (GCXGC) might be needed; cannot distinguish neutral losses.
Comprehensive Gas Chromatography (time of flight) Mass Spectrometry, low resolution GCXGC-TOF	Scan or selected ion monitoring; normal column configuration (nonpolar – polar) or reversed column configuration (polar - nonpolar)	Identification possible with good chromatographic separations in two dimensions on a nonpolar (long) and a polar (short) column; identification of families with help of principal component analysis tools; dynamic range = 10^4, mass/charge range = 10^5, resolution (at m/z = 1000) 10^3 to 10^4, well-developed hardware and software; used in standard protocols.	Unit mass resolution limits identification capability; libraries are limited; GCXGC may not remedy all aspects of component coelution.

Method (with accepted acronyms and abbreviations)	Modes	Advantages	Limitations
Gas Chromatography Mass Spectrometry (triple quadrupole) GC-MS(QQQ, or QqQ)	Multiple and selected reaction monitoring	Provides product and precursor ion scans; very sensitive for target compounds or functional groups; developed to provide enhanced daughter ion resolution; relatively simple construction with straightforward scanning procedures; no high voltage arcing; dynamic range = 10^5, mass/charge range = 10^3 to 10^4, resolution (at m/z = 1000) 10^3 - 10^4.	Unit mass, making identification ambiguous due to multiple structures as source of breakdown mass; empirical formula determination can be difficult, spectra and fragmentations must often be interpreted manually; full scan data can be acquired (similar to the single quad procedure) by turning off the collision cell.
Gas Chromatography (time of flight) Mass Spectrometry, high resolution GC-TOF	Scan or selected ion monitoring, tandem MS-M	Might obviate the need for GCXGC separations with accurate mass determinations; deconvolution software can aid in identification of multiple components under peaks; sensitivity intermediate between multiple reaction monitoring and product ion scan of a QQQ; dynamic range = 10^4, mass/charge range = 10^5, resolution (at m/z = 1000) 10^3 to 10^4.	Very large data files (currently approaching 2 Gb), software is currently developmental.
Gas Chromatography Tandem Mass Spectrometry GC-QTOF	Scan or selected ion monitoring, tandem MS-MS	Might obviate the need for GCXGC separations with accurate mass determinations; isolation of parent ions and subsequent fragmentation provides identification; will detect any daughter ion passed into the TOF; sensitivity intermediate between multiple reaction monitoring and product ion scan of a QQQ dynamic range = 10^4, mass/charge range = 10^5, resolution (at m/z = 1000) 10^3 to 10^4.	Large data files are produced; Sophisticated software is needed for processing and deconvolution; requires accurate mass and high resolution.

SOLID-PHASE MICROEXTRACTION SORBENTS

Thomas J. Bruno and Paris D. N. Svoronos

While trapping sorbents have been used for many years in headspace analysis (most commonly with gas chromatography), the modern techniques of solid-phase microextraction (SPME) are particularly applicable to survey analyses (Ref. 1). In the following tables, we provide information for the selection and application of the various fibers, and data on salting out reagents (Refs. 1 to 5). For information on other trapping sorbents, chelating agents, resins, and polymeric phases used for headspace analysis, see Ref. 1.

Fiber Selection Criteria

The main fiber selection parameters are polarity and relative molecular mass. The table below provides general guidelines on the applicability of available fibers relative to these two parameters. The fibers are characterized by the extraction mechanism, either adsorption or absorption. Adsorbent fibers contain particles suspended in polydimethyl siloxane (PDMS) or polyethylene glycol (PEG, Carbowax).

Fiber	Type of Fiber	Polarity	*RMM* Range
7 µm PDMS	Absorbent	Nonpolar	150–700
30 µm PDMS	Absorbent	Nonpolar	80–600
85 µm Polyacrylate	Absorbent	Moderately polar	60–450
100 µm PDMS	Absorbent	Nonpolar	55–400
50 µm Carbowax (PEG)	Adsorbent	Polar	50–400
PDMS-DVB	Adsorbent	Bipolar	50–350
Carbowax-DVB	Adsorbent	Polar	50–350
PDMS-DVB-Carboxen	Adsorbent	Bipolar	40–270
PDMS-Carboxen	Adsorbent	Bipolar	35–180
Carbopak Z-PDMS	Adsorbent	Nonpolar	50–500

PDMS – Polydimethylsiloxane
DVB – Divinylbenzene (3 µm to 5 µm particles)
PEG – Polyethylene glycol
Carboxen – Carboxen 1006 (contains micro-, meso-, and macro-tapered pores) (3 µm to 5 µm particles)
***RMM* Range** – Relative molecular mass range that is the ideal range for optimum extraction. Ranges can be extended by varying extraction times, but results will not be optimized

Phase Material Characteristics

Polydimethylsiloxane (PDMS):
Similar in properties to the OV-1 or SE-30 silicone phases (Ref. 1); non-polar fluid suitable for non-polar or slightly polar analytes; thicker coatings extract more analyte, but require longer extraction times; thicker coatings may show carryover effects; useful for hydrocarbons, aldehydes, ketones, and esters.

Polyacrylate:
Rigid solid material; moderate polarity; diffusion of analytes through bulk is relatively slow because of rigidity of material; relatively higher desorption temperatures required because of rigidity of material; can be oxidized easily at higher temperatures; must use oxygen-free carrier gas and ensure gas chromatographic system is leak-free; fibers are very solvent resistant; darkens to a brown color upon exposure to temperatures in excess of 280 °C, but fiber is generally still usable until color becomes black; useful for alcohols.

Carbowax (polyethylene glycol, PEG):
Similar in properties to the PEG coatings used extensively in chromatography; moderately polar; highly crosslinked to counteract water solubility; sensitive to attack by oxygen at temperatures in excess of 220 °C, at which point the fiber will darken and become powdery; requires use of high purity carrier gas (typically He at 99.999 % mass/mass) treated for oxygen contamination.

Divinylbenzene (DVB):
Similar to the properties of divinylbenzene porous polymer phases; higher polarity than Carbowax, and when combined with Carbowax results in a more polar phase; like polyacrylate, it is a solid particle that must be carried in a liquid to coat on a fiber.

Carboxen:
Similar to the material used in Carboxen porous-layer open tubular (PLOT) columns; structure has an approximately even distribution of macro-, meso-, and micro-pores, making it valuable for smaller analytes; larger analytes can show hysteresis that must be addressed by desorption at 280 °C; useful for hydrocarbons, ethers, aldehydes, ketones.

Extraction Capability of Solid-Phase Microextraction Sorbents

This table shows the extraction capability of the fibers for acetone, a small, moderately polar analyte, for 4-nitrophenol, a medium size polar analyte, and benzo(GHI)perylene, a large nonpolar analyte. This provides a general guideline for fiber selection.

Fiber	Approx. Linear Conc. Range Acetone 10 min Ext[a] (FID)	Approx. Linear Conc. Range 4-Nitrophenol 20 min Ext[b] (GC/MS)	Approx. Linear Conc. Range Benzo(GHI) Perylene 20 min Ext
7 µm PDMS	100 ppm and up	Not extracted	100 ppt to 500 ppb
30 µm PDMS	10 ppm and up	10 ppm and up	100 ppt to 10 ppm
85 µm Polyacrylate	1 ppm to 1000 ppm	5 ppb to 100 ppm	500 ppt to 10 ppm
100 µm PDMS	500 ppb to 1000 ppm	500 ppb to 500 ppm	500 ppt to 10 ppm
50 µm Carbowax (PEG)	1 ppm to 1000 ppm	5 ppb to 50 ppm	25 ppb to 10 ppm
PDMS-DVB	50 ppb to 100 ppm	25 ppb to 10 ppm	10 ppb to 1 ppm
Carbowax-DVB	100 ppb to 100 ppm	5 ppb to 10 ppm	50 ppb to 5 ppm
PDMS-DVB-Carboxen	25 ppb to 10 ppm	50 ppb to 10 ppm	100 ppb to 1 ppm poorly desorbed
PDMS-Carboxen	5 ppb to 5 ppm	100 ppb to 10 ppm	Not desorbed
Carbopak Z-PDMS	10 ppm to 500 ppm	5 ppm to 100 ppm	500 ppt to 100 ppb

Note: In each case, the concentration is expressed on a mass basis (e.g., ppm mass/mass).

[a] Water sample contains 25% NaCl (mass/mass)

[b] Water sample contains 2% NaCl (mass/mass) acidified to pH = 2 with 0.05 M phosphoric acid

1 ppm = 1 part in 1×10^6

1 ppb = 1 part in 1×10^9

1 ppt = 1 part in 1×10^{12}

Typical Phase Volumes of SPME Fiber Coatings

Fiber Coating Thickness/Type	Type of Fiber Core	Fiber Core Diameter/mm	Phase Volume/mm^3 or µL
PDMS	Fused silica	0.110	0.612

Salting-Out Reagents for Headspace Analysis

The following table provides data on the common salts used for salting out in chromatographic headspace analysis, as applied to direct injection methods and to solid-phase microextraction. Data are provided for the most commonly available salts, although others are possible. Sodium citrate, for example, occurs as the dihydrate and the pentahydrate. The pentahydrate is not as stable as the dihydrate, however, and dries out on exposure to air, forming cakes. Potassium carbonate occurs as the dihydrate, trihydrate, and sesquihydrate; however, data are provided only for the anhydrous material. The solubility is provided as the number of grams that can dissolve in 100 mL of water at the indicated temperature. The vapor enhancement cited is the degree of increase of the concentration of vapor over the solution of a 2 % (mass/mass) ethanol solution in water at 60 °C.

Salt	Formula	Rel. Mol. Mass	Density/g cm^{-3}	Solubility/g mL^{-1} H_2O		Vapor Enhancement
				Cold Water	Hot Water	
Potassium carbonate	K_2CO_3	138.21	2.428 at 14 °C	112[a]	156[b]	8
Ammonium sulfate	$(NH_4)_2SO_4$	132.13	1.769 at 50 °C	70.6[c]	103.8[b]	5
Sodium citrate (dihydrate)	$Na_3C_6H_5O_7 \times 2H_2O$	294.10		72[d]	167[b]	5
Sodium chloride	NaCl	58.44	2.165[e]	37.5[a]	39.12[b]	3
Ammonium chloride	NH_4Cl	53.49	1.527	29.7[c]	75.8[b]	2

[a] 20 °C

[b] 100 °C

[c] 0 °C

[d] 25 °C

[e] Specific gravity, 25 °C/4 °C

GAS CHROMATOGRAPHIC RETENTION INDICES

Thomas J. Bruno

The interpretation of results from chromatographic measurements can often be augmented with an appropriate mathematical treatment of the solute retention that is observed. The goal of the treatment is to make the resulting metric as independent of the instrument as possible. A typical situation that arises from analysis by gas chromatography with mass spectrometry is that the library search routine produces "hits" that are ambiguous if not nonsensical (Ref. 1). The correct interpretation of the mass spectrum must then be done manually (Refs. 2, 3), and the mass spectral data should be augmented by additional analytical techniques. The specific techniques that should be used must be determined on a case-by-case basis by a qualified person. One additional datum that is typically already present in gas chromatography with mass spectrometry detection is chromatographic retention. The raw datum from a chromatographic measurement is a retention time, t_r, of each eluted peak, and a corresponding intensity. Here, we will not treat other aspects of the output, such as the width and shape of the chromatographic signal. The retention time (for a given stationary phase) is dependent on the column temperature, column pressure, column geometry (length and inside diameter; phase ratio), and ambient (atmospheric) pressure.

If the volumetric carrier gas flow rate (at the column exit) is measured and multiplied by the retention time, the retention volume, V_R, is obtained. The adjusted retention volume, V_R', is the retention volume corrected for the void volume (or mobile phase holdup) of the column. It is obtained by simply subtracting the retention volume of an unretained solute (V_M):

$$V_R' = V_R - V_M. \tag{1}$$

While it is possible to calculate the corresponding adjusted retention time, t_r', by subtracting the retention time of the unretained peak, t_m, it is better to work with volumes since average flow-rate variations between individual analyses are then accounted for. Note that with each level of refinement beyond the raw retention time, a facet of instrument dependence from the resulting parameter is removed. V_R is independent of the flow rate; V_R' is, further, independent of column geometry. Continuing with this approach, the net retention volume, V_N, is defined, by applying a factor, j, to account for the pressure drop across the column:

$$V_N = jV_R', \tag{2}$$

where j is usually the Martin-James compressibility factor[3]:

$$j = \frac{3}{2}\left[\frac{\left(\frac{P_i}{P_o}\right)^2 - 1}{\left(\frac{P_i}{P_o}\right)^3 - 1}\right] \tag{3}$$

In Eq. 3, P_i is the inlet pressure (absolute) and P_o is the outlet pressure (usually atmospheric pressure). The net retention volume is important because it is independent of the inlet and outlet pressures, as well as being independent of the carrier gas flow rate and column geometry.

The specific retention volume, V_g, corrects the net retention volume for the amount of stationary phase actually on the column, and the column temperature is adjusted or corrected to 0 °C:

$$V_g = (273.15)\frac{V_N}{(W_s T_{col})}, \tag{4}$$

where T_{col} is the column temperature (in K), and W_s is the mass of the stationary phase in the column. The V_g value is a characteristic for a particular solute on a particular stationary phase, and is instrument independent. This is a quantity that may be compared from instrument to instrument, and laboratory to laboratory with a high level of confidence provided the stationary phase used is a single, pure compound or a well characterized mixture. If the mass of the stationary phase is not known, or is not meaningful, one may use the net retention volume directly, or one may correct the net retention volume to a column temperature of 0 °C (represented by V_N^0) by simply not including the term for W_s (that is, setting it equal to unity).

It is also extremely valuable to calculate a relative retention, $r_{a/b}$:

$$r_{a/b} = \left(\frac{V_g^b}{V_g^a}\right) = \left(\frac{V_N^b}{V_N^a}\right) \tag{5}$$

where the numerical superscripts refer to the retention volumes of solutes "a" and "b." In this case, solute "a" is a reference compound. The relative retention is dependent only on the column temperature and the type of stationary phase. For reasons of operational simplicity, this parameter is usually one of the best to use for qualitative analysis. It can account for small differences in the column temperature, stationary phase considerations, column history, and minor disturbances in the carrier gas flow rate. It is possible to account for the column temperature by plotting the logarithm of the retention parameters against $1/T$, where T is the thermodynamic temperature. The column pressure is accounted for by variations in the volume measurement; therefore, there is no pressure dependence to these parameters.

We can go beyond the simple retention parameters discussed earlier to incorporate a logarithmic interpolation on a uniform scale by use of the Kovats' retention index (Ref. 4). The isothermal Kovats' retention index is calculated by use of the following defining equation:

$$I_{sample}(T) = 100\left[\frac{\log X_S - \log X_L}{\log X_H - \log X_L} + n_L\right] \tag{6}$$

Here, I_{sample} is the dimensionless Kovats' retention index that is a function of both temperature and the stationary phase employed. The terms represented by X are retention parameters of the sample and standards. Following this convention, X_S is the retention parameter of the sample under consideration. Any retention parameter, such as the adjusted retention time, t', the net retention volume, V_N, the adjusted net retention volume, V_N^0, and the relative retentions, $r_{a/b}$, can be used. X_S is the retention parameter of the sample under consideration, X_L is the retention parameter of a normal alkane (that is, straight chain or unbranched) of carbon number n_L that elutes earlier than the sample, and X_H is the retention parameter of a normal alkane having a carbon number greater than n_L+1 that elutes after the sample. The retention index of a sample is, therefore, 100 multiplied by the carbon number of a hy-

pothetical normal alkane that shows the same retention parameter on the stationary phase at that temperature. Thus, a sample that has a retention index of 785, for example, would co-elute with a hypothetical normal alkane that has 7.85 carbon atoms. By definition, the retention indices of the normal alkanes (on any stationary phase) are equal to 100 multiplied by the carbon number. Thus, for *n*-hexane, $I = 600$, and so on for the other *n*-alkanes in this homologous series. The zero point in the scale is defined for hydrogen, for which $I = 0$. Kovats' retention indices have been determined for selected compounds on the most common stationary phases [Refs. 5-7].

The temperature dependence of I for a given sample is known to follow a hyperbolic form similar to the familiar Antoine equation used to represent vapor pressure:

$$I_{\text{sample}}(T) = A + \frac{B}{(T + C)} \tag{7}$$

In this equation, A, B, and C are empirically determined constants, and T is the temperature (in °C). A nonlinear fitting routine should be used to determine these constants. When retention indices are available for at least three temperatures, initial values for A, B, and C can be determined by use of the following equations:

$$C = \frac{(T_2 - T_1)(I_3 T_3 - I_1 T_1) + (T_3 - T_1)(I_1 T_1 - I_2 T_2)}{(T_3 - T_1)(I_2 - I_1) - (T_2 - T_1)(I_3 - I_1)}, \tag{8}$$

$$A = \frac{I_2 T_2 - I_1 T_1 + C(I_2 - I_1)}{T_2 - T_1}, \tag{9}$$

$$B = (I_2 - A)(T_2 + C). \tag{10}$$

In these equations, I_1, I_2, and I_3 are retention indices of the sample measured at temperatures T_1, T_2, and T_3. When additional retention indices are available at other temperatures, we advocate the use of minimum deviation estimates from these three equations to furnish the starting values for the nonlinear fit. When retention indices at four temperatures are available, the best starting values are obtained from the I_1, I_2, and I_3 triplet that minimizes the deviation with the experimental value with that produced by Eq. 7. This approach provides the fastest convergence, and also helps avoid converging to local minima. Predictions made by use of Eq. 7 can be used for retention indices within the measured temperature range as well as extrapolation somewhat beyond that range on a case-by-case basis.

It is also of value to report and use the temperature dependence as a slope coefficient, $\delta I_{\text{sample}}/10$ °C, the variation of I_{sample} for a particular stationary phase over a particular temperature range. While not as reliable as the Antoine-type fit, this coefficient is useful for predictions within the range of the measured results.

In all of the above discussion, one must understand that the column temperature is fixed. The Kovats' retention indices can be made applicable to temperature programmed analysis by use of

$$I = 100 \times \left[n + (N - n) \frac{t_{\text{r(unknown)}} - t_{\text{r(n)}}}{t_{\text{r(N)}} - t_{\text{r(n)}}} \right], \tag{11}$$

where I is the retention index, n is the number of carbon atoms in the smaller *n*-alkane, N is the the number of carbon atoms in the larger *n*-alkane, and t_r is the retention time of the indicated peak.

A useful alternative to the Kovats' system is the Lee retention index (isothermal and temperature dependent), based on the polynuclear aromatic hydrocarbon (PAH) standard compounds: naphthalene ($I = 200$), phenanthrene ($I = 300$), chrysene ($I = 400$), and picene or benzo(g,h,i)perylene ($I = 500$). Isothermal (and temperature-dependent) Kovats' and Lee retention indices for many compounds are tabulated in the NIST Chemistry Web Book (Ref. 8).

ELUOTROPIC VALUES OF SOLVENTS ON OCTADECYLSILANE AND OCTYLSILANE

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides, for comparative and interpretive purposes, eluotropic values on bonded octadecylsilane (ODS) and octylsilane (OS) for common solvents used in HPLC (Refs. 1–3). For additional information on common, specific and chiral stationary phases for HPLC, and for solvents, derivatizing reagents, and detectors, see Ref. 3.

2-Propanol	8.3	8.4
Tetrahydrofuran	3.7	—

DETECTORS FOR LIQUID CHROMATOGRAPHY

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides some comparative data for interpretation of results from the more common detectors applied to high-performance liquid chromatography (Refs. 1-6). In general, the operational parameters provided are for optimized systems, and represent the maximum obtainable in terms of sensitivity and linearity. In this table, the molar extinction coefficient is represented by ε.

Detector	Sensitivity	Linearity	Selectivity	Comments
Ultraviolet spectrophotometer	1×10^{-9} g (for compounds of e = 10 000 to 20 000)	1×10^{4}	For UV-active functionalities, on the basis of absorptivity.	Relatively insensitive to flow and temperature fluctuations; non-destructive, useful with gradient elution; use mercury lamp for 254 nm, and quartz-iodine lamp for 350 nm to 700 nm; often a diode-array instrument is used to obtain entire UV-vis spectrum.
Refractive index detector (RID)	1×10^{-7} g	1×10^{4}	Universal, dependent on refractive-index difference with mobile phase	Relatively insensitive to flow fluctuations, but sensitive to temperature fluctuations; non-destructive, cannot be used with gradient elution; solvents must be degassed to avoid bubble formations; laser-based RI detectors offer higher sensitivity.
Fluorometric detector	1×10^{-11} g	1×10^{5}	For fluorescent species with conjugated bonding and/or aromaticity	Relatively insensitive to temperature and flow fluctuations; non-destructive; can be used with gradient elution; often, chemical derivatization is done on analytes to form fluorescent species; uses deuterium lamp for 190 nm to 400 nm, or tungsten lamp for 350 nm to 600 nm.
Electrochemical detectors				
Amperometric	1×10^{-9} g	1×10^{4}	Responds to –OH functionalities	Used for aliphatic and aromatic –OH compounds, amines, and indoles; pulsed potential units are most sensitive, can be used with gradient elution and organic mobile phases; senses compounds in oxidatitive or reductive modes; mobile phases must be highly pure and purged of O_2.
Conductivity detector	1×10^{-9} g	2×10^{4}	Specific to ionizable compounds	Uses post-column derivatization to produce ionic species; especially useful for certain halogen, sulfur, and nitrogen compounds
Mass spectrometers	Interface dependent	Interface dependent	Universal, within limits imposed by interface	Complex, expensive devices highly dependent on an efficient interface; electrospray and thermospray interfaces are most common; linear response is difficult to achieve.

SOLVENTS FOR ULTRAVIOLET SPECTROPHOTOMETRY

This table lists some solvents commonly used for sample preparation for ultraviolet spectrophotometry. The properties given are:

- λ_c: cutoff wavelength, below which the solvent absorption becomes excessive.
- ε: dielectric constant (relative permittivity); the temperature in °C is given as a superscript.
- t_b: normal boiling point.

CORRELATION TABLE FOR ULTRAVIOLET ACTIVE FUNCTIONALITIES

Thomas J. Bruno and Paris D. N. Svoronos

The following table presents a correlation between common chromophoric functional groups and the expected absorptions from ultraviolet (UV) spectrophotometry. While not as informative as infrared correlations, UV can often provide valuable qualitative information. In these tables, λ_{max} is the wavelength in nm at which the maximum absorption occurs, and ε_{max} is the extinction coefficient.

Note: ϕ denotes a phenyl group.

Wavenumber Adjustments for Bathochromic Shifts (Woodward's Rules)

Conjugated systems show bathochromic shifts in their π→π* transition bands. Empirical methods for predicting those shifts were originally formulated by Woodward (References 5–7) and Fieser and Fieser (Reference 8). This section includes the most important conjugated system rules. The reader should consult References 6 and 8 for more details on how to apply the wavelength increment data.

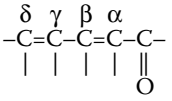
(a) Rules for Diene Absorption

Base value for diene: 214 nm

Increments for each (in nm):

Heteroannular diene	+ 0
Homoannular diene	+39
Extra double bond	+30
Alkyl substituent or ring residue	+5
Exocyclic double bond	+5
Polar groups:	
–OOCR	+0
–OR	+6
–S–R	+30
halogen	+5
$-NR_2$	+60
λ Calculated	= Total

(b) Rules for Enone Absorption*



Base value for acyclic (or six-membered) α,β-unsaturated ketone: 215 nm

Base value for five-membered α,β-unsaturated ketone: 202 nm

Base value for α,β-unsaturated aldehydes: 210 nm

Base value for α,β-unsaturated esters or carboxylic acids: 195 nm

Increments for each (in nm):

Heteroannular diene	+0
Homoannular diene	+39
Double bond	+30
Alkyl group:	
α–	+10
β–	+12
γ– and higher	+18
Polar groups:	
–OH	
α–	+35
β–	+30
δ–	+50
–OOCR	
α, β, γ, δ	+6
–OR	
α–	+35
β–	+30
γ–	+17
δ–	+31
–SR	
β–	+85
–Cl	
α–	+15
β–	+12
–Br	
α–	+25
β–	+30
$-NR_2$	
β–	+95
Exocyclic double bond	+5
λ Calculated	= Total

*Solvent corrections should be included. These are: water (-8), chloroform (+1), dioxane (+5), ether (+7), hexane (+11), and cyclohexane (+11). No correction is included for methanol or ethanol.

(c) Rules for monosubstituted benzene derivatives
Parent Chromophore (benzene): 250 nm

Substituent	Increment (in nm)
–R	–4
–COR	–4
–CHO	0
–OH	–16
–OR	–16
–COOR	–16

where R is an alkyl group, and the substitution is on C_6H_5–.

(d) Rules for disubstituted benzene derivatives
Parent Chromophore (benzene): 250 nm

	Increment (in nm)		
Substituent	***o*–**	***m*–**	***p*–**
–R	+3	+3	+10
–COR	+3	+3	+10
–OH	+7	+7	+25
–OR	+7	+7	+25
$–O^-$	+11	+20	+78 (variable)
–Cl	+0	+0	+10
–Br	+2	+2	+15
$–NH_2$	+13	+13	+58
$–NHCOCH_3$	+20	+20	+45
$–NHCH_3$	—	—	+73
$–N(CH_3)_2$	+20	+20	+85

R indicates an alkyl group.

WAVELENGTH-WAVENUMBER CONVERSION TABLE

Thomas J. Bruno and Paris D. N Svoronos

The following table provides a conversion between wavelength and wavenumber units, for use in infrared spectrophotometry (Refs. 1 and 2). Because spectra are presented in different formats, this table is an aid in interpretation.

MIDDLE-RANGE INFRARED ABSORPTION CORRELATION CHARTS

Thomas J. Bruno and Paris D.N. Svoronos

The following charts provide characteristic middle-range infrared absorptions obtained from particular functional groups on molecules (Refs. 1 and 2). These include a general mid-range correlation chart, a chart for aromatic absorptions, and a chart for carbonyl moieties. Charts for near infrared absorptions and for inorganic moieties can be found in the cited references.

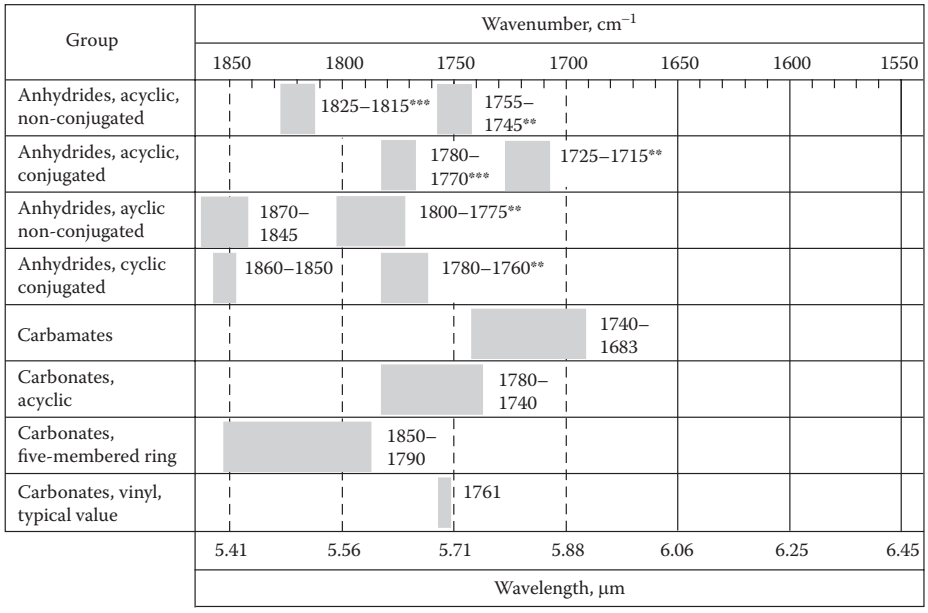
	Wavelength, μm						

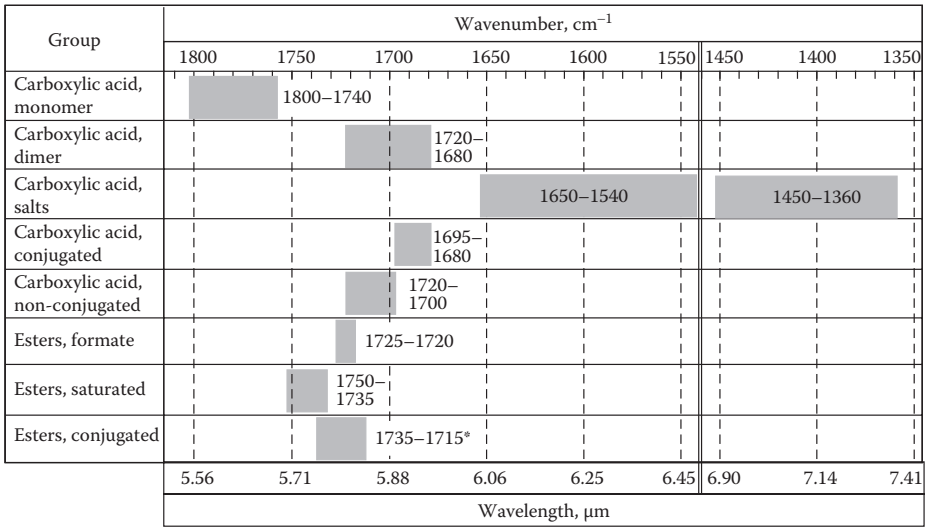
* Electron withdrawing groups at the α-position to the carbonyl will raise the wavenumber of the absorption.

Carbonyl Group Absorptions (continued)



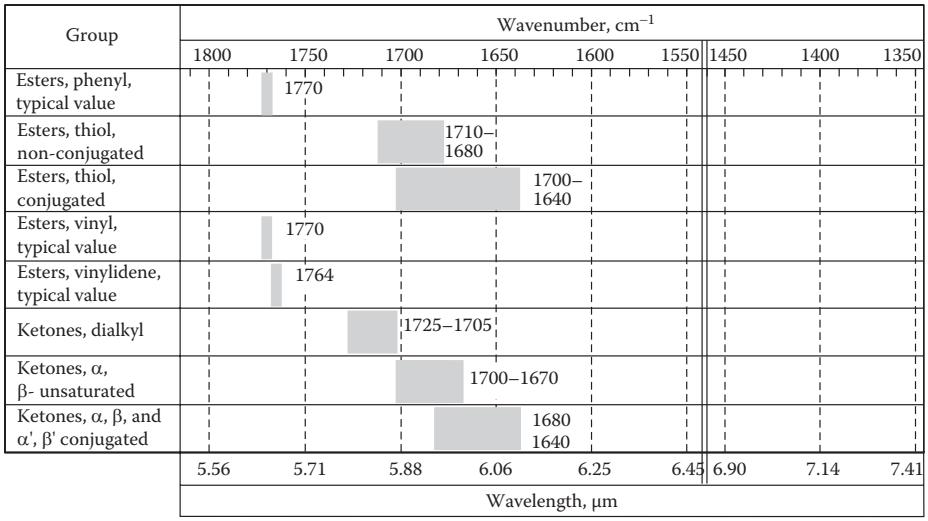
** This band is the more intense of the two.
*** Intensity weakens as colinearity is approached.

Carbonyl Group Absorptions (continued)

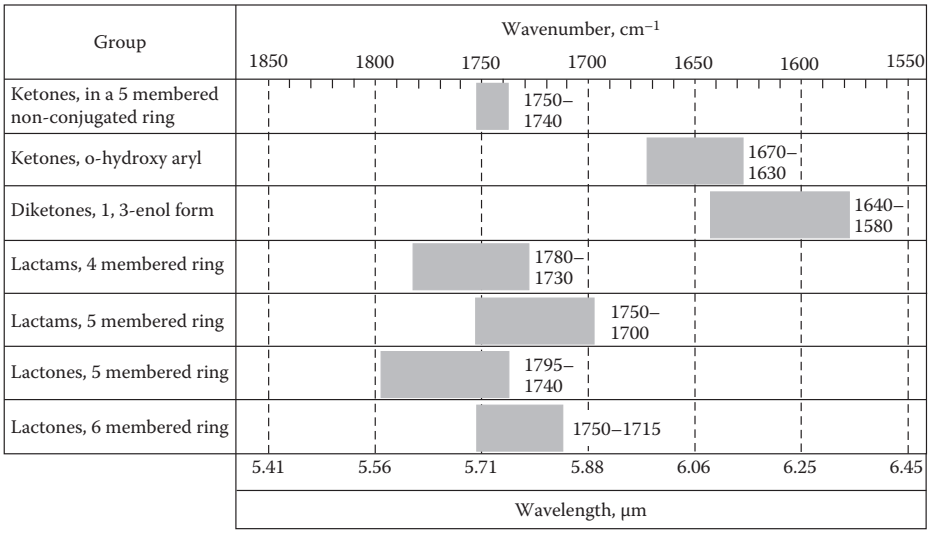


* Electron withdrawing groups in the α-position to the carbonyl will raise the wavenumber adsorption.

Carbonyl Group Absorptions (continued)



Carbonyl Group Absorptions (continued)



COMMON SPURIOUS INFRARED ABSORPTION BANDS

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides some of the common potential sources of spurious infrared absorptions that might appear on a spectrum (Refs. 1 and 2]. Occasionally, the spectral lines of some impurities can be used as diagnostics; the reader is referred to the references for more details.

Approximate Wavenumber/cm^{-1}	Wavelength/μm	Compound or Group	Origin
3700	2.70	H_2O	Water in solvent (thick layers)
3650	2.74	H_2O	Water in some quartz windows
3450	2.9	H_2O	Hydrogen-bonded water, usually in KBr disks
2900	3.44	$-CH_3$, $>CH_2$	Paraffin oil, residual from previous mulls
2350 2330	4.26 4.30	CO_2 CO_2	Atmospheric absorption, or dissolved gas from a dry ice bath
2300 and 2150	4.35 and 4.65	CS_2	Leaky cells, previous analysis of samples dissolved in carbon disulfide
1996	5.01	BO_2^-	Metaborate in the halide window
1400–2000	5–7	H_2O	Atmospheric absorption
1820	5.52	$COCl_2$	Phosgene, decomposition product in purified $CHCl_3$
1755	5.7	Phthalic anhydride	Decomposition product of phthalate esters or resins; paint off-gas product
1700–1760	5.7–5.9	>C=O	Bottle-cap liners leached by sample
1720	5.8	Phthalates	Phthalate polymer plastic tubing
1640	6.1	H_2O	Water of crystallization entrenched in sample
1520	6.6	CO_2	Leaky cells, previous analysis
1430	7.0	CO_3^{-2}	Contaminant in halide window
1360	7.38	NO_3^-	Contaminant in halide window
1270	7.9	>SiO–	Silicone oil or grease
1000–1110	9–10	–>Si–O–Si<–	Glass; silicones
980	10.2	SO_4^{-2}	From decomposition of sulfates in KBr pellets
935	10.7	$(CH_2O)_x$	Deposit from gaseous formaldehyde
907	11.02	–>C–Cl	Dissolved R-12 (Freon-12, CCl_2F_2)
837	11.95	NO_3^-	Contaminant in halide window
823	12.15	KNO_3	From decomposition of nitrates in KBr pellets
794	12.6	CCl_4 vapor	Leaky cells, from CCl_4 used as a solvent
788	12.7	CCl_4 liquid	Incomplete drying of cell or contamination, from CCl_4 used as a solvent
720 and 730	13.7 and 13.9	Polyethylene	Various experimental sources
728	13.75	–>Si–F	SiF_4, found in NaCl windows
667	14.98	CO_3^{-2}	Atmospheric carbon dioxide
Any	Any	Fringes	If refractive index of windows is too high, or if the cell is partially empty, or the solid sample is not fully pulverized

NUCLEAR SPINS, MOMENTS, AND OTHER DATA RELATED TO NMR SPECTROSCOPY

David R. Lide

This table presents the following data relevant to nuclear magnetic resonance spectroscopy:

Z: Atomic number

Isotope: Element symbol and mass number

Abundance: Natural abundance of the isotope in percent. An * indicates a radioactive nuclide; if no value is given, the nuclide is not present in nature or its abundance is highly variable.

I: Nuclear spin

ν: Resonant frequency in megahertz for an applied field H_0 of 1 tesla (in cgs units, 10 kilogauss). The resonant frequency scales with H_0.

Relative sensitivity: Sensitivity relative to ^{1}H (=1) assuming an equal number of nuclei and constant temperature. Values were calculated from the expressions:

For constant H_0: $0.0076508(\mu/\mu_N)^3(I + 1)/I^2$
For constant ν: $0.23871(\mu/\mu_N)(I + 1)$

μ/μ_N: Nuclear magnetic moment in units of the nuclear magneton μ_N

Q: Nuclear quadrupole moment in units of femtometers squared (1 fm^2 = 10^{-2} barn). Because the determination of quadrupole moments requires knowledge of the electron configuration near the nucleus, values of *Q* in the literature tend to scatter considerably. The values quoted here come mainly from the review of Pyykkö (Ref. 3), otherwise from Ref. 1.

The table includes all stable nuclides of non-zero spin for which spin and magnetic moment values have been measured, as well as selected radioactive nuclides of current or potential interest. At least one isotope is included for each element through Z = 95 for which data are available. See Reference 1 for a complete listing of spins and moments.

The assistance of P. Pyykkö in providing data on nuclear quadrupole moments is gratefully acknowledged.

PROPERTIES OF IMPORTANT NMR NUCLEI

Thomas J. Bruno and Paris D. N. Svoronos

The following table lists the magnetic properties at higher field strengths required for choosing the nuclei to be used in NMR experiments (Refs. 1–15). The reader is referred to several excellent texts and the literature for guidelines in nucleus selection. For more detailed information on these and other less common nuclei at 10 kG, the reader should consult the table entitled *Nuclear Spins, Moments and Other Data Related to NMR Spectroscopy* in this section.

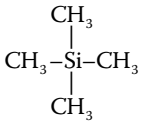
PROTON NMR ABSORPTION OF MAJOR CHEMICAL FAMILIES

Thomas J. Bruno and Paris D. N. Svoronos

The following table gives the region of the expected nuclear magnetic resonance absorptions of major chemical families (Refs. 1–12). These absorptions are reported in the dimensionless units of parts per million (ppm) versus the standard compound tetramethylsilane (TMS, structure provided), which is recorded as 0.0 ppm.



The use of this unit of measure makes the chemical shifts independent of the applied magnetic field strength or the radio frequency. For most proton NMR spectra, the protons in TMS are more shielded than almost all other protons. The chemical shift in this dimensionless unit system is then defined by:

$$\delta = \frac{\nu_s - \nu_r}{\nu_r} \times 10^6$$

where ν_s and ν_r are the absorption frequencies of the sample proton and the reference (TMS) protons (twelve, magnetically equivalent), respectively. In these tables, the proton(s) whose proton NMR shifts are cited are indicated by underscore. Reference 1 provides additional details on the absorptions of other moieties, as well as correlation charts.

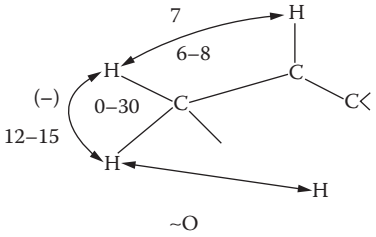
Sulfones	$\underline{CH_3}–SO_2–R^2$	~2.6 ppm		
Sulfonic acids	$\underline{CH_3}–SO_3H$	~3.0 ppm		
Sulfoxides	$\underline{CH_3}–S(=O)R$	~2.5 ppm		
	$–\underline{CH_2}–S(=O)R$	~3.1 ppm		
Thiocyanates	$\underline{CH_3}–S–C\equiv N$	~2.7 ppm		
	$–\underline{CH_2}–S–C\equiv N$	~3.0 ppm		
	$–\underline{CH}–S–C\equiv N$	~3.3 ppm		
Thiols	See mercaptans			

Note: Ar represents aryl.

Some Useful ^1H Coupling Constants

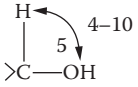
The following chart gives the values of some useful proton NMR coupling constants (in Hz). The single numbers indicate a typical or average value, while in some cases, the range is provided.

1. Freely rotating chains.

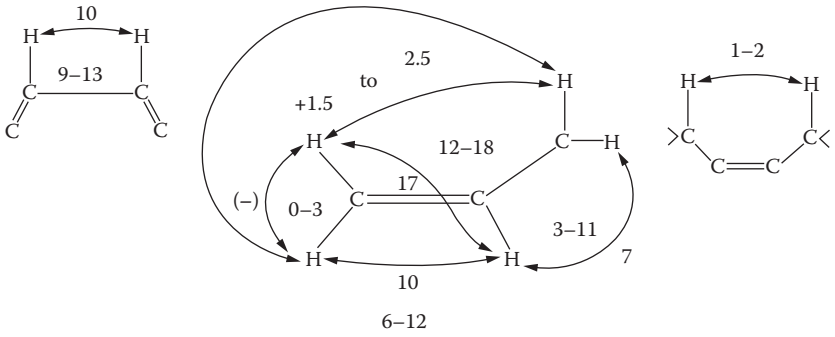


2. Alcohols with no exchange as in DMSO.
   1° = triplet
   2° = doublet (broad)
   3° = singlet

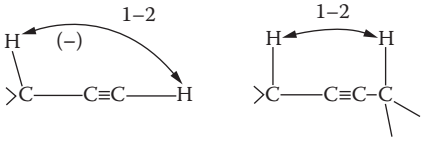
Upon addition of TFA, a sharp singlet results.



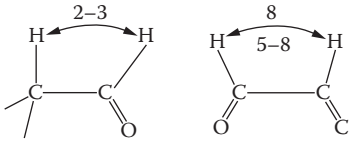
3. Alkenes



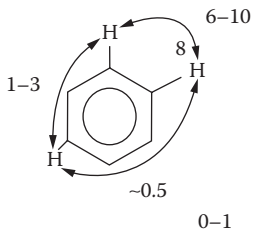
4. Alkynes



5. Aldehydes



6. Aromatic

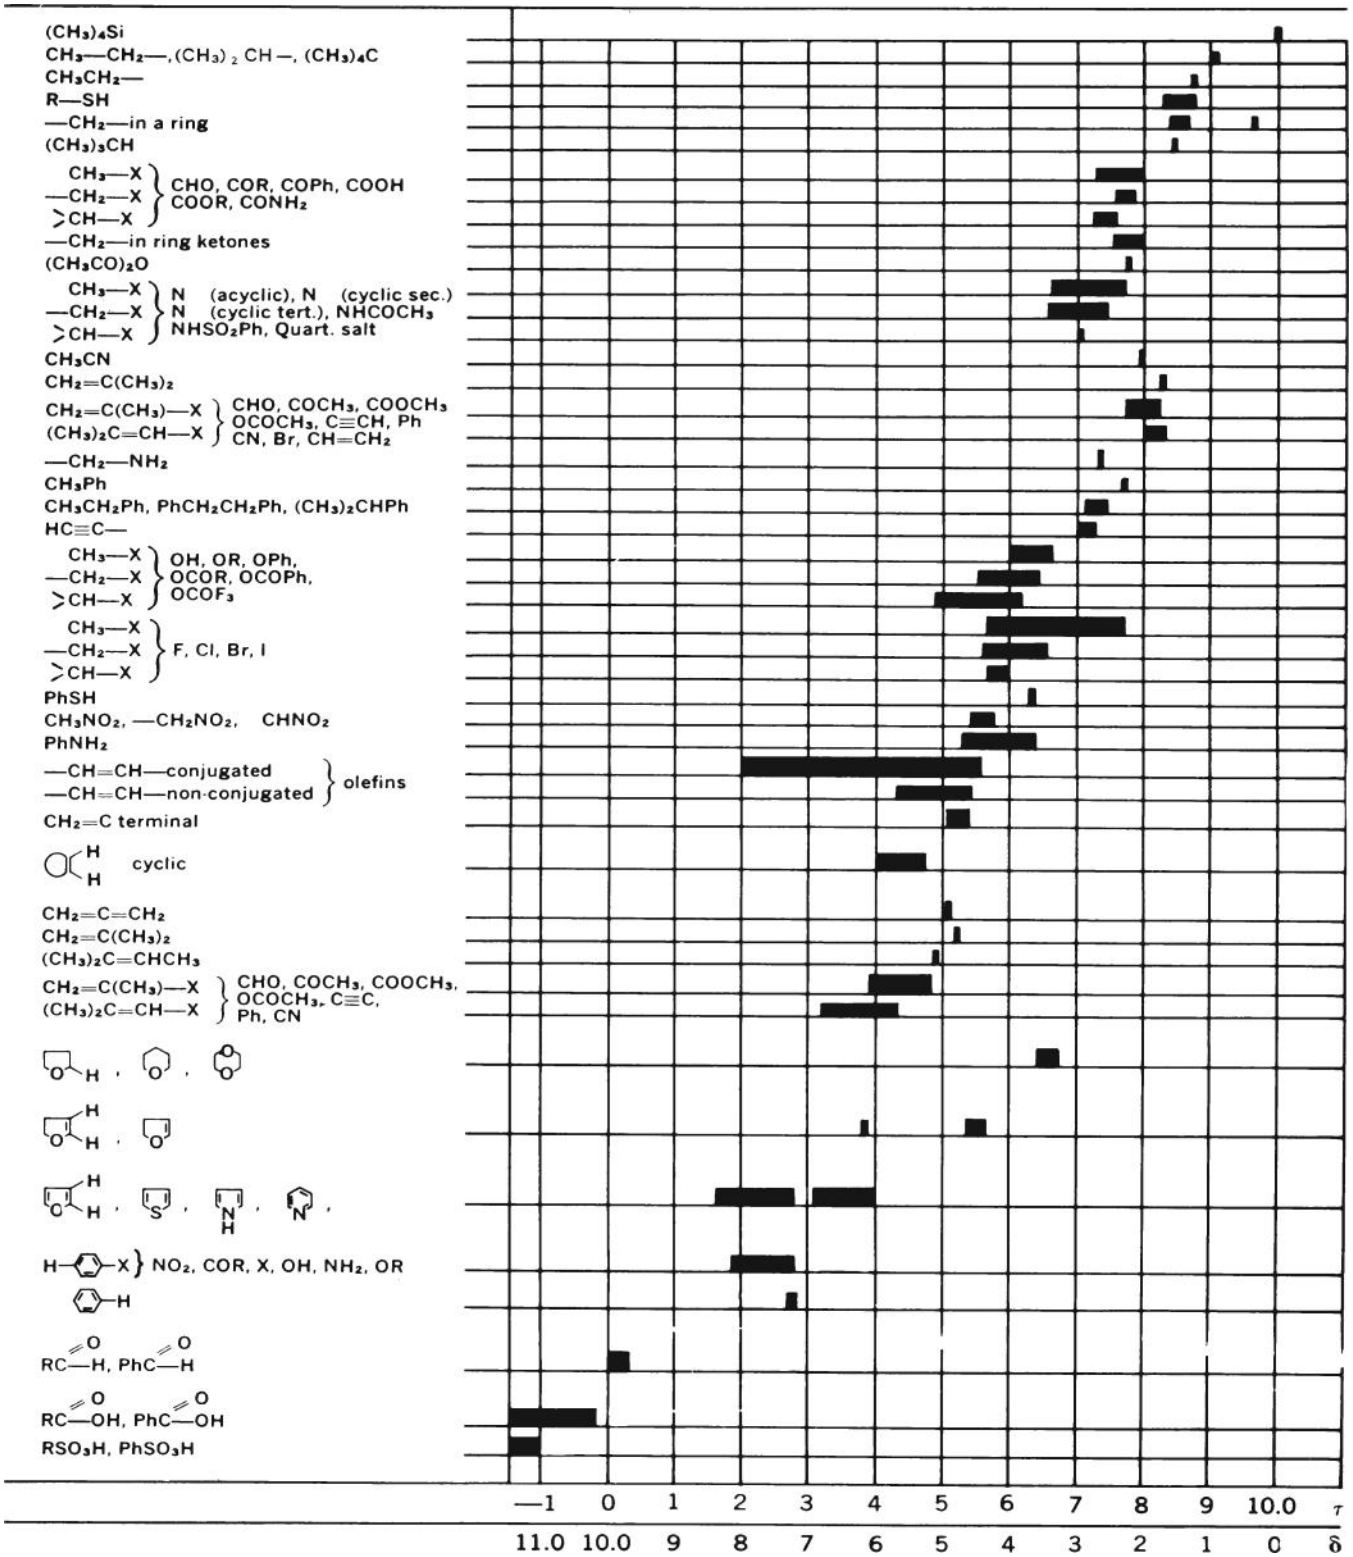


PROTON NMR CORRELATION CHART FOR MAJOR ORGANIC FUNCTIONAL GROUPS

The chart below summarizes the range of chemical shifts for protons in several classes or organic compounds and substituent groups. The chemical shifts δ are given in parts per million relative to tetramethylsilane.

Reference

Mohacsi, E., *J. Chem. Edu.* 41, 38, 1964 (with permission).



PROTON NMR SHIFTS OF COMMON ORGANIC SOLVENTS

The table below lists the ^{1}H chemical shifts for over 300 organic solvents and liquid reagents. The solvent in which the shift was measured is given in the second column. Shifts are given in parts per million relative to tetramethylsilane (TMS) and are listed in order of smallest to largest shift. In many cases the peaks show additional small splittings. Compounds are listed by the name used in this *Handbook*, with other common names given in parentheses.

^{13}C-NMR ABSORPTIONS OF MAJOR FUNCTIONAL GROUPS

Thomas J. Bruno and Paris D. N. Svoronos

The table below lists the ^{13}C chemical shift ranges (in ppm) with the corresponding functional groups in descending order. Some typical simple compounds for every family are given to illustrate the corresponding range. The shifts for the carbons of interest are given in parentheses, either for each carbon as it appears from left to right in the formula, or by the underscore (Refs. 1–17). In Ref. 1, the reader can find additional details, correlation charts, additivity rules and the expected ^{13}C peaks attributed to common solvents.

δ/ppm	Group	Family	Example (δ of Underlined Carbon)	
220–165	>C=O	Ketones	$(CH_3)_2\underline{C}O$	(206.0)
			$(CH_3)_2CH\underline{C}OCH_3$	(212.1)
		Aldehydes	$CH_3\underline{C}HO$	(199.7)
		α,β-unsaturated carbonyls	$CH_3CH=CH\underline{C}HO$	(192.4)
			$CH_2=CH\underline{C}OCH_3$	(169.9)
		Carboxylic acids	$H\underline{C}O_2H$	(166.0)
			$CH_3\underline{C}O_2H$	(178.1)
		Amides	$H\underline{C}ONH_2$	(165.0)
			$CH_3\underline{C}ONH_2$	(172.7)
		Esters	$CH_3\underline{C}O_2CH_2CH_3$	(170.3)
			$CH_2=CH\underline{C}O_2CH_3$	(165.5)
140–120	>C=C<	Aromatics, alkenes	$\underline{C}_6H_6$	(128.5)
			$\underline{C}H_2=CH_2$	(123.2)
			$\underline{C}H_2=CHCH_3$	(115.9, 136.2)
			$\underline{C}H_2=CHCH_2Cl$	(117.5, 133.7)
			$CH_3CH=\underline{C}HCH_2CH_3$	(132.7)
125–115	–C≡N	Nitriles	$CH_3–\underline{C}\equiv N$	(117.7)
80–70	–C≡C–	Alkynes	$H\underline{C}\equiv CH$	(71.9)
			$CH_3\underline{C}\equiv CCH_3$	(73.9)
70–45	>C–O⁻ |	Esters, alcohols	$\underline{C}H_3OOCCH_2CH_3$	(57.6, 67.9)
			$HO\underline{C}H_3$	(49.0)
	>C–OH |		$HO\underline{C}H_2CH_3$	(57.0)
40–20	>C–NH_2 |	Amines	$\underline{C}H_3NH_2$	(26.9)
			$CH_3\underline{C}H_2NH_2$	(35.9)
30–15	–S–CH_3	Sulfides (thioethers)	$C_6H_5–S–\underline{C}H_3$	15.6
30–(–2.3)	>CH–	Alkanes, cycloalkanes	$\underline{C}H_4$	(–2.3)
			$\underline{C}H_3CH_3$	(5.7)
			$\underline{C}H_3\underline{C}H_2CH_3$	(15.8, 16.3)
			$\underline{C}H_3\underline{C}H_2CH_2CH_3$	(13.4, 25.2)
			$\underline{C}H_3\underline{C}H_2\underline{C}H_2CH_2CH_3$	(13.9, 22.8, 34.7)
			Cyclohexane	(26.9)

^{13}C NMR CHEMICAL SHIFTS OF COMMON ORGANIC SOLVENTS

The following table gives the expected carbon-13 chemical shifts, relative to tetramethylsilane, for various useful NMR solvents. In some solvents, slight changes can occur with change of concentration.[2,3]

Solvent	Formula	Chemical shift (ppm)
Acetic acid-d_4	CD_3COOD	20.0 (CD_3) 205.8 (C=O)
Acetone	$(CH_3)_2C=O$	30.7 (CH_3) 206.7 (C=O)
Acetone-d_6	$(CD_3)_2C=O$	29.2 (CD_3) 204.1 (C=O)
Acetonitrile-d_3	$CD_3C\equiv N$	1.3 (CD_3) 117.1 (C≡N)
Benzene	C_6H_6	128.5
Benzene-d_6	C_6D_6	128.4
Carbon disulfide	CS_2	192.3
Carbon tetrachloride	CCl_4	96.0
Chloroform	$CHCl_3$	77.2
Chloroform-d_3	$CDC1_3$	77.05
Cyclohexane-d_{12}	C_6D_{12}	27.5
Dichloromethane-d_2	CD_2C1_2	53.6
Dimethylformamide-d_7	$(CD_3)_2NCDO$	31 (CD_3) 36 (CD_3) 162.4 (C=O)
Dimethylsulfoxide-d_6	$(CD_3)_2S=O$	39.6
Dioxane-d_8	$C_4D_3O_2$	67.4
Formic acid-d_2	DCOOD	165.5
Methanol-d_4	CD_3OD	49.3
Nitromethane-d_3	CD_3NO_2	57.3
Pyridine	C_5H_5N	123.6 (C_3) 135.7 (C_4) 149.8 (C_2)
Pyridine-d_5	C_5D_5N	123.9 (C_3) 135.9 (C_4) 150.2 (C_2)
1,1,2,2-Tetrachloroethane-d_2	$CDC1_2CDC1_2$	75.5
Tetrahydrofuran-d_8	C_4D_8O	25.8 (C_2) 67.9 (C_1)
Trichlorofluoromethane	$CFC1_3$	117.6

^{15}N-NMR CHEMICAL SHIFTS OF MAJOR CHEMICAL FAMILIES

Thomas J. Bruno and Paris D. N. Svoronos

The following table contains ^{15}N NMR chemical shifts of various organic nitrogen compounds. Chemical shifts are expressed relative to different standards (NH_3, NH_4Cl, CH_3NO_2, NH_4NO_3, HNO_3, etc.) and are interconvertible. Chemical shifts are sensitive to hydrogen bonding and are solvent dependent as seen in the case of pyridine (see footnote a below). Consequently, the reference as well as the solvent should always accompany chemical shift data. All shifts are relative to ammonia unless otherwise specified (Refs. 1–16). A section of "miscellaneous" data gives the chemical shift of special compounds relative to unusual standards. In Ref. 16, the reader can find additional details, correlation charts, and spin-spin coupling ranges.

Chemical Shift Range/ppm	Family	Example (δ)
<930	Nitroso compounds	C_6H_5–NO (913, 930)
608	Sodium nitrite	$NaNO_2$
~500	Azo compounds	C_6H_5–N=N–C_6H_5 (510)
380–350	Nitro compounds	$C_6H_5NO_2$ (370.3); CH_3NO_2 (380.2); 4-F–C_6H_4–NO_2 (368.5); 1,3-$(NO_2)_2C_6H_4$ (365.4)
367	Nitric acid (8.57 M)	HNO_3
360–325	Nitramines	CH_3NHNO_2 (355.6); $CH_3O_2CNHNO_2$ (334.9)
350–300	Pyridines	C_5H_5N (317)[a] (gas); 4-CH_3–C_5H_4N (309.3);4-NH_2–C_5H_4N (271.5); 4-NC–C_5H_4N (327.9)
~310	Imines (aromatic)	$(C_6H_5)_2C$=NH (308); C_6H_5CH=NCH_3 (318); C_6H_5CH=NC_6H_5 (326)
310.1	Nitrogen (gas)	N_2
250–200	Pyridinium salts	$C_5H_5NH^+$ (215)
260–175	Cyanides (nitriles)	CH_3CN (239.5, 245); C_6H_5CN (258.7); KCN 177.8
~160	Pyrroles, isonitriles	C_4H_4NH (158)CH_3NC (162)
~150	Thioamides	CH_3C(=S)NH_2 (150.2)
120–110	Lactams	$HN(CH_2)_3C$=O (5-membered ring; 114.7) $HN(CH_2)_6C$=O (8-membered ring; 117.7)
110–100	Amides	$C_6H_5CONH_2$ (100); CH_3CONH_2 (103.4); $CH_3CONHCH_3$ (105.8); $CH_3CON(CH_3)_2$ (103.8); $HCONH_2$ (108.5)
125–90	Sulfonamides	$CH_3SO_2NH_2$ (95); $C_6H_5SO_2NH_2$ (94.3)
~100	Hydrazines	$C_6H_5NHNHC_6H_5$ (96)
110–60	Ureas	$[H_2N]_2CO$ (75, 82); $[(CH_3)_2N]_2CO$ (63.5); $[C_6H_5NH]_2CO$ (107.7)
100–70	Aminophospines, aminophosphine oxides	$C_6H_5NHP(CH_3)_2$ (71.1) $C_6H_5NHPO(CH_3)_2$ (86.6)
70–50	Aromatic amines	$C_6H_5NH_2$ (55, 59), (–322.3)[b]; $C_6H_5NH_3^+$ (48), (–326.4)[b], 26.1[c]; p–O_2N–C_6H_4–NH_2 (70)
40–0	Aliphatic amines	CH_3NH_2 (1.3)[d], (–371)[b]; $(CH_3)_2NH$ (–363.3)[b], (–364.9)[e], 6.7[d]; $(CH_3)_3N$ (–356.9)[b], (–360.7)[e], 13.0[d]
50–10	Isonitriles	CH_3NCO (14.1); C_6H_5NCO (46.5)
65–20	Ammonium salts	NH_4Cl (26.1)[d]; CH_3NH_3Cl (24.5); $(CH_3)_2NH_2Cl$ (26.6); $(CH_3)_3NHCl$ (33.8); $(CH_3)_4NCl$ (44.7)
~15	Isocyanates	CH_3NCO (14.1)
Miscellaneous:		
(–130)–(–110) and ~(–212)	Imidazoles	*N*-methylimdazole (–111.4, pyridine N and -215.7, pyrrole N)[b]
(–345)–(–310)[b]	Piperidine, hydrochloride salts	piperidinium hydorchloride (–344.8); 2-methyl piperdinium hydrochloride (–322.1)[e]
	Decahydroquinolines, hydrochloride salts	*trans*-decahydroquinolinium hydrochloride (-322.5); *cis*-decahydroquinolinium hydrochloride (–328.5)

Chemical Shift Range/ppm	Family	Example (δ)
(−293)–(−280)[f]	Enaminones	$CH_3C(=O)CH=CHNHCH_3$ [(*E*)-(−294.2); (*Z*)-(−285.9)]
35–15[g]	4-Aminotetrahydropyrans, 4-aminotetrahydro-thiopyrans	2,6-diphenyl 4-aminotetrahydropyran (34.5) 2,6-diphenyl 4-aminotetrahydrothiopyran (33.6)
(−325)–(−310)[c]	1-Naphthylamines	8-nitro-1-naphthylamine (313.9)
(−350)–(−300)[h]	Silylamines	$HN[Si(CH_3)_3]_2$ (−354.2)

[a] Varies with solvent. For instance: cyclohexane (315.5), benzene (312.1), chloroform (304.5), methanol (292.1), water (289), 2,2,2-trifluoroethanol (277.1). All chemical shifts relative to ammonia.
[b] Upfield from external HNO_3 1M (CH_3OH).
[c] In ppm upfield from external 1M $D^{15}NO_3$ in D_2O (DMSO) (Ref. 10).
[d] Downfield from anhydrous liquid ammonia, ±0.2 ppm unless otherwise specified.
[e] Upfield from external HNO_3 1M (cyclohexane).
[f] Relative to external $CH_3{}^{15}NO_2$.
[g] With respect to an external standard of 5M $^{15}NH_4NO_3$ in 2M HNO_3 ($^{15}NH_4NO_3$ = 21.6 ppm relative to anhydrous ammonia) (Ref. 9).
[h] Relative to $N(SiH_3)$ (50 % in $CDCl_3$) (Ref. 11).

NATURAL ABUNDANCE OF IMPORTANT ISOTOPES

Thomas J. Bruno and Paris D. N. Svoronos

The following table lists the atomic masses and relative percent concentrations of naturally occurring isotopes of importance in mass spectroscopy (Refs. 1–6).

COMMON MASS SPECTRAL FRAGMENTATION PATTERNS OF ORGANIC COMPOUND FAMILIES

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides a guide to the identification and interpretation of commonly observed mass spectral fragmentation patterns for common organic functional groups (Refs. 1–10). It is of course highly desirable to augment mass spectroscopic data with as much other structural information as possible. Especially useful in this regard will be the confirmatory information of infrared and ultraviolet spectrophotometry as well as nuclear magnetic resonance spectrometry.

The reader is referred to other tables in this book for additional information that can be used in assessing or predicting fragmentation patterns, particularly the table of Proton Affinities (p. 10-167) and ionization energies of Gas-Phase Molecules (p. 10-199).

Family	Molecular Ion Peak	Common Fragments; Characteristic Peaks
Acetals		Cleavage of all C–O, C–H and C–C bonds around the original aldehydic carbon
Alcohols	Weak for 1° and 2°; not detectable for 3°; strong for benzyl alcohols	Loss of 18 (H_2O — usually by cyclic mechanism); loss of H_2O and olefin simultaneously with four (or more) carbon-chain alcohols; prominent peak at *m/z* = 31$(CH_2\ddot{O}H)^+$ for 1° alcohols; prominent peak at *m/z* = $(RCH\ddot{O}H)^+$ for 2° alcohols and *m/z* = $(R_2C\ddot{O}H)^+$ for 3° alcohols
Aldehydes	Low intensity	Loss of aldehydic hydrogen (strong M-1 peak, especially with aromatic aldehydes); strong peak at *m/z* = 29$(HC{\equiv}O^+)$; loss of chain attached to alpha carbon (beta cleavage); McLafferty rearrangement via beta cleavage if gamma hydrogen is present
Alkanes		
(a) Chain	Low intensity	Loss of 14 mass units (CH_2)
(b) Branched	Low intensity	Cleavage at the point of branch; low intensity ions from random rearrangements
(c) Alicyclic	Intense	Loss of 28 mass units ($CH_2{=}CH_2$) and side chains
Alkenes (olefins)	Rather high intensity (loss of π-electron) especially in case of cyclic olefins	Loss of units of general formula C_nH_{2n-1}; formation of fragments of the composition C_nH_{2n} (via McLafferty rearrangement); retro Diels-Alder fragmentation
Alkyl halides	Abundance of molecular ion F<Cl<Br<I; intensity decreases with increase in size and branching	Loss of fragments equal to the mass of the halogen until all halogens are cleaved off
(a) Fluorides	Very low intensity	Loss of 20 (HF); loss of 26 (C_2H_2) in case of fluorobenzenes
(b) Chlorides	Low intensity; characteristic isotope cluster	Loss of 35 (Cl) or 36 (HCl); loss of chain attached to the gamma carbon to the carbon carrying the Cl
(c) Bromides	Low intensity; characteristic isotope cluster	Loss of 79 (Br); loss of chain attached to the gamma carbon to the carbon carrying the Br
(d) Iodides	Higher than other halides	Loss of 127 (I)
Alkynes	Rather high intensity (loss of π-electron)	Fragmentation similar to that of alkenes
Amides	High intensity	Strong peak at *m/z* = 44 indicative of a 1° amide $(O{=}C{=}NH^+_2)$; base peak at *m/z* = 59 $(CH_2{=}C(OH)N^+H_2)$; possibility of McLafferty rearrangement; loss of 42 (C_2H_2O) for amides of the form $RNHCOCH_3$ when R is aromatic ring
Amines	Hardly detectable in case of acyclic aliphatic amines; high intensity for aromatic and cyclic amines	Beta cleavage yielding $>C{=}N^+<$; base peak for all 1° amines at *m/z* = 30 $(CH_2{=}N^+H_2)$; moderate M-1 peak for aromatic amines; loss of 27 (HCN) in aromatic amines; fragmentation at alpha carbons in cyclic amines
Aromatic hydrocarbons (arenes)	Intense	Loss of side chain; formation of RCH=CHR' (via McLafferty rearrangement); cleavage at the bonds beta to the aromatic ring; peaks at *m/z* = 77 (benzene ring; especially mono-substituted), 91 (tropyllium); the ring position of alkyl substitution has very little effect on the spectrum
Carboxylic acids	Weak for straight-chain monocarboxylic acids; large if aromatic acids	Base peak at *m/z* = 60 $(CH_2{=}C(OH)_2)$ if alpha hydrogen is present; peak at *m/z* = 45 (COOH); loss of 17 (–OH) in case of aromatic acids or short-chain acids
Disulfides	Low intensity	Loss of olefins (*m/z* equal to $R{-}S{-}S{-}H^{+\cdot}$); strong peak at *m/z* = 66 $(HSSH^+)$
Phenols	Highly intense peak (base peak* generally)	Loss of 28 (C=O) and 29 (CHO); strong peak at *m/z* = 65 $(C_5H_5^+)$

Family	Molecular Ion Peak	Common Fragments; Characteristic Peaks
Sulfides (thioethers)	Rather low intensity peak but higher than that of corresponding ether	Similar to those of ethers (–O– substituted by –S–); aromatic sulfides show strong peaks at *m/z* = 109 ($C_6H_5S^+$.); 65 ($C_5H_5^+$.); 91 (tropyllium ion)
Sulfonamides	Intense	Loss of *m/z* = 64 ($SONH_2$) and *m/z* = 27 (HCN) in case of benzenesulfonamide
Esters	Weak intensity	Base peak at *m/z* equal to the mass of R–C≡O^+; peaks at *m/z* equal to the mass of $^+$O≡C–OR', the mass of OR' and R'; McLafferty rearrangement possible in case of: (a) presence of a beta hydrogen in R' (peak at *m/z* equal to the mass of R–C($^+$OH)OH, and (b) presence of a gamma hydrogen in R (peak at *m/z* equal to the mass of (CH_2=C($^+$OH)OR); loss of 42 (CH_2=C=O) in case of benzyl esters; loss of ROH via the ortho effect in case of o–substituted benzoates
Ketones	High intensity	Loss of R–groups attached to the >C=O (alpha cleavage); peak at *m/z* = 43 for all methyl ketones (CH_3CO^+); McLafferty rearrangement via beta cleavage if gamma hydrogen is present; loss of *m/z* = 28 (C=O) for cyclic ketones after initial alpha cleavage and McLafferty rearrangement
Mercaptan (thiols)	Rather low intensity but higher than that of corresponding alcohol	Similar to those of alcohols (–OH substituted by –SH); loss of *m/z* = 45 (CHS) and *m/z* = 44 (CS) for aromatic thiols
Nitriles	Unlikely to be detected except in case of acetonitrile (CH_3CN) and propionitrile (C_2H_5CN)	M+1 ion may appear (especially at higher pressures); M-1 peak is weak but detectable (R–CH=C=N^+); base peak at *m/z* = 41 (CH_2=C=N^+H); McLafferty rearrangement possible; loss of HCN is case of cyanobenzenes
Nitrites	Absent (or very weak at best)	Base peak at *m/z* = 30 (NO^+); large peak at *m/z* = 60 (CH_2=O^+NO) in all unbranched nitrites at the alpha carbon; absence of *m/z* = 46 permits differentiation from nitro compounds
Nitro compounds	Seldom observed	Loss of 30 (NO); subsequent loss of CO (in case of aromatic nitro- compounds); loss of NO_2, *m/z* = 46, from molecular ion peak
Sulfones	High intensity	Similar to sulfoxides; loss of mass equal to RSO_2; aromatic heterocycles show peaks at M-32 (sulfur), M-48 (SO), M-64 (SO_2)
Sulfoxides	High intensity	Loss of 17 (OH); loss of alkene (*m/z* equal to RSOH^+.); peak at *m/z* = 63 (CH_2=SO$H)^+$; aromatic sulfoxides show peak at *m/z* = 125 ($^+$S–CH=CHCH=CHCHC=O), 97($C_5H_5S^+$), 93(C_6H_5O·); aromatic heterocycles show peaks at M-16 (oxygen), M-29(COH); M-48(SO)

* The base peak is the most intense peak in the mass spectrum, and is often the molecular ion peak, M^+.

COMMON MASS SPECTRAL FRAGMENTS LOST

Thomas J. Bruno and Paris D. N. Svoronos

The following table gives a list of neutral species that are most commonly lost when measuring the mass spectra of organic compounds. The list is suggestive rather than comprehensive, and should be used in conjunction with other sources [1–5]. The listed fragments include only combinations of carbon, hydrogen, oxygen, nitrogen, sulfur, and the halogens.

MAJOR REFERENCE MASSES IN THE SPECTRUM OF HEPTACOSAFLUOROTRIBUTYLAMINE (PERFLUOROTRIBUTYLAMINE)

Thomas J. Bruno and Paris D. N. Svoronos

The following list tabulates the major reference masses (with their relative intensities and formulas) of the mass spectrum of heptacosafluorotributylamine (CAS No. 311-89-7) (Ref. 1). This is one of the most widely used reference compounds in mass spectrometry. For guidance in the selection of additional reference compounds, the reader is advised to consult Ref. 1.

MASS SPECTRAL PEAKS OF COMMON ORGANIC SOLVENTS

David R. Lide

The strongest peaks in the mass spectra of 375 important organic solvents and other liquid reagents are listed in this table. The *m*/*z* value for each peak is followed by the relative intensity in parentheses, with the strongest peak assigned an intensity of 100. The peaks for each compound are listed in order of decreasing intensity. Compounds are listed by the name used in this *Handbook*, with other common names given in parentheses.

Data on the physical properties of the same compounds may be found in Section 15 in the table *Laboratory Solvents and Other Liquid Reagents*.

COMMON SPURIOUS SIGNALS OBSERVED IN MASS SPECTROMETERS

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides guidance in the recognition and interpretation of potentially spurious signals (*m/z* peaks) that will sometimes be observed in measured mass spectra (Ref. 1). Often, the occurrence of these signals can be predicted by the recent history of the instrument or the method being used. This is especially true if the mass spectrometer is interfaced to a gas chromatograph.

Ions Observed, *m/z*	Possible Compound	Possible Source
13, 14, 15, 16	Methane*	Chlorine reagent gas
18	Water*	Residual impurity, outgassing of ferrules, septa and seals
14, 28	Nitrogen*	Residual impurity, outgassing of ferrules, septa and seals; leaking seal
16, 32	Oxygen*	Residual impurity, outgassing of ferrules, septa and seals; leaking seal
44	Carbon dioxide*	Residual impurity, outgassing of ferrules, septa and seals; leaking seal; note it may be mistaken for propane in a sample
31, 51, 69, 100, 119, 131, 169, 181, 214, 219, 264, 376, 414, 426, 464, 502, 576, 614	Perfluorotributyl amine (PFTBA), and related ions**	This is a common tuning compound; may indicate a leaking valve
31	Methanol	Solvent; can be used as a leak detector
43, 58	Acetone	Solvent; can be used as a leak detector
78	Benzene	Solvent; can be used as a leak detector
91, 92	Toluene	Solvent; can be used as a leak detector
105, 106	Xylenes	Solvent; can be used as a leak detector
151, 153	Trichloroethane	Solvent; can be used as a leak detector
69	Rough (fore) pump fluid, PFTBA	Back diffusion of fore pump fluid, possible leaking valve of tuning compound vial
73, 147, 207, 221, 281, 295, 355, 429	Dimethylpolysiloxane	Bleed from a column or septum, often during high temperature program methods in GC-MS
77, 94, 115, 141, 168, 170, 262, 354, 446	Diffusion pump fluid	Back diffusion from diffusion pump, if present
149	Phthalates	Plasticizer in vacuum seals, gloves
X – 14 peaks	Hydrocarbons	Loss of a methylene group indicates a hydrocarbon sample

* It is possible to operate the analyzer to ignore these common background impurities. They will be present to contribute to poor vacuum if these impurities result from a significant leak.

** See the table "Major Reference Masses in the Spectrum of Heptacosafluorotributylamine (Perfluorotributylamine) in this section for additional details.

REDUCTION OF WEIGHINGS IN AIR TO VACUO

When the mass M of a body is determined in air, a correction is necessary for the buoyancy of the air. The corrected mass is given by $M + kM/1000$, where k is a function of the material used for the weights, given by

$$k = 1000\rho_{air}(1/\rho_{body} - 1/\rho_{weight})$$

and ρ is density. The table below is computed for an air density of 0.0012 g/cm^3 and for densities of three common weights: platinum-iridium (21.6 g/cm^3), brass (8.5 g/cm^3), and aluminum or quartz (2.65 g/cm^3).

20.0	0.00	-0.08	-0.39
22.0	0.00	-0.09	-0.40

For a more accurate calculation, use the following values of the density of air (assuming 50% relative humidity and 0.04% CO_2).

	Air temperature		
P/kPa	10 °C	20 °C	30 °C
85	0.001043	0.001005	0.000968
90	0.001105	0.001065	0.001025
95	0.001166	0.001124	0.001083
100	0.001228	0.001184	0.001140
105	0.001290	0.001243	0.001198

Formulas for calculating the density of air over more extended ranges of temperature, pressure, and humidity may be found in the references.

STANDARDS FOR LABORATORY WEIGHTS

Thomas J. Bruno and Paris D. N. Svoronos

The following table provides a summary of the requirements for metric weights and mass standards commonly used in chemical analysis (Refs. 1–3). The actual specifications are under the jurisdiction of ASTM Committee E-41 on General Laboratory Apparatus and are the direct responsibility of subcommittee E-41.06 that deals with weighing devices. These standards do not generally refer to instruments used in commerce. Weights are classified according to type (either Type I or Type II), grade (S, O, P, or Q), and class (1, 2, 3, 4, 5, or 6). Information on these mass standards is presented to allow the user to make appropriate choices when using analytical weights for the calibration of electronic analytical balances, for making large-scale mass measurements (such as those involving gas cylinders), and in the use of dead-weight pressure balances. Some historical context can be found in Ref. 4.

Type — Classification by Design

Type I — One-piece construction; contains no added adjusting material; used for highest accuracy work.

Type II — Can be of any appropriate and convenient design, incorporating plugs, knobs, rings, etc.; adjusting material can be added if it is contained so that it cannot become separated from the weight.

Grade — Classification by Physical Property

Grade S:	Density:	7.7 g cm^{-3} to 8.1 g cm^{-3} (for 50 mg and larger)
	Surface area:	not to exceed that of a cylinder of equal height and diameter
	Surface finish:	highly polished
	Surface protection:	none permitted
	Magnetic properties:	no more magnetic than 300 series stainless steels
	Corrosion resistance:	same as 303 stainless steel
	Hardness:	at least as hard as brass
Grade O:	Density:	7.7 g cm^{-3} to 9.1 g cm^{-3} (for 1 g and larger)
	Surface area:	same as grade S
	Surface finish:	same as grade S
	Surface protection:	may be plated with suitable material such as platinum or rhodium
	Magnetic properties:	same as grade S
	Corrosion resistance:	same as grade S
	Hardness:	at least as hard as brass when coated; smaller weights at least as hard as aluminum
Grade P:	Density:	7.2 g cm^{-3} to 10 g cm^{-3} (for 1 g or larger)
	Surface area:	no restriction
	Surface finish:	smooth, no irregularities
	Surface protection:	may be plated or lacquered
	Magnetic properties:	same as grades S and O
	Corrosion resistance:	surface must resist corrosion and oxidation
	Hardness:	same as grade O
Grade Q:	Density:	7.2 g cm^{-3} to 10 g cm^{-3} (for 1 g or larger)
	Surface area:	same as grade P
	Surface finish:	same as grade P
	Surface protection:	may be plated, lacquered, or painted
	Magnetic properties:	no more magnetic than unhardened unmagnetized steel
	Corrosion resistance:	same as grade P
	Hardness:	same as grades O and P

Tolerance — Classification by Deviation[1]

CLASS 1			CLASS 2		
Grams	**Individual Tolerance/mg**	**Group Tolerance/mg**	**Grams**	**Individual Tolerance/mg**	**Group Tolerance/mg**
500	1.2		500	2.5	
300	0.75		300	1.5	
200	0.50		200	1.0	
100	0.25	1.35	100	0.5	2.7
50	0.12		50	0.25	
30	0.074		30	0.15	
20	0.074		20	0.10	
10	0.050	0.16	10	0.074	0.29
5	0.034		5	0.054	
3	0.034		3	0.054	
2	0.034		2	0.054	
1	0.034	0.065	1	0.054	0.105

CLASS 3		CLASS 4		CLASS 5		CLASS 6	
Grams	**Tolerance/mg**	**Grams**	**Tolerance/mg**	**Grams**	**Tolerance/mg**	**Grams**	**Tolerance/mg**
500	5.0	500	10	500	30	500	50
300	3.0	300	6.0	300	20	300	30
200	2.0	200	4.0	200	15	200	20
100	1.0	100	2.0	100	9	100	10
50	0.6	50	1.2	50	5.6	50	7
30	0.45	30	0.9	30	4.0	30	5
20	0.35	20	0.7	20	3.0	20	3
10	0.25	10	0.5	10	2.0	10	2
				5	1.3	5	2
				3	0.95	3	2
				2	0.75	2	2
				1	0.50	1	2

[1] In simple terms, the permitted deviation between the assigned nominal mass value of the weight and the actual mass of the weight. Verification of tolerance should be possible on reasonably precise equipment, without using a buoyancy correction, within the political jurisdiction or organizational bounds of a given weight specification.

Applications for Weights and Mass Standards[1]

Application	Type	Grade	Class
Reference standards used for calibrating other weights	I	S	1,2,3, or 4[1]
High-precision standards for calibration of weights and precision balances	I or II[2]	S or O[2]	1 or 2[3]
Working standards for calibration and precision analytical work, dead-weight pressure balances	I or II[2]	S or O	2
Laboratory weights for routine analytical work	II	O	2 or 3
Built-in weights, high-quality analytical balances	I or II	S	2
Moderate precision laboratory balances	II	P	3 or 4
Dial scales and trip balances	II	Q	4 or 5
Platform scales	II	Q	5 or 6

[1] Primary standards are for reference use only and should be calibrated. Since the actual values for each weight are stated, close tolerances are neither required nor desirable.

[2] Type I and Grade S will have a higher constancy but will probably be higher priced.

[3] Since working standards are used for the calibration of measuring instruments, the choice of tolerance depends upon the requirements of the instrument. The weights are usually used at the assumed nominal values and appropriate tolerances should be chosen.

INDICATORS FOR ACIDS AND BASES

Thomas J. Bruno and Paris D. N Svoronos

The following table lists the most common indicators together with their pH range and colors in acidic and basic media. Since the color change is not instantaneous at the pK_a value, a pH range is given where a combination of colors is present. This pH range, which varies between indicators, generally falls between the pK_a with a spread or uncertainty of 1 pH unit. All solutions are either aqueous or ethanol/aqueous (% ethanol, vol/vol) (Refs. 1–4). Reference 4 provides additional solution properties that are related to buffer and solvent properties, and Ref. 5 lists the exact quantities needed for the indicator solutions.

Indicator	pH Range	Solvent	Acid	Base
Gentian violet (crystal violet)	0.0–2.0	Aqueous	Yellow	Blue-violet
Thymol blue	1.2–2.8	Aqueous	Red	Yellow
Pentamethoxy red	1.2–2.3	70% ethanol	Red-violet	Colorless
Tropeolin OO	1.3–3.2	Aqueous	Red	Yellow
2,4-dinitrophenol	2.4–4.0	50% ethanol	Colorless	Yellow
Methyl yellow	2.9–4.0	90% ethanol	Red	Yellow
Methyl orange	3.1–4.4	Aqueous	Red	Orange
Bromophenol blue	3.0–4.6	Aqueous	Yellow	Blue-violet
Tetrabromphenol blue, sodium salt	3.0–4.6	Aqueous	Yellow	Blue
Congo red	3.0–5.0	Aqueous	Blue-violet	Red
Alizarin sodium sulfonate	3.7–5.2	Aqueous	Yellow	Violet
α-Naphthyl red	3.7–5.0	70% ethanol	Red	Yellow
p-Ethoxychrysoidine	3.5–5.5	Aqueous	Red	Yellow
Bromocresol green, sodium salt	4.0–5.6	Aqueous	Yellow	Blue
Methyl red, sodium salt	4.4–6.2	Aqueous	Red	Yellow
Bromocresol purple	5.2–6.8	Aqueous	Yellow	Purple
Chlorphenol red	5.4–6.8	Aqueous	Yellow	Red
Bromophenol blue, sodium salt	6.2–7.6	Aqueous	Yellow	Blue
p-nitrophenol	5.0–7.0	Aqueous	Colorless	Yellow
Azolitmin	5.0–8.0	Aqueous	Red	Blue
Bromothymol blue, sodium salt	6.0–7.6	70% ethanol	Yellow	Blue
Phenol red, sodium salt	6.4–8.0	Aqueous	Yellow	Red
Neutral red	6.8–8.0	70% ethanol	Red	Yellow
Rosolic acid	6.8–8.0	90% ethanol	Yellow	Red
Cresol red, sodium salt	7.2–8.8	Aqueous	Yellow	Red
α-naphtholphthalein	7.3–8.7	70% ethanol	Rose	Green
Tropeolin OOO	7.6–8.9	Aqueous	Yellow	Rose-red
Thymol blue, sodium salt	8.0–9.6	Aqueous	Yellow	Blue
Phenolphthalein	8.0–10.0	70% ethanol	Colorless	Red
α-naphtholbenzein	9.0–11.0	70% ethanol	Yellow	Blue
Thymolphthalein	9.4–10.6	90% ethanol	Colorless	Blue
Nile blue	10.1–11.1	Aqueous	Blue	Red
Alizarin yellow R	10.0–12.0	Aqueous	Yellow	Lilac
Salicyl yellow	10.0–12.0	90% ethanol	Yellow	Orange-brown
Diazo violet	10.1–12.0	Aqueous	Yellow	Violet
Tropeolin O	11.0–13.0	Aqueous	Yellow	Orange-brown
Nitramine	11.0–13.0	70% ethanol	Colorless	Orange-brown
Poirrier's blue	11.0–13.0	Aqueous	Blue	Violet-pink
Trinitrobenzoic acid	12.0–13.4	Aqueous	Colorless	Orange-red

PREPARATION OF SPECIAL ANALYTICAL REAGENTS

Paris D. N. Svoronos and Thomas J. Bruno

This listing of analytical reagents has been updated to include formulations based on more recent research, and to also include safety notes (Refs. 1–3). In the absence of specific cautions, the user must observe sound laboratory practice and housekeeping to avoid exposure and environmental contamination. When less familiar reagents are described, we include a chemical formula and a CAS registry number to avoid ambiguity. When a reagent calls for 95% ethanol, the azeotrope with water is specified unless noted. Additional details can be found in the references listed below.

Aluminon (qualitative test for aluminum). Aluminon is the name for the triammonium salt of aurintricarboxylic acid (5-[(3-carboxy-4-hydroxyphenyl)(3-carboxy-4-oxo-2,5-cyclohexadienylidene)methyl]-2-hydroxybenzoic acid triammonium salt, $C_{22}H_{23}N_3O_9$, CAS No. 569-58-4). Dissolve 1 g of the salt in 1 L of distilled water. Shake the solution well to ensure thorough mixing.

Bang's reagent (for glucose estimation). Dissolve (in the exact order) 100 g of potassium carbonate, 66 g of potassium chloride and 160 g of anhydrous potassium bicarbonate in approximately 700 mL of distilled water at 30 °C. Add (while stirring) 4.4 g of copper (II) sulfate and dilute to 1 L with distilled water after all CO_2 has been released. This solution should be shaken and saved in an air-tight flask. After 24 hours, 300 mL of it are diluted to 1 L with a saturated aqueous potassium chloride solution, shaken gently and used after 24 hours. 50 mL of this solution is equivalent to 10 mg glucose.

Barfoed's reagent (test for glucose). See Cupric acetate.

Baudisch's reagent. See Cupferron.

Benedict's solution (qualitative reagent for glucose). Dissolve 173 g of sodium citrate and 100 g of sodium carbonate in 800 mL of distilled water. Filter, if necessary, and dilute to 850 mL with distilled water. Dissolve 17.3 g of copper (II) sulfate pentahydrate in 100 mL of distilled water. Pour the latter solution, with constant stirring, into the carbonate-citrate solution and dilute to 1 L with distilled water.

Benzidine hydrochloride solution (for sulfate determination). Prepare a paste of 8 g of benzidine hydrochloride ($C_{12}H_8(NH_3)_2 \cdot 2HCl$) and 20 mL of distilled water, add 20 mL of 20% (mass/mass) HCl and dilute to 1 L with distilled water. Each mL of this solution is equivalent to 0.00357 g of H_2SO_4. Note that the reagent is often called benzidine dihydrochloride.

Bertrand's reagent (glucose estimation). Consists of the following solutions:

1. Dissolve 200 g of Rochelle salt (potassium sodium tartrate, $NaKC_4H_4O_6$) and 150 g of NaOH in sufficient distilled water to make 1.0 L of solution.
2. Dissolve 40 g of copper (II) sulfate pentahydrate in sufficient distilled water to a total of 1.0 L of solution.
3. Dissolve 50 g of iron (III) sulfate and 200 g of H_2SO_4 (sp. gr. 1.84) in sufficient distilled water to a total of 1.0 L of solution.
4. Dissolve 5 g of potassium permanganate in sufficient distilled water to a total of 1.0 L solution.

Bial's reagent (for pentose). Dissolve 1 g of orcinol (5-methyl-1,3-benzenediol, $C_7H_8O_2$, CAS No. 504-15-4) in 500 mL of 30% (mass/mass) HCl to which 30 drops of a 10% aqueous solution of iron (III) chloride have been added.

Boutron — Boudet soap solution: Consists of the following solutions:

1. Dissolve 100 g of pure castile soap (olive oil based) in about 2.5 L of 56% (vol/vol) aqueous ethanol.
2. Dissolve 0.59 g of barium nitrate in 1.0 L of water. Adjust the castile soap solution (1) so that 2.4 mL of it will produce a permanent lather with 40 mL of solution (2). When adjusted, 2.4 mL of this soap solution is equivalent to 220 parts per million of hardness (as calcium carbonate) for a 40 mL sample. See also Soap solution.

Brucke's reagent (protein precipitation). See Potassium iodide mercuric iodide.

Cobaltic cyanide paper (Rinnmann's test for zinc detection). Dissolve 4 g of potassium cobalt (III) hexacyanide ($K_3Co(CN)_6$) and 1 g of potassium chlorate in 100 mL of water. Soak filter paper in solution and dry at 100 °C. Apply a drop of the zinc solution and heat in an evaporating dish. A green disk on the filter paper is obtained if zinc is present.

Congo red. Dissolve 0.5 g of Congo red (3,3'-([1,1'-biphenyl]-4,4'-diyl)bis(4-amino naphthalene-1-sulfonic acid, $C_{32}H_{22}N_6Na_2O_6S_2$, CAS No. 573-58-0) in 90 mL of distilled water and 10 mL of ethanol.

Cupferron (Baudisch's reagent for iron analysis). Dissolve 6 g of Cupferron, the ammonium salt of *N*-hydroxy-*N*-nitrosoaniline ($NH_4[C_6H_5N(O)NO]$) in 100 mL of distilled water. The reagent is good only for one week and must be kept in the dark.

Cupric acetate (Barfoed's reagent for reducing monosaccharides). Dissolve 66 g of copper (II) acetate and 10 mL of glacial acetic acid in water and dilute to 1.0 L.

Cupric oxide, ammoniacal; Schweitzer's reagent (dissolves cotton, linen, and silk, but not wool). Dissolve 5 g of cupric sulfate in 100 mL of boiling water, and add sodium hydroxide until precipitation is complete. Wash the precipitate well, and dissolve it in a minimal quantity of ammonium hydroxide. Bubble a slow stream of air through 300 mL of concentrated ammonium hydroxide solution containing 50 g of fine copper turnings. Continue stirring for 1 hour.

Cupric sulfate in glycerin-potassium hydroxide (reagent for silk). Dissolve 10 g of copper (II) sulfate pentahydrate in 100 mL of water and add 5 g of glycerol. Add 6N KOH solution slowly until a deep blue solution is obtained.

Cupron (precipitates copper). Dissolve 5 g of benzoinoxime in 100 mL 95% ethanol.

Cuprous chloride, acidic (reagent for CO in gas analysis).

1. Cover the bottom of a 2 L flask with a layer of copper (II) oxide about 1.5 cm deep, suspend a coil of copper wire so as to reach from the bottom to the top of the solution, and fill the flask with hydrochloric acid 20% (vol/vol) HCl

(aq) with continuous stirring. When the solution becomes nearly colorless, transfer to reagent bottles, which should also contain copper wire. The stock bottle may be refilled with dilute (6N) HCl until either the cupric oxide or the copper wire is used up. Copper (II) sulfate may be substituted for copper oxide in the above procedure.

2. Dissolve 340 g of copper (II) chloride dihydrate in 600 mL of concentrated HCl and reduce the cupric chloride by adding 190 mL of a saturated solution of stannous chloride or until the solution is colorless. The stannous chloride is prepared by treating 300 g of metallic tin in a 500 mL flask with concentrated HCl until no more tin is dissolved.
3. (Winkler method). Add a mixture of 86 g of copper (II) chloride and 17 g of finely divided metallic copper, prepared by the reduction of 8 g to12 g of cupper (II) oxide with hydrogen gas, to a solution of HCl, made by diluting 650 mL of concentrated HCl with 325 mL of distilled water. After the mixture has been added slowly and with frequent stirring, a spiral of copper wire is suspended in the bottle, reaching all the way to the bottom. The solution is ready to use when the solution becomes colorless.

Cuprous chloride, ammoniacal (reagent for CO in gas analysis).

1. The acid solution of copper (II) chloride as prepared above is neutralized with 6N ammonium hydroxide until the ammonia odor persists. An excess of metallic copper must be kept in the solution.
2. Pour 800 mL of acidic copper (II) chloride, prepared by the Winkler method, into approximately 4 L of water. Transfer the precipitate to a 250 mL graduated cylinder. After several hours, siphon off the liquid above the 50 mL mark and refill with 7.5% ammonium hydroxide solution which may be prepared by diluting 50 mL of concentrated ammonium hydroxide with 150 mL of distilled water. The solution, which should have a faint odor of ammonia should be well stirred and allowed to stand for several hours.

Note: Proper precautions must be taken for the safe handling of gaseous samples that contain CO.

Dichlorofluorescein indicator. Dissolve 1 g dichlorofluorescein ($C_{20}H_{10}Cl_2O_5$, CAS No. 76-54-0) in 1 L 70% (vol/vol) ethanol or 1 g of the sodium salt in 1 L of distilled water.

Dimethyglyoxime, 0.01 N. Dissolve 0.6 g of dimethylglyoxime (2,3-butanedione oxime) in 500 mL of 95% ethanol. This is an especially sensitive test for nickel (II) and produces a very characteristic crimson color.

Diphenylamine (reagent for rayon). Dissolve 0.2 g diphenylamine in 100 mL of concentrated sulfuric acid.

Diphenylamine sulfonate (for titration of iron with $K_2Cr_2O_7$). Dissolve 0.32 g of the barium salt of diphenylamine sulfonic acid in 100 mL of distilled water, add 0.5 g of sodium sulfate and filter off the precipitated barium sulfate.

Diphenylcarbazide. Dissolve 0.2 g of diphenylcarbazide[$(C_6H_5NHNH)_2CO$] in 10 mL of glacial acetic acid and dilute to 100 mL with 95% ethanol.

2,4-Dinitrophenylhydrazine (2,4-DNP) Reagent. Dissolve 3 g of 2,4-dinitrophenylhydrazine in 15 mL to 20 mL of concentrated sulfuric acid. Add this solution with stirring to a solution of 10 mL distilled water in 70 mL of 95% hydrous ethanol. Use the filtrate to test for the presence of aldehydes and ketones as follows: To 2 mL of the solution add 10 drops of the unknown. A precipitate (which may be recrystallized from 95% hydrous ethanol) is indicative of a positive test and its melting point can be matched to the corresponding melting points of various aldehydes and ketones.

Esbach's reagent (estimation of protein). Dissolve 10 g of picric acid and 20 g of citric acid in sufficient distilled water to make a 1.0 L of solution.

Eschka's compound. Two parts of calcinated ("light") magnesia are thoroughly mixed with 1 part of anhydrous sodium carbonate.

Fehling's solution (reagent for reducing sugars).

1. Copper (II) sulfate solution: Dissolve 34.66 g of copper (II) sulfate pentahydrate in distilled water and dilute to 500 mL.
2. Alkaline tartrate solution: Dissolve 173 g of potassium sodium tartrate (Rochelle salt, $KNaC_4H_4O_6{\cdot}4H_2O$) and 50 g of NaOH in distilled water, cool and dilute to 500 mL. Mix equal volumes of solutions (1) and (2) just before using.

Ferric-alum indicator. Dissolve 140 g of iron (III) ammonium sulfate crystals in 400 mL of hot distilled water. Cool, filter, and add enough 6N nitric acid until the 500 mL mark.

Folin's mixture (for uric acid). To 650 mL of distilled water add 500 g of ammonium sulfate, 5 g of uranium (VI) acetate, and 6 g of glacial acetic acid and then dilute to 1.0 L with distilled water.

Formaldehyde — sulfuric acid (Marquis' reagent for alkaloids). Add 100 mL of concentrated sulfuric acid to 5 mL of 37% (mass/mass) aqueous formaldehyde solution.

Froehde's reagent. See Sulfomolybdic acid.

Fuchsin (reagent for linen). Dissolve 1 g of fuchsin (an aniline dye) in 100 mL of ethanol.

Fuchsin - sulfurous acid (Schiff's reagent for aldehydes). Dissolve 0.5 g of fuchsin and 9 g of sodium bisulfite in 500 mL of distilled water, and add 10 mL of concentrated HCl. Keep in well-stoppered bottles and protect from light. The fuchsin used to make the Schiff reagent should incorporate a high content of pararosanilin.

Gunzberg's reagent (detection of HCl in gastric juice). Dissolve 4 g of phloroglucinol (1,3,5-benzenetriol, $C_6H_3(OH)_3$) and 2 g of vanillin ($C_8H_8O_3$) in 100 mL of absolute ethanol.

Hager's reagent. See Picric acid.

Hanus solution (for iodine number). Dissolve 13.2 g of resublimed iodine in 1 L of glacial acetic acid, which should pass the dichromate test for reducible matter. Add sufficient bromine to double the halogen content, as determined by titration (approximately 3 mL). The iodine may be dissolved by heating, but the solution should be cold when the bromine is added.

Hopkins-Cole Reagent (test for presence of the indole ring in the tryptophan moiety of a protein or peptide). Add 5 mL cold water to 10 g of magnesium in a conical flask and add 250 mL of a cold saturated aqueous oxalic acid solution with vigorous stirring. Filter, add 25 mL of glacial acetic acid and dilute with distilled water to the 1.0 L mark. Place 10 drops of the saturated protein or peptide solution in a test tube, add 10 drops of concentrated nitric acid and heat in a water bath for three minutes. Allow the mixture to cool and add 4 mL 6N NaOH. A positive test is confirmed by the formation of a yellow color.

Iodine, tincture of. To 50 mL of distilled water add 70 g of iodine and 50 g of potassium iodide. Dilute to 1 L with absolute ethanol.

Iodo-potassium iodide (Wagner's reagent for alkaloids). Dissolve 2 g of iodine and 6 g of KI in 100 mL of distilled water.

Jones Reagent (test is positive for 1° and 2° alcohols, aldehydes, mercaptans, sulfides and sulfoxides). To 1 mL of 5% (mass/mass) sodium (or potassium) dichromate add 10 drops of the unknown compound. The formation of a green color (sometimes appearing as brown due to the mixture of the green chromium (III) and the unreacted orange chromium (VI) colors) indicates a positive test.

Litmus (indicator). Extract litmus powder three times with boiling alcohol (ethanol or isopropanol), each treatment lasting for an hour. Discard the alcoholic extract. Treat the residue with an equal mass of cold distilled water and filter; then add five times its weight of boiling distilled water. Cool, filter, and combine all aqueous extracts.

Magnesia mixture (reagent for phosphates and arsenates). Dissolve 50 g of magnesium chloride ($MgCl_2$·6H2O) and 100 g of ammonium chloride (NH_4Cl) in 500 mL of distilled water, add a slight excess of NH_4OH, and allow to stand overnight. Filter, make the solution just acidic with HCl, and dilute with distilled water to 1 L. Let stand for several days and separate the precipitated solid by decanting. The decantate should be used just prior to testing; otherwise, if stored for any period of time it becomes turbid.

Magnesium uranyl acetate. Dissolve 100 g of uranyl (VI) acetate dehydrate ($UO_2(C_2H_3O_2)_2$·$2H_2O$) in 60 mL of glacial acetic acid and dilute to 500 mL with distilled water. Dissolve 330 g magnesium acetate tetrahydrate ($Mg(C_2H_3O_2)_2$·$4H_2O$) in 60 mL of glacial acetic acid and dilute to 200 mL. Heat both solutions to boiling until clear; pour the magnesium acetate solution into the uranyl acetate solution, cool and dilute with distilled water to 1 L. Let stand overnight and filter if necessary.

Marme's reagent. See Potassium-cadmium iodide.

Marquis' reagent. See Formaldehyde-sulfuric acid.

Mayer's reagent (white precipitate with most alkaloids in slightly acid solutions). Dissolve 1.358 g of mercury (II) chloride in 60 mL of distilled water and pour into a solution of 5 g of potassium iodide in 10 mL of distilled water. Add sufficient distilled water to a final volume of 100 mL.

Methyl orange indicator. Dissolve 1 g of methyl orange in 1 L of distilled water. Filter, if necessary.

Methyl orange, modified. Dissolve 2 g of methyl orange and 2.8 g of xylene cyanole FF ($C_{25}H_{27}N_2NaO_6S_2$, CAS No: 2650-17-1) in 1 L of 50% (vol/vol) ethanol.

Methyl red indicator. Dissolve 1 g of methyl red in 600 mL of ethanol and dilute with 400 mL of distilled water.

Methyl red, modified. Dissolve 0.50 g of methyl red and 1.25 g of xylene cyanole FF ($C_{25}H_{27}N_2NaO_6S_2$) in 1 L of 90% (vol/vol) ethanol. Alternatively dissolve 1.25 g of methyl red and 0.825 g of methylene blue in 1 L of 90% (vol/vol) ethanol.

Millon's reagent (for albumins and phenols). Dissolve 1 part of mercury in 1 part of cold fuming nitric acid. Dilute with twice the volume of distilled water and decant the clear solution after several hours. All appropriate precautions must be observed when handling mercury.

Molisch's reagent. See 1-Naphthol.

1-Naphthol (Molisch's reagent for wool). Dissolve 15 g of 1-naphthol in 100 mL of 95% (vol/vol) ethanol or chloroform.

Nessler's reagent (for ammonia). Dissolve 50 g of potassium iodide in the smallest possible quantity of cold distilled water (50 mL). Add a saturated solution of mercury (II) chloride (about 22 g in 350 mL of distilled water will be needed) until an excess is indicated by the formation of a precipitate. Then add 200 mL of 5 N NaOH and dilute to 1 L with distilled water. Allow to settle and draw off the clear liquid.

Nickel oxide, ammoniacal (reagent for silk). Dissolve 5 g of nickel (II) sulfate in 100 mL of distilled water, and add 6N NaOH solution until nickel hydroxide is completely precipitated. Wash the precipitate well and dissolve in 25 mL of concentrated ammonium hydroxide and 25 mL of distilled water.

Nitron (detection of the nitrate radical). Dissolve 10 g of nitron (1,4-diphenyl-3-(phenylamino)-1,2,4-triazolium hydroxide, $C_{20}H_{18}N_4O$) in 5 mL of glacial acetic acid and 95 mL of distilled water. The solution may be filtered with slight suction through an Alundum thimble crucible and kept in a dark bottle.

1-Nitroso-2-naphthol. Make a saturated solution 1-nitroso-2-naphthol in 50% (vol/vol) aqueous acetic acid. The reagent should be used as soon as it is prepared.

Nylander's solution (carbohydrates). Dissolve 20 g of bismuth subnitrate ($Bi_5O(OH)_9(NO_3)_4$) and 40 g of Rochelle salt (potassium sodium tartrate, $KNaC_4H_4O_6$·$4H_2O$)in 1 L of 8% (mass/mass) aqueous NaOH solution. Cool and filter.

Obermayer's reagent (for indoxyl in urine). Dissolve 4 g of iron (III) chloride in 1 L of aqueous (vol/vol) 40% HCl.

Oxine. Dissolve 14 g of 8-hydroxyquinoline (C_9H_7NO) in 30 mL of glacial acetic acid. Warm slightly, if necessary to dissolve. Dilute to 1 L with distilled water.

Oxygen absorbent. Dissolve 300 g of ammonium chloride in 1 L distilled water and add 1 L of concentrated ammonium hydroxide solution. Shake the solution thoroughly. For use as an oxygen absorbent, the gas to be tested is passed through a bottle that is half full of copper turnings filled nearly to the top with this ammonium chloride - ammonium hydroxide solution.

Pasteur's salt solution. To 1 L of distilled water add 2.5 g of potassium phosphate, 0.25 g of calcium phosphate, 0.25 g of magnesium sulfate, and 12.00 g of ammonium tartrate.

Pavy's solution (glucose reagent). To 120 mL of Fehling's solution, add 300 mL of 6N ammonium hydroxide (sp. gr. 0.88) and dilute to 1 L with distilled water.

Phenanthroline ferrous ion indicator. Dissolve 1.485 g of 1,10-phenanthroline monohydrate ($C_{12}H_8N_2$·H_2O) in 100 mL of 0.025 M aqueous iron (II) sulfate solution.

Phenolphthalein. Dissolve 1 g of phenolphthalein in 50 mL of ethanol and add 50 mL of distilled water.

Phenolsulfonic acid (determination of nitrogen as nitrate). Dissolve 25 g of phenol in 150 mL of concentrated H_2SO_4, add 75 mL of fuming sulfuric acid (approximately 15% SO_3), stir well and heat for 2 hours at 100 °C.

Phloroglucinol solution (pentosans). Make a 3% phloroglucinol (1,3,5-benzenetriol) solution in alcohol. Store in a dark bottle.

Phosphomolybdic acid (Sonnenschein's reagent for alkaloids).

1. Prepare ammonium phosphomolybdate and after washing with distilled water, boil with nitric acid to expel all ammonia. Evaporate to dryness and dissolve in 2 M HNO_3.
2. Dissolve ammonium molybdate in HNO_3 and treat with phosphoric acid. Filter, wash the precipitate, and boil with aqua regia (a mixture of concentrated nitric acid and concentrated hydrochloric acid, 1:3 vol/vol) until the ammonium salt is decomposed. Evaporate to dryness. The residue is dissolved in 10% (vol/vol) HNO_3. The solution constitutes Sonnenschein's reagent.

Phosphoric acid — sulfuric acid mixture. Dilute 150 mL of concentrated sulfuric acid and 100 mL of concentrated phosphoric acid with distilled water to a final volume of 1 L.

Phosphotungstic acid (Scheibler's reagent for alkaloids).

1. Dissolve 20 g of sodium tungstate and 15 g of sodium phosphate in 100 mL of distilled water slightly acidified with dilute nitric acid.
2. The reagent is a 10% (mass/mass) solution of phosphotungstic acid in distilled water. The phosphotungstic acid is prepared by evaporating a mixture of 10 g of sodium tungstate dissolved in 5 g of phosphoric acid (sp. gr. 1.13) and enough boiling water to a complete solution. Crystals of phosphotungstic acid will separate.

Picric acid (Hager's reagent for alkaloids, wool and silk). Dissolve 1 g of picric acid in 100 mL of distilled water.

Potassium antimonate (reagent for sodium). Boil 22 g of potassium antimonate with 1 L of distilled water until nearly all of the salt has dissolved, cool quickly, and add 35 mL of 10% (mass/mass) potassium hydroxide. Filter after standing overnight.

Potassium-cadmium iodide (Marme's reagent for alkaloids). Add 2 g of cadmium (II) chloride to a boiling solution of 4 g of potassium iodide in 12 mL of distilled water, and then mix with 12 mL of saturated aqueous potassium iodide solution.

Potassium hydroxide (for CO_2 absorption). Dissolve 360 g of potassium hydroxide in distilled water and dilute to 1 L.

Potassium iodide — mercuric iodide (Brucke's reagent for proteins). Dissolve 50 g of potassium iodide in 500 mL of distilled water, and saturate with mercury (II) iodide (about 120 g). Dilute to 1 L with distilled water.

Potassium pyrogallate (for oxygen absorption). For mixtures of gases containing less than 28% (mass/mass) oxygen, add 100 mL of potassium hydroxide solution (50 g of KOH to 100 mL of distilled water) to 5 g of pyrogallol. For mixtures containing more than 28% (mass/mass) oxygen, the KOH solution should contain instead 120 g of KOH in 100 mL of distilled water.

Pyrogallol, alkaline. The reagent is a mixture of two solutions

1. Dissolve 75 g of pyrogallic acid in 75 mL of distilled water.
2. Dissolve 500 g of KOH in 250 mL distilled water. When cooled, adjust the solution with distilled water until the concentration is 50% (vol/vol).

For use, add 270 mL of solution (2) to 30 mL of solution (1).

Rosolic acid (indicator). Dissolve 1 g of rosolic acid ($C_{19}H_{14}O_3$) in 10 mL of ethanol and add 100 mL of distilled water.

Sakaguchi Reagent (for the presence of arginine in proteins or peptides). To 10 drops of the saturated protein or peptide solution, add 5 drops of 6 N NaOH followed by 5 drops of 0.05% (mass/mass) ethanolic 1-naphthol solution and 10 drops of 0.5% aqueous sodium hypochlorite. A positive test is indicated by the formation of a red color that fades away upon standing.

Scheibler's reagent. See Phosphotungstic acid.

Schiff's reagent. See Fuchsin-sulfurous acid.

Schweitzer's reagent. See Cupric oxide, ammoniacal.

Soap solution (reagent for hardness in water). Dissolve 100 g of dry castile soap in 1 L of 80% (vol/vol) ethanol (4 parts ethanol to 1 part distilled water). Allow to stand for several days and dilute with 70% ethanol until 6.4 mL of this solution produces a permanent lather with 20 mL of standardized calcium solution. The latter solution is made by dissolving 0.2 g of calcium carbonate in a small amount of dilute HCl, evaporating to dryness and then dissolving the precipitate with distilled water to a final volume of 1 L.

Sodium bismuthate (for the oxidation of manganese). Heat 20 parts of sodium hydroxide nearly to redness in an iron or nickel crucible and add slowly 10 parts of basic bismuth (III) nitrate which has been previously dried. Add 2 parts of sodium peroxide, and pour the brownish-yellow fused mass onto an iron plate to cool. When cooled, break up in a mortar, extract with distilled water, and collect on an asbestos filter.

Sodium hydroxide (for CO_2 absorption). Dissolve 330 g of sodium hydroxide in distilled water and dilute to 1 L.

Sodium nitroprusside (reagent for hydrogen sulfide and wool). Use a freshly prepared solution of 1 g of sodium nitroferricyanide in 10 mL of distilled water.

Sodium oxalate (primary standard). Dissolve 30 g of the commercial salt of sodium oxalate in 1 L of distilled water, make slightly alkaline with sodium hydroxide, and let stand until clear. Filter and evaporate the filtrate to 100 mL. Cool and filter. Pulverize the residue and wash it several times with small volumes of distilled water. The procedure is repeated until the mother liquor is sulfate-free and is neutral to phenolphthalein.

Sodium plumbite (reagent for wool). Dissolve 5 g of sodium hydroxide in 100 mL distilled water. Add 5 g of litharge (lead (II) oxide) and boil until dissolved.

Sodium polysulfide. Dissolve 480 g of sodium sulfide nonahydrate in 500 mL of distilled water, add 40 g of NaOH and 18 g of sulfur. Stir thoroughly and dilute to 1 L with distilled water.

Sonnenschein's reagent. See Phosphomolybdic acid.

Starch solution.

1. Make a paste with 2 g of soluble starch and 0.01 g of mercury (II) iodide with a small amount of distilled water. Add the mixture slowly to 1 L of boiling distilled water and boil further for a few minutes. Keep in a glass stoppered bottle. If other than soluble starch is used, the solution will not be clear on boiling; it should then be allowed to stand and the clear liquid decanted.
2. A solution of starch that keeps stable indefinitely is made as follows: Mix 500 mL of aqueous saturated NaCl solution (filtered), 80 mL of glacial acetic acid, 20 mL of distilled water and 3 g of starch. Bring slowly to a boil and further heat for 2 minutes.
3. Make a paste with 1 g of soluble starch and 5 mg of mercury (II) iodide using as little cold distilled water as possible. Then pour about 200 mL of boiling distilled water on the paste and stir immediately. This will give a clear solution if the paste is prepared correctly and the water is actually boiling. Cool and add 4 g of potassium iodide. Starch solution decomposes on standing due to bacterial action, but this solution will be stable if stored under a layer of toluene.

Stoke's reagent. Dissolve 30 g of iron (II) sulfate and 20 g of tartaric acid in distilled water and dilute to 1 L. Just before using, add concentrated ammonium hydroxide until the precipitate that is initially formed is redissolved.

Sulfanilic acid (reagent for nitrites). Dissolve 0.5 g of sulfanilic acid in a mixture of 15 mL of glacial acetic acid and 135 mL of recently boiled distilled water.

Sulfomolybdic acid (Froehde's reagent for alkaloids and glucosides). Dissolve 10 g of molybdic acid or sodium molybdate in 100 mL of concentrated sulfuric acid.

Tannic acid (reagent for albumin, alkaloids, and gelatin). Dissolve 10 g of tannic acid in 10 mL of ethanol and dilute with distilled water to 100 mL.

Titration mixture (residual chlorine in water analysis). Prepare 1 L of dilute HCl (100 mL of HCl (sp. gr. 1.19) in sufficient distilled water to make 1 L). Dissolve 1 g of *o*-tolidine (3,3'-dimethylbenzidine , CAS No. 119-93-7) in 100 mL dilute hydrochloride, stir well and dilute to 1 L using dilute HCl solution.

Tollen's Reagent (confirming the presence of aldehydes). 5 drops of 5% NaOH is added to 2 mL 10% aqueous silver nitrate in a test tube. The insoluble silver (I) oxide dissolved by the drop wise addition of 10% aqueous ammonia (ammonium hydroxide) yields a clear solution. Excess ammonium hydroxide should be avoided as it may give false positive result. Approximately 10 drops of the aldehyde will yield a silver mirror coating on the test tube inner wall, especially if the mixture is warmed up to 50 °C.

Trinitrophenol solution. See Picric acid.

Turmeric tincture (reagent for borates). Digest ground turmeric root with several quantities of distilled water which are discarded. Dry the residue and digest it several days with six times its weight of ethanol. Filter.

Uffelmann's reagent (turns yellow in presence of lactic acid). To a 2% solution of pure phenol in distilled water, add an aqueous solution of iron (III) chloride until the phenol solution becomes violet in color.

Wagner's reagent. See Iodo-potassium iodide.

Wagner's solution (used in phosphate rock analysis to prevent precipitation of iron and aluminum). Dissolve 25 g of citric acid and 1 g of salicylic acid in distilled water and dilute to 1 L. Use 50 mL of the reagent.

Wij's iodine monochloride solution (for iodine number). Dissolve 13 g of resublimed iodine in 1 L of glacial acetic acid that will pass the dichromate test for reducible matter. Set aside 25 mL of this solution. Bubble into the remainder of the solution dry chlorine gas (dried and washed by passing through concentrated sulfuric acid) until the characteristic color of free iodine has been dissipated. Add the 25 mL of the iodine solution that was set aside, until all free chlorine has been dissipated. A slight excess of iodine does little or no harm, but an excess of chlorine must be avoided. Preserve in well stoppered, amber colored bottles. Avoid the use of solutions that have been stored for more than 30 days.

Wij's special solution (for iodine number). To 200 mL of glacial acetic acid that will pass the dichromate test for reducible matter, add 12 g of dichloramine T (*N,N*-dichloro-4-methylbenzenesulfonamide, CAS No. 473-34-7), and 16.6 g of dry potassium crystals (in small quantities with continual shaking until all the potassium iodide has dissolved). Dilute to 1 L with the same quality of acetic acid used above and preserve in a dark colored bottle.

Zimmermann-Reinhardt reagent (determination of iron). Dissolve 70 g of manganese (II) sulfate tetrahydrate in 500 mL of water, add slowly 125 mL of concentrated sulfuric acid and 125 mL of 85% phosphoric acid, and dilute to 1 L with water.

Zinc chloride solution, basic (reagent for silk). Dissolve 1000 g of zinc chloride in 850 mL of distilled water, and add 40 g of zinc oxide. Heat until complete dissolving is complete.

Zinc uranyl acetate (reagent for sodium). Dissolve 10 g of $UO_2(C_2H_3O_2)2{\cdot}2H_2O$ in 6 g of 30% acetic acid, heat, if necessary, and dilute to 50 mL. Dissolve 30 g of zinc acetate dehydrate in 3 g of 30% acetic acid and dilute to 50 mL. Mix the two solutions, add 50 mg of sodium chloride, allow to stand overnight and filter. Use distilled water in all dilutions.

ORGANIC ANALYTICAL REAGENTS FOR THE DETERMINATION OF INORGANIC IONS

Paris D.N. Svoronos and Thomas J. Bruno

The table entitled Organic Analytical Reagents for the Determination of Inorganic Substances, by G. Ackermann, L. Sommer, and D. Thorburn Burns, has been revamped and considerably expanded for this edition. The many recent advancements in this area have been surveyed, and in this table, we present the major tests, reagents, and some guidance as to the expected result or method of observation. The abbreviations used here are defined in the abbreviations table in this section. In addition, for brevity, when a determination calls for a spectrophotometric measurement at a particular wavelength, for example at 500 nm, we denote this as: "spec λ = 500 nm." No wavelength is specified if it is variable, for example, with pH; here we indicate: "spec determination." When a determination calls for spectrofluormetric determination, the excitation and emission wavelengths are provided thus: specf λ_{ex} = 303.5 nm, λ_{em} = 353 nm. Note that a common surfactant used in many of these tests is cetyltrimethylammonium bromide, abbreviated (CTAB). When relevant, we provide an approximate limit of detection (LOD), and when the uncertainty can vary, this is expressed as a relative standard deviation (RSD). Some of the procedures listed here require the use of hazardous chemicals (carcinogens such as benzene, strong acids such as HF). Appropriate precautions must be observed.

While a great deal of the information presented here is from the recent literature, the reader is referred to several excellent reviews and monographs for additional information (Refs. 1–10).

I. Cations

Determination	Reagents	Results
Aluminum	Alizarin red S	Red color develops; spectrophotometric determination preferred
	Aluminon	Lake pigment stabilized with CTAB
	Chrome azurol S	Spec λ = 500 nm, stabilized with CTAB
	Chromazol KS	Spec λ = 625 nm, stabilized with cetylpyridinium bromide
	Eriochrome cyanine R (also known as mordant blue 3) + CTAB	Red dye lake (pH = 6) stabilized with CTAB
	Eriochrome cyanine R (also known as mordant blue 3) + *N*,*N*-dodecyltrimethylammonium bromide (DTAB)	Spec determination by use of cationic surfactants
	8-Hydroxyquinoline	Produces tris(8-hydroxyquinolinato) aluminum (Alq3), found in organic light emitting diodes (OLEDs)
	Bromopyrogallol red + cetyltrimethyl ammonium bromide	Spec λ = 627 nm
	Bromopyrogallol red + nonylphenol tetradecaethylene glycol ether	Spec λ = 612 nm
	Pyrocatechol violet	Spec λ = 578 nm after separation of aluminum from the matrix materials by chloroform extraction of its acetylacetone complex (pH = 6.5), from an ammonium acetate-hydrogen peroxide medium
	2,2′,3,4-Tetrahydroxy-3′,5′-disulfoazobenzene	Spec determination of the binary system (pH = 5)
Antimony	Brilliant green	Isolated as the hexachloroantimonate (V) salt extracted by either toluene or benzene
	Bromopyrogallol red	Used for the determination of antimony (III) with EDTA, cyanide or fluoride ions as masking agents
	Catechol violet	Ternary complex stabilized with CTAB
	Malachite green (basic green 4)	Isolated as the hexachloantimonate (V) complex after benzene extraction
	Phenyl fluorene	Sensitive color reaction with antimony (III) by use of cationic surfactants
	Potassium iodide	Antimony (III)-iodide complex formation in the presence of ascorbic acid
	Rhodamine B	Ion pair or ion association extraction by use of toluene or benzene as solvents

Determination	Reagents	Results
	Silver diethyldithiocarbamate	Spec λ = 504 nm to avoid arsenic interference
	Thiourea	Determination by hydride generation inductively coupled plasma atomic emission spectrometry after reduction of antimony (V) to antimony (III) by thiourea
Arsenic	Michler's ketone	Spec λ = 640 nm trophotometric determination of trace arsenic (V) in water
	Silver diethyldithiocarbamate	Spec λ = 600 nm to avoid antimony interference
	Thiourea	Determination by hydride generation inductively coupled plasma atomic emission spectrometry after reduction of arsenic (V) to arsenic (III) by thiourea
Barium	Dimethylsulfonazo-III (DMSA-III)	Spec λ = 662 nm of the chelate complex
	Alizarin S red	Red color used spectrophotometrically as a stain to determine the amount of barium in bone
Beryllium	Aluminon	Lake pigment derivative
	Ammonium bifluoride	Derivative detected by fluorescence
	Beryllon II	A resin phase spectrophotometric method that detects a change in absorbance of the resin phase immobilized with beryllon II
	Beryllon III	Determination achieved via third –derivative spectrophotometry and decolorization of excess reagent
	Chrome azurol S	Spec determination with chrome azurol S in the presence of EDTA or CTAB
	Eriochrome cyanine R + (CTAB)	Spec λ = 590 nm of ternary complex
	Sulfon black F	Derivative has a long color-development time
Bismuth	Amberlite XAD-7	Determination system implemented with (HG-ICP-AES) associated with flow injection (FI)
	Sodium azide	Azidodimethylbismuthine precipitate formed by the reaction of the corresponding bismuthine with sodium azide
	Diethyldithiocarbamate	Heterometric micro-determination of lead with sodium diethyldithiocarbamate by use of a mixture of EDTA, cyanide and ammonium hydroxide (λ = 400 nm)
	Dithizone	Orange-red derivative that is extracted in carbon tetrachloride
	Pyrocatechol violet	Spec determination of bismuth (III) with pyrocatechol violet in the presence of septonex CTAB
	Quinolin-8-ol	Determination system implemented with HG-ICP-AES associated with flow injection (FI)
	Thiourea	Determination by HG-ICP-AES
	Xylenol orange	Derivative used for sol-gel thin films that serve as bismuth (III) sensors
Boron	Azomethine H	Spec determination
	Carminic acid	Spec determination
	Curcumin	Spec determination of rosocyanine and rubrocurcumin formed by the reaction between borates and curcumin
	Methylene blue	Spec determination of complex formed between fluoroborate ions and methylene blue after treatment with hydrofluoric and sulfuric acids and extraction with ethylene chloride
Cadmium	2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol (PAR)	Spec determination in the presence of cationic surfactant cetylpyridinium chloride
	Cadion	Determination by β-correction spectrophotometry with cadion and surfactant Triton-X
	Dithizone	Determination of dithizonate derivative by the extraction – spectrophotometric method
	1-(2-Pyridylazo)-2-naphthol (PAN)	Two-dimensional absorption spec determination of complex in aqueous micellar solutions
	4–(2-Pyridylazo)resorcinol	Preconcentration by cloud point extraction of the complex; determination by ICP optic emission spectrometry. Simultaneous spectrophotometric determination of cadmium and mercury
Calcium	Alizarin S	Red dye used in staining bones for calcium determination
	Chlorophosphonazo III	Spec λ = 667.5 nm (pH = 2.2)
	Eriochrome black T + EDTA	Complexometric titration where the initially formed red calcium-eriochrome black T color is replaced with the blue calcium-EDTA color at the end point
	Glyoxal-bis(2-hydroxyanil)	Spectrophotometric titration of the complex without preliminary extraction
	Murexide	Spec λ = 506 nm (pH = 11.3)
	Phthalein purple	High-performance chelation ion chromatography involving dye-coated resins
Cerium	Butaperazine dimaleate propericiazine	Spec determination of the colored complex in a phosphoric acid medium
	Persulfate oxidation to cerium (IV)	UV spec λ = 320 nm
	Propericiazine	Spec determination of the colored complex in a phosphoric acid medium
	Propionyl promazine phosphate (PPP)	Spec λ = 513 nm of the red-colored radical cation formed upon the reaction of PPP with cerium(IV) in a phosphoric acid medium
	N-Benzoyl-*N*-phenylhydroxylamine	Spec titration of the cerium (IV) complex (pH = 8 to 10)
	Sodium triphosphate	Specf λ_{ex} = 303.5 nm, λ_{em} = 353 nm of the cerium (III) complex

Determination	Reagents	Results
	8-Hydroxyquinoline	Spec determination of the metal-ligand complex
Chromium	Alizarin S	Lake pigment complex formation
	1,5-Diphenylcarbazide	Spec determination during sonication in carbonated aqueous solutions saturated with CCl_4 that produces chlorine radicals
	3-(2-Pyridyl)-5,6 bis(5-(2 furyl disulfonic acid))-1,2,4-triazine disodium salt (ferene-TM)	Indirect spec λ = 593 nm in aqueous samples with a chromogen ferene-TM
	4-(2-Pyridylazo)resorcinol (PAR)	Spec determination of the ternary chromium-peroxo-par ternary complex
	4-(2-Pyridylazo)resorcinol (PAR) + hydrogen peroxide	Spec determination of the ternary chromo-peroxo-PAR mixture after ethyl acetate extraction in 0.1 M sulfuric acid
	4-(2-Pyridylazo)resorcinol (PAR) + xylometazolonium (XMH) chloride	Spec determination of the orange-red anionic complex formed in a heated acetate buffer medium (pH = 4.0 to 5.5) and extracted with the xylometazolonium (XMH) chloride
	Sulfanilic acid	Spec λ = 360 nm on the catalytic effect of chromium (VI) in the oxidation of sulfanilic acid by hydrogen peroxide with *p*-aminobenzoic acid as an activator
Cobalt	8-Hydroxyquinoline	Spec determination of the metal-ligand complex
	p-Nitroso-*N*,*N*-dimethylaniline	Spec determination of the binary complex
	Nitroso-R salt	AAS by use of a continuous on-line precipitation-dissolution procedure
	1-Nitroso-2-naphthol	Spec determination by use of non-ionic surfactant Triton X-100
	1-Nitroso-2-naphthol	Spec Tween 80 micelar determination
	1-Nitroso-2-naphthol	AAS by use of a continuous on-line precipitation-dissolution procedure based on 1-nitroso-2-naphthol
	2-Nitroso-1-naphthol	Spec λ = 530 nm after isoamyl acetate extraction
	1-(2-Pyridylazo)-2-naphthol + surfactants	Spec λ = 620 nm of the cobalt complex in the presence of surfactants (Triton X-100 combined with sodium dodecylbenzene sulfonate (DBS)) and trace of ammonium persulfate (pH = 5.0)
	4-(2-Pyridylazo)resorcinol (PAR)	Spec determination of complex at both pH = 7.2 to 7.9 and in 1 M H_2SO_4
	4-(2-Pyridylazo)resorcinol (PAR) + triethanolamine	Ion-pair reversed-phase high-performance liquid chromatography of the complex
Copper	Bathocuproine disulfonic acid	Spec λ = 470 nm to 550 nm of the Bathocuproine-disulfonic acid complex after extraction with chloroform and methanol by use of (PLS2)
	Dithizone	Spec determination of the dithizone complex at pH = 2.3
	Neocuproine	Spec determination of the deep orange-red $Cu(neocuproine)_2^+$ complex color
	Cuprizone	Spec determination of the highly chromogenic copper (III) cuprizone complex
	p-Nitroso-*N*,*N*-dimethylaniline	Spec determination of the binary complex
	1-Nitroso-2-naphthol	Spec determination by use of non-ionic surfactant Triton X-100
	4-(2-Pyridylazo)resorcinol	Preconcentration of copper by cloud point extraction of the complex and determination by ICP optic emission spectrometry
Europium	1-Nitroso-2-naphthol	Spec Tween 80 micelar determination
	ChromAsurol S	Spec determination of the binary complex
	4-(2-Pyridylazo)resorcinol (PAR) + tetradecyl-dimethylbenzylammonium chloride (TDBA)	Spec λ = 510 nm of the ion-associate complex extracted with chloroform at pH = 9.7
Gallium	Chrome azurol S + (CTAB)	Spec λ = 640 nm of the ternary complex
	Haematoxylin or its oxidized form + (CTAB)	Spec determination of the ternary complex of indium with haematoxylin or its oxidized form in the presence of cationic, anionic and non-ionic surfactants such as (CTAB)
	Pyrocatechol violet + diphenylguanidine	Spec determination of the ternary complex
	8-hydroxyquinoline	Spec determination of the gallium complex
	1-(2-Pyridylazo)-2-naphthol	Spectrofluorimetric determination of Ga(III) with 1-(2-pyridylazo)-2-naphthol in sodium dodecyl sulfate micellar medium
	4-(2-Pyridylazo)resorcinol (PAR)	Extraction and spec λ = 510 nm of gallium with 4-(2-pyridylazo)resorcinol
	Rhodamine B	Comparison of the determination of gallium by a rhodamine B spectrophotometric method and by an AA method based on preliminary solvent extraction
	Xylenol orange + 8-hydroxyquinoline	Spectrophotometric determination of the ternary complex
Germanium	Brilliant Green + Molybdate	Spec λ = 430 nm of the yellow germanomolybdic acid
	Phenylfluorone	Spec determination of the complex previously extracted with carbon tetrachloride at pH = 3.1
Gold	5-(4-Diethylaminobenzylidene) rhodanine	Immobilized 5-(4-dimethylamino-benzylidene) rhodanine serves as a stable solid sorbent for trace amounts of gold (III) ions (pH = 2 to 4)
	Di(methylheptyl)methyl phosphonate (DMHMP)	Trace gold determination by on-line preconcentration with flow injection atomic absorption spectrometry, by use of di(methylheptyl)methyl phosphonate (DMHMP) as the immobilized phase loaded onto a macroporous resin
	2-Mercaptobenzothiazole	Radiochemical separation and determination of gold complex matrices employing substoichiometric thermal neutron activation analysis

Determination	Reagents	Results
	Molybdate + nile blue (NB)	A spectrophotometric method based on the reaction of gold(III) with molybdate and nile blue (NB) to form an ion-association complex in the presence of poly(vinyl alcohol)
	Rhodamine B	Aqueous spec determination of gold with rhodamine B and surfactant
Hafnium	Arsenazo III	Spec determination of the arsenazo III complex in 10 M HCl or H_2SO_4
Indium	Bromopyrogallol red	Spec determination of indium after an ether extraction from hydrobromic acid, and benzyl alcohol extraction of its complex with bromopyrogallol red (pH 9.0)
	5-Bromine-salicylaldehyde salicyloylhydrazone (5-Br-SASH)	Specf λ_{ex} = 395 nm, λ_{em} = 461 nm of the indium: 5-Br-SASH chelate in a water–ethanol (63%) medium (pH = 4.6)
	Chrome azurol S	Spec determination of the binary complex
	Chrome azurol S + benzyldodecyldimethyl-ammonium bromide (BDDMAB)	Spec determination of the mixed complex with chrome azurol S and (BDDMAB)
	Chrome azurol S + (CTAB)	Spec λ = 630 nm of the ternary complex after *n*-butyl acetate extraction from hydrobromic acid
	Chrome azurol S + cationic surfactants	Spec determination by use of chrome azurol S and surfactants such as CTA, CP, or zephiramine
	Dithizone	Spec determination of the binary complex
	Haematoxylin or its oxidized form + (CTAB)	Spec determination of the ternary complex of indium with haematoxylin or its oxidized form in the presence of cationic, anionic and non-ionic surfactants such as (CTAB)
	8-Hydroxyquinoline	Spec determination of the binary complex
	Methylthymol blue + zepheramine	Spec determination of the ternary complex
	1-(2-Pyridylazo)-2-naphthol (PAN)	Spec determination of the chelate complex after chloroform extraction (pH = 6)
	4-(2-Pyridylazo)resorcinol	Spec λ = 520 nm after indium extraction from the aqueous phase (pH 5.0 to 5.5) into chloroform with *N-p*-chlorophenyl-2-furohydroxamic acid and formation of the 4-(2-pyridylazo)resorcinol red chelate
	Pyrocatechol violet	Spec determination of the binary complex
	Pyrocatechol violet + tridodecylammonium bromide	Spec determination of the ternary complex
	Quinalizarin (1,2,5,8-tetrahydroxyanthraquinone)	Spec λ = 565 nm of the binary 3:1 Quinalizarin:In(III) colored complex in dimethylformamide-water solution
	2,2′,3,4-Tetrahydroxy-3′,5′-disulfoazobenzene	Spec determination of the binary system (pH = 5)
	Xylenol orange	Spec determination of the ternary complex
Iridium	1,5-Diphenylcarbazide	Spec determination of the complex (pH = 5.0)
	1-(2-Pyridylazo)-2-naphthol	Spec λ = 550 nm of the red complex (pH = 5.1) after chloroform extraction
Iron	Bathophenanthroline	Determination of iron(II) in the presence of thousand-to-one ratio of iron(III) by use of bathophenanthroline
	Bathophenantroline-disulfonic acid	Spec λ = 470 nm to 550 nm of the bathophenantroline-disulfonic acid complex after extraction with chloroform and methanol
	2,2′-Bipyridine	Spec determination of the iron (II)-2,2'-bipyridine dark red complex
	FerroZine	Spec λ = 562 nm of iron (II)-ferrozine complex after all iron(III) has been reduced by ascorbic acid
	Hematoxylin + (CTAB)	Spec of the ternary complex. Addition of CTAB shifts λ_{max} from 630 nm to 640 nm
	1-Nitroso-2-naphthol	Spec determination by use of non-ionic surfactant Triton X-100
	1-Nitroso-2-naphthol	Spec determination Tween 80 micelar determination
	1,10-Phenanthroline (o-Phen)	Spec λ = 508 nm of the $Fe(o\text{-}Phen)_3^{+2}$ complex
	1,10-Phenanthroline + bromothymol blue	Spec determination of the $Fe(o\text{-}Phen)_3^{+2}$ complex in the presence of bromothymol blue
	Phenylfluorone	Spec λ = 530 nm of the binary complex (pH = 9.0)
	Phenylfluorone + Triton X	Spec λ = 555 nm of the binary complex sensitized with Triton X-100 (pH = 9.0)
Lanthanum	Ammonium purpurate	Spec determination of lanthanum with ammonium purpurate as a chromogenic reagent
	Arsenazo III	Spec determination of the lanthanum complexation with reagents of the arsenazo III group on the solid phase of fibrous ion exchangers
	Eriochrome cyanine R (ECR)	Spec λ = 540 nm of the binary complex
	N-Phenylbenzohydroxamic acid + xylenol orange	Solvent extraction followed by the spec λ = 600 nm of the ternary complex (pH = 8.8 to 9.5)
Lead	Dithizone	Orange-red derivative that is extracted in carbon tetrachloride
	Sodium diethyldithiocarbamate	Electrothermal AAS determination of the diethyldithiocarbamate derivative extracted in carbon tetrachloride
	Sodium diethyldithiocarbamate	Heterometric micro-determination of lead diethyldithiocarbamate derivative
	4-(2-Pyridylazo)resorcinol	Spec λ = 520 nm of 4-(2-pyridylazo)-resorcinol:lead (1:1) complex in an ammonia-ammonium chloride medium at pH = 10 after extracting the lead in isobutyl methyl ketone

Determination	Reagents	Results
Lithium	1-(*o*-Arsenophenylazo)-2-naphthol-3, 6-disulfonate (Thoron)	Spec λ = 480 nm of Thoron-lithium complex in an alkaline acetone medium is measured against the reagent as reference
Magnesium	Chlorophosphonazo III	Spec λ = 669 nm (pH = 7.0)
	Eriochrome black T + EDTA	Complexometric titration where the initially formed red magnesium-eriochrome black T color is replaced with the blue magnesium-EDTA color at the end point
	8-Hydroxyquinoline	Volumetric, titrimetric, and colorimetric determination
	8-Hydroxyquinoline + butylamine	Spec λ = 380 nm of the complex after chloroform extraction
	Titan yellow	Spec determination of magnesium by titan yellow in biological fluids
	Xylidyl blue	Spec determination of magnesium in biological fluids
Manganese	Formaldoxime	Spec determination of the formaldoxime/ammonia complex (pH = 8.8 to 8.9)
	1-(2-Pyridylazo)-2-naphthol (PAN)	Preconcentration determination by use of (PAN) anchored SiO_2 nanoparticles
Mercury	Dithizone	Spec λ = 500 nm of dithizone complex after chloroform extraction at pH = 0.3
	Michler's thioketone	Spec λ = 560 nm of the binary complex in acetate buffer
	4–(2-Pyridylazo)resorcinol	Simultaneous spec determination of cadmium and mercury with 4-(2-pyridylazo) resorcinol
	Rhodamine 6G	Photoelectrochemical determination of mercury (II) in aqueous solutions by use of a rhodamine 6G derivative (RS) and polyaniline (PANI) coated optical probe in a photoelectrochemical cell
	Xylenol orange + amine buffer	Spec λ = 590 nm of Hg(II)/xylenol orange complex display a sharp hyperchromic effect in the presence of amine buffers (pH= 7.5)
	Xylenol orange + citric acid-phosphate buffer	Spec λ = 580 nm of Hg(II)/xylenol orange complex display a sharp hypochromic effect upon substituting amine buffers with a citric acid-phosphate (pH = 7.5)
Molybdenum	Bromopyrogallol red + cetylpyridium chloride	Sequential injection analysis to the determination of CPC based on the sensitized molybdenum-bromopyrogallol red reaction
	Phenylfluorone	Spec λ = 560 nm of molybdenum with phenylfluorone (pH of 1.5 to 3)
	8-Hydroxyquinoline-5-sulfonic acid and phenylfluorone	Diffuse reflection spectrometry with 8-hydroxyquinoline-5-sulfonic acid and phenylfluorone after sorbing on a disk of an anion exchange fibrous material
	Pyrocatechol violet	Preconcentration (by use of basic anion exchanger AV-17-10P) and determination via diffuse reflection spectroscopy. The colored surface compound to be determined involves Mo(VI) sorption on the resin and subsequent treatment of the concentrate obtained with pyrocatechol violet
Neodymium	Semi-xylenol orange + cetylpyridinium chloride	Fourth-order derivative spectrophotometric determination of the ternary complex
Neptunium	Arsenazo III	Spec after separation by use of thenoyltrifluoroacetone extraction method and determination in 5M HNO_3
Nickel	2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol	Spec λ = 520 nm and 560 nm of the red-violet complex in water-ethanol (pH = 5.5)
	Dimethylglyoxime + ammonia	Spec λ = 543 nm of the complex
	Dimethylglyoxime, voltammetry	Nickel voltammetric determination at a chemically modified electrode based on dimethylglyoxime-containing carbon paste
	2,2′-Furildioxime	Spec λ = 438 nm after separation by adsorption of its α-furildioxime complex on naphthalene
	Hematoxylin	Spec λ = 595 nm of the binary system (pH = 7.8 to 8.3)
	Hematoxylin + (CTAB)	Spec λ = 608 nm of the ternary system (pH = 7.4 to 8.1)
	1-Nitroso-2-naphthol	Spec Tween 80 micelar determination
	p-Nitroso-*N*,*N*-dimethylaniline	Spec determination of the binary complex
	2-(2-Pyridylazo)-2-naphthol	Derivative spectrophotometry λ= 569 nm determination of nickel complex in Tween 80 micellar solutions
	4-(2-Pyridylazo)resorcinol	Preconcentration of nickel by cloud point extraction of the complex and determination by ICP optic emission spectrometry
	1-(2-Thiazolylazo)-2-naphthol (TAN)	Flow-injection solid phase spectrophotometry by use of TAN immobilized on C_{18}-bonded silica (λ = 595 nm)
	Xylenol orange	Spec determination by mean centering of ratio kinetic profile (pH = 5.3)
Niobium	*N*-Benzoyl-*N*-phenylhydroxylamine	Separation and determination of the complex from a tartrate solution at pH > 2
	Bromopyrogallol red	Spec λ = 610 nm of complex extracted into isopentyl acetate containing di-*n*-octylmethylamine
	O-Hydroxyhydroquinonephthalein (Qnph) + hexadecyltrimethylammonium chloride (HTAC)	Spec λ = 520 nm of the complex in strong acidic media
	4-(2-Pyridylazo)resorcinol + citrate	Determination of the ternary complex by ion-interaction reversed-phase HPLC on a C18 column with a 5 mM citrate buffer (pH = 6.5, λ = 540 nm)
	Pyrocatechol violet	Extraction and spec determination of niobium complex in the presence of pyridine and trichloroacetic acid
	Sulfochlorophenol S	Spec determination of the complex after extraction into amyl alcohol
	Xylenol orange	Spec λ = 530 nm of chelate (pH = 5.0)
Osmium	1,5-Diphenylcarbazide	Spec λ = 560 nm of the bluish-violet complex after extraction with isobutyl methyl ketone

Determination	Reagents	Results
	Thiourea	Spec λ = 540 nm of the red-rose complex in acid medium
Palladium	Ammonia + iodide	Thermogravimetric determination of palladium as $Pd(NH_3)_2I_2$
	2,2-*bis*-[3-(2-Thiazolylazo)-4-4-hydroxyphenyl-propane], (TAPHP)	Application of TAPHP immobilized on silica beads to determine the palladium concentration in a trans-luminance configuration (pH = 2) by use of flow-through spectrophotometric sensing phase
	2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol	Spec determination of the complex in a sulfuric acid medium in the presence of ethanol
	Dithizone	Volumetric determination of palladium with dithizone in acid medium after extraction of its dimethylglyoxime complex with chloroform; PAS determination of the dithizone extraction solution into a thermally thin solid film
	Dithiazone + iodide	Spec determination of palladium with dithizone, by use of an iodide medium in the presence of sulfite at pH = 3 to 5, to separate platinum
	Dithizone + stannous chloride	Extractive separation and spec determination of palladium in the presence of stannous chloride to separate platinum
	Isonitrosobenzoylacetone	Radiochemical separation and determination of palladium in complex matrices employing substoichiometric thermal NAA
	2-Nitroso-1-naphthol	Spec λ = 370 nm of the violet complex
	4-(2-Pyridylazo)resorcinol	Spec determination of complex at both pH = 7.2 to 7.9 and in 1 M H_2SO_4
	4-(2-Pyridylazo)resorcinol + diphenylguanidine	Spec determination after extraction of the red Pd(II) chelate with 4-(2-pyridylazo) resorcinol in the presence of *N,N′*-diphenylguanidine into *n*-butanol
Platinum	*N*-Phenylbenzimidoylthiourea (PBITU)	Flow injection analysis spec λ = 345 nm of the Pd:PBITU complex in (0.2 to 2.0) M HCl in10% (vol/vol) ethanol solution
	Dithizone + iodide	Spec determination of platinum with Dithizone, by use of an iodide medium in the presence of sulfite at pH = 3 to 5, to separate palladium
	Dithizone + stannous chloride	Extractive separation and spectrophotometric determination of platinum in the presence of stannous chloride to separate palladium
	2-Mercaptobenzothiazole	Radiochemical separation and determination of platinum complex matrices employing substoichiometric thermal NAA
Protactinium	Arsenazo III	Spec λ = 680 nm of the complex after extraction with 7 N H_2SO_4 and isoamyl alcohol
	EDTA + tannic acid	Gravimetric analysis of the tannic acid precipitate (pH = 5.0)
Rhenium	2,2′-Furildioxime	Spec λ = 532 nm of the complex
	N,N-Diethyl-*N′*-benzoylthiourea	Spec λ = 383 nm of the green complex in hydrochloric acid medium in the presence of tin(II) chloride
	Tin(II)	Spectrophotometric titration for the determination of rhenium by use of tin(II) as the titrant
Rhodium	1,5-Diphenylcarbazide	Spec determination of the complex after isobutyl alcohol extraction (pH = 5.0)
	p-Nitrosodimethylaniline	Spec λ = 510 nm of the cherry-red binary complex (pH = 4.4)
	1-(2-Pyridylazo)-2-naphthol	Spec λ = 598 nm of the green complex (pH = 5.1) after chloroform extraction
Ruthenium	4-Benzylideneamino-3-mercapto-6-methyl-1,2,4-triazine (4H)-5-one	Spec λ = 620 nm
	1,10-Phenanthroline	Chemiluminescence determination of chlorpheniramine by use of tris(1,10-phenanthroline)-ruthenium(II) peroxydisulfate system and sequential injection analysis; Spec determination of the complex after reducing Ru (IV) to Ru(II)
	Thiourea	Spec λ = 640 nm of ruthenium complex in carbon supported Pt-Ru-Ge catalyst in 5 M HCl
	1,4-Diphenylthiosemicarbazide	Spec determination of the bright red complex
Scandium	Alizarin red S	Cathodic adsorptive stripping of the scandium-alizarin red S complex onto a carbon paste electrode
	Ammonium purpurate	Spec determination of scandium with ammonium purpurate as a chromogenic reagent
	Chrome azurol S	Spec determination of the binary complex
	Xylenol orange	Spec λ = 553 nm of the binary mixture
Selenium	3,3′-Diaminobenzidine	Spec λ = 350 nm of the yellow complex (pH = 3.0)
	2,3-Diaminonaphthaline	Fluorometric determination of the binary complex in water
	Thiourea	Determination of selenium by hydride generation inductively coupled plasma atomic emission spectrometry
Silver	Dithizone	Graphite-furnace atomic-absorption spectrophotometric determination of silver on suspended dithizone particles from acidic sample solutions with ultrasonics to facilitate the separation
	Eosin + 1,10-phenanthroline	Spec λ = 540 nm to 555 nm of the 1,10-phenanthroline (PHEN) and eosin (2,4,5,7-tetrabromofluorescein) association complexes
Strontium	Phthalein purple	High-performance chelation ion chromatography involving dye-coated resins
Tantalum	*N*-Benzoyl-*N*-phenylhydroxylamine	Separation and determination of the complex from a tartrate solution at pH < 1.5

Determination	Reagents	Results
	Crystal violet (CV) + *N*,*N*′-diphenylbenzamidine (DPBA)	Spec λ = 600 nm of Ta(V)-F-CV+ cation complex with a benzene solution of DPBA from sulfuric acid solution
	O-Hydroxyhydroquinonephthalein (Qnph) + hexadecyltrimethylammonium chloride (HTAC)	Spec λ = 510 nm of the complex in strong acidic media
	Malachite green	Spec λ = 623 nm of the complex in HF after extraction with benzene or toluene
	Methyl violet	Spec determination of the complex
	4-(2-Pyridylazo)resorcinol + citrate	Determination of the ternary complex by ion-interaction reversed-phase HPLC on a C18 column in 5 mM citrate buffer (pH = 6.5, λ = 540 nm)
	Phenylfluorone	Spectrophotometric determination from HF-HCl solution with methyl isobutyl ketone
	Victoria blue	Spectrophotometric determination of the complex after benzene extraction
Tellurium	Ammonium pyrrolidinedithiocarbamate	Differential determination of tellurium(IV) and tellurium(VI) by AAS with a carbon-tube atomizer
	Bismuthiol II	Spec λ = 330 mm of the yellow complex in acidic medium (pH = 3.5) after chloroform extraction
	Dithizone	Differential determination of tellurium(IV) and tellurium(VI) by AAS with a carbon-tube atomizer
	Sodium diethyldithiocarbamate	Differential determination of tellurium(IV) and tellurium(VI) by AAS with a carbon-tube atomizer
	Thiourea	Determination of selenium by hydride generation inductively coupled plasma atomic emission spectrometry
Thallium	Brilliant green	Spec determination of the binary complex after toluene extraction
	Dithizone	Spec λ = 505 mm of the complex after chloroform extraction from a citrate-sulfite-cyanide medium at pH = 10.6
	8-Hydroxyquinoline	Spectrophotometric determination of the metal-ligand complex
	Rhodamine B	Fluorimetric determination of thallium (in silicate rocks) with rhodamine B after separation by adsorption on a crown ether polymer
	Rhodamine B hydroxide	Spec λ = 565 nm via oxidation of rhodamine B hydrazide by thallium(I) in acidic medium to give a pinkish violet radical cation
Thorium	Arsenazo III	Spec determination of the arsenazo III complex in 10 M HCl or H_2SO_4
	Eriochrome cyanine R (ECR)	Spec λ = 540 nm of the binary complex
	Thoron	Spectrophotometric determination of binary complex in tartaric acid
	Xylenol orange	Spec λ = 570 nm of the binary complex (pH = 4.0)
	Xylenol orange + CTAB bromide	Spec λ = 600 nm of the complex sensitized by CTMAB (pH = 2.5)
Tin	Catechol violet + CTAB bromide	Spectrophotometric determination of the green complex
	Pyrocatechol violet (and + CTAB bromide)	Spec λ = 660 nm of the complex (pH = 2.0)
	Gallein	Spectrophotometric determination of complex in acid medium
	Phenylfluorone	Spec determination of the complex (pH = 1) in 36% aqueous ethanol after a preliminary solvent extraction of the tin as the iodide
	Toluene-3,4-dithiol + dispersant	Spec determination of the complex
Titanium	Chromotropic acid	Spec λ = 443 nm of the complex by use of a flow injection manifold
	Diantipyrinylmethane	Spec λ = 390 nm of the yellow complex
	3-Hydroxy-2-methyl-1-(4-tolyl)-4-pyridone (HY)	Spec λ = 355 nm of the ternary complex formed in perchloric acid and is extracted by chloroform
	Methylene blue-ascorbic acid redox reaction	Spec λ = 665 nm of the titanium-methylene blue-ascorbic acid redox reaction
	Tiron	Spec λ= 420 nm of the yellow Tiron derivative (pH = 5.2 to 5.6)
Tungsten	Cyanate	Spectrophotometric determination of tungsten with thiocyanate after both tungsten(VI) and molybdenum(VI) are extracted into chloroform as benzoin α-oxime complexes
	Pyrocatechol violet	Determination of the 2:1 green complex in acid medium which is fixed on a dextran-type anion-exchange resin (Sephadex QAEA-25) by first-derivative solid-phase spectrophotometry (λ = 674 nm)
	Tetraphenylarsonium chloride + thiocyanate	Gravimetric determination of tungsten with tetraphenylarsonium chloride after its extraction as thiocyanate (pH = 2 to 4)
	Toluene-3,5-dithiol	Spec λ = 630 nm of the toluene-3,4-dithiol derivative after extraction with isoamyl acetate
Uranium	Arsenazo III (1,8-dihydroxynaphthalene-3,6-disulfonic acid-2,7-bis[(azo-2)-phenylarsonic acid])	Spec determination of the binary complex
	2-(5-Bromo-2-pyridylazo)diethylaminophenol	Spec λ = 578 nm of the complex (pH = 7.6)
	Chlorophosphonazo III	Spec λ = 673 nm of the complex after extraction into 3-methyl-1-butanol from (1.5 to 3.0) M HCl
	8-Hydroxyquinoline	Spectrophotometric determination of the metal (UO_2 (II))-ligand complex

Determination	Reagents	Results
	2-(2-Pyridylazo)-5-diethylaminophenol (PADAP)	Spec λ = 564 nm of the complex after extraction into methyl isobutyl ketone (pH = 8.2)
	1-(2-Pyridylazo)-2-naphthol (PAN)	Spec λ = 560 nm of the deep red precipitate in ammoniacal solutions extracted with chloroform
	4-(2-Pyridylazo)-resorsinol (PAR)	Spec λ = 530 nm of the intensely deep red complex after extraction into methyl isobutyl ketone (pH = 8.0)
	2-(2-Thiazolylazo)-*p*-cresol + surfactants	Spec λ = 588 nm of the complex (pH = 6.5) with surfactants such as Triton X-100 or N-cetyl-*N*,*N*,*N*-trimethyl ammonium bromide (CTAB)
Vanadium	Chrome azurol S	Spectrophotometric determination of the binary complex
	N-Benzoyl-*N*-phenylhydroxylamine	Spec determination of the violet complex in acidic medium
	3,5-Dinitrocatechol (DNC) + brilliant green	Extraction-spectrophotometric determination of the system V(V)-3,5-dinitrocatechol (DNC)-brilliant green chelate complex
	8-Hydroxyquinoline (oxine)	Extraction with *n*-butanol and spec λ = 390 nm of a ternary complex (vanadium:oxine:*n*-butanol = 1:2:2)
	8-Hydroxyquinoline-5-sulfonic acid and phenylfluorone	Diffuse reflection spectrometry with 8-hydroxyquinoline-5-sulfonic acid and phenylfluorone after sorbing on a disk of an anion exchange fibrous material
	4-(2-Pyridylazo)resorcinol (PAR)	Spec determination of the binary complex based on the extraction tetraphenylphosphonium or tetraphenylarsonium chloride
	Xylenol orange	Spec λ = 490 nm of chelate (pH = 5.0)
Yttrium	Alizarin red S	Spec λ = 550 nm of the complex
	Ammonium purpurate	Spec determination of yttrium with ammonium purpurate as a chromogenic reagent
	Arsenazo III	Spec λ = 660 nm of the blue colored complex after preliminary purification with hydroxide and subsequent acidification
	Eriochrome cyanine R (ECR)	Spec λ = 540 nm of the binary complex
	Pyrocatechol violet	Spec λ = 665 nm of complex
Zinc	2-(5-Bromo-2-pyridylazo)-5-diethylaminophenol	Spec determination by use of 2-(5-bromo-2-pyridylazo)-5-diethyl aminophenol in the presence of cationic surfactant cetylpyridinium chloride
	Carbonic anhydrase	Enzymatic determination by use of carbonic anhydrase after removing zinc by dialysis against dipicolinic acid
	Dithizone	Spec λ = 530 nm of binary complex after chloroform extraction
	Eriochrome black T + EDTA	Complexometric titration where the initially formed red zinc-eriochrome black T color is replaced with the blue zinc-EDTA color at the end point (pH = 10)
	7-(4-Nitrophenylazo)-8-hydroxyquinoline-5-sulfonic acid (*p*-NIAZOXS)	Spec λ = 520 nm of the zinc derivative (pH = 9.2, borax buffer)
	Phenylglyoxal mono(2-pyridyl) hydrazone (PGMPH)	Spec λ = 464 nm to 470 nm of the yellow-orange complex (pH = 7.2 to 8.5) in 40% (v/v) ethanol
	1-(2-Pyridylazo)-2-naphthol (PAN)	Two-dimensional absorption spec determination of complex in aqueous micellar solutions
	1-(2-Pyridylazo)-2-naphthol (PAN)	Preconcentration determination by use of 1-(2-pyridylazo)-2-naphthol (PAN) anchored. SiO_2 nanoparticles
	4-(2-Pyridylazo)resorcinol	Spec determination at pH = 7.0; preconcentration of zinc by cloud point extraction of the complex and determination by ICP optic emission spectrometry
	1-(2-Thiazolylazo)-2-naphthol (TAN)	Flow-injection solid phase spec λ = 595 nm with TAN immobilized on C18-bonded silica
	Xylenol orange	Spec determination of 1:1 zinc-xylenol orange red-violet complex (pH= 5.8 to 6.2)
	Xylenol orange	Sequential injection analysis (SIA) based on the spec λ = 568 nm of zinc by use of xylenol orange as a color reagent
	Xylenol orange	Spec determination by mean centering of ratio kinetic profile (pH = 5.3)
	Xylenol orange + cetylpyridinium chloride	Spec λ = 580 nm of the 1:2:4 ratio for the metal:ligand: surfactant ternary complex (pH = 5.0 to 6.0)
Zirconium	Alizarin red S	Spec determination of the binary complex after phosphate extraction
	Arsenazo III (1,8-dihydroxynaphthalene-3,6-disulfonic acid-2,7-bis[(azo-2)-phenylarsonic acid])	Spec determination of the binary complex
	N-*p*-Chlorophenylbenzohydroxamic acid (*N*-*p*-Cl-BHA) + morin	Spec λ = 420 nm and fluorimetric determination of the *N*-*p*-Cl-BHA greenish yellow complex after extraction with isoamyl alcohol from (0.2 to 0.5) N H_2SO_4 followed by morin addition; it is critical that the morin be very pure
	Pyrocatechol violet	Spec λ = 650 nm of the blue complex in sulfuric acid solution
	Pyrocatechol violet + tri-*n*-octylphosphine oxide (TOPO)	Spec λ = 655 nm of the blue complex after extraction with tri-*n*-octylphosphine oxide (TOPO) in cyclohexane
	Morin	Fluorimetric determination of the complex after EDTA addition
	Xylenol orange	Flow injection spectrophotometric determination in sulfuric acid medium

II. Anions

Anion	Method	Results/Comments
Arsenate, AsO_4^{-3}	X-ray absorption near edge structure (XANES)	Use of self-consistent multiple-scattering methods that measure the AsO_4^{-3} adsorption on TiO_2
	Dual detection ion chromatography	Simultaneous determination of AsO_4^{-3} and AsO_3^{-3} (LOD = 0.044 mg/L)
	Ion chromatography/inductively-coupled plasma/MS	Validation established after ultrasonic-assisted enzymatic extraction
	Ion chromatography	Post-column generation and detection of the AsO_4^{-3} molybdate heteropoly ion
	Surface-enhanced Raman scattering (SERS)	Use of Ag nanostructured multilayer films; LOD = 5 μg/L
	Liquid chromatography-atomic fluorescence detection	Simultaneous determination of six As ions; LOD < 4 μg/L
	LC-ICP/MS	Simultaneous determination of five As ions; LOD < 4 μg/L
	HPLC/hydride generation atomic absorption	Simultaneous determination of six As ions; LOD = 3 ng to 9 ng
	Ion exchange determination	Separation of AsO_4^{-3} and AsO_3^{-3} using the weakly basic anion exchanger A63-X4A by difference of respective pK_a values
	Titration	As^{+5} is reduced by NH_2NH_2 and titration with Br^-/BrO_3^-
Bromide, Br^-	Ion chromatography using electrochemical detection	Use of Ag working electrode; LOD = 10 ppb (mass/mass)
Carbonate, CO_3^{-2}	GC	Carbonation of salt and use of a GC with methanation reformer and a flame ionization detector
	GC-MS	Determination of pentafluorobenzyl derivative
	FTIR	CO_3^{-2} measurement in organic matter (875 cm^{-1} and 712 cm^{-1})
	Gas measurement	Conversion to CO_2 measured by a barometer or manometer
	Ion chromatography	Measurement in the presence of formyl ions
	Photoacoustic IR spectroscopy	Use of several multi-calibration methods typically in sedimentary rocks
	Thermal optical analysis	Use of semi-continuous carbon elemental analyzer
	Liquid chromatography	Use of a C18 HPLC column, MeOH/AcOH mobile phase and UV detection (spec λ = 290 nm)
	Raman spectroscopy	Use of OH stretch band of H_2O as internal standard
	Thermogravimetry	CO_3^{-2} measurement in organic matter after identification of evolved gaseous species
Chlorate, ClO_3^-	Flow injection analysis	Reduction of methylene blue's leuco form to methylene blue followed by optical detection in the visible region
	Spectrophotometry	Reduction to Cl_2 via Tl^{+3} which oxidizes the leuco form of methylene blue
	FTIR	Absorption band at 973 cm^{-1} (λ = 10 277 nm)
	Anodic electrochemical dissociation	Determination made during the anodic dissociation of Ti grade VT-1
	Potentiometric titration	Reduction to Cl^- (pH = 7) using As^{+3} (OsO_4 as catalyst)
	Titrimetric analysis	ClO_3^- converted to Cl^- which is titrated against $Hg(NO_3)_2$ (diphenylcarbazone as indicator)
	Titrimetric analysis	Iodometric titration
	Titrimetric analysis	Use of methyl orange (LOD = 10^{-2} μg, mass/mass)
Chromate, CrO_4^{-2}	Potentiometric titration	Selective electrode based on the N,N-butylenebis (salicylideneiminato) copper(II); LOD = 3.0×10^{-6} mol/L
	Spectrophotometry	Determination by oxidation of ascorbic acid (spec λ = 548 nm)
	Ion exchange chromatography	Diaminetetraacetic acid (DCTA)/CH_3CN used as eluent
	Ion pair chromatography	Tetrabutylammonium hydroxide (TBAH)/aq. CH_3CN used as eluent
	Capillary electrophoresis	KH_2PO_4 buffer (pH = 7)
	Titration	Iodometric titration
	X-ray absorption near edge structure (XANES)	LOD = 10 ppm using a 150 μm synchrotron X-ray beam
Cyanide, CN^-	Headspace GC/MS	Use of gas chromatography with a silica PLOT column coupled with mass selective detection
	Headspace GC/MS	Use of gas chromatography with a nitrogen-phosphorus detector; LOD = 0.05 μg/mL to 5 μg/mL
	Headspace GC/MS	Use of headspace solid-phase microextraction (SPME); LOD = 0.006 μg/mL
	Headspace GC/MS	Determined as the pentafluorobenzylbromide derivative in the presence of TDMBC
	Headspace GC	Use of GC with thermoionic detection (NPD)
	Headspace GC/MS	Use of GC with the flame ionization detector (FID)
	Headspace GC/MS	Determination after reaction with chloramine-T
		Derivatization by the pyridine-pyazolone method
	Ion chromatography using electrochemical detection	Use of Ag working electrode; LOD = 1 μg/L
	Cyclic voltammetry	Au electrode; LOD = 10^{-5} mol/L to 10^{-6} mol/L

Anion	Method	Results/Comments
	Differential cathodic stripping voltammetry	LOD = 2×10^{-7} M in the presence of 5×10^{-5} M [S^{-2}] and 1×10^{-3} M [Cu^{+2}]
	Differential electrolytic potentiometry (DEP)	DEP coupled with the sequential injection/flow analysis (SIA/FIA) of aqueous solutions; con. range 6 µg/mL to 39 µg/mL; LOD = 0.31 µg/mL; RSD = 2.55
	Isotachophoresis	Determination as [$Au(CN)_2^-$], [$Ag(CN)_2^-$], or [$Cu(CN)_3^{-2}$] complexes
	Potentiometric determination	Use of PVC sensors responsive to $Ag(CN)_2^-$
	Spectrofluorometry	Use of naphthoquinone imidazole boronic-based sensors (M-NQB and p-NQB) with CTAB (spec λ = 460 nm)
	Fluorescence	Derivatization with naphthalene 2,3-dicarboxyaldehyde and taurine (specf λ_{ex} = 418 nm, λ_{em} = 460 nm); LOD = 0.002 µg/mL to 0.025 µg/mL
	Argentometric method	Argentometric titration/quantification using KCNS ($FeNH_4SO_4$) as indicator
	Capillary electrophoresis/UV spectrophotometry	Conversion of CN^- to SCN^- via rhodanese, separated by capillary electrophoresis and measured by UV spectrophotometry (spec λ = 200 nm); LOD = 3 µmol
	Piezoelectric quartz crystal (PQC) sensors	Method makes use of silver coated sensors; LOD = 1.25×10^{-8} mol/L
	Visible spectrophotometry colorimetric assay	Picrate/resorcinol derivative in bicarbonate (spec λ = 488 nm)
	Visible spectrophotometry colorimetric assay	Lithium/sodium picrate derivative (spec λ = 500 nm to 520 nm); LOD = 2.5 µg/100 mg sample
	Visible spectrophotometry colorimetric assay	Isonicotinic acid-barbituric acid derivative after treatment with chloramine-T (spec λ = 600 nm)
	Visible spectrophotometry colorimetric assay	4-hydroxy-3-(2-oxoindoline-3-ylideneamino)-2-thioxo-2H-1,3-thiazin-5(3H)-one) HOTT derivative (spec λ = 466 nm)
	Visible spectrophotometry colorimetric assay	Ethanol extraction of the red complex formed on picric acid test strips (spec λ = 500 nm); LOD = 0.5 µg to 1.0 µg
	Visible spectrophotometry colorimetric assay	Derivatization with p-nitrobenzaldehyde followed by reaction with o-dinitrobenzene to yield a purple color; LOD = 10 µg/L
	Visible spectrophotometry colorimetric assay	Barbituric or N,N-dimethylbarbituric acid derivative
	Visible spectrophotometry colorimetric assay	Spectrophotometric determination by use of a modified Konig reaction with NaOCl as the chlorinating agent
	Visible spectrophotometry colorimetric assay	Complexation with pyridine or 4-pyridinecarboxylic acid
	Visible spectrophotometry colorimetric assay	Reaction of CN^- with Pd-dimethylglyoximate complex that releases dimethylglyoxime, isolated as the Ni derivative
	Visible spectrophotometry colorimetric assay	Determination (spec λ = 570 nm) of pyridine/barbituric acid derivative after chloramine-T derivative
	Visible spectrophotometry colorimetric assay	Measurement of the pyridine-pyrazolone derivative
	Visible spectrophotometry colorimetric assay	Measurement of the isocotinic acid/1-phenyl-3-methyl-5-pyrazolone derivative after reaction with chloramine-T (spec λ = 638 nm)
	Visible spectrophotometry colorimetric assay	Measurement of the derivative with the Hg(II)-p-dimethylaminobenzylidenerho danine complex (spec λ = 452 nm)
	Visible spectrophotometry colorimetric assay	Measurement of the Hg(II)-diphenylcarbazone derivative (spec λ = 562 nm)
	Visible spectrophotometry colorimetric assay	Measurement of the pyridine-benzidine complex; LOD = 0.02 µg
	Visible spectrophotometry colorimetric assay	Measurement of the pentacyano(N-methylpyrazinium) ferrate (II) complex (spec λ = 658 nm)
	Flow injection analysis	Use of Ag and Pt electrodes to determine CN^- as Cu complexes
	Flow injection analysis	Analyzed as the teracyanonickelate (II) complex
	Fluorescent sensors	Fluoresecein derivative emits a green light
	Fluorescent sensors	Naphthoquinone-imidazole boronic-based sensors (spec λ = 460 nm); LOD = 1.4 µM
	FTIR	Use of a horizontal attenuated total reflectance (HATR) accessory; detection range = 0.3 M to 1.0 M
	Chemiluminescence	Measurement of intensity of the reaction with luminal, hemin, and peroxide
	Amperometry/flow injection analysis	Use of a multimeter as a detection device; LOD = 200 µg/L
	Photoacoustic IR detection	Applied to the determination of HCN and NCCl in air
	X-ray diffraction	LOD = 0.1 % in waste water analyses
	Coulometric determination	LOD = 10^{-9} mg/100 µL
	Cavity ringdown spectroscopy	Use of external cavity tunable diode laser
CN^-/SCN^- (only)	Chemical ionization GC/MS	Derivatization with pentafluorobenzyl bromide (PFBBr) via extraction with ethyl acetate and tetrabutylammonium sulfate (TBAS); LOD = 1 µM (CN^-) and LOD < 50 nM (SCN^-)
Dichromate, $Cr_2O_7^{-2}$	FTIR	Absorption band at 950 cm^{-1}
	Paper electrophoresis-photodensity scanning	Photodensity scanning determination after development with diphenyl carbazide

Anion	Method	Results/Comments
	Cell voltage variation	Applied to the electrochemical synthesis of sodium dichromate from sodium chromate
	Conductimetric determination	Performed in the presence of CrO_4^{-2}
	Adsorptive stripping voltamemtry	Commonly applied to body fluids
	Potentiometric titration	Determination of Pu via the $Fe^{+2}/Cr_2O_7^{-2}$ redox titration
	Sequential injection analysis	$Cr_2O_7^{-2}$ determination based on oxidation of pindolol (spec λ = 640 nm)
	Spectrophotometric analysis	Applied to the determination of pyridine derivatives
		Reduction to Cr^{+3} in organic carbon soil analysis
	Titrimetric analysis	Reduction by Fe^{+3} titration
	Thin-layer chromatography (TLC)	Applied to determination of unsaturated fats and further spectrophotometric analysis (spec λ = 350 nm)
	X-ray absorption fine structure spectroscopy	Applied to the speciation of $CrO_4^{-2}/Cr_2O_7^{-2}$ equilibrium
Hypochlorite, ClO^-	Titrimetric determination	Iodometric titration
	Polarography	Determination by conversion of Br^- to BrO_3^-
	Spectrophotometry	Oxidation of Ir^{+3} to Ir^{+4} (spec λ = 488 nm)
	Spectrophotometry	Measurement of ClO^- absorbance at pH > 7
	Spectrophotometry	Measurement of chloramine formed by addition of aq. NH_3
	Voltametry	Technique compared to iodometric titration
	Potentiometric titration	ClO^- measured by subtraction of BrO^- in a ClO/BrO^-
	Potentiometric titration	Reduction to Cl^- (pH < 7, OsO_4 as catalyst)
Iodide, I^-	Ion chromatography using electrochemical detection	Use of Ag working electrode; LOD = 100 ppb
Isocyanates, NCO^-	Mass spectrometry	Use of a proton transfer reaction (PTR), time-of-flight mass spectrometer and high sensitivity PTR quadruple mass spectrometer
	FTIR	Use of sealed liquid cell for polymer analysis
	HPLC	Analysis of ethanol derivative (spec λ = 245 nm)
	Capillary electrophoresis	Use of tris(2,2'-bipyridine)ruthenium (II) by electrochemiluminescence
	Potentiometric titration	Titration of carboxylic acid hydrazide derivative with $NaNO_2$
	Spectrophotometric analysis	Conversion of CH_3NCO to CH_3NH_2 and reaction with 1-fluoro-2,4-dinitrobenzene to yield $CH_3NHC_6H_3(NO_2)_2$ (spec λ = 352 nm)
Manganate, MnO_4^{-2}	Titrimetric analysis	Oxidation of As^{+3}, Cr^{+3}, Sb^{+3}, Te^{+4}, PO_3^{-3}, various carboxylic acids, trimethylammoniated compounds
	Gravimetric analysis	Precipitation of $BaMnO_4$
	Potentiometric titration	Use of a Pt electrode
	Voltammetry	Use of glassy carbon working electrode
	Spectrophotometry	LOD = 0.185 µg/mL; (spec λ = 635 nm)
	Anodic oxidation	Rotating disk electrode
	Gravimetric analysis	Precipitation of $BaMnO_4$
Nitrite, NO_2^-	Ion chromatography	Use of high capacity, OH^--selective, anion exchange column with a guard column) in simultaneous determination of BrO_3^-; LOD = 0.05 µg/L; RSD = 3.61 % to 4.77 %
	HPLC	Simultaneous determination of NO_3^-, SO_4^{-2}, and SCN^-; samples are ultrasonically extracted with $EtOH/CCl_3COOH$ and purified by C18 SPE column (highly retentive alkyl-bonded phase); LOD = 0.01 mg/kg to 0.02 mg/kg; RSD = 0.87 % to 2.6 %
	HPLC	KOH or NaOH aq. solution used as mobile phase for 10 µL to 25 µL sample size
	Quantitative sequential injection analysis (SIA)	LOD = 0.002 mg/L
	Diffuse UV-visible reflectance method	Reaction of nitrite with sulphadiazine and o-naphthol; LOD = 0.02 mg/L; RSD = 5 % to 8 %
	Cyclic voltammetry (CV)/pulse voltammetry	Electropolymerization of Nile Blue at pre-polarized glassy carbon electrode (phosphate buffer, pH = 7.1) leading to a NO_2^- sensor
	Cyclic voltammetry (CV)/pulse voltammetry	Use of a solid-state microelectrode formed through the electrochemical co-deposition of Pt-Fe nanoparticles on Au microelectrode
	Cyclic voltammetry (CV)/pulse voltammetry	Use of a sol-gel electrode using 3-aminopropyltrimethoxy silane for covalent immobilization of toluidine blue
	Capillary electrophoresis	Simultaneous determination of NO_3^- and $C_2O_4^{-2}$
	Capillary zone electrophoresis	Simultaneous determination of NO_3^- and Cl^- by use of a photoiodie-array detector (PDA)
	UV-visible spectrophotometry	Derivatization with $Zn(OH)_2$/basic fuchsin
	UV-visible spectrophotometry	Derivatization with Griess reagent (spec λ = 537 nm); RSD ~1.5 %

Anion	Method	Results/Comments
	Microfluidic gradient elution moving boundary electrophoresis (GEMBE)	Simultaneous determination of NO_3^- and NH_4^+
	Microfluidic gradient elution moving boundary electrophoresis (GEMBE)	Simultaneous determination of NO_3^-, Cl^-, $C_2O_4^{-2}$, NO_3^-, and SO_4^{-2}
	Gasometric analysis	The NO_2^- concentration is quantified by the formation of N_2(g) produced *vis a vis* its reaction with sulfamic acid
	Seeping layer test paper	Derivatization with p-aminobenzenesulfonic acid/N(1-naphthyl) ethylenediamine dihydrochloride
NO_2^- simultaneous NO_2^-/NO_3^- (only)	HPLC	Pre-column derivatization with Griess reagents (spec λ = 540 nm)
	UV-visible spectrophotometry	Following derivatization with HCl/naphthyl ethylenediamine
		LOD = 0.5 mg to 18 mg nitrogen per L (NO_3^-) and 0.5 mg to 5 mg nitrogen per L (NO_2^-)
	HPLC-UV	LOD = 2.5 mg/kg (NO_3^-) and 5.0 mg/kg (NO_2^-)
	GC-mass spectrometry	Quantification of ^{15}N-labeled nitrate and nitrite biological fluids
	Chemiluminescence	LOD = 10 nmol/L; RSD = 3 % (200 nmol/L) to 5 % (400 nmol/L)
Oxalate, $C_2O_4^{-2}$	Capillary electrophoresis	Use of acid run buffer to revert electroosmotic flow
	Capillary gas chromatography	LOD = 500 µg by use of a flame ionization detector
	Chromogenic strip	Test strip equipped with sorghum leaf oxalate oxidase cross-linked with glutaraldehyde and o-toluidine
	FT-IR (attenuated)	LOD = 0.07 % of the matrix
	Capillary electrophoresis	Use of acid run buffer to revert electroosmotic flow
	Capillary gas chromatography	LOD = 500 µg by use of a flame ionization detector
	Flow injection analysis	Oxalate oxidase and peroxidase are immobilized on Au electrode
	Gas chromatography	Analysis of methylated product
	Ion exchange chromatography method	LOD = 6 µg/L to 9 µg/L
	Isotachophoresis	Detection at λ = 254 nm; LOD = 20 nmol/L
	LC-tandem MS	System attached to online weak anion exchange chromatography
	Raman spectroscopy	Intensity of peak at 1462 cm^{-1} is used
	Spectrophotometric analysis	Analysis of catalytic effect of reaction products of methylene blue/$Cr_2O_7^{-2}$
	Spectrophotometric analysis	Analysis of the NaDH → NAD^+ reaction with $C_2O_4^{-2}$
	Titrimetric analysis	Titration against MnO_4^-
	Titrimetric analysis	Titration against Ce^{+4}
Perchlorate, ClO_4^-	Spectrophotometric analysis	Analysis of catalytic effect of reaction products of methylene blue/$Cr_2O_7^{-2}$
	Spectrophotometric analysis	Analysis of the NaDH → NAD^+ reaction with $C_2O_4^{-2}$
	Titrimetric analysis	Titration against MnO_4^-
	Titrimetric analysis	Titration against Ce^{+4}
	Spectrophotometry	Yb-pyrocatechol violet complex
	Spectrophotometry	Determination of reddish-violet color produced by adding methylene blue/$ZnSO_4$ in presence of NO_3^-
	HPLC/MS	LOD = 0.2 ppb
	Capillary electrophoresis	Analysis typically performed on tobacco plants
	MS	Determination of organic base-phosphate complex
	Ion pair extraction-MS ESI	Use of cationic surfactants
	Titrimetric analysis	Titration against H-tetramethylammonium sulfate with various indicators
	Titrimetric analysis	Back titration of excess $TiCl_3$ against $Fe_2(SO_3)_2$
Phosphate, PO_4^{-3}	FTIR	Use of 1037 cm^{-1} ($Ca_3(PO_4)_2$) and 1010 cm^{-1} ($MgNH_4PO_4$)
Phosphide, P^{-3}	Gravimetric	Derivatization as Ag_3PO_3 after formation of Ag_3P and further oxidation with HNO_3
	ESR	Derivatization to GaP
	X-ray electron spectrometry	Derivatization to AlP
	X-ray fluorescence	Derivatization to AlP
	X-ray diffractometry	Derivatization to AlP
	X-ray photoelectron spectroscopy	Derivatization to functionalized GaP
	Fluorescence	Derivatization to Ca_3P_2
Phosphite, PO_3^{-3}	Fluorescence	Enzymatic oxidation to phosphate with NAD^+ as co-substrate to produce fluorescence
	^{31}P NMR	Esterification of OH in organic polymers
	Laser Raman spectrometry	Ar-ion laser allows quantitative analysis of $H_2PO_3^-$ and HPO_3^{-2}
	Ion exchange chromatography	Method makes use of conductivity detection
	Visible spectrophotometry	Measurement of 3,5-$(O_2N)_2C_6H_3COOH$ derivative
Silcate, SiO^{-4}	Raman spectroscopy	Use of *ab initio* quantum chemical simulation

Anion	Method	Results/Comments
	Electron probe microanalysis (EPMA)	Analysis of Na, Mg, Al, Si, K, Ca, Ti, Mn, and Fe salts
	Ion-exclusion chromatography	Use of ascorbate solution as both an eluent and a reducing agent following by molybdate derivatization
	Laser-induced plasma spectroscopy	Use of a Q switched Nd:YAG laser and time-resolved spectroscopy
	Time-of-flight secondary ion mass spectrometry	Use of C60 primary ions
	Laser ablation-inductively coupled plasma mass spectrometry (LA-ICPMS)	No need for internal standard
Sulfide, S^{-2}	Ion chromatography using electrochemical detection	Use of Ag working electrode; LOD = 30 ppb
Sulfite, SO_3^{-2}	Amperometric titration	Use of iodine solution
	Potentiometric titration	Pt wire coated with Hg is balanced against calomel electrode
	Spectrophotometric analysis	Product of reaction with p-rosaniline acid bleached dye and HCHO (spec λ = 560 nm)
	Ion chromatography	
	Titration analysis	Titration against BrO_3^-
	Coulometric determination	LOD = 10^{-11} mg/100 μL
Thiocyanate, CNO^-	Flow injection analysis	Formation of the 2-(5-bromo-2-pyridylazo)-5-diethylamino–phenol derivative in $Cr_2O_7^{-2}/H^+$
	Flow injection analysis	Analyzed as the teracyanonickelate (II) complex

PRECIPITATION OF SULFIDES

Robert Joyce and Blaine C. McKusick

TABLE 1. Precipitation of Sulfides

Precipitated at pH 7	Not precipitated at low pH	Forms a soluble complex at high pH
Ag^{+}		
As^{3+a}		X
Au^{+a}		X
Bi^{3+}		
Cd^{2+}		
Co^{2+}	X	
Cr^{3+a}		
Cu^{2+}		
Fe^{2+a}	X	
Ge^{2+}		X
Hg^{2+}		X
In^{3+}	X	
Ir^{4+}		X
Mn^{2+a}	X	
Mo^{3+}		X
Ni^{2+}	X	
Os^{4+}		
Pb^{2+}		
Pd^{2+a}		
Pt^{2+a}		X
Re^{4+}		
Rh^{2+a}		
Ru^{4+}		
Sb^{3+a}		X
Se^{2+}		X
Sn^{2+}		X
Te^{4+}		X
Tl^{+a}	X	
V^{4+a}		
Zn^{2+}	X	

[a] Higher oxidation states of this ion are reduced by sulfide ion and precipitated as this sulfide.

pH RANGE FOR PRECIPITATION OF METAL HYDROXIDES AND OXIDES

Robert Joyce and Blaine C. McKusick

TABLE 1. pH Range for Precipitation of Metal Hydroxides and Oxides

BOND LENGTHS IN CRYSTALLINE ORGANIC COMPOUNDS

The following table gives average interatomic distances for bonds between the elements H, B, C, N, O, F, Si, P, S, Cl, As, Se, Br, Te, and I as determined from X-ray and neutron diffraction measurements on organic crystals. The table has been derived from an analysis of high-precision structure data on about 10,000 crystals contained in the 1985 version of the Cambridge Structural Database, which is maintained by the Cambridge Crystallographic Data Center. The explanation of the columns is:

Column 1: Specification of elements in the bond, with coordination number given in parentheses, and bond type (single, double, etc.). For carbon, the hybridization state is given.

Column 2: Substructure in which the bond is found. The target bond is set in boldface. Where X is not specified, it denotes any element type. C# indicates any sp^3 carbon atom, and C* denotes an sp^3 carbon whose bonds, in addition to those specified in the linear formulation, are to C and H atoms only.

Column 3: *d* is the unweighted mean in Å units of all the values for that bond length found in the sample.

Column 4: *m* is the median in Å units of all values.

Column 5: σ is the standard deviation in the sample.

Column 6: q_1 is the lower quartile for the sample (i.e., 25% of values are less than q_1 and 75% exceed it).

Column 7: q_u is the upper quartile for the sample.

Column 8: *n* is number of observations in the sample.

Column 9: Notes refer to the footnotes in Appendix 1.

References to special cases are given in a shorthand form and listed in Appendix 2. Further information on the method of analysis of the data may be found in the reference cited below.

The table is reprinted with permission of the authors, the Royal Society of Chemistry, and the International Union of Crystallography.

† The standard deviation in the sample for the bond type is greater than for the other entries.

Appendix 1. (Footnotes to Table)

1. Sample dominated by B–CH_3. For longer bonds in B^-–CH_3 see LITMEB10 [B(4)–CH_3 = 1.621–1.644Å].
2. p(π)–p(π) Bonding with Bsp^2 and Nsp^2 coplanar (τBN = 0 ± 15°) predominates. See G. Schmidt, R. Boese, and D. Bläser, *Z. Naturforsch.*, 1982, **37b**, 1230.
3. 84 observations range from 1.38 to 1.61 Å and individual values depend on substituents on B and O. For a discussion of borinic acid adducts see S. J. Rettig and J. Trotter, *Can. J. Chem.,* 1982, **60**, 2957.
4. See M. Kaftory in *The Chemistry of Functional Groups. Supplement D: The Chemistry of Halides, Pseudohalides, and Azides*, S. Patai and Z. Rappoport, Eds., Wiley: New York, 1983, Part 2, ch. 24.
5. Bonds which are endocyclic or exocyclic to any 3- or 4-membered rings have been omitted from all averages in this section.
6. The overall average given here is for Csp^3–Csp^3 bonds which carry only C or H substituents. The value cited reflects the relative abundance of each 'substitution' group. The 'mean of means' for the 9 subgroups is 1.538 (σ = 0.022) Å.
7. See F. H. Allen, (a) *Acta Crystallogr.,* 1980, **B36**, 81; (b) 1981, **B37**, 890.
8. See F. H. Allen, *Acta Crystallogr.*, 1984, **B40**, 64.
9. See F. H. Allen, *Tetrahedron*, 1982, **38**, 2843.
10. See F. H. Allen, *Tetrahedron*, 1982, **38**, 645.
11. Cyclopropanones and cyclobutanones excluded.
12. See W. B. Schweizer and J. D. Dunitz, *Helv. Chim. Acta*, 1982, **65**, 1547.
13. See L. Norskov-Lauritsen, H.-B. Bürgi, P. Hoffmann, and H. R. Schmidt, *Helv. Chim. Acta*, 1985, **68**, 76.
14. See P. Chakrabarti and J. D. Dunitz, *Helv. Chim. Acta,* 1982, **65**, 1555.
15. See J. L. Hencher in *The Chemistry of the C≡C Triple Bond,* S. Patai, Ed., Wiley, New York, 1978, ch. 2.
16. Conjugated: torsion angle about central C–C single bond is 0 ± 20° (*cis*) or 180 ± 20° (*trans*).
17. Unconjugated: torsion angle about central C–C single bond is 20–160°.
18. Other conjugative substituents excluded.
19. TCNQ is tetracyanoquinodimethane.
20. No difference detected between C2 ≃ C3 and C3 ≃ C4 bonds.
21. Derived from neutron diffraction results only.
22. Nsp^3: pyramidal; mean valence angle at N is in range 108–114°.
23. Nsp^2: planar; mean valence angle at N is ≥ 117.5°.
24. Cyclic and acyclic peptides.
25. See R. H. Blessing, *J. Am. Chem. Soc.*, 1983, **105**, 2776.
26. See L. Lebioda, *Acta Crystallogr.*, 1980, **B36**, 271.
27. *n* = 3 or 4, i.e. tri- or tetra-substituted ureas.
28. Overall value also includes structures with mean valence angle at N in the range 115–118°.
29. See F. H. Allen and A. J. Kirby, *J. Am. Chem. Soc.*, 1984, **106**, 6197.
30. See A. J. Kirby, 'The Anomeric Effect and Related Stereoelectronic Effects at Oxygen,' Springer, Berlin, 1983.
31. See B. Fuchs, L. Schleifer, and E. Tartakovsky, *Nouv. J. Chim.*, 1984, **8**, 275.
32. See S. C. Nyburg and C. H. Faerman, *J. Mol. Struct.,* 1986, **140,** 347.
33. Sample dominated by P–CH_3 and P–CH_2–C.
34. Sample dominated by C* = methyl.
35. See A. Kalman, M. Czugler, and G. Argay, *Acta Crystallogr.*, 1981, **B37**, 868.
36. Bimodal distribution resolved into 22 'short' bonds and 5 longer outliers.
37. All 24 observations come from BUDTEZ.
38. 'Long' O–H bonds in centrosymmetric O---H---O H–bonded dimers are excluded.
39. N–N bond length also dependent on torsion angle about N–N bond and on nature of substituent C atoms; these effects are ignored here.
40. N pyramidal has average angle at N in range 100–113.5°; N planar has average angle of ≥ 117.5°.
41. See R. R. Holmes and J. A. Deiters, *J. Amer. Chem. Soc.*, 1977, **99**, 3318**.**
42. No detectable variation in S=O bond length with type of C-substituent**.**

BOND LENGTHS IN ORGANOMETALLIC COMPOUNDS

This table summarizes the average values of interatomic distances of representative metal–ligand bonds. Sigma bonds between *d*- and *f*-block metals and the elements C, N, O, P, S, and As are included. The values are extracted from a much larger list in Reference 1. The tabulated values are the unweighted means of reported measurements on compounds in each category. If four or more measurements are available, the standard deviation is given in parentheses. All values are in Ångstrom units (10^{-10} m).

The first part of the table covers metal–carbon bonds in different ligand categories, while the second part covers metal bonds to other elements. R stands for any alkyl group; Me for a CH_3 group; C_6R_5 indicates an aryl group; and C(=O)R an acyl group. Metals are listed in atomic number order.

STRUCTURE OF FREE MOLECULES IN THE GAS PHASE

David R. Lide

This table gives information on the geometric structure of selected molecules in the gas phase, including the overall geometry, interatomic distances, and bond angles. The molecules have been chosen to provide data on a wide variety of chemical bonds and to illustrate the influence of molecular environment on bond distances and angles. The table is restricted to molecules with conventional covalent or ionic bonds, but it should be pointed out that structure data on many loosely bonded complexes of the van der Waals type have recently become available. The references below contain data on many molecules that are not included here and give additional information such as uncertainties and isotopic variations.

The two techniques for gas phase structure determination are spectroscopy and electron diffraction. The following codes are used to indicate the method used for each set of data:

ED – Gas phase electron diffraction
MW – Microwave spectroscopy, including both measurements in bulk gases and molecular beams
IR – Infrared spectroscopy
R – Raman spectroscopy
UV – Electronic spectroscopy in the ultraviolet and visible regions, including fluorescence measurements
ESR – Electron spin resonance.

In some cases data from two sources have been combined to derive the structure; these are labeled by "ED, MW," for example.

Because of the internal vibrations that are present in all molecules, even in their lowest energy state, the definition of interatomic distance is not a simple matter. The ideal measure is the equilibrium distance in the hypothetical non-vibrating state, designated by r_e. This is the value of the separation of the atoms at the minimum of the potential function that describes the forces between the two atoms. All other measures represent some form of average, generally complex, over the vibrational motions. Since the potential function is asymmetric and less steep at distances beyond the potential minimum, the average distance is normally greater than r_e. Distances determined by electron diffraction (ED) represent an average over all vibrational states that are populated at the temperature of the measurement; the most common measure is designated r_g. Distances determined by spectroscopy (MW, IR, R, or UV) through measurements on the ground vibrational state of the molecule, designated by r_0, describe some form of average, not easily defined, over the zero-point vibrations. Another measure that is frequently used in microwave spectroscopy is the "substitution" distance r_s, which is operationally defined through a series of measurements on different isotopic species. In simple cases, r_s often lies between r_0 and r_e and is therefore a closer approximation to r_e. Several other types of averages have been used; good discussions can be found in Volumes II/25 and II/28 of the *Landolt-Börnstein* series (Reference 1) and in References 4 and 5.

Unless otherwise specified, distances and angles given in this table are r_0 values if the method is spectroscopic and r_g values if the method is electron diffraction. When given, equilibrium and substitution distances are designated by r_e and r_s, respectively.

Many interatomic distances and angles calculated by *ab initio* techniques have been reported in the recent literature. However, it should be emphasized that all data in this table are obtained from direct experimental measurements. In a few cases, *ab initio* calculations of vibration-rotation interaction constants have been combined with the primary experimental measurements to derive r_e values in the table.

The number of significant figures in the values is an indication of the precision of the measurement; thus a distance quoted to three decimal places is probably reliable to about 0.005 Å or better. However, discrepancies between r_e, r_0, and r_g values for the same bond are often the order of 0.01 Å because of vibrational averaging considerations, so care must be taken in comparing bond distances in different molecules. Some distances in simple molecules are given here to four or five decimal places, but little chemical significance can be attached to differences beyond the third decimal place.

The table is presented in two parts: Part A covers molecules that do not contain carbon while Part B lists carbon-containing molecules. Because many of the entries in Part A are free radicals or other transient species whose systematic chemical names are unfamiliar, the listing in Part A is in order of chemical formula. Part B is ordered by name. In both parts the second column gives information on the overall configuration of the molecule, often indicated by the point group of the equilibrium geometry. Columns 3 through 8 give the values of the bond distances and angles, and the last column indicates the experimental method. Distances are given in Å units, where 1 Å = 10^{-10} m or 0.1 nm. Angles are given in degrees.

The efforts of Kozo Kuchitsu in preparing an earlier version of this table and in giving advice on the new version are gratefully acknowledged.

CHARACTERISTIC BOND LENGTHS IN FREE MOLECULES

David R. Lide

This is a summary of typical bond lengths in gas-phase molecules. The value given for each bond is near the mid-range of values found in simple molecules. Bond lengths usually vary by 1% or 2%, and often by more, depending on the nature of the other bonds attached to the two atoms in question. References 1 and 2 give measured bond lengths in individual gas-phase molecules, as determined by spectroscopic and electron diffraction methods.

All bond lengths are given in Å (1 Å = 10^{-10} m).

ATOMIC RADII OF THE ELEMENTS

Manjeera Mantina, Rosendo Valero, Christopher J. Cramer, and Donald G. Truhlar

Atomic radii are not precisely defined, but are nevertheless very widely used parameters in modeling and understanding molecular structure and interactions. Three main classes of radii may be identified: van der Waals radii (which include radii used to characterize steric interactions), covalent radii, and ionic radii. This section is concerned with the first two; ionic radii are covered in another section of the *Handbook* called "Ionic Radii in Crystals."

There are many scales of van der Waals radii, but they are not fully consistent with one another. The van der Waals radii determined by Bondi [1] from x-ray diffraction data, crystal densities, gas kinetic collision cross sections, critical densities, and liquid-state properties are the most widely used values, but Bondi recommended radius values for only 28 of the 44 main-group elements in the periodic table plus 9 transition metals and one actinide. Rowland and Taylor [2] redetermined nine of the main-group radii from crystal structure data and recommended that Bondi's values be accepted except for H, for which they recommended a new value; we accepted their recommendation for H and adopted Bondi's 27 other values for main-group elements. Radii for the 16 remaining main-group elements were determined from electronic structure calculations on selected van der Waals molecules by analyzing the results in a way designed to yield radii compatible with Bondi's scale for main-group elements [3]. Bondi's values for the transition metals and actinide are smaller than expected based on ionization potentials and covalent radii, so we do not adopt them, but defer to later recommendations based on analysis of a more extensive set of crystal data. Van der Waals radii for the remaining elements through atomic number Z = 93 were taken from Hu et al. [4], who determined them from bond valence parameters (this gives radii usually within 0.1 Å to 0.15 Å of the radii from average atomic volumes in crystals as obtained by statistical analysis of the Cambridge Structural Database [5], but the results show a smoother variation with atomic number). Van der Waals radii for the elements with Z = 94 to 103 were based on the work of Guzei and Wendt [6], who modeled the zero-potential distance for the interaction potentials involved in nonbonded steric interactions; we increased their values by 6%, which is the value they found is needed to make their steric radii scale most consistent with Bondi's van der Waals radii.

Covalent radii are more straightforward, especially for elements that tend to form only single bonds, although some researchers distinguish metallic bonds from covalent bonds. The covalent radii tabulated here are recommendations for single covalent bonds, and they are based on a comprehensive evaluation of experimental data by Cordero et al. [7], who recommended covalent radii for all elements up to Z = 96, and on an analysis combining experimental data and theoretical calculations by Pyykkö and Atsumi [8], who recommended single-bond covalent radii for all elements up to Z = 118. If one is interested in a specific coordination number, oxidation state, or type of ligand, one might find a more appropriate radius in the specialized literature or in the Characteristic Bond Lengths in Free Molecules table in this *Handbook* since the values in the table below are generic average values. In particular, we give the Pyykkö-Atsumi values for carbon and for Z = 97 to 118 and an average of the values from the two sources for all other elements. For Mn, Fe, and Co, Cordero et al. give two values, and we used the lower of these on the average because it corresponds to a smoother periodic trend.

Please note that the van der Waals radii of bromine and lithium have typographical errors in Ref. 3; the correct values (1.85 for Br and 1.82 for Li) in the table below are from Ref. 1.

All values are rounded to the nearest 0.01 Å, but in most cases the uncertainty in the value is of the order of 0.1 Å.

DIPOLE MOMENTS

David R. Lide

This table gives selected values of the electric dipole moment for over 800 molecules. When available, values determined by microwave spectroscopy, molecular beam electric resonance, and other high-resolution spectroscopic techniques were selected. Otherwise, the values come from measurements of the dielectric constant in the gas phase or, if these do not exist, in the liquid phase. Entries are listed alphabetically; compounds not containing carbon are listed first, followed by compounds containing carbon.

The dipole moment is given in debye units (D). The conversion factor to SI units is $1\ \mathrm{D} = 3.33564 \times 10^{-30}$ C m.

Dipole moments of individual conformers (rotational isomers) are given when they have been measured. The conformers are designated as *gauche*, *trans, axial*, etc. The meaning of these terms can be found in the references. In some cases an average value, obtained from measurements on the bulk gas, is also given. Other information on molecules that have been studied by spectroscopy, such as the components of the dipole moment in the molecular framework and the variation with vibrational state and isotopic species, is given in the references.

When the accuracy of a value is explicitly stated (i.e., 1.234 ± 0.005), the stated uncertainty generally indicates two or three standard deviations. When no uncertainty is given, the value may be assumed to be precise to a few units in the last decimal place. However, if more than three decimal places are given, the exact interpretation of the final digits may require analysis of the vibrational averaging.

Values measured in the gas phase that are questionable because of undetermined error sources are indicated as approximate (≈). Values obtained by liquid phase measurements, which sometimes have large errors because of association effects, are enclosed in brackets, e.g., [1.8].

HINDERED INTERNAL ROTATION

I. Ozier and N. Moazzen-Ahmadi

In asymmetric tops like methyl alcohol, CH_3OH, and symmetric rotors like CH_3SiH_3, the methyl group can undergo internal rotation relative to the rest of the molecule, traditionally called the frame (Refs. 1 and 2). Although various different tops are considered here, all have three-fold symmetry. In such cases, the potential V hindering the internal rotation can be written:

$$V(\alpha) = V_3(\tfrac{1}{2})(1 - \cos 3\alpha) + V_6(\tfrac{1}{2})(1 - \cos 6\alpha) + V_9(\tfrac{1}{2})(1 - \cos 9\alpha) + \ldots,$$

where α is the deviation from equilibrium of the angle between the top and frame that measures the torsional motion. If only the first two terms are retained, then V_3 is the height of the hindering potential and V_6 is the shape parameter. For symmetric tops like CH_3CH_3 where the top and frame are identical, α is replaced by 2γ and the origin for γ is often taken as the eclipsed configuration. In the expansion, $-\cos 6n\gamma$ is then replaced by $(-1)^{n+1}\cos 6n\gamma$, where n=1,2,... In cases where different forms of the expansion have been used in the original works, the values of the parameters published there have been converted to the conventions defined here.

In Tables 1 and 2, values are given for V_3 for a selection of asymmetric and symmetric tops, respectively. In cases where the higher order parameters have been determined, these are given in the Comments column. Where appropriate, this column also indicates the specific top, isomer, state, and/or isotopomer that has been studied. For ethane, three symmetric top isotopomer are listed to illustrate the isotopic dependence of V_3 and V_6. In all other cases, only one isotopomer is listed, even if several have been studied. In all but one of these cases, the isotopomer reported is the one with the highest natural abundance. However, CH_3OCDO is listed because the results obtained are more precise than for CH_3OCHO. The molecules are listed alphabetically in Hill order according to the molecular formula.

The determinations listed for the potential parameters are effective values that incorporate to varying degrees effects from other molecular parameters. For example, the apparent value of V_3 can be changed significantly if the reduced rotational constant F is calculated from the structure, rather than being determined independently (Ref. 1). Other examples include such mechanisms as coupling to excited skeletal vibrations (Ref. 2) and redundancies connecting some of the torsional parameters (Refs. 3 and 4). The experimental uncertainties quoted are taken from the original works; no attempt has been made to standardize the definitions. All the potential parameters are given in cm^{-1}. Where the original work has reported these values in other units, the conversion to cm^{-1} has been carried out using standard factors: 1 calorie = 4.1868 joules and 1 calorie/mole = 0.34998915 cm^{-1} (Ref. 5).

A variety of different methods have been used to measure V_3, V_6, and V_9 (Refs. 1 and 2); only a few of the more important will be discussed here. *For asymmetric rotors*, both the pure rotational spectrum and its torsion-rotation counterpart are electric dipole allowed and are affected in lowest order by the leading terms in the torsional Hamiltonian. Both types of spectra have been used extensively to determine V_3 (Ref. 1). *For symmetric tops* with a single torsional degree of freedom, either the permanent electric dipole moment vanishes, as in CH_3CH_3, or the normal rotational spectrum is independent of V_3 in lowest order, as in CH_3SiH_3. In the latter case, the molecular beam avoided crossing method can often be used (Ref. 2). The torsion-rotation spectrum is forbidden in lowest order, but becomes weakly allowed through interactions with the infrared active skeletal vibrations (Ref. 2). By employing long absorption path lengths, this spectrum has been used to determine V_3 in a number of molecules. For both asymmetric and symmetric tops, the most precise determinations of the molecular parameters have been made in cases where both rotational and torsion-rotation spectra have been investigated.

TABLE 1. Asymmetric Top Potential Parameters

	Name	Molecular Formula	Line Formula	Ref.	V_3/cm^{-1}	Comments
1	Trifluoromethanethiol	CHF_3S	CF_3SH	5	500.83 ± 0.03	
2	Methylphosphonic difluoride	CH_3F_2OP	$CH_3P(=O)F_2$	6	676 ± 25	
3	Methanol	CH_4O	CH_3OH	5	373.594 ± 0.007	V_6 = −1.597 ± 0.051
						V_9 = 1.04 ± 0.20
4	Methanethiol	CH_4S	CH_3SH	7	443.029 ± 0.070	V_6 = −1.6451 ± 0.0144
5	Methyldisulfane	CH_4S_2	CH_3SSH	8	609.0 ± 14.0	
6	Trifluoromethyl isocyanate	C_2F_3NO	$CF_3N=C=O$	5	47.8769 ± 0.0051	
7	Trifluoroacetaldehyde	C_2HF_3O	$CF_3C(H)=O$	9	298 ± 10	
8	Pentafluoroethane	C_2HF_5	CF_3CHF_2	10	1190 ± 4	
9	Acetyl bromide	C_2H_3BrO	$CH_3C(Br)=O$	11	456.7 ± 10.5	
10	1-Chloro-1,1-difluoroethane	$C_2H_3ClF_2$	CH_3CClF_2	12	1311.8 ± 1.4	
11	Acetyl chloride	C_2H_3ClO	$CH_3C(Cl)=O$	5	442.74 ± 1.05	^{35}Cl
12	Acetyl fluoride	C_2H_3FO	$CH_3C(F)=O$	13	364.3 ± 2.1	
13	Methyl fluoroformate	$C_2H_3FO_2$	$CH_3OC(F)=O$	5	374.1 ± 0.2	
14	Methyl trifluoromethyl ether	$C_2H_3F_3O$	CH_3OCF_3	5	382 ± 10	CH_3
15	Acetyl iodide	C_2H_3IO	$CH_3C(=O)I$	14	455.3 ± 10.5	
16	Methyl cyanate	C_2H_3NO	$CH_3OC{\equiv}N$	5	399.0 ± 17.5	
17	1-Chloro-1-fluoroethane	C_2H_4ClF	CH_3CHClF	5	1334.9 ± 3.8	
18	1,1-Difluoroethane	$C_2H_4F_2$	CH_3CHF_2	5	1163.0 ± 2.5	
19	Acetaldehyde	C_2H_4O	$CH_3C(H)=O$	15	407.716 ± 0.010	V_6 =−12.068 ± 0.037
20	Thioacetaldehyde *S*-oxide	C_2H_4OS	$CH_3C(H)=S=O$	5	285.6 ± 0.3	*Z* isomer
21	Acetic acid	$C_2H_4O_2$	CH_3COOH	16	170.1742 ± 0.0002	V_6 = −6.4725 ± 0.0001
22	Methyl formate	$C_2H_3DO_2$	$CH_3OC(D)=O$	5	400.60 ± 0.03	deuterated
23	Fluoroethane	C_2H_5F	CH_3CH_2F	17	1172.1 ± 1.4	
24	Nitrosoethane	C_2H_5NO	$CH_3CH_2N=O$	5	903 ± 25	*gauche* conformer
		C_2H_5NO	$CH_3CH_2N=O$	5	911 ± 25	*cis* conformer
25	Acetamide	C_2H_5NO	$CH_3C(NH_2)=O$	5	24.949 ± 0.008	
26	Difluorodimethylsilane	$C_2H_6F_2Si$	$(CH_3)_2SiF_2$	18	439.4 ± 2.5	

	Name	Molecular Formula	Line Formula	Ref.	V_3/cm^{-1}	Comments
27	*N*-Nitrosodimethylamine	$C_2H_6N_2O$	$(CH_3)_2NN{=}O$	5	145.8 ± 0.25	*cis* CH_3
		$C_2H_6N_2O$	$(CH_3)_2NN{=}O$	5	737.4 ± 13.3	*trans* CH_3
28	Ethanol	C_2H_6O	CH_3CH_2OH	5	1173.76 ± 2.20	*trans* isomer
29	Dimethyl ether	C_2H_6O	$(CH_3)_2O$	19	926.0 ± 3.5	
30	Dimethyl sulfide	C_2H_6S	$(CH_3)_2S$	19	751.1 ± 4.8	
31	Vinylsilane	C_2H_6Si	$SiH_3C(H){=}CH_2$	20	520.1 ± 1.8	
32	Dimethyl disulfide	$C_2H_6S_2$	CH_3SSCH_3	5	535.1 ± 1.8	
33	Dimethyl diselenide	$C_2H_6Se_2$	$CH_3SeSeCH_3$	21	395 ± 2	
34	Dimethylsilane	C_2H_8Si	$(CH_3)_2SiH_2$	19	578.0 ± 3.5	
35	3,3,3-Trifluoropropene	$C_3H_3F_3$	$CF_3C(H){=}CH_2$	22	653.06 ± 0.83	
36	Methyl cyanoformate	$C_3H_3NO_2$	$CH_3OC(C{\equiv}N){=}O$	5	406.6 ± 1.1	*s-trans* conformer
37	(Methylthio)acetylene	C_3H_4S	$CH_3SC{\equiv}CH$	23	592.0 ± 3.3	
38	1,1,1-Trifluoropropane	$C_3H_5F_3$	$CH_3CH_2CF_3$	24	922.2 ± 1.4	
39	2-Iodopropene	C_3H_5I	$CH_3C(I){=}CH_2$	5	905.8 ± 4.2	
40	Ethyl isocyanide	C_3H_5N	$CH_3CH_2N{\equiv}C$	5	1167.6 ± 18.2	
41	Propene	C_3H_6	$CH_3C(H){=}CH_2$	5	697.499 ± 0.048	V_6 = −13.0 (fixed)
42	Propanal	C_3H_6O	$CH_3CH_2C(H){=}O$	25	798 ± 39	*cis* conformer
43	Acetone	C_3H_6O	$(CH_3)_2C{=}O$	26	251.4 ± 2.6	V_6 = −6.92 ± 0.65
44	(Methylthio)ethene	C_3H_6S	$CH_3SC(H){=}CH_2$	27	1138 ± 13	
45	Propanoic acid	$C_3H_6O_2$	CH_3CH_2COOH	28	819.0 ± 10.5	*cis* conformer
46	Methyl mercaptoacetate	$C_3H_6O_2S$	$CH_3OC(=O)C(H_2)SH$	5	411 ± 8	state 0^+
		$C_3H_6O_2S$	$CH_3OC(=O)C(H_2)SH$	5	412 ± 9	state 0^-
47	2-Bromopropane	C_3H_7Br	$(CH_3)_2CHBr$	5	1437.0 ± 2.5	^{79}Br
48	1-Chloropropane	C_3H_7Cl	$CH_3C(H_2)C(H_2)Cl$	29	1017.8 ± 1.4	*gauche* conformer
		C_3H_7Cl	$CH_3C(H_2)C(H_2)Cl$	29	966.0 ± 7.0	*trans* conformer
49	2-Chloropropane	C_3H_7Cl	$(CH_3)_2CHCl$	5	1374.03 ± 1.00	^{35}Cl
50	1-Fluoropropane	C_3H_7F	$CH_3C(H_2)C(H_2)F$	30	965.3 ± 12.2	*gauche* conformer
		C_3H_7F	$CH_3C(H_2)C(H_2)F$	30	948.5 ± 2.8	*trans* conformer
51	2-Fluoropropane	C_3H_7F	$(CH_3)_2CHF$	5	1162.79 ± 0.84	
52	Butanenitrile	C_4H_7N	$CH_3C(H_2)C(H_2)C{\equiv}N$	31	1087.4 ± 8.4	*gauche* conformer
		C_4H_7N	$CH_3C(H_2)C(H_2)C{\equiv}N$	31	1088.5 ± 13.3	*trans* conformer
53	Propanamide	C_3H_7NO	$CH_3CH_2C(=O)NH_2$	32	761 ± 42	*syn* conformer
54	*N,N*-Dimethylformamide	C_3H_7NO	$(CH_3)_2NC(H){=}O$	5	366.04 ± 0.26	*cis* CH_3
		C_3H_7NO	$(CH_3)_2NC(H){=}O$	5	772.4 ± 7.4	*trans* CH_3
55	Propane	C_3H_8	$(CH_3)_2CH_2$	33	1108.1 ± 9.5	
56	Cyclopropylgermane	C_3H_8Ge	$\underline{C(H_2)C(H_2)C}(H)(GeH_3)$	5	466.6 ± 16.7	GeH_3
57	*N*-Nitrosoethylmethylamine	$C_3H_8N_2O$	$CH_3CH_2N(CH_3)N{=}O$	5	310 ± 30	*N*-methyl top, OGM conformer
58	1-Propanol	C_3H_8O	$CH_3C(H_2)C(H_2)OH$	34	956 ± 21	*trans* conformer
59	Cyclopropylsilane	C_3H_8Si	$\underline{C(H_2)C(H_2)C}(H)(SiH_3)$	35	670.9 ± 1.5	
60	Dimethyl(methylene)silane	C_3H_8Si	$(CH_3)_2Si{=}CH_2$	5	351.4 ± 5.9	
61	Dimethyl methylphosphonate	$C_3H_9O_3P$	$(OCH_3)_2P(=O)CH_3$	36	662 ± 6	*P*-methyl top
		$C_3H_9O_3P$	$(OCH_3)_2P(=O)CH_3$	37	278.82 ± 0.06	*O*-methyl top #1
		$C_3H_9O_3P$	$(OCH_3)_2P(=O)CH_3$	37	181.82 ± 0.01	*O*-methyl top #2
62	But-2-ynoyl fluoride	C_4H_3FO	$CH_3C{\equiv}CC(F){=}O$	5	2.20 ± 0.12	
63	*cis*-2-Butenenitrile	C_4H_5N	$CH_3C(H){=}C(H)C{\equiv}N$	5	485.50 ± 0.25	
64	2-Methylacrylonitrile	C_4H_5N	$CH_2{=}C(CH_3)C{\equiv}N$	5	695.2 ± 2.1	
65	2-Methyloxazole	C_4H_5NO	$\underline{N{=}C(CH_3)OC(H){=}C}(H)$	5	251.70 ± 1.17	
66	4-Methyloxazole	C_4H_5NO	$\underline{N{=}C(H)OC(H){=}C}(CH_3)$	5	429.44 ± 0.33	

	Name	Molecular Formula	Line Formula	Ref.	V_3/cm^{-1}	Comments
67	5-Methyloxazole	C_4H_5NO	N=C(H)OC(CH_3)=C(H)	5	477.90 ± 1.34	
68	5-Methylisoxazole	C_4H_5NO	C(H)=NOC(CH_3)=C(H)	5	272.05 ± 1.00	
69	2-Methylthiazole	C_4H_5NS	N=C(CH_3)SC(H)=C(H)	38	34.938 ± 0.020	
70	4-Methylisothiazole	C_4H_5NS	N=C(H)C(CH_3)=C(H)S	5	105.767 ± 0.043	
71	4-Methyl-2-oxetanone	$C_4H_6O_2$	OC(=O)C(H_2)C(H)(CH_3)	5	1256.5 ± 10.5	
72	*trans*-1-Fluoro-2-butene	C_4H_7F	CH_3C(H)=C(H)CH_2F	5	596 ± 7	anticlinal conformer
73	1-Isocyanopropane	C_4H_7N	CH_3C(H_2)C(H_2)N≡C	5	1012.3 ± 8.4	*gauche* conformer
		C_4H_7N	CH_3C(H_2)C(H_2)N≡C	5	1033.8 ± 7.7	*trans* conformer
74	Isobutene	C_4H_8	(CH_3)$_2$C=CH_2	5	761.58 ± 1.05	
75	*cis*-2-Butene	C_4H_8	CH_3CH=CHCH_3	5	259.89 ± 0.42	
76	3-Methoxy-1-propene	C_4H_8O	CH_3OC(H_2)C(H)=CH_2	5	728.0 ± 10.5	*skew-gauche* conformer
		C_4H_8O	CH_3OC(H_2)C(H)=CH_2	5	829.5 ± 10.5	*syn-trans* conformer
77	2,2-Dimethyloxirane	C_4H_8O	OC(CH_3)(CH_3)C(H_2)	5	945.61 ± 0.75	
78	*cis*-2,3-Dimethyloxirane	C_4H_8O	OC(H)(CH_3)C(H)(CH_3)	5	577.80 ± 1.84	*cis* conformer
		C_4H_8O	OC(H)(CH_3)C(H)(CH_3)	5	862.52 ± 1.84	*trans* conformer
79	2-Methyloxetane	C_4H_8O	OC(H_2)C(H_2)C(H)(CH_3)	5	1166.5 ± 4.9

BOND DISSOCIATION ENERGIES

Yu-Ran Luo and Jin-Pei Cheng

The bond dissociation energy (enthalpy) is also referred to as bond disruption energy, bond energy, bond strength, or binding energy (abbreviation: BDE, BE, or D). It is defined as the standard enthalpy change of the following fission: R–X → R + X. The BDE, denoted by D^o(R–X), is usually derived by the thermochemical equation, D^o(R–X) = $\Delta_f H^o$(R) + $\Delta_f H^o$(X) – $\Delta_f H^o$(RX). The enthalpy of formation $\Delta_f H^o$ of a large number of atoms, free radicals, ions, clusters and compounds is available from the websites of NIST, NASA, CODATA, and IUPAC. Most authors prefer to use the BDE values at 298.15 K.

The following seven tables provide essential information of experimental BDE values of R–X and R^+–X bonds.

(1) Table 1: Bond Dissociation Energies in Diatomic Molecules
(2) Table 2: Enthalpy of Formation of Gaseous Atoms
(3) Table 3: Bond Dissociation Energies in Polyatomic Molecules
(4) Table 4: Enthalpies of Formation of Free Radicals and Other Transient Species
(5) Table 5: Bond Dissociation Energies of Common Organic Molecules
(6) Table 6: Bond Dissociation Energies in Diatomic Cations
(7) Table 7: Bond Dissociation Energies in Polyatomic Cations

The data in these tables have been revised through September 2013.

TABLE 1. Bond Dissociation Energies in Diatomic Molecules

The BDEs in diatomic species have usually been measured by spectroscopy or mass spectrometry. In the absence of data on the enthalpy function, the values at 0 K, D^o(A–B), are converted to D^o_{298} by the approximate equation:

$$D^o_{298}(\text{A–B}) \approx D^o(\text{A–B}) + (3/2)RT = D^o(\text{A–B}) + 3.7181 \text{ kJ mol}^{-1}$$

This table has been arranged in an alphabetical order of the atoms A in the diatomics A–B.

TABLE 3. Bond Dissociation Energies in Polyatomic Molecules

The D^o_{298} values in polyatomic molecules are notoriously difficult to measure accurately since the mechanism of the kinetic systems involved in many of the measurements are seldom straightforward. Thus, much lively controversy has taken place in the literature and is likely to continue for some time to come. We will continue updating and presenting our assessment of the most reliable BDE data every year.

The references relating to each of the D^o_{298} values listed in Table 3 are contained in the *Comprehensive Handbook of Chemical Bond Energies*, by Yu-Ran Luo, CRC Press, 2007. Many D^o_{298} in Table 3 are derived from the equation

$$D^o_{298}(\text{R-X}) = \Delta_f H^o(\text{R}) + \Delta_f H^o(\text{X}) - \Delta_f H^o(\text{RX})$$

Here, the enthalpies of formation of the atoms and radicals are taken from Tables 2 and 4, respectively, and the enthalpies of formation of the molecules are from reference sources listed in the above *Comprehensive Handbook of Chemical Bond Energies.*

Table 3 presents **H**-C, **C**-C, C-**halogen**, **O**-, **N**-, **S**-, **Si**-, **Ge**-, **Sn**-, **Pb**-, **P**-, **As**-, **Sb**-, **Bi**-, **Se**-, **Te**-, and **metal**-X BDEs. The **boldface** in the species indicates the dissociated fragment. The **metal**-X BDEs are arranged on the basis of the Periodic Table with the new IUPAC notation for Groups 1 to 18, see inside front cover of this *Handbook*.

TABLE 6. Bond Dissociation Energies in Diatomic Cations

From thermochemistry, we have

$$D^o_{298}(A^+–B) \equiv \Delta_f H^o(A^+) + \Delta_f H^o(B) – \Delta_f H^o(AB^+) = D^o_{298}(A–B) + IP(A) – IP(AB)$$

Thus, $D^o_{298}(A^+–B)$ may be derived using the Table 1 and the ionization potentials of species A and AB. The following Table has been arranged in an alphabetical order of the atoms. The **boldface** in the species indicates the dissociated fragment.

TABLE 7. Bond Dissociation Energies in Polyatomic Cations

This Table has been arranged on the basis of the Periodic Table with the IUPAC notation for Groups 1 to 18, see inside front cover of this *Handbook*. The **boldface** in the species indicates the dissociated fragment.

Bond	D^o_{298}/kJ mol^{-1}	Ref.
(1) Group 1		
Li$^+$–H_2	27.2	1
Li$^+$–CO	57 ± 13	1
Li$^+$–H_2O	139 ± 8	1
Li$^+$–NH_3	156 ± 8	1
Li$^+$–CH_4	130	1
Li$^+$–CH_3OH	156 ± 8	1
Li$^+$–CH_3OCH_3	167 ± 10	1
Li$^+$–pyridine	183.0 ± 14.5	1

ELECTRONEGATIVITY

Electronegativity is a parameter originally introduced by Pauling which describes, on a relative basis, the tendency of an atom in a molecule to attract bonding electrons. While electronegativity is not a precisely defined molecular property, the electronegativity difference between two atoms provides a useful measure of the polarity and ionic character of the bond between them. This table gives the electronegativity *X*, on the Pauling scale, for the most common oxidation state. Other scales are described in the references.

FORCE CONSTANTS FOR BOND STRETCHING

David R. Lide

Representative force constants (*f*) for stretching of chemical bonds are listed in this table. Except where noted, all force constants are derived from values of the harmonic vibrational frequencies ω_e. Values derived from the observed vibrational fundamentals ν, which are noted by a, are lower than the harmonic force constants, typically by 2 to 3% in the case of heavy atoms (often by 5 to 10% if one of the atoms is hydrogen). Values are given in the SI unit newton per centimeter (N/cm), which is identical to the commonly used cgs unit mdyn/Å.

FUNDAMENTAL VIBRATIONAL FREQUENCIES OF SMALL MOLECULES

David R. Lide

This table lists the fundamental vibrational frequencies of selected three-, four-, and five-atom molecules. Both stable molecules and transient free radicals are included. The data have been taken from evaluated sources. In general, the selected values are based on gas-phase infrared, Raman, or ultraviolet spectra; when these were not available, liquid-phase or matrix-isolation spectra were used.

Molecules are grouped by structural type. Within each group, related molecules appear together for convenient comparison.

The vibrational modes are described by their approximate character in terms of stretching, bending, deformation, etc. However, it should be emphasized that most such descriptions are only approximate, and that the true normal mode usually involves a mixture of motions. Abbreviations are:

sym.	symmetric
antisym.	antisymmetric
str.	stretch
deform.	deformation
scis.	scissors
rock.	rocking
deg.	degenerate

In the case of free radicals, strong interactions may exist between the electronic and bending vibrational motions. Details can be found in References 3 and 4. The references should be consulted for information on the accuracy of the data and for data on other molecules not listed here.

All fundamental frequencies (more precisely, wavenumbers) are given in units of cm^{-1}.

SPECTROSCOPIC CONSTANTS OF DIATOMIC MOLECULES

David R. Lide

This table lists the leading spectroscopic constants and equilibrium internuclear distance r_e in the ground electronic state for selected diatomic molecules. The constants are those describing the vibrational and rotational energy through the expressions:

$$E_{vib}/hc = \omega_e(v + ½) - \omega_e x_e(v + ½)^2 + \bullet\bullet\bullet$$

$$E_{rot}/hc = B_v J(J + 1) - D_v[J(J + 1)]^2 + \bullet\bullet\bullet$$

where

$$B_v = B_e - \alpha_e(v + ½) + \bullet\bullet\bullet$$

$$D_v = D_e + \bullet\bullet\bullet$$

Here v and J are the vibrational and rotational quantum numbers, respectively, h is Planck's constant, and c is the speed of light. In this customary formulation the constants ω_e, B_e, etc. have dimensions of inverse length; in this table they are given in units of cm^{-1}.

Users should note that higher order terms in the above energy expressions are required for very precise calculations. The references contain constants for many of these higher terms, as well as more precise values of the lower constants. Also, if the ground electronic state is not $^1\Sigma$, additional terms are needed to account for the interaction between electronic and pure rotational angular momentum. For some molecules in the table the data have been analyzed in terms of the Dunham series expansion:

$$E/hc = \Sigma_{lm}\, Y_{lm}(v + ½)^l J^m(J + 1)^m$$

In such cases it has been assumed that $Y_{10} = \omega_e$, $Y_{01} = B_e$, etc., although in the highest approximations these identities are not precisely correct. Some of the values of r_e in the table have been corrected for breakdown of the Born-Oppenheimer approximation, which can affect the last decimal place. Because of differences in the method of data analysis and limitations in the model, care should be taken in comparing r_e values for different molecules to a precision beyond 0.001 Å.

Entries in the ω_e column that are marked by * give the interval between $v = 0$ and $v = 1$ states instead of a value of ω_e.

Molecules are listed in alphabetical order by formula as most commonly written. In most cases this form places the more electropositive element first, but there are exceptions such as OH, NH, CH, etc. References 1–5 are evaluated compilations covering many molecules and giving references to the original literature.

* Indicates a value for the interval between $v = 0$ and $v = 1$ states instead of a value of ω_e.

Section 10
Atomic, Molecular, and Optical Physics

Line Spectra of the Elements 10-1
Atomic Transition Probabilities 10-93
Electron Affinities 10-147

LINE SPECTRA OF THE ELEMENTS

Joseph Reader and Charles H. Corliss

The original tables from which this table was derived were prepared under the auspices of the Committee on Line Spectra of the Elements of the National Academy of Sciences National Research Council. The table contains the outstanding spectral lines of neutral (I) and singly ionized (II) atoms of the elements from hydrogen through plutonium (Z = 1–94); selected strong lines from doubly ionized (III), triply ionized (IV), and quadruply ionized (V) atoms are also included. Listed are lines that appear in emission from the vacuum ultraviolet to the far infrared. These lines were selected from much larger lists in such a way as to include the stronger observed lines in each spectral region. A more extensive list may be found in Reference 1.

The data were compiled by the following contributors.

J. G. Conway — Lawrence Berkeley Laboratory
C. H. Corliss — National Bureau of Standards
R. D. Cowan — Los Alamos Scientific Laboratory
C. R. Cowley — University of Michigan
Henry M. and Hannah Crosswhite — Argonne National Laboratory
S. P. Davis — University of California, Berkeley
V. Kaufman — National Bureau of Standards
R. L. Kelly — Naval Postgraduate School
J. F. Kielkopf — University of Louisville
W. C. Martin — National Bureau of Standards
T. K. McCubbin — Pennsylvania State University
L. J. Radziemski — Los Alamos Scientific Laboratory
J. Reader — National Bureau of Standards
C. J. Sansonetti — National Bureau of Standards
G. V. Shalimoff — Lawrence Berkeley Laboratory
R. W. Stanley — Purdue University
J. O. Stoner, Jr. — University of Arizona
H. H. Stroke — New York University
D. R. Wood — Wright State University
E. F. Worden — Lawrence Livermore Laboratory
J. J. Wynne — International Business Machines Corporation
R. Zalubas — National Bureau of Standards

All wavelengths are given in Ångstrom units (10^{-10} m). Below 2000 Å the wavelengths are in vacuum (except for the Cu II line at 1999.698 Å, which is in air); above 2000 Å the wavelengths are in air. Wavelengths given to three decimal places have an uncertainty of less than 0.001 Å and are therefore suitable for calibration purposes. In the air region, the elements used most commonly for calibration are Ne, Ar, Kr, Fe, Th, and Hg; in the vacuum region, the most common are C, N, O, Si, Cu.

All data refer to natural isotopic abundance of the elements except that Kr I and Kr II lines below 11,000 Å given to three decimal places are for ^{86}Kr. A separate table for ^{198}Hg contains accurately known wavelengths that are frequently used for calibration.

A large number of the lines for neutral and singly ionized atoms were extracted from the National Bureau of Standards (NBS) *Tables of Spectral Line Intensities* (Reference 2). The intensities of these lines represent quantitative estimates of relative line strengths that take into account varying detection sensitivity at different wavelengths. They are on a linear scale. For nearly all of the other lines the intensities represent qualitative estimates of the relative strengths of lines not greatly separated in wavelength. Because different observers frequently use different scales for their intensity estimates, these intensities are useful only as a rough indication of the appearance of a spectrum. In some cases the intensity scale is not intended to be linear. In the first and second spectra the intensities of the lines of the singly ionized atom (II) relative to those of the neutral atom (I) should be used with caution, inasmuch as the concentration of ions in a light source depends greatly on the excitation conditions.

Descriptive symbols that follow the wavelength have the following meanings:

c — complex
d — line consists of two unresolved lines
h — hazy
l — shaded to longer wavelengths
s — shaded to shorter wavelengths
p — perturbed by a close line
r — easily reversed
w — wide

The table is arranged alphabetically by element name (not symbol); for each element the lines are listed by wavelength. References to the sources of data for each element are given at the end of the table, starting on page 10-89.
