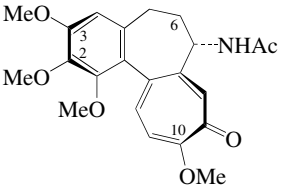
Colchiceine methyl ether. Artrichine. Colchisol. Colsaloid. NSC 757. Many other names



(-)-*form*

$C_{22}H_{25}NO_6$ 399.443
Colchicine has one chiral centre (7*S*- in the natural enantiomer) and an axis of chirality. The barrier to interconversion of the atropisomers is approx. 23 kcal mol^{-1} which is too low to allow separate characterisation for colchicine itself, although isomers of various close relatives have been isolated, and de(acetamido)colchicine can be resolved. The abs. config. of the chiral axis is (*aR*) as shown (axial chirality), which was incorrectly described for some time as *S*- using an incorrect application of the Cahn-Ingold-Prelog rules. Log P -0.21 (uncertain value) (calc).

(-)-*form* [64-86-8]
Chief alkaloid from *Colchicum autumnale*, many other *Colchicum* spp., several *Merendera* spp., *Gloriosa superba* and others (Liliaceae). Functions by binding to tubulin and arresting cell division at metaphase. Also inhibits many cell transport systems. Antimitotic agent used to induce polyploidy in plant breeding and for studying cell division. Toxicity has precluded exploitation of these props. for antineoplastic use. Potential HIV inhibitor. Antiinflammatory agent. Used for relief of pain in acute gout. Sol. MeOH, C_6H_6, H_2O; fairly sol. Et_2O; poorly sol. hexane. Mp 155-157°. $[\alpha]_D$ -121 ($CHCl_3$). Log P -0.21 (uncertain value) (calc). Pharmacol. active isomer. λ_{max} 243 (ϵ 18600); 350 (ϵ 16700) (EtOH) (Berdy).
▶ Gastrointestinal effects when used therapeutically. Other adverse effects reported incl. a lethal dose of 7 mg in humans. Cuscohygrine C-818

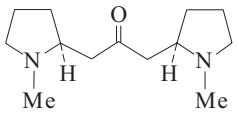
1,3-Bis(1-methyl-2-pyrrolidinyl)-2-propanone, 9CI. Cuskhygrine. Bellaradine. Hellaradine
[454-14-8]
[46727-05-3]



$C_{13}H_{24}N_2O$ 224.345

Stereochem. not fully established. Natural Cuscohygrine is either the *meso*-form (illus.) or a mixt. of *meso*- and (±)-forms. Like other related alkaloids it appears to racemise and epimerise readily. It is unknown in opt. active form but opt. active dihydrocuscohygrine (see Dihydrocuscohygrine, D-413) is known which suggests that the opt. active form may be present in the plant. The correct struct. was assigned by Liebermann in 1896 but for some years an incorrect alternative was put forward by Hess. Hellaradine appears to be a misprint in *CA* for Bellaradine. Alkaloid from *Atropa belladonna* (roots only), *Hyoscyamus niger*, *Datura* spp., *Erythroxylum coca* and other *Erythroxylum* spp., *Solanum*, *Cyphomandra*, *Margaranthus*, *Acnistus*, *Salpichroa*, *Scopolia*, *Solandra*, *Convolvulus*, *Mandragora*, *Anthocercis* and *Lycianthes* spp. (Solanaceae). Inhibitor of 2,4-dinitrofluorobenzene-induced hypersensitivity in mice. Several cuscohygrine-contg. plants are used in folk medicine as sedatives or narcotics. Oil; cryst. + $3\frac{1}{2}H_2O$. d_4^{16} 0.98. Mp 40-41° (hydrate). $n_D^{18.4}$ 1.4845.
