$C_8H_{15}NO_2$ 157.212
Considerable confusion regarding the abs. config. of natural lentiginosine. The compd. isol. by Pastuszak *et al* ($[\alpha]_D$ -3.3) was attributed the (1*S*,2*S*,8*aS*) config. based on biogenetic reasoning. The (1*S*,2*S*,8*aS*) enantiomer synthesised independently by Yoda *et al* and Cordero *et al* had opt. rotns. of $[\alpha]_D$ = +0.19 and +3.2 respectively. The most recent research (Brandi *et al*, 1995) based on synth. of both enantiomers and their inhibition of amyloglucosidases, demonstrates that natural lentiginosine has the (1*S*,2*S*,8*aS*) config. and that it is dextrorotatory.

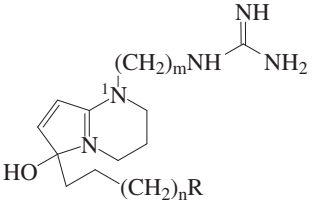
Phloeodictyne A P-366

Phloeodictine A



Naming system and numbering revised in 2004. Under the revised numbering scheme, the number before the comma indicates *m*, the number after the comma indicates *n*, and the suffix *a* or *i* indicates the end-group *R* (*a* = allyl, $-CH_2CH{=}CH_2$, *i* = isopropyl, $-CH(CH_3)_2$). The +ve charge is delocalised over the two ring nitrogens. Isol. from the New Caledonian deep water sponge *Phloeodictyon* sp. and shallow-water sponge *Oceanapia fistulosa* (*Phloeodictyon fistulosa*). Shows *in vitro* antibacterial activity and mod. cytotoxicity against KB cells. Shows antiplasmodial props.
