Ikhiri *et al* isolated Ipalbine and Ipomine with opt. rotns. completely different from those previously reported. They suggest that their Ipomine, $[\alpha]_D$ -46°(EtOH) is the enantiomer of that previously isol., but since the chirality of Ipomine is entirely due to a D-Glucose residue, this is extremely improbable. It could be the glycoside of an enantiomer of Ipalbidine. They also suggest photoisomerism of the *p*-Hydroxycinnamoyl residue as a possibility.

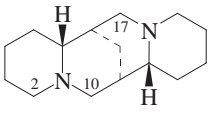
Spartalupine. Pusilline. Spathulatine. Nonalupine



(-)-*form*

$C_{15}H_{26}N_2$ 234.384

Care needed with numbering of derivs owing to twofold rotational symmetry. The term 'β-Isosparteine' was first used by Winterfeld *et al* (1934) for a different compd. (semisynthetic). For the naturally occurring alkaloid the name Spartalupine has historical precedence, but β-Isosparteine is preferred as being more descriptive. Nonalupine was actually a hydrate of β-Isosparteine and Spathulatine was its hydrochloride.
