Metabolic prod. of present in fish oils and in many phospholipids. Tuna eyeballs are a major source. Isol. from the sponge *Microciona prolifera*. Nutriceutical with antioxidation props. Extensively marketed as a dietary supplement in Japan. Essential for the functional development of nervous system including retina. Modulates arachidonic metab. and has antiinflammatory effects. May also depress platelet aggregation, augment efficiency of anticancer drugs, prevent arrhythmia and reduce serum cholesterol. Platelet aggregation inhibitor. Antihypertensive and antihypercholesterolaemic activities. Putative nootropic agent. Log P 7.44 (uncertain value) (calc). Component of Omega-3 Marine Triglycerides.

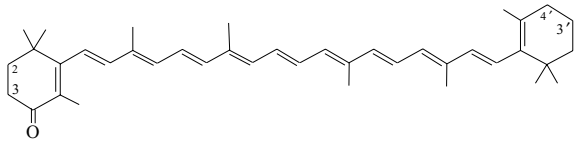
Echinenone E-2

β,β-Caroten-4-one. Myxoxanthin. Aphanine. Echininone

[432-68-8]



$C_{40}H_{54}O$ 550.866

Orange pigment originally isol. from the gonads of sea urchins. Xanthophyll of cyanobacteria. Found in echinoids, crustacea, green algae and sponges. Violet cryst. (petrol).

Mp 178-179°.

4-Alcohol: ***Isocryptoxanthin****. β,β-Caroten-4-ol. 4-Hydroxy-β-carotene. Myxoxanthol. Aphanol*

[472-62-8]

$C_{40}H_{56}O$ 552.882

Isol. from blue-green algae.

2-Hydroxy: ***2-Hydroxyechinenone****. 2-Hydroxy-β,β-caroten-4-one*

[100459-63-0]

$C_{40}H_{54}O_2$ 566.865

3S-Hydroxy: ***3-Hydroxyechinenone***

[72843-12-0]

$C_{40}H_{54}O_2$ 566.865

Isol. from *Adonis annua*, *Rhizobium lupini*, fish eggs, algae. Prisms (Me_2CO/petrol).

Mp 155-157°. λ_{max} 457 (petrol). λ_{max} 466 (EtOH).

3′-Hydroxy: ***3′-Hydroxyechinenone***

[4481-36-1]

$C_{40}H_{54}O_2$ 566.865

Main carotenoid component of several genera of cyanobacteria, present as carotenoid-protein complex. Isol. from *Arthrospira* sp. λ_{max} 458 (Me_2CO). λ_{max} 450 (hexane).

4′-Hydroxy: ***4′-Hydroxyechinenone***

[2213-17-4]

$C_{40}H_{54}O_2$ 566.865

Isol. from the spindle shell *Fusinus perplexus*, goldfish eggs, green algae and other spp. Rosettes (Et_2O/petrol).

Mp 189-190° (175°). λ_{max} 458 (EtOH). λ_{max} 454 (petrol).

4′-Ethoxy: ***4′-Ethoxy-β,β-caroten-4-one****. 4′-Ethoxy-4-keto-β-carotene*

[54897-06-2]

$C_{42}H_{58}O_2$ 594.919

Occurs in the Echinodermata. Plates ($CHCl_3$/EtOH or C_6H_6/MeOH).

Mp 163-164° (154-156°). λ_{max} 459 (hexane).

3′,4′-Didehydro: ***3′,4′-Didehydro-β,β-caroten-4-one****. 4-Keto-3′,4′-dehydro-β-carotene*

[991-90-2]

$C_{40}H_{52}O$ 548.85

Occurs in the decapod crustacean *Xantho poressa*. Red-purple plates (C_6H_6/MeOH).

Mp 192-194°. Poss. artifact.

3′,4′-Didehydro, 4-alcohol: ***3′,4′-Didehydro-β,β-caroten-4-ol****. 3′,4′-Dehydro-4-hydroxy-β-carotene*

Enkephalins E-83

[59141-40-1]

H-Tyr-Gly-Gly-Phe-X-OH, X = Met or Leu

Many syntheses descr. Pentapeptides isol. from several CNS and peripheral tissues. [Met^5]-enkephalin is derived from β-lipotropin (residues 61-65). Also obt. from the cyanobacterial assemblage *Lyngbya majuscula* / *Schizothrix calcicola* as an inseparable mixt. with its C-15 epimer. Both peptides have antinociceptive activity but this is v. transient due to the rapid inactivation by enkephalinases. Hundreds of analogues have been prepd. and evaluated as analgesics in the hope of finding a long-acting non-addictive material.

Equinatoxins E-589

[54578-46-0]
Proteins, MW approx. 19500. Isol. from the venom of the sea anemone *Actinia equina*. Neurotoxins. Show antitumour activity.
▶ LD_{50} (mus, ivn) 0.33 mg/kg.

Equinatoxin I [115966-05-7]

Equinatoxin II [107852-47-1]
Comprises 2 nearly equimolar isoforms each with 179 amino acid residues and no cysteines; one isoform is identical to one isoform of Tenebrosin C.

Equinatoxin III [115966-06-8]

Equinatoxin V
Contains 179 amino acid residues.

Erabutoxin E-590

[59536-69-5]
Peptide complex. Three Erabutoxins, designated Erabutoxin A, B and C, have been isolated. Each comprises a single chain of 62 amino-acid residues with 4 intramolecular disulfide bridges. Erabutoxin B differs from Erabutoxin A in one amino-acid residue. Erabutoxin C differs from erabutoxin B in a further residue. Isol. from the venom of the sea snake *Laticauda senifasciata*.

A B

A polysaccharide containing L-fucose and half sulfate ester. Small amounts of galactose, xylose and uronic acid are present. Two possible components are illustrated. The precise struct. of fucoidin in variants remains unclear (2000). Present in the intercellular tissues and surface exudates of Phaeophyceae, although the amount in some spp. is exceedingly small. The polysaccharide content varies with the depth at which the plant is located. *Pelvetia canaliculata* contains about 23% of the dry weight while in permanently submerged *Laminaria* it is V. hygroscopic, may prevent dehyd. of the plant upon long exp. Shows a range of biol. activities incl. antitumour and antiviral. $[\alpha]_D$ -118. Fucoins showing some structural differences isol. from *Sargassum linifolium* and from *Ascophyllum nodosum* have been termed Sargassan and Ascophylan respectively.

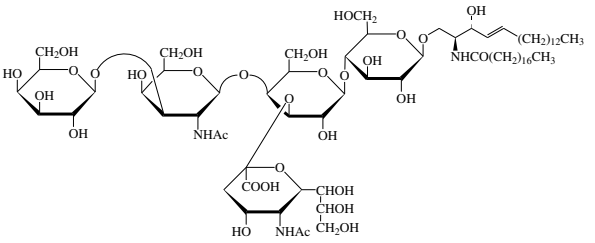
Gangliosides G-24



A large class of glycosphingolipids composed of hexoses, Sphingosine, fatty acids and sialic acids. The differences between the gangliosides are mainly in the carbohydrate moieties. Four major gangliosides referred to as GM_1 (illus.), DD_{1a}, GD_{1b}, GT_{1b}. Found in the CNS and widely distributed in other tissues. Gangliosides are the main cause of cell surface negative charge. They are also thought to be involved in many different cell functions e.g. metabolism, growth and malignant transformation. A monoganglioside prepn. has been used in the treatment of cerebrovascular disorders.

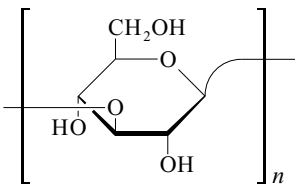
Pachyman. Callose. Paramylon
[51052-65-4]



Isol. from many fungi, bacteria, plants and algae. A practical laboratory source is the fungus *Poria cocos* (94% of dry weight). Synthetic source of 3-*O*-β-D-Glucopyranosyl-D-glucose, G-100, Laminaritriose and higher homologues. Sol. H_2O. Curdlan below is a well-studied variant having n = 540. Also closely related is Laminarin, L-21 which has a limited amount of chain branching.

Curdlan

Cerdlan. Kerdlan. TAK-N
[54724-00-4]
Extracellular polysaccharide prod. by *Alcaligenes faecalis* var. *myxogenes*, structural or reserve polysaccharide of yeasts, fungi and higher plants. Gelling agent for foods. Claimed to show anti-HIV activity by inhibiting attachment of the virus to T-cells. Insol. H_2O but absorbs H_2O. Suspensions heated >54° form a firm gel. Phase 1 clinical trials (1995)

Sulfate: ***Curdlan sulfate***
[115743-28-7] Semisynthetic polysaccharide. Used in the treatment of AIDS myelopathy, dementia.

1,3-Glucan phosphorylase G-98

E.C. 2.4.1.97. 1,3-β-D-Glucan:phosphate α-D-glucosyltransferase. Laminarin phosphoryltransferase. Laminarin phosphorylase
[37340-31-1]
Hexosyltransferase enzyme. Isol. from *Ochromonas malhamensis*. Catalyses the reaction of $(1,3\text{-}\beta\text{-D-glucosyl})_n$ with phosphate to give $(1,3\text{-}\beta\text{-D-glucosyl})_{n-1}$ and α-D-glucose 1-phosphate. Acts on β-1,3-oligoglucans and on glucans of the laminarin type.

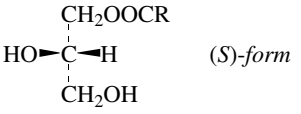
Glycerol 1-alkanoates G-119

1-O-*Acylglycerols. 1-Monoacylglycerols*



(*S*)-*form*

Chiral compds. The *S*-enantiomers correspond to 1-*O*-acyl-*sn*-glycerol. Synth. by protection of 1,2-positions in glycerol or glycerol synthons, esterification of 3-position and deprotection. Enzymatic (lipase-catalysed) routes from glycerol or triacylglycerols have been developed. Stepwise mammalian metabolism of triacylglycerols at the *sn*-1,3-positions by, successively, lingual, gastric, and pancreatic lipases produces 2-monoacylglycerols. Small amounts of *sn*-1,2 and *sn*-2,3-diacylglycerols are intermediates. Further metabolism of 2-monoacylglycerols to glycerol may proceed via isomerisations to 1(3)-monoacylglycerols, but the relevance of this acyl migration has been questioned. In a wider study of the action of lipases of animal and microbial origin, stereoselective preference was mainly for the *sn*-1 position. The *Candida antarctica* A lipase is one of a small number of lipases that will hydrolyse the *sn*-2 position in triacylglycerols. Regioisomerically pure derivatives used for the synthesis of defined triacylglycerols, phospholipids and glycolipids. Long-chain commercial mixtures are non-ionic surfactants used as emulsifiers in food, cosmetics and pharmaceutical manufacturing.
Acyl migrations, particularly under the influence of heat, acidic or alkaline conditions, can result in the interconversion of 1(3)-acyl- and 2-acylglycerols.

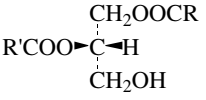
Glycerol 1,2-dialkanoates G-121

1,2-Di-O-*acylglycerols*



(*S*)-*form*

Chiral molecules, whether R and R′ are the same or different. The biol. important S-enantiomer corresponds to 1,2-diacyl-*sn*-glycerol. 3-Phosphates have the *R*-config. Props. of individual compds. refer to this enantiomer unless otherwise stated. See also 1,2-Diacylglycerol 6-sulfoquinovosides, D-111. Synth. by protection of 1,2 and 3-positions in glycerol, deprotection and esterification of 1,2-positions and deprotection of 3-position. Glycerol synthons (oxiranemethanol; 2-propen-1-ol; (chloromethyl)oxirane; 2,3-dihydroxypropanoic acid; and glyceraldehyde) are also utilised, esp. for stereospecific synth. Stepwise mammalian metab. of triacylglycerols at the *sn*-1,3-positions by, successively, lingual, gastric, and pancreatic lipases produces 2-monoacylglycerols. Small amounts of *sn*-1,2 and *sn*-2,3-diacylglycerols are intermediates. Further metab. of 2-monoacylglycerols to glycerol may proceed via isomerisation to 1(3)-monoacylglycerols, but the relevance of this acyl migration has been questioned. In a wider study of the action of lipases of animal and microbial origin, stereoselective preference was mainly for the *sn*-1 position. The *Candida antarctica* A lipase is one of a small number of lipases that will hydrol. the *sn*-2 position in triacylglycerols. Regioisomerically pure derivs. used for the synth. of defined triacylglycerols, phospholipids and glycolipids. Surfactants, used as food emulsifiers. Other food-processing uses for mixts. of mono- and diglycerides include dough strengthener, formulation aid, flavouring agent, lubricant, stabiliser, surface active agent, and texturiser.
Acyl migration, particularly under the influence of heat, acidic or alkaline conditions, can result in the interconversion of 1,2-di-*O*-acyl- and 1,3-di-*O*-acylglycerols. Commercial preps., prepared by chemical glycerolysis of triacylglycerols, contain mixts. of mono- and diacylglycerols. The diacylglycerol component forms an equilib. mixt. with a mole ratio of approx. 1.5:1 of the 1,3- and 1,2(2,3)-regioisomers.

Glycerol 1,3-dialkanoates G-122

*1,3-Di-*O*-acylglycerols*

$RCOOCH_2CH(OH)CH_2OOCR'$

Meso-compds. if the R groups are identical. Potentially opt. active if they are different. Data given here refers to racemates unless stated otherwise. Synth. by protection of 1,2-positions in glycerol or glycerol synthons, esterification of 3-position, deprotection and selective esterification of 1-position. Enzymatic (lipase-catalysed) routes from glycerol or triacylglycerols have been developed. Stepwise mammalian metabolism of triacylglycerols at the *sn*-1,3-positions by, successively, lingual, gastric, and pancreatic lipases produces 2-monoacylglycerols. Small amounts of *sn*-1,2- and *sn*-2,3-diacylglycerols are intermediates. Further metabolism of 2-monoacylglycerols to glycerol may proceed via isomerisation to 1(3)-monoacylglycerols, but the relevance of this acyl migration has been questioned. In a wider study of the action of lipases of animal and microbial origin, stereoselective preference was mainly for the *sn*-1 position. The *Candida antarctica* A lipase is one of a small number of lipases that will hydrolyse the *sn*-2 position in triacylglycerols. Surfactants, used as food emulsifiers. Other food-processing uses for mixtures of mono- and diglycerides include dough strengtheners, formulation aids, flavouring agents, lubricants, stabilisers, surface active agents, and texturisers.

Acyl migration, particularly under the influence of heat, acidic or alkaline conditions, can result in the interconversion of 1,2-di-*O*-acyl- and 1,3-di-*O*-acylglycerols. Commercial preparations, prepared by chemical glycerolysis of triacylglycerols, contain mixtures or mono- and diacylglycerols. The diacylglycerol component forms an equilibrium mixture with a mole ratio of approximately 1.5:1 of the 1,3- and 1,2(2,3)-regioisomers.

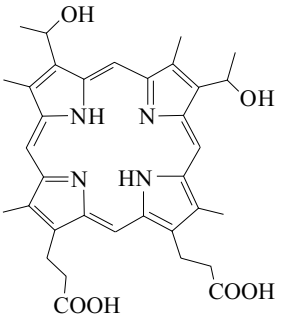
Haematoporphyrin IX. Hematoporphyrin
[14459-29-1]



$C_{34}H_{38}N_4O_6$ 598.697
Obt. from Haemin or Haematin by removal of Fe with conc. acids. Isol. from a *Chlorella vulgaris* mutant. Antidepressant. Treatment of haematoporphyrin with H_2SO_4/AcOH followed by NaOH yields a complex mixt. of ester, ether and C–C linked dimers and trimers known as HPD, which is used as a photosensitiser for photodynamic tumour therapy (PDT). Purple cryst. (Et_2O/AcOH). Log P 4.75 (calc). Use limited by chemical instability.

Haemocyanin H-4

Hemocyanin
Metalloprotein with a multisubunit struct incl. 2 Cu atoms. Present in the blood of most molluscs and some arthropods such as the horseshoe crab (*Limulus polyphemus*). Respiratory

protein. Cu atoms reversibly bind an O_2 molecule. Oxygenation causes a colour change between the colourless Cu(I) deoxygenated form and the blue Cu(II) oxygenated form.

Caesium sulfate (1:1:2) hexahydrate: Caesium vanadium alum
[95246-80-3]
$CsH_{24}O_{20}S_2V$ 592.157
Synth. by electrolytic reduction of V(*V*) in H_2SO_4 soln. in the presence of a Cs salt. Green solid (dil. H_2SO_4).

Ammonium sulfate (1:1:2) hexahydrate: Ammonium vanadium alum
$H_{28}NO_{20}S_2V$ 477.289
Synth. by electrolytic reduction of NH_4VO_3 in H_2SO_4. Blue-violet air-stable solid.

*Guanidinium sulfate (1:1:2): Guanidinium vanadium(*III*) disulfate hexahydrate*
[19497-65-5] Synth. by Zn reduction of V_2O_5 in aq. $H_2C_2O_4$ followed by addition of guanidinium sulfate.
Red-violet solid. Paramagnetic, μ_{eff} = 2.804μ_B (299K), 1.690μ_B (1.96K).

(Oxoniummonohydrate)tetrakis(trifluoromethanesulfonate):
$C_4H_{17}F_{12}O_{20}S_4V$ 792.353
Synth. from Bis(acetic acid)hexakis[μ-(acetato-*O*:*O*′)]-μ_3-oxo (tetrahydrofuran)trivanadium(*III*)(1+) loaded on a Dowex 50Wx2 column and eluting with 2*M* CF_3COOH. Blue-violet solid. Struct. determined by x-ray and not giving particularly precise struct.

Hexadecanol dehydrogenase H-251

E.C. 1.1.1.164. Hexadecanol:NAD⊕ oxidoreductase
[62213-59-6]
Oxidoreductase enzyme. Isol. from rat liver and *Euglena gracilis.* Catalyses the reversible reaction of 1-Hexadecanol, H-250 with $NAD^{\oplus}$ to give Hexadecanal and NADH. The rat liver enzyme acts on C_8-C_{16} primary alcohols; the *Euglena* enzyme oxidises the aldehyde to the carboxylic acid.
