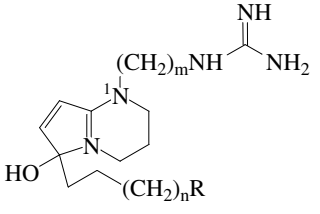
Phloeodictyne A P-340

Phloeodictine A



Naming system and numbering revised in 2004. Under the revised numbering scheme, the number before the comma indicates *m*, the number after the comma indicates *n*, and the suffix *a* or *i* indicates the end-group *R* (*a* = allyl, -$CH_2CH{=}CH_2$, *i* = isopropyl, -$CH(CH_3)_2$). The +ve charge is delocalised over the two ring nitrogens. Isol. from the New Caledonian deep water sponge *Phloeodictyon* sp. and shallow-water sponge *Oceanapia fistulosa* (*Phloeodictyon fistulosa*). Shows *in vitro* antibacterial activity and mod. cytotoxicity against KB cells. Shows antiplasmodial props.

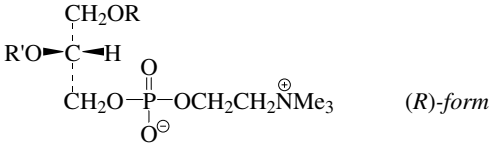
Phosphatidylcholine P-362

1,2-Diacylglycero-3-phosphocholine. Lecithin. Vitellin. Kelecin. Granulestin. Lecithol. Diacyllecithin. Diacylphosphatidylcholine. E322. PC
[8002-43-5]



(*R*)-*form*

R, R' = acyl groups

The naturally occurring (*R*)-form is equivalent to 1,2-diacyl-*sn*-glycero-3-phosphocholine (*sn*-3-phosphatidylcholine). First identified in egg yolk, ox brain and soybean oil. Present in microorganisms and throughout the animal and vegetable kingdoms; structural component of intracellular membranes and the plasma membrane. Major phospholipid in lung surfactant, component of bile. Emollient, emulsifying and solubilising agent. Used in food processing. Involved in permeability, oxidative phosphorylation, phagocytosis and chemical and electrical excitation. Forms bilayers in aq. dispersions which are used to model biol. membranes and to prepare liposomes for drug delivery systems and cosmetics. The degree of unsaturation and chain length result in distinct physical and biol. props. Mammalian phosphatidylcholine usually has a saturated acyl group at *sn*-1 and and an unsaturated group at *sn*-2. The term lecithin is also used to describe a mixture of phosphatidyl esters isolated from vegetable oils and consisting mainly of phosphatidyl-choline, -serine, -ethanolamine and -inositols with some triglycerides, fatty acids and carbohydrates. There is extensive proliferation of CAS numbers for phosphatidylcholines owing to specification of stereochemistry at different levels of precision in the literature.

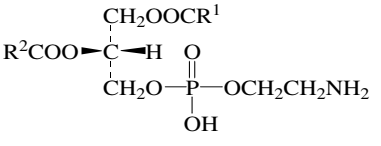
Phosphatidylethanolamine P-363

1,2-Diacylglycero-3-phosphoethanolamine. Cephalin (obsol.). Kephalin (obsol.). PE



The naturally occurring *R*-form is equivalent to 1,2-diacyl-*sn*-glycero-3-phosphoethanolamine. The nature of R^1 and R^2, including degree of unsaturation and chain length, result in distinct biol. and phys. props. Mammalian phosphatidylethanolamine normally has a saturated acyl group at *sn*-1 and an unsaturated group at *sn*-2. A prominent constit. of the membranes of eukaryotic and prokaryotic cells. Isol. from egg yolk, soya bean lecithin, brain tissue and other biol. sources. Biosynthetic precursor of phosphatidylcholines in eukaryotes. Various members show renin-inhibitory props. Racemates and other stereoisomers are mostly known but phys. props. are not given here.

[9002-69-1]
Peptide hormones. All relaxins have a two chain, disulfide-linked insulin-like struct. and two arginine residues in the midregion of the B chain. The primary structs. of relaxins from apparently closely related species can differ significantly in their AA compositions. Present in mammals and other species, e.g. sharks and chickens. Hormones of reproduction which appear to affect parturition, uterine accommodation and sperm motility in varying degrees in many species.

Dodecasulfur

[S]

Atomic No. 16. Ground state electron config. [Ne]$3s^2 3p^4$. 10 Isotopes are known of which 4 are stable. ^{33}S is used in nmr spectroscopy. Known since Biblical times. Two of many oligomeric forms shown. Has a strong tendency to catenate. Allotropic. Widely distributed in lithosphere (0.048%). Major component of atmosphere of Venus. Occurs as elemental sulfur and vast range of metal sulfides and as atmospheric H_2S and SO_2. Manuf. from H_2S, pyrites and other sulfide minerals. Mined via Frasch Process. Commercially available. Used in manuf. of H_2SO_4, CS_2, sulfites, insecticides, fungicides, plastics; for vulcanisation of rubber, in gunpowder, in bleaches, pharmaceuticals. Component of Crystex. Scabicide and ectoparasiticide. Yellow solid. Insol. H_2O; sol. CS_2; sl. sol. other org. solvs. Various metastable forms of sulfur include e.g. Plastic sulfur, Catena sulfur , Lamina sulfur, Fibrous sulfur. These are mixts. of allotropes that revert to S_8 at r.t. Dissolves in oleum → coloured solns. contg. $S_4^{2\oplus}$, $S_8^{2\oplus}$ and $S_{16}^{2\oplus}$ ions. Pharmaceutical sulfur has ≥99.5% purity.

▶ Eye irritant, poison, fungicide; explosive as dust, combustible. On heating, burns to emit toxic fumes of sulfur oxides. WS4250000

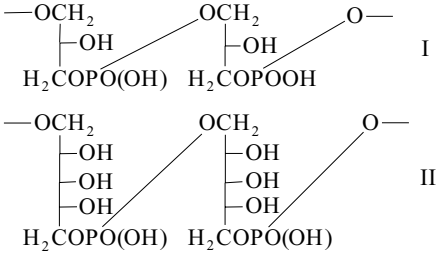
Teichoic acid T-50

[9041-38-7]



Teichoic acids are polymers of glycerol or ribitol phosphate in which some of the free hydroxyl groups may be glycosylated or esterified with D-alanine. Prominent constits. (along with peptidoglycan and other heteropolysaccharides) of the cell walls or envelopes which surround the cytoplasmic membrane of gram-positive bacteria cells. There are two major classes; those which occur in the wall, covalently linked to the peptidoglycan, and those known as lipoteichoic acids, which are situated on the surface of the cytoplasmic membrane and are covalently linked to the glycolipid located within the membrane. The former class of polymers contain glycerol and ribitol phosphates (I and II) and they comprise a major part of the purified cell walls (30-50%). The lipoteichoic acids are formed exclusively from glycerol phosphate (I); see separate entry Lipoteichoic acids.

V

V 50.942

Atomic No. 23. Ground state electron config. [Ar]$3d^3 4s^2$. 9 Isotopes have been reported of which 2 are natural. Discovered by A.M. del Rio (Mexico City) in 1801, and 'rediscovered' by N .G. Sefström (Sweden) in 1831. Metal prep. reasonably pure by H.E. Roscoe in 1867. Abundance: 136 ppm (earth's crust), 0.002 ppm (sea water). Bcc struct. Important minerals are vanadinite and carnotite. Also found in some crude oils. Extraction is usually by forming $NaVO_3$ with alkali and reduction with Al or with ferrosilicon (to yield Fe/V alloys). Pure metal obt. from VCl_3 VCl_5, + H_2, or Mg; or from V_2O_5 + Ca, Al, C; or by electrolysis of fused halides. Accumulated by many organisms in various ionic forms and as complexes (up to 1.45% in blood of some marine worms, e.g *Ascidia ceratodes*). Used in steels to impart wear resistance and high temp. strength. Biological activity uncertain. Essential trace element. Silvery metal, comparatively soft and ductile when pure. Corrosion resistant (oxide film). Resistant to fused alkalis, attacked by hot conc. mineral acids.

Mp 1915° (1890°). Bp 3380° (3350°). Reacts with Cl_2 at 180°. At high temps. reacts with most non metals.

▶ Human poison by subcutaneous route. Flammable and highly reactive when in finely divided form. YW1355000

DICTIONARY OF MARINE NATURAL PRODUCTS with CD-ROM

Vast arrays of novel products are derived from marine organisms such as sponges, worms, and algae. Many contain structural features that are unique to the marine environment. The presence of high levels of halogens and nitrogen in the host organisms' environment, for example, can engender certain characteristics that make these products suitable for investigation as drug candidates, pesticides, and marine anti-fouling agents. Driven by the search for novel drug-like leads from the sea, marine natural products are emerging as an increasingly valuable resource. Growing research in this area demands a single source reference cataloguing the current knowledge and state-of-the-science.

Deriving its format from the *Chapman and Hall Chemical Database*, **Dictionary of Marine Natural Products with CD-ROM** presents a comprehensive resource for all natural products drawn from marine organisms. Edited by pioneers in the field, this reference—

- Documents all known marine natural products and their structures
- Indexes each product by chemical name, organism type, and compound type
- Presents the biological source, chemical structure, physical properties, biological activity, and references for each compound
- Provides an accompanying CD-ROM that is fully text- and structure-searchable
- Includes an insightful, introductory monograph that describes structural compound types and marine organisms
