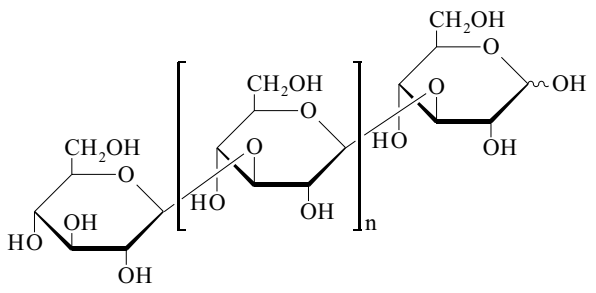
Laminaran, 9CI, 8CI. Lamariose
[9008-22-4]



$C_6H_{10}O_5$ 162.142
General term for low M.W. water-soluble reserve glucans from phaephyte algae. Soluble and insoluble forms were earlier recognised, but laminarans differ considerably in struct. There are different degrees of chain branching caused by additional substitution at C-6, and the chain termini are mostly substituted with Mannitol, M-83. The proportion of mannitol is mostly responsible for the difference between soluble and insoluble forms. Anticoagulant. Antilipemic agent.

Soluble-*form*
Found in brown algae especially the Laminaria subgroup; isol. from *Laminaria digitata*. Sol. H_2O, pptd. by addn. of EtOH. $[\alpha]_D^{18}$ -11.9 (c, 2.1 in H_2O).
Per-Ac: $[\alpha]_D^{17}$ -64.6 (c, 0.9 in $CHCl_3$).
Per-carbanilate: Mp 175-185°. $[\alpha]_D^{20}$ -7 ($CHCl_3$). $[\alpha]_D^{20}$ -52 (Py).

Insoluble-*form*
Found in brown algae especially the Laminaria subgroup; isol. from *Laminaria cloustoni*. Insol. H_2O. $[\alpha]_D^{16}$ -13.4 (c, 0.9 in H_2O).
Per-Ac: $[\alpha]_D^{15}$ -65.6 (c, 0.45 in $CHCl_3$).
