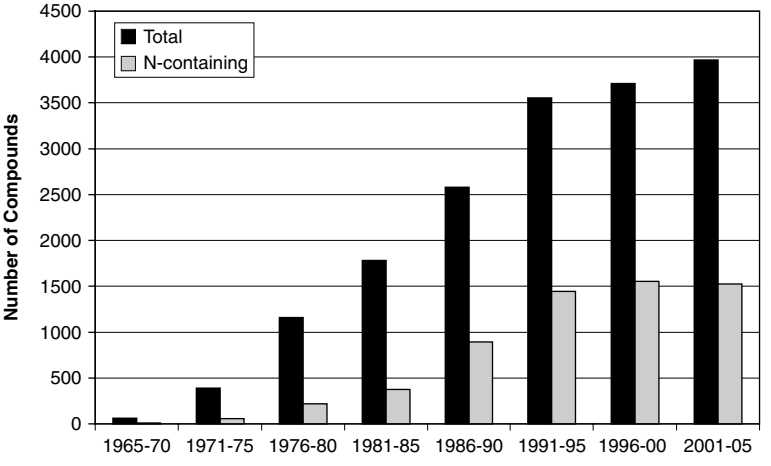
Preface

This production of the *Dictionary of Marine Natural Product*s has been made in response to the growing importance of marine natural products (MNPs) as a subset of all natural product studies. Whilst the study of natural products has been a major focus of the discipline of chemistry for well over a century, most of the effort has been on those derived from terrestrial sources. This emphasis began to change after the 1950s when the impact and significance of Werner Bergmann's pioneering work on natural products from the marine environment was recognised. Bergmann started his work on MNPs in 1933 and published the 50th article in his "Marine Product" series in 1961. The work for which he is widely recognised was the isolation and characterisation in the early 1950s of the non-ribose nucleosides, spongothymidine and spongouridine, from the Caribbean sponge *Cryptotethia crypta.* Within a decade of these discoveries the biomedical importance of non-ribose nucleosides was being realised and the development of drugs such as Ara-C, Ara-A and AZT can be traced directly back to Bergmann's work. The delayed onset of more extensive research into MNPs was partly a consequence of the relatively limited access that biologists and chemists had to that part of the marine environment beyond the sub-tidal zones. This was remedied by the popularisation of SCUBA which dramatically enhanced the ability to collect in the aquatic environment as well as opening up possibilities for marine environmental chemistry. SCUBA was followed in turn by the use of ROVs and various submersibles that have allowed access to very much deeper water. Along with the enhanced collecting opportunities came the recognition that most of the biodiversity on earth was actually present in the oceans.

From the recognition of the importance of marine natural products in the 1950s the field progressed steadily with the next champion, Paul Scheuer, who played a dominant role from the mid-1960s until recently. Joining Scheuer as leaders in the field from the 1970s onwards were Ken Rinehart and John Faulkner (sadly, all three recently deceased). Further MNP studies from the 1970s onwards were assisted by advances in spectroscopic methods and separation science that allowed for the rapid isolation and characterisation of many new structural types. Since then the number of groups undertaking research in the area has grown rapidly, as reflected by the rapid increase in MNP publications and the establishment of MNPs as a separate focal point for conferences. Currently, studies on MNPs are carried out by a wide range of research groups (in excess of 150) scattered across at least 40 countries, but with many of the current leaders of the field able to trace an academic ancestry back to having worked for, or with, Scheuer, Rinehart or Faulkner. Over the years the number of new compounds reported has been rising steadily and is shown graphically below from 1965 until 2005. In 2006 814 new compounds were reported in 302 refereed publications. The total number of MNPs is now approximately 18,000.



Early investigations focussed on the diversity of chemical structures elaborated by marine organisms readily accessible to collectors, notably algae, sponges, tunicates and other invertebrates. The best illustration of this approach was the degree of attention that was focused on halogenated metabolites available from red algae (Rhodophycota). Genera such as *Plocamium* and *Laurencia* were readily available by shore wading, could be collected in relatively large amounts and the metabolites present were relatively non-polar and could be readily

extracted and separated by the conventional separation techniques available at that time (1970s). However, by the 1980s the focus of attention was switching to the role of these diverse structures in ecological interactions and especially to the potential of compounds of marine origin as pharmaceutical agents. Considering the dramatic start that Bergmann's discovery of the non-ribose nucleosides had on the biomedical role of MNPs some 20 years earlier, this preoccupation with non-polar non-nitrogenous compounds was a distraction. In John Faulkner's first review on marine metabolites (1977) covering the period 1974-6 only 10% of the metabolites covered were nitrogenous. However, for the period 1977-85 this figure had almost doubled to 19.5% with 332 out of 1706 metabolites containing at least one N. Long before Lipinski's "rule of five" had been enunciated it was well recognised that nitrogen was an important structural feature in bioactive compounds. Fortuitously, rapid advances in chromatographic techniques and phases were occurring at this time that dramatically eased the problems of working on the (usually) more polar bioactive compounds. This move towards searching for bioactive compounds was a major driving force for the expansion of interest in MNPs and continues to provide a strong rationale for new discovery programmes. Structural elucidation aspects of MNPs continue as a core activity. With the advent of more sensitive NMR techniques, the mass requirements for obtaining good 1D- and 2D-NMR data have been reduced by two orders of magnitude. The effects of this have been two-fold. Firstly, it is easier to examine and characterise the very minor metabolites. Secondly, these advances have had a distinct influence on the mass requirements for field collections - smaller samples are possible as well as the opening up of a whole new range of marine organisms that are only ever available in small amounts.

Also dating back to the 1980s was the move towards the study of marine microorganisms. A continuing leader in this field is William Fenical. Initially, Fenical and his group focused on bacteria, especially those colonising the surfaces of marine algae and invertebrates, but in time changed their emphasis more towards marine fungi. This focus is now a major preoccupation of many of the marine research groups. For the literature on marine microorganisms, 45% of the total citations over the 1965 to 2005 period have been published since 2001. A significant find has been the discovery of new obligate marine actinomycete genera that produce unique metabolites. Accompanying the study of marine microorganisms has been the recognition that many of the MNPs described in the literature may well be of microbial origin and produced by microorganisms that are symbiotic, commensal or dietary components of the host invertebrate species. Modern developments in the tools of molecular biology are making the studies of these relationships more accessible. There has been a hiatus in the use or development of compounds of marine origin as pharmaceuticals. The recent licensing of Prialt, from the toxin of a *Conus* species, for the treatment of intractable pain comes some 50 years since the introduction of Ara-A and Ara-C and is the first direct drug from a marine invertebrate. It is likely that others, such as Yondelis for the treatment of cancer, will now soon follow.

No matter what the role or the source of MNPs might be, or what the focus of the research, the type of assays or analytical techniques that are directing the purification, chemists needs to quickly establish the novelty of compounds that they are working on (dereplication), and to explore the relatedness of new compounds to others in the same class of structural types. The dereplication process in a modern context relies heavily on UV libraries (from HPLC data), mass spectrometry (from LC-MS data) and NMR pattern recognition (from cryoprobe or capillary probe NMR spectroscopy). The scale of such operations is now at the μg level and effectively telescopes the traditional process of several steps (crude extract evaluation, isolation, dereplication and characterisation) into just one process. The dereplication of MNPs relies heavily on access to appropriate collections of data, especially those with substructure searching capability, MW and UV data, that enable researchers to rapidly distinguish unique molecules from known compounds.

Such collections of data include the *Dictionary of Natural Products* (DNP) which is an all-encompassing compilation of natural product compound information from all sources including compound data, taxonomy and key references to structural, synthetic, ecological and biological activity studies. DNP was first published in 1992, and since that time has been continually updated by a team of specialist contributors and republished every six months in electronic form (CD-ROM, and more recently also as a web product). The *Dictionary of Marine Natural Products* is a specialist subset of the DNP. During 2004 to 2006, all entries in the DNP database referring to marine natural products were extracted, reviewed and where necessary expanded with reference to specialist literature sources such as MarinLit, and with the input of further levels of expertise from the marine natural specialists (John Blunt and Murray Munro).

The resulting *Dictionary of Marine Natural Products* in printed/CD-ROM format consists of approximately one-sixth of the DNP database, specially enhanced with new types of information particularly relevant to the marine environment. In particular, during the compilation, Type of Organism codes were added to the (whole) database for the first time, allowing the data to be searched by broad taxonomic criteria in parallel with other

parameters. This information, along with the MS, MF and UV data, can be directly searched in the CD-ROM version of *Dictionary of Marine Natural Products* and can give a rapid, unambiguous answer on the novelty of any metabolite isolated or partially characterised.

It is intended that the *Dictionary of Marine Natural Products* will be republished periodically, probably in CD-ROM format only. Users can obtain access to more frequent updates of the whole DNP database (including new marine information) by subscription. This first compilation of the *Dictionary of Marine Natural Products* will be of significant value to the growing number of investigators in the field of marine natural products. The efforts of John Buckingham and Steve Walford, coordinating a team of contributors (principally Keith Baggaley, Bob Hill and Andy Roberts) will be greatly appreciated.

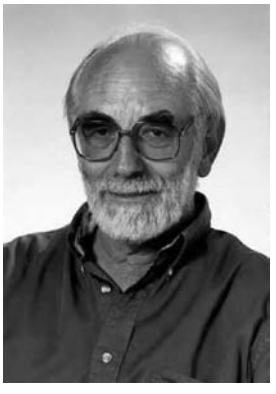
Editorial Board

Biography

John Blunt obtained his BSc (Hons) and PhD degrees from the University of Canterbury, followed by postdoctoral appointments in Biochemistry at the University of Wisconsin-Madison, and with Sir Ewart Jones at Oxford University. He took up a lectureship at the University of Canterbury in 1970, where he is now a Professor. His research interests are with natural products, and the application of NMR techniques to structural problems.



Murray Munro, University of Canterbury, Christchurch New Zealand, has worked on natural products, mainly of New Zealand origin, right through his career. Following a sabbatical with Ken Rinehart at the University of Illinois in 1973 interest in marine natural products developed with a particular focus on bioactive compounds. In recent years his research interests have widened to include terrestrial and marine fungi and actinomycetes as well as marine invertebrates.

Introduction

1. COVERAGE

The *Dictionary of Marine Natural Products* is a comprehensive database containing over 30,000 compounds. It is a subset of the *Dictionary of Natural Products* (DNP) database. DNP is an ongoing project based on a 25-year review of the natural product literature. For the present project, the subset of DNP entries referring to marine natural products were carefully checked and reviewed and enhanced with a considerable amount of additional information relating to their natural occurrence. Several careful reviews were also carried out to ensure that the coverage of marine natural products in the finished publication was as complete as possible.

The compounds present in the Dictionary have been classified under the following major headings, which are described in more in the **Structural Types** section below. (There are obvious overlaps between the categories.)

Aliphatic natural products
Carbohydrates
Oxygen heterocycles
Simple aromatic natural products
Terpenoids
Steroids
Aminoacids and peptides
Alkaloids
Polypyrroles

Biosynthetic information on these compound classes can also be found in the Structural Types section. Taxonomic information on the organisms and their metabolites is covered in the **Classification of Organisms** section.

In compiling the printed version and the CD-ROM, the primary literature has been reviewed up to mid-2006.

The definition of a marine natural product is imprecise. The coverage of this Dictionary in terms of 'mainstream' natural products is intended to be comprehensive and as far as can be determined by various cross-checks carried out in the later stages of compilation, it comes extremely close to achieving that aim. Natural products which may be considered marginal are present to a great extent, but to include every compound that might be found somewhere in the sea would be an unrealistic target. In particular, compounds of the following type may not necessarily be present:

(1) Biochemicals endogenous to the higher marine animals, e.g. bile acids of marine mammals, endocrine hormones of crustaceans.
(2) Microbial products isolated from organisms that are widespread on both sea and land and have in fact been isolated from a marine-related source, e.g. an antibiotic from *Streptomyces* harvested from driftwood.
(3) Natural products of a 'terrestrial' type isolated from plants and animals in marginal environments, e.g. mangrove saltmarshes, may not be fully covered.
(4) Widespread polysaccharides, e.g. Amylose, Amylopectin.

All of these are included in the parent database *Dictionary of Natural Products*, available on DVD or online from CRC Press.

The coverage of lipids is extensive but not completely comprehensive. Numerous homologous series of fatty acids with different unsaturation patterns occur in both terrestrial and marine organisms, and there may not be an individual entry for every minor congener.

1.1 Natural products in the marine environment; general observations

The marine environment is an extremely complex one, showing immense biodiversity. Marine organisms produce all of the main type of natural product found among their terrestrial counterparts, but with a very different range of chemodiversity, so that, for example, the range of terpenoid skeletons includes some not found on land. Conversely, there are large groups of natural product found in some higher plants (e.g. many terpenoid skeletons; large categories of alkaloids) for which the enzymatic pathways have not evolved among marine organisms; higher plants are essentially absent from the sea.

1.1.1 Elemental composition

Many marine natural products contain the elements nitrogen, sulfur and halogens available in seawater, but with very uneven distribution across the phyla. A few compounds containing other elements such as arsenic and boron are also known, and also metal complexes (Ni, V, Zn). Vanadium bromoperoxidases are involved in the production of brominated marine natural products (but chlorinated metabolites arise by a different route). The proportion of nitrogenous compounds is much higher in cyanobacteria, bryozoans and ascidians, and the proportion of halogenated compounds is very high in the red algae (in marked contradistinction to the brown algae). More details are given in the sections below describing these organisms.

Kornprobst, J.M. *et al, Comp. Biochem. Physiol. B,* 1998, **119**, 1–51 (*rev, sulfates*)
Jiménez, C., *Stud. Org. Chem*., 2001, **25**, 811-917 (*rev, sulfur-containing marine natural products*)
Butler, A. *et al, Nat. Prod. Rep*., 2004, **21**, 180-188 (*vanadium bromoperoxidases*)

1.1.2 Interspecific interactions

It is now clear that, whilst many marine natural products are located in the tissues of the larger marine animals and plants, and are thus genuine natural products of those organisms, many others are produced by associated endo- and epibiotic microorganisms. Most marine microorganisms have not yet been successfully cultured, and definitive proof of origin is in most cases currently lacking. These products produced by symbiotic or epiphytic microorganisms appear in many cases to play a role in chemical defence mechanisms.

In the past five years, however, much progress has been made in assigning a definite microbial origin to many natural products. For example, in the case of **Swinholide A**, originally isolated from the sponge *Theonella swinhoei*, centrifugation of macerated cell samples from the sponge showed that the alkaloid was located within heterotrophic unicellular bacterial cells, was absent from the sponge cells themselves, but was also in the cells of the co-occurring cyanobacterium *Aphanocapsa feldmanni* also present. More recently, however, Swinholide A has been found in some cyanobacteria, and it has been speculated that it may be produced by one component of this symbiont system, and stored by another. In the case of the isocyano- and related metabolites found in marine invertebrate extracts, the isocyano group, possibly derived from cyanide ion, may be produced by an associated microorganism, while the terpenoid component derives from the animal. Genomic techniques are now being used; for example to show that **Patellamides A** and **C** are biosynthesised by a cyanobacterial symbiont of the originally cited source. Other natural products isolated from the higher marine organisms, however, have a known dietary origin, while a definite *de novo* biosynthesis of some mollusc products has been demonstrated.

It may be true in some cases that although a particular type of metabolite isolated from a higher animal has not yet been found among the lower forms such as cyanophytes forming part of the same ecosystem, this is merely an accident of the search process.

2. ORGANISATION OF ENTRIES

The Dictionary is arranged alphabetically by entry name. Every entry is numbered to assist ready location. Many compounds are included as derivatives of main entry compounds but important derivatives have their own individual cross-referenced entries. Use of the CD-ROM indexes enables the rapid location of all compounds in the Dictionary by name or compound type, regardless of their location. Entries may sometimes contain data on natural products which are not of marine origin, but this is obvious from the context and may provide valuable links to relationships between marine and terrestrial sources. This is especially true of entries dealing with fungal metabolites (see the section dealing with fungi, below).

A representative dictionary entry is shown in **Figure 1.**

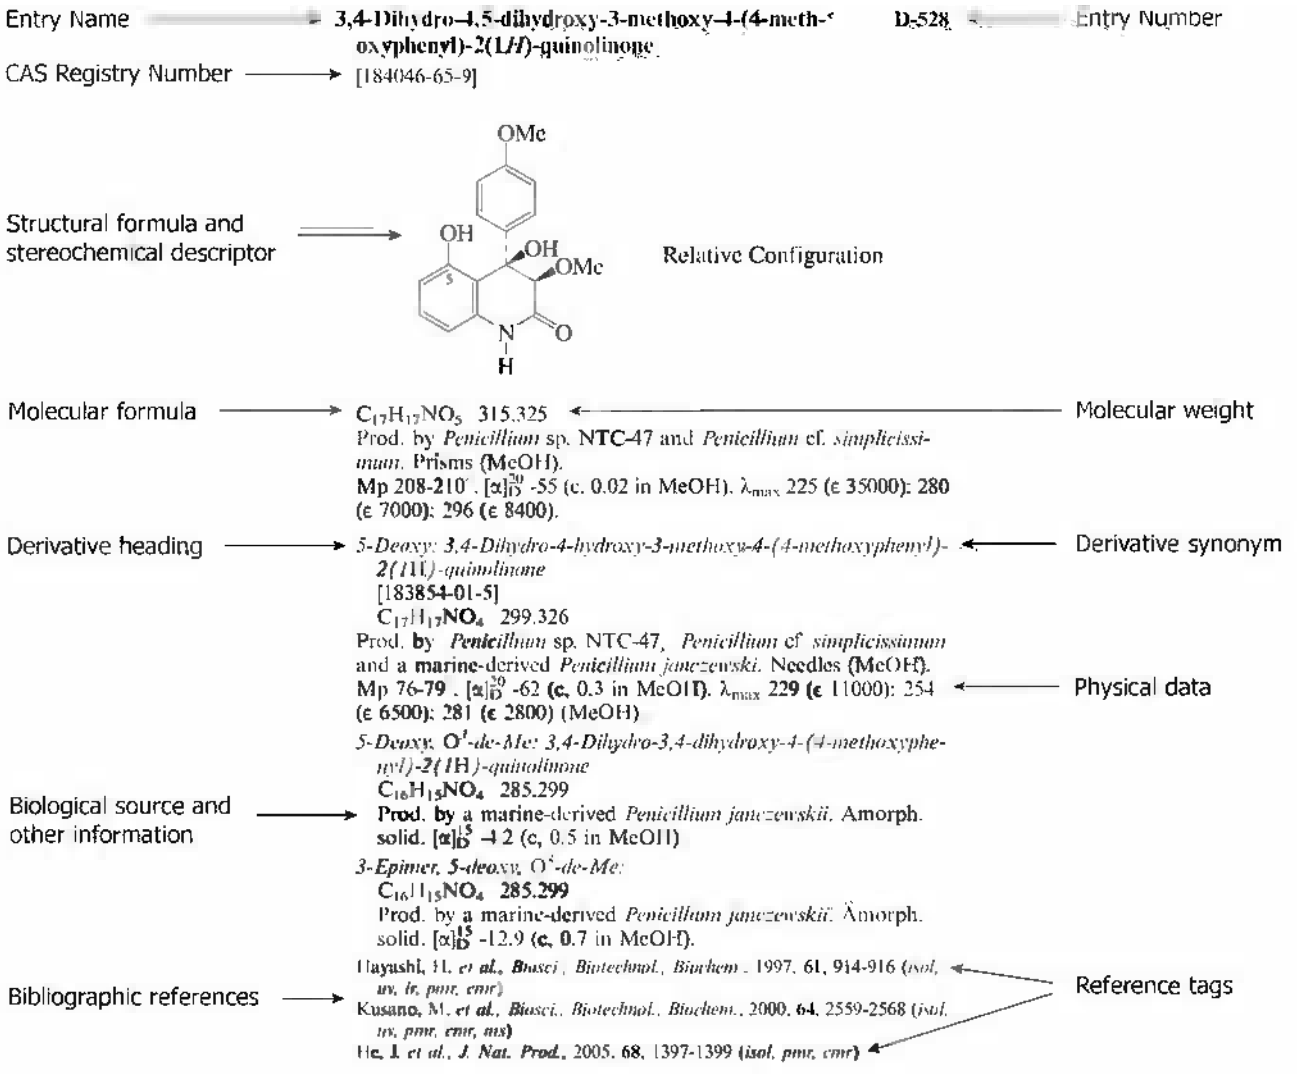

FIGURE 1

.

2.1 Chemical names and synonyms

The Dictionary contains a wide range of synonyms which may be (a) those found in the primary literature, (b) *Chemical Abstracts* names, or (c) names added editorially to achieve as much consistency as possible with other closely related substances. Names corresponding to those used by CAS during the 9th and subsequent Collective Index periods (1973) are labelled 9CI Names. All important derivatives embedded within entries are named (but see comment on CAS nomenclature below). If a compound cannot be located immediately in the main body of the entries, it is important to use the indexes. The CD-ROM version of the Dictionary is much more highly indexed than the printed version.

The most authoritative current statement of good practice on natural product nomenclature is the document *IUPAC Recommendations 1999* (*Pure Appl. Chem.,* 1999, **71**, 587–643) the full text of which can be read on the *Dictionary of Marine Natural Products on CD-ROM* (access from the Windows® Start menu item or via the Help menu in the main program).

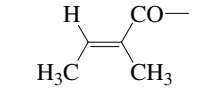
Some marine natural products have been given trivial names which duplicate those already in the literature, or which are simultaneously published for two or more non-identical substances. Where such a duplication is noticed this is indicated by the dagger symbol (‡) immediately following the name. Borderline cases, especially as between presence or absence of terminal e or suffix A or 1, are considered to constitute duplicates for this purpose.

2.1.1 Nomenclature

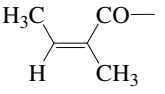
It is expected that this Dictionary will be used by a wide variety of scientists, not all of whom will be specialist organic chemists. Therefore compounds have been named so as to facilitate access to their factual data by keeping the nomenclature as simple as possible, whilst still adhering to good practice as determined by IUPAC (the International Union of Pure and Applied Chemistry). A great deal of care has been taken to achieve this aim as nearly as possible.

A much fuller description of the detailed nomenclature of individual classes of marine natural product is given in the **Structural Types** section. The following notes are of general applicability throughout the Dictionary.

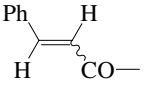
1. There are many examples in the primary literature of compounds being named in ways which are violations of good IUPAC practice, e.g. where the substituents are ordered non-alphabetically. These are not reported in their incorrect form but have been corrected.
2. The number of trivial names used for acylating substituents has been kept to a minimum but the following are used throughout the Dictionary.



Tigloyl = *E*-2-methyl-2-butenoyl



Angeloyl = *Z*-2-methyl-2-butenoyl



Cinnamoyl = 3-phenyl-2-propenoyl

3. Many other trivial appellations have from time to time appeared in the literature for other acyl groups (e.g. Senecioyl = 3-methyl-2-butenoyl, Feruloyl = 3-(4-hydroxy-3-methoxypheny1)-2-propenoyl or 4-hydroxy-3-methoxycinnamoyl).

The term **prenyl** for the common 3-methyl-2-butenyl substituent, $(H_3C)_2C{=}CHCH_2$-, is used throughout the Dictionary. Several other names for this substituent have from time to time been used and appear in the primary literature including the following:

3-Methyl-2-butenyl (systematic)
γ,γ-Dimethylallyl
3,3-Dimethylallyl
3,3-Dimethylpropenyl
Dimethallyl
Isoprenyl
Isopentenyl
β,β-Dimethylacrylyl

2.2 CAS REGISTRY NUMBERS

CAS numbers are identifying numbers allocated to each distinctly definable chemical substance indexed by CAS since 1965 (plus some retrospective allocation of numbers by CAS to compounds from earlier index periods). The numbers have no chemical significance but they provide a label for each substance independent of any system of nomenclature. They are extensively used for exchanging information between individuals and databases. The numbers take the form NNNNNN-NN-R, where the total number of digits is five or more and R is a check digit.

For practical purposes, CAS numbers have certain shortcomings arising from their free allocation, resulting in one substance having more than one potential number. Duplication may arise for one of several reasons to do with the detailed chemistry of the substance, for example tautomerism, solvent formation, partially unspecified stereochemistry. There are also replaced numbers. For this reason, Dictionary entries will often contain one or more *Additional CAS numbers* which may help the user to obtain further information about the substance, especially by online searching.

Clearly, the additional CAS numbers given in this Dictionary have to be used with care. Their inclusion in the entry is the result of an editorial decision by the Dictionary contributor that they refer to what is essentially the same substance, but this decision may be a subjective one. Care has been taken to ensure that the main CAS number given in this Dictionary for each substance is the correct one.

Further information on CAS number allocation policy can be obtained from CAS indexes or *The Organic Chemist's Desk Reference* (Chapman & Hall, 1995).

2.3 Structural formulae

Every attempt has been made to present the structures of chemical substances as accurately as possible according to best current practice and recommendations of IUPAC. As much consistency as possible has aimed at between closely-related structures. For example, all sugars are shown as Haworth formulae, and whenever possible in complex structures the rings are oriented in the standard Haworth convention so that structural comparisons can be quickly made.

2.4 Molecular formula and molecular weight

The elements in the molecular formula are given according to the Hill convention (C, H, then other elements in alphabetical order). The molecular weights given are formula weights (or more strictly, molar masses in daltons) and are rounded to three places in decimals. In the case of some high molecular mass substances, such as proteins, the value quoted may be that taken from an original literature source and may be an aggregate molar mass.

2.5 Physical data

The Dictionary gives the following physical characteristics of substances, when available: appearance, melting point, boiling point, optical rotation, density, refractive index, solubility, p*K*a. All of these fields are searchable by numerical value (including range searching) in the CD-ROM version of the Dictionary.

2.5.1 Appearance

Organic compounds are considered to be colourless unless otherwise stated. Where the compound contains a chromophore which would be expected to lead to visible colour, but no colour is mentioned in the literature, the Dictionary entry will mention this fact if it has been noticed by the contributor. An indication of crystal form and recrystallisation solvent is often given but these are imprecise items of data; most compounds can be crystallised from several solvent systems and the crystal form often varies. In the case of the small number of compounds where crystal behaviour has been intensively studied (e.g. pharmaceuticals), it is found that polymorphism is a very common phenomenon and there is no reason to believe that it is not widespread among organic compounds generally.

2.5.2 Melting Points and Boiling Points

The policy followed in the case of conflicting data is as follows:

a. Where the literature melting points are closely similar, only one figure (the highest or most probable) is quoted
b. Where two or more melting points are recorded and differ by several degrees (the most likely explanation being that one sample was impure) the lower figure is given in parentheses, thus Mp 139° (134–135°)
c. Where quoted figures differ widely and some other explanation such as polymorphism or incorrect identity seems the most likely explanation, both figures are quoted without parentheses, thus Mp 142°, Mp 205–206°
d. Known cases of polymorphism or double melting points are noted

Boiling point determination is less precise than that of melting points and conflicting boiling point data are not usually reported except when there appears to be a serious discrepancy between the different authors.

2.5.3 Optical rotations

These are given wherever possible, and normally refer to what the Dictionary contributor believes to be the best characterised sample of highest chemical and optical purity. Where available an indication of the optical purity

(op) or enantiomeric excess (ee) of the sample measured follows the specific rotation value. For a recent discussion of the validity and applicability of these terms, see Gawley, R.E., *J. Org. Chem*., 2006, **71**, 2411–2416.

Specific rotations are dimensionless numbers and the degree sign which was formerly universal in the literature has been discontinued.

2.6 Spectroscopic data

Many Dictionary entries include ultraviolet spectra which are presented in the format:

[neutral] λ_{max} 198(log ε 1.55); 224 (sh) (log ε 0.61); 241 (sh) (log ε 0.55)(H_2O)(Berdy)

where ε is the absorption coefficient for a given UV maxima value (λ_{max}). A description of the solvent conditions used, if reported in the literature, is listed at the beginning and end of the UV data in parentheses. All peak absorptions cited are maxima unless otherwise described, e.g. shoulder/inflection (sh) and end absorption (end). In addition, UV data may be followed by the term 'Berdy' or 'DEREP' indicating from which database the data originated. The absence of these terms implies that the data were abstracted from the primary literature.

On the CD-ROM, all the λ_{max} values are indexed in the UV Maxima field and can be searched for numerically including range searching. Similarly, the solvent data associated with the UV data are indexed in the UV Solvent field.

2.7 Hazard and toxicity information

2.7.1 General

Toxicity and hazard information is highlighted by the symbol and has been selected to assist in risk assessments for experimental, manufacturing and manipulative procedures with chemicals.

The Publishers cannot be held responsible for any inaccuracies in the reported information, neither does the omission of hazard data in the Dictionary imply an absence of this data from the literature. Widely recognised hazards are included, however, and where possible key toxicity reviews are identified in the references. Further advice on the storage, handling and disposal of chemicals is given in *The Organic Chemist's Desk Reference*.

2.7.2 RTECS® Accession Numbers*

Many entries in this Dictionary contain one or more RTECS® Accession Numbers. Possession of these numbers allows users to locate toxicity information on relevant substances from the NIOSH *Registry of Toxic Effects of Chemical Substances*, which is a compendium of toxicity data extracted from the scientific literature.

2.8 Bibliographic references

The selection of references is made with the aim of facilitating entry into the literature for the user who wishes to locate more detailed information about a particular compound. The contents of most references are indicated by reference tags (suffixes) indicating their content and in particular the stereoisomers and derivatives of the parent compound which they document. The number of references cited does not indicate the relative importance of a compound; one key recent citation may supersede a number of older ones.

Journal abbreviations generally follow the practice of the Chemical Abstracts Service Source Index (CASSI), except for a short list of very well known journals where the Dictionary gives shorter abbreviations to save space (e.g. *J.A.C.S.* instead of *J. Am. Chem. Soc.*)

2.8.1 Further References

Further useful information on a variety of topics concerned with the structure, description, stereochemistry and nomenclature of organic compounds can be found in the *Organic Chemist's Desk Reference*.

*RTECS® Accession Numbers are compiled and distributed by the National Institute for Occupational Safety and Health Service of the U.S. Department of Health and Human Services of The United States of America.

3. INDEXES

There are three printed indexes:

1. **Name Index** which lists every compound name and synonym in the Dictionary
2. **Type of Compound index** listing all compounds given in the Dictionary organised by structural type
3. **Type of Organism index** listing all compounds according to the species from which they have been isolated.

The indexes refer to the entry number. Searches on all text and numerical indexes, as well as structure and substructure searching can be carried out on the CD-ROM version of the Dictionary. For information on the Type of Compound codes used in the Type of Compound Index, please see the **Structural Types** section.

4. ABBREVIATIONS

The following is a selection of the most common Database abbreviations used:

Abbreviation	**Name**
[α]	specific rotation
abs config	absolute configuration
Ac	acetyl
acc	according
AcOH	acetic acid
Ac_2O	acetic anhydride
alk	alkaline
amorph	amorphous
amt	amount
anal	analytical applications, analysis of detection
anhyd	anhydrous
aq	aqueous
BAN	British Approved Name
bibl	bibliography
biosynth	biosynthesis
Bp	boiling point
c	concentration
ca	(*circa*) about
cd	circular dichroism
CAS	Chemical Abstracts Service
chromatog	chromatography
cmr	carbon (^{13}C) nuclear magnetic resonance
CNS	central nervous system
col	colour, coloration
coml	commercial(ly)
compd	compound
conc	concentrated
config	configuration
conformn	conformation
constit	constituent
cryst struct	X-ray crystal structure determination
d	density
dec	decomposes, decomposition
degradn	degradation
deg	degree
deriv(s)	derivative(s)
detn	detection, determination
dil	dilute, dilution
dimorph	dimorphic

diss	dissolves, dissolved
dist(n)	distil, distillation
DMF	dimethylformamide
DMSO	dimethyl sulfoxide
ee	enantiomeric excess
epr	electron paramagnetic (spin) resonance
equilib	equilibrium
esp	especially
Et	ethyl
EtOAc	ethyl acetate
EtOH	ethanol
EtOH aq	aqueous ethanol
exp	experimental
FEMA	Flavor and Extract Manufacturers' Association
fl p	flash point
fluor	fluoresces, fluorescence
formn	formation
Fp	freezing point
g	gram
glc	gas liquid chromatography
Glc	β-D-glucopyranosyl
GRAS	Generally Recognised As Safe
ham	hamster
haz	hazard
hplc	high performance liquid chromatography
hydrol	hydrolyses, hydrolysed, hydrolysis
ihl	inhalation
ims	intramuscular
INN	International Nonproprietary Name
intermed	intermediate
ipr	intraperitoneal
ir	infra-red spectrum
isol(n)	isolation, isolated
isom	isomerism, isomers, isomerises
ivn	intravenous
JAN	Japanese Accepted Name
JMAF	Japanese Ministry for Agriculture, Forestry and Fisheries
LC	lethal concentration
LD	lethal dose: LD_{50}, a dose which is lethal to 50% of the animals tested
M	molecular weight (formula weight)
manuf	manufacturer, manufactured
max	maximum
Me	methyl
MeOH	methanol
Me_2CO	acetone
MEL	maximum exposure limit
metab	metabolite, metabolism
misc	miscible
mixt	mixture
mod	moderately
Mp	melting point
ms	mass spectrum
mus	mouse
n	index of refraction, e.g. n_D^{20} for 20° and sodium light
nmr	nuclear magnetic resonance spectrum (general)
obt	obtained

oc	open cup
occup	occupational
OES	Occupational Exposure Standard
op	optical purity
ord	optical rotatory dispersion
orl	oral
Ph	phenyl (C_6H_5)
pharmacol	pharmacology
pmr	proton (^1H) nuclear magnetic resonance
polarog	polarography

sepn	separation
skn	skin
sl	slightly
sol	soluble
soln	solution
solv	solvent
sp	species (singular)
spar	sparingly
spp	species (plural)
ssp	subspecies
subl	sublimation, sublimes
synth	synthesis
tautom	tautomerism
THF	tetrahydrofuran
tlc	thin layer chromatography
TLV	Threshold Limit Value
tox	toxicity
unsatd	unsaturated
USAN	United States Adopted Name
uv	ultraviolet spectrum
v	very
var	variety
vis	visible
vol	volume

4.1 Reference tags

The following is a selection of the most common Reference Tag abbreviations used:

Abbreviation	**Name**
abs config	absolute configuration
anal	analysis
bibl	bibliography
biosynth	biosynthesis

cd	circular dichroism
chromatog	chromatography
cmr	^{13}C nuclear magnetic resonance spectrum
config	configuration
conformn	conformation
cryst struct	X-ray crystal structure determination
deriv(s)	derivative(s)
detn	determination, detection
dta	differential thermal analysis
glc	gas-liquid chromatography
hplc	high performance liquid chromatography
ir	infrared spectrum
isol	isolation
isom	isomerism
manuf	manufacture
metab	metabolism
ms	mass spectrum
nmr	nuclear magnetic resonance spectrum
occur	occurrence
ord	optical rotatory dispersion
pharmacol	pharmacology
pmr	proton (^1H) nuclear magnetic resonance spectrum
props	properties (chemical or physical)
Raman	Raman spectrum
resoln	resolution
rev	review
sepn	separation
struct	structure
synth	synthesis
tautom	tautomerism
tlc	thin layer chromatography
tox	toxicity
trans	transition(s)
uv	ultraviolet spectrum
uv-vis	ultraviolet visible spectrum

5. THE DICTIONARY OF MARINE NATURAL PRODUCTS ON CD-ROM

The *Dictionary of Marine Natural Products* is published together with a fully searchable CD-ROM. Space considerations have precluded the inclusion of indexes other than the Name, the Type of Compound and the Type of Organism indexes in the hard-copy version. By contrast, the CD-ROM contains searchable indexes on the following 35 fields:

Accurate Mass	Chemical Name	Molecular Weight	Supplier
All Entries	Density	Optical Rotation	Type of Compound
All Text	Development Status	Partition Coefficient (Calc.)	Type of Compound Words
Biological Source	Dissociation Constant	Percent Composition	Type of Organism
Biological Use/Importance	Hazard & Toxicity	References	Type of Organism Words
Boiling Point	Hazard Flag	Refractive Index	Use/Importance
Boiling Point Pressure	Ion Charge	Rotation Conditions	UV Maxima
CAS Registry Number	Melting Point	RTECS Accession No.	UV Solvent
Chapman & Hall Number	Molecular Formula	Source/Synthesis	

In addition to searching the above text fields, it is possible to search on structure and substructure.

Once installed, a Help file providing additional information on data content and guide to searching is available from the Chapman & Hall_CRC folder in the Start Menu and from the Help menu on the CD-ROM.

When accessing the *Dictionary of Marine Natural Products on CD-ROM* the first screen that is obtained is the Search Form window (**Figure 2**).

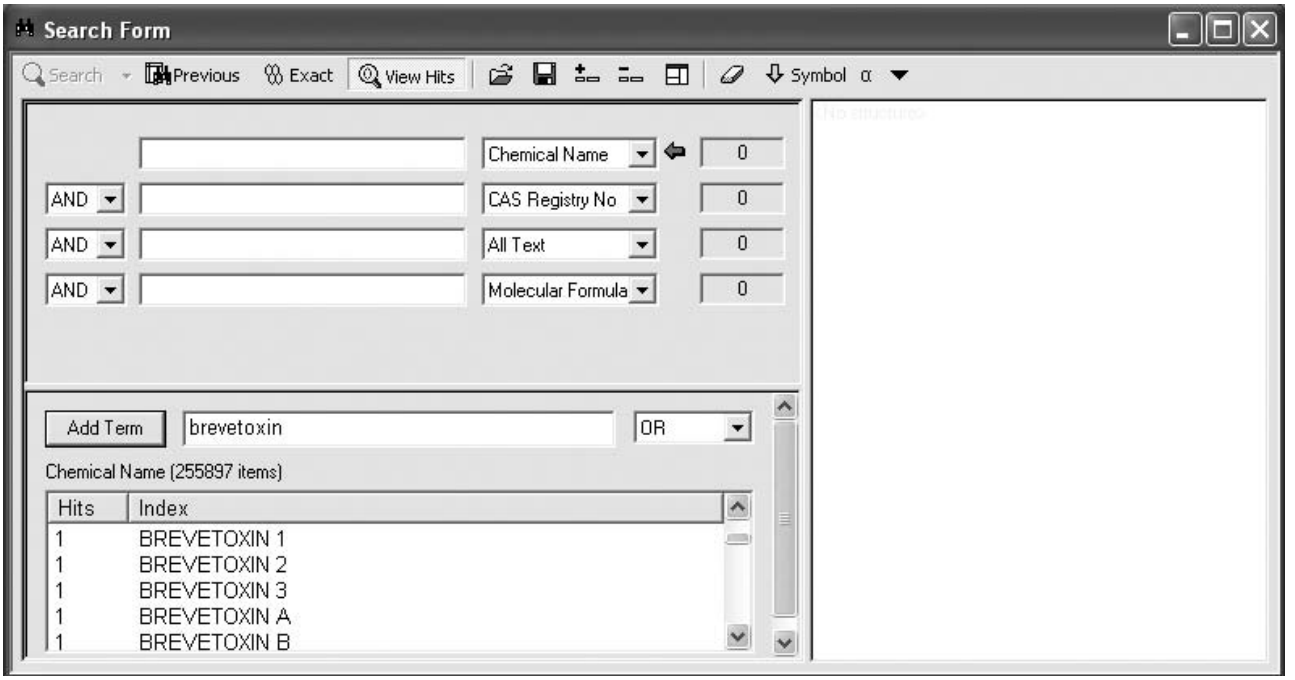

FIGURE 2

The Search Form window is split in to three panes:

1. Structure Search pane – allowing structure and substructure searching
2. Search Terms pane – search from one or more of the 35 available data/text fields
3. Index pane – displays the indexed terms within a selected field

From the Search Form window design your search profile using text, structure or text/structure searching. Once your search has been performed the resultant hits are listed alphabetically by chemical name in the Hit List screen. Clicking on any one of the hits in the hit list screen will result in that entry being displayed in the Entry Display screen (**Figure 3**).

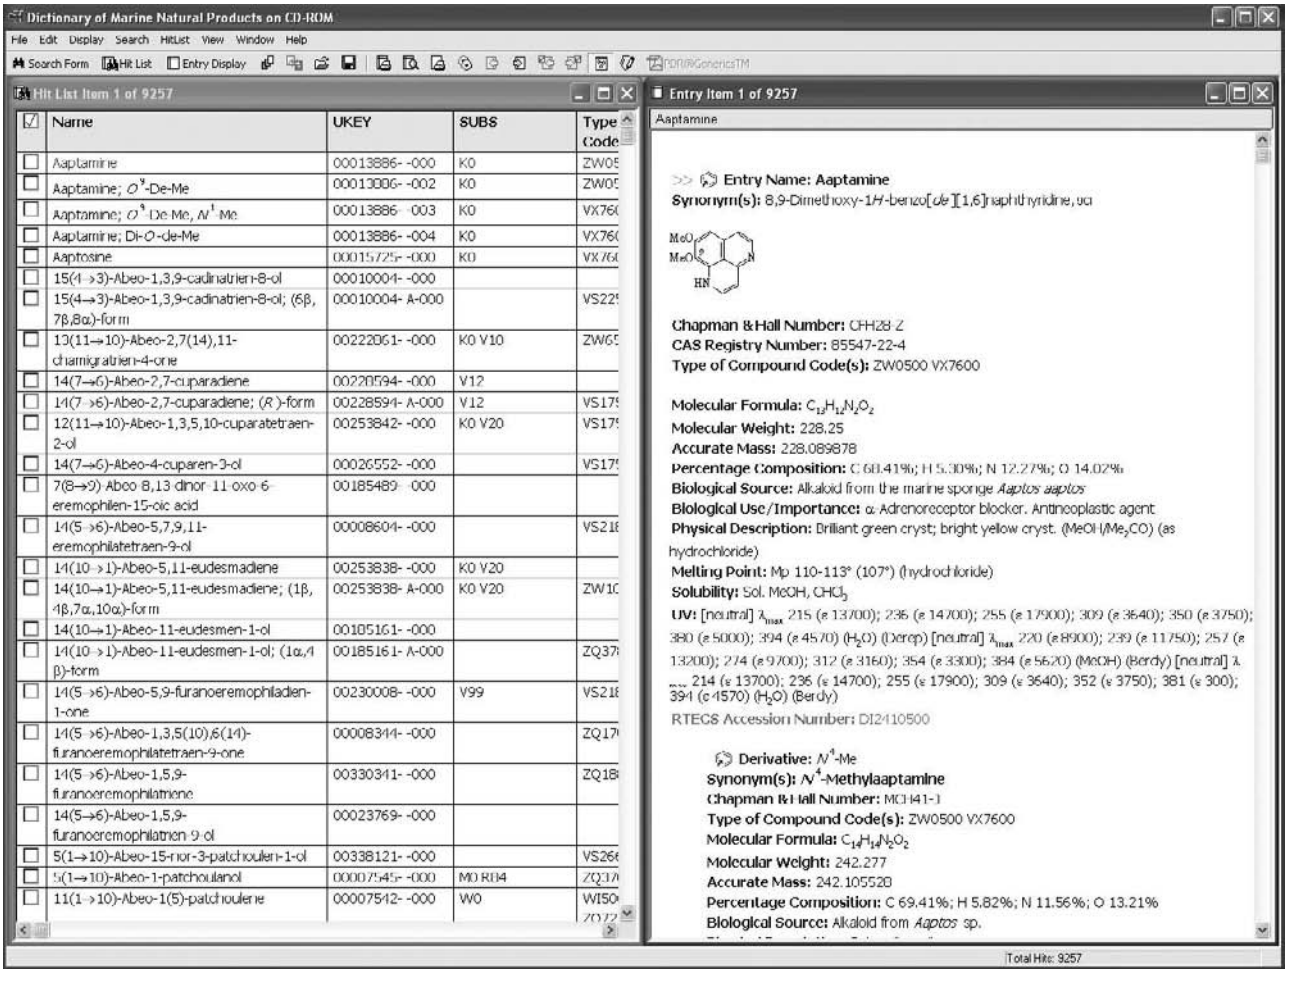

FIGURE 3

Any comments and suggestions for inclusion may be sent to:

Structural Types

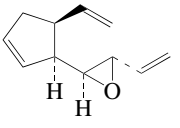
1. ALIPHATIC NATURAL PRODUCTS (VA)

A wide variety of small aliphatic and alicyclic compounds occur in nature. Because they are diverse, no attempt will be made here to give a general account; for information on specific aliphatics, their individual entries should be consulted. In the Type of Compound Index, the aliphatic compounds included in the Dictionary are simply classified by functional group and ring/chain structure.

1.1 Semiochemicals

Semiochemicals are defined as chemicals that mediate communication between individual organisms. When semiochemicals act between members of the same species they are known as pheromones. Pheromonal systems are usually the most highly developed semiochemical systems because the species directly benefits from any improvement. The phrase 'highly developed', in this context means that release of the pheromone is efficient and timely and that the receiver has a sensitive and selective detection system. Because most pheromones are involved in reproductive functions (mate attraction, courtship and copulation), increased efficacy is immediately apparent in higher fecundity. The most widely known semiochemicals in the marine environment are the pheromones of the brown algae which are described in more detail below (section ZH1000). Examples are **Dictyopterene B** and **Caudoxirene**.

Dictyopterene B
(Hormosirene)



Caudoxirene

Pohnert, G. *et al, Nat. Prod. Rep*., 2002, **19**, 108–122 (*algal pheromones*)

1.2 Lipids

Lipids have been defined in different ways at different times and there is still no agreed definition of the term. A simple definition is fatty acids and their derivatives, and substances related biosynthetically or functionally to them.

1.2.1 **Fatty acids** (VA0300, VA0600, VA1100, VA1500, VA1750)

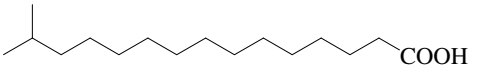
A wide variety of fatty acids are found in marine organisms. These include the common ones found in virtually all organisms, to rare types, typically polyunsaturated, which may be unique to certain phyla or classes of marine animal. No attempt will be made here to give an account of their distribution. Useful searches can be done on the CD-ROM version of this Dictionary by combining one or more codes for fatty acid type as given above (e.g. VA1100, with a code for organism type, e.g. ZE0001, green algae. A more detailed treatment is given in Kornprobst (2005) (various locations), Berge (2005), Rezanka (1989), Dalsgaard (2003) and Ackman (2006). The best general reference for lipids is Gunstone *et al*.

Fatty acids are given in this Dictionary under their systematic chemical names, and their trivial names (e.g. **Palmitic**, **Linoleic**) are given as synonyms and can readily be found in the CD-ROM version. The carbon chain is numbered from the carboxy group (COOH=1). The position of a double bond is sometimes denoted by Δ. Hence a Δ^9 indicates a double bond between the carbons 9 and carbon 10 and a Δ^9-desaturase inserts this unsaturation. An internationally accepted nomenclature uses abbreviations of the form A: B(C). A indicates the number of

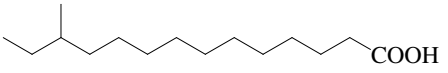
carbon atoms in the molecule, B represents the number of unsaturated centres which are usually *cis*-(*Z*-)-alkenic, and C indicates the position and configuration of the unsaturation counted from the *terminal* methyl of the carbon chain. Symbols such as ω3 or *n*-3 indicate the position of the unsaturated centre closest to the terminal CH_3 group. In this case it is assumed that all unsaturation is methylene-interrupted and has *cis*-(*Z*-) configuration.

Trivial	**Systematic**	**Abbreviation**
Palmitic acid	Hexadecanoic acid	16:0
Oleic acid	*cis*-9-Octadecenoic acid	18:1 (9*Z*)
Arachidonic acid	all-*cis*-5,8,11,14-Eicosatetraenoic acid	20:4 (*n*-6)

Acids with a single methyl substituent, most commonly have this at the penultimate position of the chain, and are named **isoacids**. If the methyl substituent is located on the antepenultimate carbon from the end of the chain the acids are named **anteiso** acids.



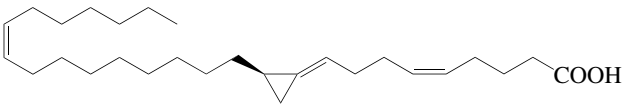
Isopalmitic acid
(14-Methylpentadecanoic acid)



Anteisopentadecanoic acid
(12-Methyltetradecanoic acid, Sarcinic acid)

The number of natural fatty acids known exceeds 1000 though only 20–50 are ubiquitous. From a survey of all these structures it is possible to make a number of generalisations, although there are significant exceptions to each statement. These statements were first based on chemical structure but it is clear that they also reflect underlying biosynthetic pathways.

(i) Natural fatty acids – both saturated and unsaturated – are mostly straight-chain compounds with an even number of carbon atoms. Chain lengths range from two to more than eighty carbon atoms but are most commonly between C_{12} and C_{22}. Odd-carbon acids (e.g. Hentriacontanoic acid) occur and are widespread in marine sources. Acids with branched structures (e.g. **Isopalmitic**, **Anteisononadecanoic**) or with carbocyclic units (e.g. **Amphimic acids**) also occur.



Amphimic acid B

(ii) Acids with one unsaturated centre are usually alkenic compounds with *cis*-(*Z*-) configuration and with the double bond in one of a limited number of preferred positions. This is most commonly Δ^9 (e.g. **Oleic acid**) or *n*-9 (e.g. **Erucic acid**) but the double bond can occur in other positions (e.g. **Petroselinic acid**) and monoacetylenic acids are also known (e.g. **7-Hexadecynoic acid**).

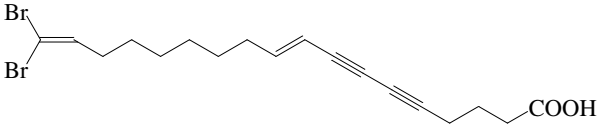
$$H_3C(CH_2)_7C{\equiv}C(CH_2)_5COOH$$

7-Hexadecynoic acid

(iii) Polyunsaturated acids are mainly polyalkenic (*cis*-/*Z*-configuration) with a methylene-interrupted arrangement of double bonds, i.e. double bonds are separated from each other by one CH_2 group. The pattern of 1,4-unsaturation is characteristic of fatty acids and differs from that in isoprenoids which are usually 1,3- or 1,5- conjugated. Polyunsaturated fatty acids occur in biochemically related families and the two most important are the *n*-6 family based on **Linoleic acid** and the *n*-3 family based on **α-Linolenic acid**. Some acids have conjugated unsaturation which is both *cis* and *trans* (e.g. **5,7,9,14,17-Eicosapentaenoic acid**), some have mixed ene/yne unsaturation both conjugated (e.g. **7,9,12-Octadecatrien-5-ynoic acid**) and non-conjugated (e.g. **16,16-Dibromo-15-hexadecen-5-ynoic acid**), and there is a group of acids in which unsaturation is not methylene-interrupted (e.g. **10,15-Eicosadienoic acid**).

10*Z*,15*Z*-Eicosadienoic acid

(iv) Fatty acids having additional functionality apart from the carboxyl group and unsaturation and are widespread. Acids are known with chloro, bromo, hydroxy, methoxy, oxo, and epoxy groups. Examples are **10-Chloro-9-hydroxy-hexadecanoic acid, 2-Methoxy-6-tetradecenoic acid, 18,18-Dibromo-9,17-octodecadiene-5,7-diynoic acid**.



(9*E*)-18,18-Dibromo-9,17-octadecadiene-5,7-diynoic acid

The major biosynthetic pathways leading to fatty acids are summarised in Figure 1. In the *de novo* pathway leading to saturated fatty acids, acetate (the primer) condenses with malonate (the extender) to produce a C_4 oxo acid which is reduced in three steps to butanoate. This cycle of condensation and reduction continues until, most commonly, palmitate has been obtained. The malonate is itself derived from acetate by carboxylation in the presence of a biotin enzyme and the carbon dioxide lost during condensation is that derived during carboxylation so that the carbon atoms in butanoate and in the longer chain acids are entirely acetate-derived. If the acetate is replaced by a different primer then other fatty acids are produced. This can be propanoate (major product: heptadecanoate), 2-methylpropionate (*iso* acids), or 2-methylbutanoate (*anteiso* acids).

The chain-elongation process is similar in outline to the *de novo* process but differs in some significant details. It operates with both saturated and unsaturated acids and occurs with either acetate or malonate. **Erucic acid** is made from Oleic acid by two chain-elongation steps:

$$18:1(9Z)\rightarrow 20:1(11Z)\rightarrow 22:1(13Z)$$

The most common route to monoene acids involves Δ^9 desaturation. This oxygen-requiring process occurs in plants, animals and microorganisms and furnishes acids with a *cis*-double bond between carbon atoms 9 and 10, e.g. **9-hexadecenoic**, **9-octadecenoic acids** (**Oleic acid**).

Further desaturation of **Oleic acid** to the 9,12-diene (**Linoleic acid**) and 9,12,15-triene (**α-Linolenic acid**) occurs only in plants. The additional double bonds assume a methylene interrupted pattern and lie between the existing double bond and the methyl group. Generally only plants are capable of biosynthesising *de novo* *n*-3 and *n*-6 polyunsaturated acids. Animals requiring these acids for the production of *n*-6 and *n*-3 polyene acids must obtain them through their dietary intake. Figure 1 shows the major pathways in marine algae and herbivorous calanoid copepods.

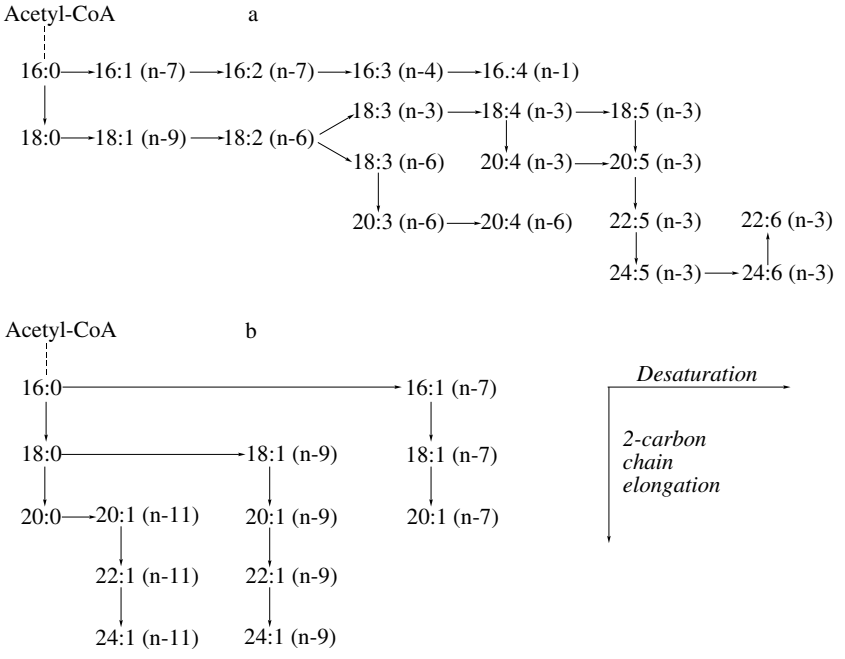


FIGURE 1. Major pathways of fatty acid biosynthesis in (a) marine algae and (b) herbivorous calanoid copepods (Dalsgaard et al)

Desaturation between an existing double bond and the carboxyl group occurs only rarely in plants (e.g. γ-Linolenic acid) but readily in animals. The additional double bonds have *cis*- configuration and are introduced in a methylene-interrupted pattern.

A wide variety of unusual fatty acids and phospholipids are found in sponges, and these arise by totally different biosynthetic pathways (Djerassi (1991). The fatty acids are derived by homologation of short chain fatty acid precursors largely derived from exogenous sources, most likely bacteria and plankton. Fatty acid desaturation in sponges has characteristics of both animal and plant processes. There is no conclusive evidence that sponges are incapable of *de novo* fatty acid biosynthesis, but so far the formation of short-chain acids from radiolabelled acetate had not been observed to any significant extent. Examples are 5*Z*,9*Z*,19*Z*-hexacosatrienoic acid and 6-bromo-5E,9Z-hexacosatrienoic acid.

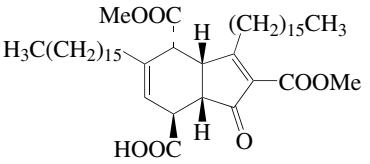
1.2.2 Oxylipins (VA6150)

Three C_{20} acids, 20:3 (*n*-6), 20:4 (*n*-6), and 20:5 (*n*-3) are precursors of prostaglandins and of many other C_{20} metabolites. These are known collectively as eicosanoids and are products of the eicosanoid cascade.

The term oxylipin has been coined relatively recently to describe the class of natural product, of which prostaglandins are the most widespread. They are produced from C_{20} and in some cases C_{18} fatty acid precursors in at least one stage of mono- or dioxygenase-dependent oxidation. Since it is now known that C_{20} precursors are not universal, the term oxylipin is to be preferred to the previous term eicosanoid.

A wide variety of structural types is found in marine organisms where ring formation may produce three, (e.g. **Constanolactones**), five (e.g. **Ecklonialactone A**) or six- (e.g. **Manzamenone A**) membered rings.



Manzamenone A

Gerwick, W.H., *Chem. Rev*., 1993, **93**, 1807–1823 (*marine oxylipins*)
Gerwick, W.H., *Adv. Exp. Med. Biol*., 1999, **447**, 211 (*biosynth*)
Pohnert, G. *et al, Nat. Prod. Rep*., 2002, **19**, 108–122 (*brown algal oxylipins*)

1.2.3 **Prostaglandins** (VA6100)

The eicosanoid or arachidonic acid cascade produces prostaglandins. **Prostaglandins $F_{2\alpha}$** and **E_2** are encountered in marine algae and invertebrates. In corals, it has been demonstrated that these arise via the cyclooxygenase from the arachidonic acid pathway involved in arachidonic acid metabolism. Other compounds in this group are the **Clavulones** and the **Punaglandins**. An example is **Iodopunaglandin 8**.

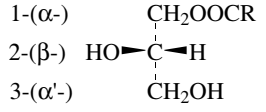
Moore, B.S. *et al*, *Nat. Prod. Rep*., 2006, **23**, 615–629 (*biosynth*)

1.2.4 **Glycerides** (VA6700, VA6800, VA6900)

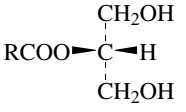
Fatty acids occur naturally as esters of **Glycerol** or of some other hydroxy compound or as amides of long-chain amines such as **Sphingenine**. The less common long-chain alcohols occur as esters or as ethers. Triacylglycerols are major storage lipids whilst phospholipids (see below) are important membrane constituents.

Acylglycerols are esters of glycerol and fatty acids. Partial glycerides are important intermediates in metabolism and triacylglycerols are the major constituents of natural fats and oils. In this Dictionary, glycerides are named as glycerol triesters, e.g. entry name = **Glycerol tri-9-octadecenoate**.

Monoacylglycerols (monoglycerides) (VA6700) are fatty acid monoesters. See the major Dictionary entries for **Glycerol 1-alkanoates** and **Glycerol 2-alkanoates**.



1-Monoacyl-*sn*-glycerol
(chiral)



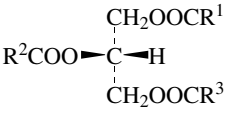
2-Monoacyl-*sn*-glycerol
(achiral)

Diacylglycerols (diglycerides) (VA6800) are fatty acid diesters of glycerol. See the major Dictionary entries for **Glycerol 1,2-dialkanoates** and **Glycerol 2,3-dialkanoates**.

1,2-Diacyl-*sn*-glycerol (α,β-isomer)

1,3-Diacyl-*sn*-glycerol (α,α'-isomer)

Triacylglycerols (triglycerides) (VA6900) are fatty acid triesters of glycerol. The fatty acids may be all different, two different, or all alike. See the major Dictionary entries for **Glycerol trialkanoates (diacid, symmetrical)**, **Glycerol trialkanoates (diacid, unsymmetrical)** and **Glycerol trialkanoates (triacid)**. The common monoacid triesters have separate entries.



Triacyl-*sn*-glycerol

Particular fatty acids may be concentrated in or excluded from particular positions in the glycerol ester.

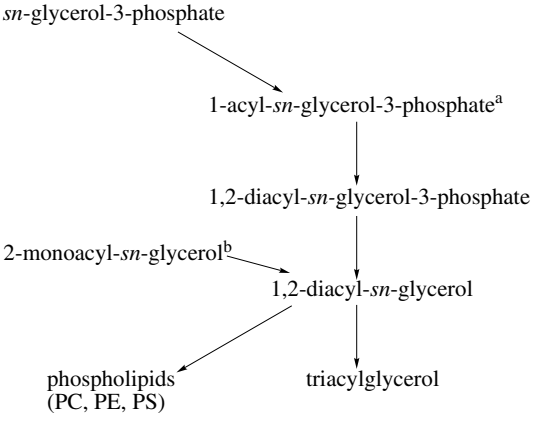


FIGURE 2. Biosynthesis of the major lipid classes

In plants glycerolipids are produced by wholly endogenous pathways but in animals there are additional routes by which dietary lipids are modified. The lipid composition of animals is influenced by dietary intake but is not completely defined by it.

1,2-Diacyl-*sn*-glycerols (Figure 2) are key intermediates in the biosynthesis of both triacylglycerols and phospholipids and are produced mainly from *sn*-glycerol-3-phosphate (a product of carbohydrate metabolism) by acylation of both free hydroxyl groups in separate stages followed by dephosphorylation. Further acylation of the *sn*-3 hydroxyl group gives triacylglycerols.

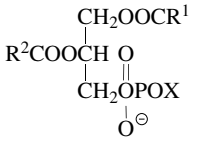
Gunstone, F.D. *et al*, *The Lipid Handbook with CD-ROM*, 3rd edn, Chapman & Hall/CRC Press, Boca Raton, 2007

1.2.5 Phospholipids and sphingolipids (VA7000, VA7200)

Phospholipids and sphingolipids are constituents of cell membranes and they play an essential role in the synthesis of plasma lipoproteins and in the transduction of messages from cell surfaces to second messengers that control cellular processes. **Phosphatidylcholine** (Lecithin) is the most abundant phospholipid (see Figure 3).

Sphingosine (4-Sphingenine) – the most common of the long-chain bases – is produced from Palmitic acid (as its CoA derivative) and Serine as shown in Figure 4. Such compounds are then acylated at the NH_2 group to give

ceramides and further modified at the primary hydroxyl group to give sphingolipids (Figure 5). In this Dictionary, most ceramides are reported as acyl derivatives of the various amino bases. A variety of unusual odd-carbon and branched-chain amines have been reported from marine organisms.



X	Name of class	Abbreviation
H	phosphatidic acid	PA
$CH_2CH_2N^{\oplus}H_3$	phosphatidylethanolamine	PE
$CH_2CH_2N^{\oplus}Me_3$	phosphatidylcholine	PC
$CH_2CH(N^{\oplus}H_3)COOH$	phosphatidylserine	PS
$CH_2CH(OH)CH_2OH$	phosphatidylglycerol	PG
$C_6H_{11}O_6$	phosphatidylinositol	PI

FIGURE 3. Structures of the major phospholipids

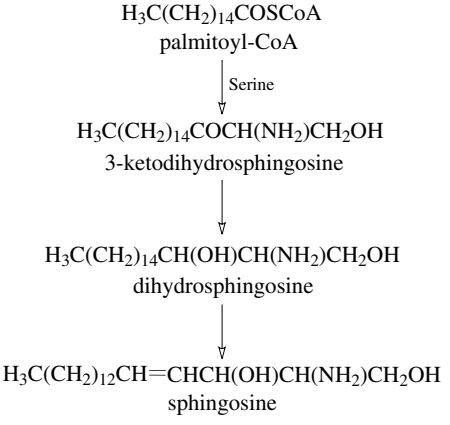


FIGURE 4. Biosynthesis of Sphingosine

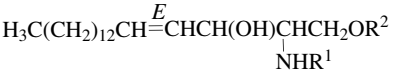

sphingosine	($R^1 = R^2 = H$)
ceramides	($R^1 = COR$, $R^2 = H$)
cerebrosides	($R^1 = COR$, R^2 = sugar residue)
sphingomyelin	($R^1 = COR$, $R^2 = PO_3^{\ominus}CH_2CH_2N^{\oplus}Me_3$)

FIGURE 5. Structures of sphingolipids

Alternatively the free hydroxyl group is converted to an appropriate phosphate ester to produce a phospholipid. Dietary triacylglycerols can be hydrolysed to 2-monoacyl-*sn*-glycerols and then reacylated to diacylglycerols and triacylglycerols.

Typical compounds in these classes are the **Acanthacerebrosides**, **Plakosides**, **Stellettacholine A** and **Yendolipin**.

2. POLYKETIDES (VC)

Many organisms have the ability to produce a very wide range of structural types of metabolite which are derived from a poly-β-ketomethylene chain. This chain is formed by condensation of an acetyl unit (or other acyl unit) with malonyl or methylmalonyl units, with concomitant decarboxylation as in fatty acid biosynthesis but without the reduction of the intermediate β-dicarbonyl system. The resulting polyketide chain can take part in internal aldol-type condensations to give aromatic systems characterised by an alternating oxygenation pattern. Alternatively reduction or partial reduction of the carbonyls during biosynthesis can give rise to nonaromatic metabolites. One method of classifying polyketides is by the number of acetate (or propionate) units in a metabolite; however, this has the disadvantage of separating structurally similar types. The vast array of polyketides is treated in DMNP according to a mixture of structural, biosynthetic and functional criteria. The advantage of this approach is that related compounds are listed together. Aromatic polyketides are classified under the appropriate aromatic grouping (see section VG below).

Simpson, T.J., *Nat. Prod. Rep*., 1985, **2**, 321–347; 1987 **4**, 339–376; 1991, **8**, 573–602 (*biosynth*)

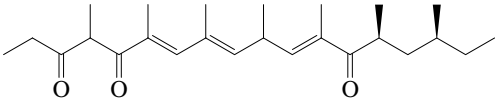
2.1.1 Linear polyketides (VC0050)

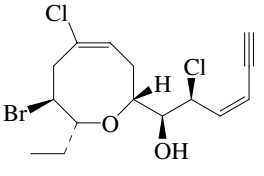
This section contains polyketides that do not contain carbocyclic or macrolide ring systems but may contain tetrahydrofuran or tetrahydropyran rings. An example is **Aglajne 1**.



Aglajne 1

2.1.2 Marine halogenated acetogenins (VC0070)

Marine metabolites include a series of halogenated polyketides particularly from red algae (*Laurencia* spp.). The metabolites contain, along with bromine and chlorine substituents, oxygen heterocycles, acetylenes and allenes. A typical example is **Bermudenynol**.



Bermudenynol

Butler, A. *et al*, *Nat. Prod. Rep*., 2004, **21**, 180–188 (*biosynth*)

2.1.3 Macrolides and lactone polyketides (VC0100, VC0150)

Structurally, macrolides are a class of complex lactones; normally containing a 12–16 membered macrocyclic ring, often with ether bridges forming further 3-, 4-, 5-, or 6-membered rings, and one to three neutral or aminosugar residues that are linked to the macrocycle via ether linkages. Examples in this class are the **Bryostatins**, **Amphidinolides**, **Macrolactins**, **Oscillatoxins** and **Halichoblelide**.

2.1.4 Polyenes (VC0300)

The group of compounds, known collectively as polyenes, are compounds containing a series of conjugated double bonds. This leads to the sub-division of the group into trienes, tetraenes etc. The **Amphidinols** are built up with five regular C2-elongation sequences, which are separated by continuous acetate-methyl derived carbons. An example of this group is **Amphidinol 3**.

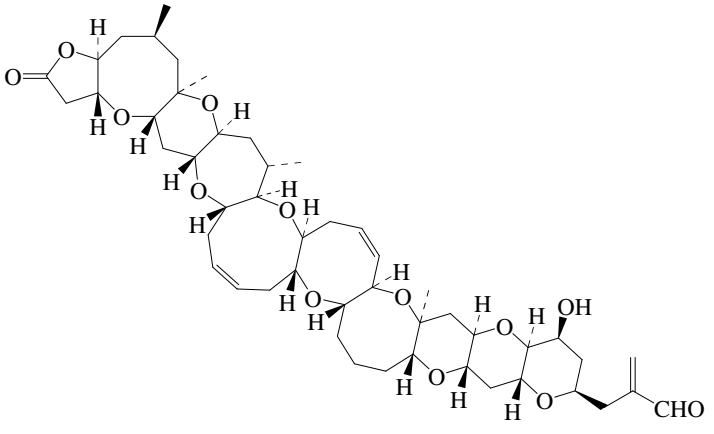
2.1.5 Polyether antibiotics (VC0500)

The majority of polyethers are characterised by a linear series of tetrahydrofuran and tetrahydropyran residues, frequently linked by spiroketal systems. They are metabolites of marine microoganisms that are often symbiotic with sponges. Polyethers are generally produced as a series of closely related compounds, e.g. the major component may possess methyl substituents on each of the cyclic ether units, but in addition small amounts of ethyl homologues may also be present. Chemical subdivision can be based on the number of spiroketal functionalities, and the presence or absence of a sugar residue.

Polyethers possess the ability to bind and transport certain ions, and each antibiotic has its own ion specificity. The antibiotics show a wide range of activities, being active against gram-positive organisms and mycobacteria, fungi and yeasts, but because of their toxicity, these properties have found little application. Polyether compounds of this type, however, are now much more than antibiotics, e.g. **Halichondrins** are potent antimitotic agents, analogues of which are being developed through clinical trials.

Biosynthetically, the polyethers are polyketide in origin. The major building blocks are acetate, propanoate, and butyrate. There is evidence to suggest the intermediacy of an epoxide in the formation of the tetrahydrofuran and tetrahydropyran systems. **Brevetoxin** A is a typical polyether compound.



Brevetoxin A

3. CARBOHYDRATES (VE)

This is an abbreviated account dealing only with aspects of carbohydrate chemistry relevant to marine natural products. Although carbohydrates are important components of the tissues of marine bacteria and algae, and of marine animal tissues (e.g. **chitin**), their marine chemistry presents few aspects that have not already been documented among terrestrial organisms. For a fuller coverage including synthetic carbohydrates, see the companion publication *Dictionary of Carbohydrates*.

Carbohydrates comprise a family of polyhydroxy aldehydes, ketones and acids, together with linear and cyclic polyols. They are diverse because they exist as a wide range of stereoisomers. These compounds are the most abundant and widespread organic substances in nature and are essential constituents of all living matter. Of the 36 possible stereoisomeric pentoses, pentuloses, hexoses and hexuloses only D-glucose, D-fructose, D-galactose, D-mannose and L-arabinose occur naturally in the free state, and only the first two are found in large amounts. However, modified sugar residues belonging to many of the stereoisomeric series are crucial components of, and precursors to, a wide range of important biologically active molecules.

Photosynthesis is the means by which plants produce sugars from carbon dioxide and water. In brief, it occurs by carbon dioxide being transferred to D-*erythro*-pentulose-1,5-diphosphate to give, via an unstable β-keto-6-carbon acid, two molecules of D-glyceric acid-3-phosphate, from which hexoses, for example, D-fructose 1,6-diphosphate and D-glucose 1-phosphate can be formed. Animals, on the other hand, use the reverse of the glycolysis metabolic pathway to produce glucose from proteins and fats utilising phosphoenolpyruvate as an intermediate. Most of the routes used by nature to interconvert sugars occur by way of enzymic reactions on nucleoside diphosphate sugars, particularly **Uridine diphosphate glucose** (UDPG) which gives D-galactose on epimerisation at *C*-4, D-glucuronic acid by oxidation at *C*-6 and D-xylose by decarboxylation of this acid. Deoxygenation at *C*-6 and configuration changes at *C*-4 and *C*-5 give L-rhamnose and by similar means the commonly occurring D-sugars may be transformed into members of the L-series.

3.1.1 Fundamental aldoses and ketoses (VE0100–VE2200)

In the Type of Compound classification the simple sugars are classified into their various stereoisomeric subgroups.

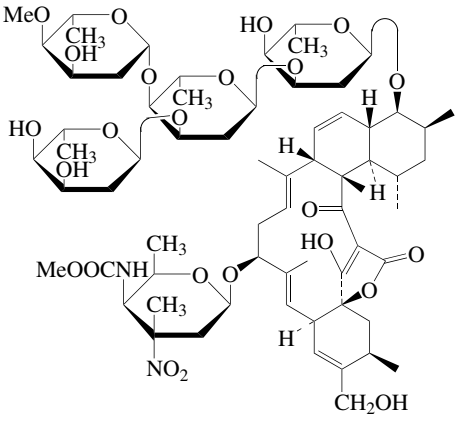
3.1.2 Modified aldoses and ketoses (VE2600–VE8400)

The number of natural sugars increases when modified forms of the 36 fundamental sugars are considered. Thus in addition to the common occurrence of combined forms of the five sugars mentioned above, D-allose, D-talose, D-arabinose, D-ribose, D-xylose, L-lyxose, D-psicose, L-sorbose and D-tagatose are also found as their derivatives in varying quantities. It is rather surprising that the vast number of naturally occurring carbohydrate compounds is derived from so few sugars in this pool. The shortfall is made up by the occurrence of so called modified sugars such as deoxy-, amino-, thio-, branched chain, and higher sugars in addition to various alditols, cyclitols and sugar acids.

Bacteria contain several sugars that are unique to their constitution. **Muramic acid**, glycosidically linked to ***N*-Acetylglucosamine**, is the disaccharide repeating unit that forms the peptidoglycan of gram-negative bacterial cell walls. In gram-positive bacteria, teichoic acids, which are large polymers of the phosphates of D-ribitol or glycerol, form up to 50% of the cell wall.

3.1.3 Branched-chain sugars (VE7200)

Carbon chain branching in sugars can arise biogenetically in two ways; either *C*-bonded hydrogen atoms are replaced to give *C*-substituted derivatives of the normal straight-chain compounds (CHOH → CROH), or else hydroxyl functions are replaced (CHOH →CHR). In the naming of the latter class, the 'deoxy' prefix is included to denote the absence of the hydroxyl substituent at the branching carbon atom, and members can be described as belonging to the 'deoxy' group of branched chain sugars (e.g. 3-*C*-methyl-D-glucose and 3-deoxy-3-*C*-methyl-D-glucose are the respective names of compounds obtained by replacing in glucose either the hydrogen at *C*-3 or the hydroxyl at *C*-3 by methyl). **Kijanimicin** produced by an actinomycete isolated from the alga *Lobophora variegata* contains a 3-*C*-methyl sugar residue.



Kijanimicin

3.1.4 Carbohydrate acids (VE7900, VE8000, VE8100, VE8200)

The following four types of carbohydrate acids occur in nature for which named examples are given for compounds derived from glucose: aldonic acids (VE7900) (**D-Gluconic acid**) which are formed when the aldehydic function in an aldose is oxidised; aldaric acids (VE8100) (**D-Glucaric acid**) which are dicarboxylic acids formed by oxidation of the aldehydic groups and hydroxymethyl groups in aldoses; uronic acids (VE8000) (**D-Glucuronic acid**) and ketoaldonic acids (VE8200) (**D-*arabino*-Hex-2-ulosonic acid**) which are formed by oxidation of the hydroxymethyl groups in aldoses and ketoses respectively.

3.1.5 Alditols (VE8600–VE8900)

The polyols, obtained by reduction of the aldehyde function of an aldose, are known as alditols. An example is **Mannitol**. They are named by a straightforward extension of the rules used for aldoses. The alditol corresponding to a chiral sugar may be *meso*-, e.g. **Galactitol**.

3.1.6 Cyclitols (VE9000)

The polyhydroxycycloalkanes, known as cyclitols, are a group of natural products closely related to the carbohydrates proper, of which the most important are the inositols (1,2,3,4,5,6-cyclohexanehexols). Trivial names are often used but systematic rules have been introduced to assign configurations at each enumerated ring carbon atom and this requires the application of a recommended numbering convention. Further information on the various descriptions of stereochemistry for these compounds can be obtained by the inspection of the individual Dictionary entries. It should be noted that some *meso*-isomers in the series can have optically active derivatives.

3.1.7 Oligosaccharides and polysaccharides (VE9300, VE9400)

Oligosaccharides are most often found as glycosides in, for example, plants, antibiotics and some glycoproteins. Polysaccharides are the most abundant form of carbohydrates. **Cellulose** is the principal constituent of plant cell walls providing their structural strength. **Starch** and **Glycogen** are found preponderantly in plants and animals respectively where they serve as energy reserves. Whereas glucose is the building unit for the previous three polymers, **Chitin**, which is found in the shells of arthropods, is a polymer of 2-acetamido-2-deoxyglucose. **Carrageenan** and **Agar** are structural polysaccharides of the red algae. These polymers are derivatives of linear galactans.

Glycosidic bonds in naturally occurring oligosaccharides and glycosides are formed in natural glycosylations which take place primarily by way of the nucleoside diphosphate sugars as follows:

$$\text{nucleoside}-\text{DP}-\ \text{sugar}+\text{ROH}\rightarrow\text{sugar}-\text{OR}+\text{nucleoside}-\text{DPH}$$

Disaccharides or their phosphates are produced when ROH is a sugar or a sugar phosphate. Polysaccharide biosynthesis is basically similar but requires an oligomer primer as an acceptor; glycogen synthesis follows the course:

$$\text{primer}+\text{UDPG}\rightarrow\text{G}\alpha\text{-primer}+\text{UDP}$$

there being one enzyme present which catalyses the formation of 1,4-bonds and another responsible for glycosylations at position 6. The biosynthesis of cellulose and other polysaccharides is basically similar, UDP being the nucleoside diphosphate used predominantly. However, starch synthesis depends rather on adenosine diphosphate.

3.1.8 Nucleosides (VE9900)

These are glycosides of purines, pyrimidines and other heterocyclic bases. The well-known quartet of **Adenosine**, **Guanosine**, **Cytidine** and **Thymidine** are fundamental biomolecules essential to life through their participation in the structure of DNA and RNA. A number of 'hypermodified' nucleosides occur in bacterial nucleic acids.

Another group of nucleosides consist of a sugar linked to a base either via a ring nitrogen or through a ring C atom (the latter are designated *C*-nucleosides). Structurally they are rather diverse but a subclassification is given by Isono. A typical example is **Spongosine**.

4. OXYGEN HETEROCYCLES (VF)

Many simple natural products contain basic oxygen heterocycles - although most can be seen to be derived from polyketides or carbohydrates, some have unknown biosynthetic origins. The oxygen heterocycles are listed under

the headings: β-Lactones (VF1000), Furans (VF2000), Butanolides (VF3000), Pyrans (VF4000), Pentanolides (VF5000), 2-Pyrones (VF6000) and 4-Pyrones (VF7000). Natural products that contain these substructures in terpenoid, steroid or alkaloid skeletons are not listed here. An example of this group is **Diemenensin A**, which is clearly a polyketide and also coded as such.

5. SIMPLE AROMATIC NATURAL PRODUCTS (VG)

5.1.1 Simple benzene derivatives (VG0005)

These may be of terpenoid, polyketide or shikimate origin. Those of terpenoid origin, such as the aromatic *p*-menthanes are coded as such and are described below. Fungi are a prolific source of simple benzoquinones which in the main arise by the polyketide route.

Shikimic acid is derived from glucose in plants *via* the shikimate pathway, which feeds many biosynthetic pathways including those involving the aromatic amino acids **Phenylalanine**, **Tyrosine**, **Tryptophan** and also **p-Aminobenzoic acid**, **Anthranilic acid**, **Cinnamic acid** and other phenylpropanoids. **4-Hydroxybenzoic acid** is the precursor of **2,4,6-Tribromophenol** in the green alga *Ulva lactuca*.

5.1.2 Diphenyl ethers, biphenyls, dibenzyls and phlorotannins (VG1000, VG2000, VG3000, VG2500)

Diphenyl ethers and biphenyls probably arise by radical coupling mechanisms whereas dibenzyl derivatives may be derived from a mixed shikimate-polyketide pathway. Phlorotannins from brown algae are produced by the polymerisation of **Phloroglucinol**. An example is **Bisfucoheptaphlorethol A**.

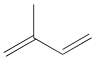
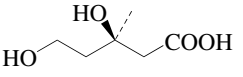
6. TERPENOIDS (VS)

6.1 Classification of terpenoids

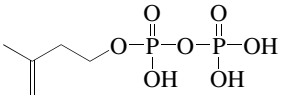
The immense variety of structural types found in the terpenoids was rationalised by the isoprene rule of Ruzicka. However, the number of exceptions to the regular arrangement of isoprene units led to the biogenetic isoprene rule which encompassed the possibility of rearrangements during biosynthesis. Terpenoids are thus seen as being formed from linear arrangements of isoprene units followed by various cyclisations and rearrangements of the carbon skeleton. They can also be biosynthetically modified by the loss or addition of carbon atoms. It is useful to classify terpenoids according to the number of isoprene units from which they are biogenetically derived, even though some carbons may have been added or lost. (This sometimes causes some uncertainty if it is believed that more than five carbons have been lost; only a biosynthetic study can resolve this issue). The biogenetic isoprene rule implies the involvement of a branched five-carbon unit in the biosynthesis of terpenoids. The biosynthetic origin of this five-carbon unit is well established; isoprene iself, although a natural product, is not a precursor of the terpenoids. There are two pathways to the common precursors, isopentenyl diphosphate and dimethylallyl diphosphate. One pathway involves mevalonic acid whereas the more recently discovered pathway involves 1-deoxyxylulose 5-phosphate and is known as the non-mevalonate pathway. The mevalonate pathway is found in animals, the cytoplasm of higher plants, fungi and some bacteria whereas the deoxyxylulose phosphate pathway is found in chloroplasts, algae, cyanobacteria, eubacteria and apicomplexan parasites.



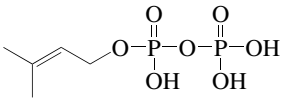
Isoprene



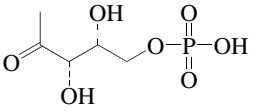
Mevalonic acid



Isopentenyl diphosphate



Dimethylallyl diphosphate



1-Deoxyxylulose 5-phosphate

6.1.1 Nomenclature

The systems used for the nomenclature of terpenoids have evolved over a long period. For many terpenoid classes more than one name has been proposed for the carbon skeleton and in a large number of cases, including many recently discovered marine terpenoid skeletons, several numbering systems are in use. This Dictionary has used the most accepted numbering system for most skeletal types. In cases for which no numbering system has been proposed or where several are in use, preference has been given to the biogenetic system. Many higher terpenoids are named as formal variants of steroid structures and their nomenclature and numbering therefore follows on from that of steroids, which is described more fully in section VT below.

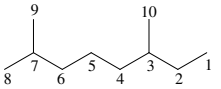
6.2 Monoterpenoids (VS0100–VS1200)

Monoterpenoids are found in many marine organisms, where they are generally halogenated, and as insect pheromones and defence secretions. The biosynthetic pathways of the main classes of monoterpenes have been well studied.

Banthorpe, D.V. *et al*, *Chem. Rev*., 1972, **72**, 115–155 (*monoterpene biosynth*)
Naylor, S. *et al, Progress in the Chemistry of Organic Natural Products*, (eds, Herz, W. *et al*), SpringerWien, New York, 1983, **Vol. 44**, 189–241 (*marine monoterpenoids*)
Croteau, R., *Chem. Rev*., 1987, **87**, 929–954 (*monoterpene biosynthesis*)
Grayson, D.H. *et al*, *Nat. Prod. Rep*., 2000, **17**, 385–419 (*monoterpenoids*)

6.2.1 Acyclic monoterpenoids (VS0100)

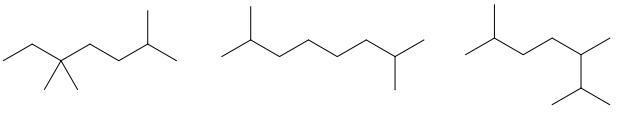
In this section are grouped the regular linear monoterpenoids, that is those formed by a head to tail arrangement of the isoprene units. No semisystematic name has been ascribed to this carbon skeleton because the systematic 2,6-dimethyloctane naming is straightforward. The numbering system shown below is in line with that used with other acyclic terpenoids.



Regular acyclic monoterpenoid skeleton
2,6-Dimethyloctane, 9Cl, 8Cl

6.2.2 Irregular acyclic monoterpenoids (VS0150)

Some acyclic monoterpenoids arise from other arrangements of the isoprene units. These may arise by alternative linkages of the units, e.g. head to head, by rearrangement of regular acyclic monoterpenoids or by cleavage of cyclic monoterpenoids.



Irregular acylic monoterpenoid skeletons

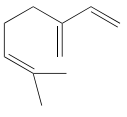
6.2.3 Halogenated dimethyloctane monoterpenoids (VS0200)

This group is obtained principally from marine organisms. They are all regular acyclic monoterpenoids and the numbering system follows the accepted pattern.

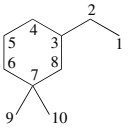
Naylor, S. *et al, Progress in the Chemistry of Organic Natural Products*, (eds, Herz, W. *et al*), SpringerWien, New York, 1983, **Vol. 44**, 189–241 (*marine terpenoids*)

6.2.4 Ochtodane monoterpenoids (VS0220)

The ochtodanes are also principally from marine organisms particularly *Ochtodes* spp. and presumably arise by cyclisation of myrcene.



Myrcene

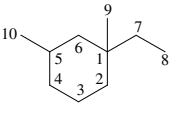


Ochtodane
3-Ethyl-1,1-dimethylcyclohexane, 9Cl

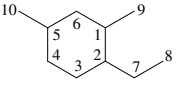
Naylor, S. *et al, Progress in the Chemistry of Organic Natural Products*, (eds, Herz, W. *et al*), SpringerWien, New York, 1983, **Vol. 44**, 189–241 (*marine terpenoids*)

6.2.5 1-Ethyl-1,3-dimethylcyclohexane and 1-ethyl-2,4-dimethylcyclohexane monoterpenoids (VS0240, VS0260)

These two terpenoid skeletons are only found in marine organisms and presumably arise by cyclisation of a regular acyclic monoterpene skeleton followed in the latter case by an ethyl migration. The numbering systems reflect their probable biogenetic relationship.



1-Ethyl-1,3-dimethyl-
cyclohexane



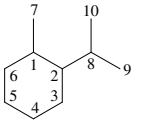
1-Ethyl-2,4-dimethyl-
cyclohexane

Naylor, S. *et al, Progress in the Chemistry of Organic Natural Products*, (eds, Herz, W. *et al*), SpringerWien, New York, 1983, **Vol. 44**, 189–241 (*marine terpenoids*)

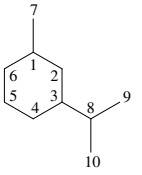
6.2.6 Menthane monoterpenoids (VS0500, VS0520, VS0540)

The menthane group comprises three isomeric types, *o*-, *m*- and *p*-menthanes. The *p*-menthanes are the most widespread and arise by a cyclisation of a regular acyclic monoterpenoid. The *o*- and *m*-menthanes are much rarer, and presumably arise by alkyl migration of *p*-menthanes. The numbering systems of the menthanes reflect

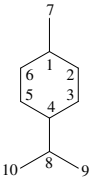
their biogenetic relationship. Since *p*-menthane has a plane of symmetry the numbering of ring substituents is chosen to give the lowest numbers consistent with the avoidance of compound locants for double bonds when possible. For example the name *p*-menth-1-en-6-one is preferred to *p*-menth-1(6)-en-2-one. They are mostly plant products and are thinly scattered in the marine environment.



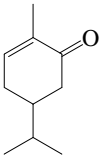
o-Menthane



m-Menthane



p-Menthane, 8Cl
1-Methyl-4-(1-methylethyl)-cyclohexane, 9Cl



p-Menth-1-en-6-one

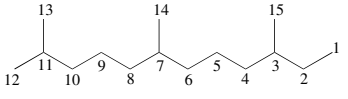
6.3 Sesquiterpenoids (VS1300–VS5320)

The sesquiterpenoids are C_{15} compounds formed by the assembly of three isoprenoid units. There is a large number of sesquiterpenoid carbon skeletons, which all however arise from the common precursor, farnesyl pyrophosphate, by various modes of cyclisations followed, in many cases, by skeletal rearrangement.

Cordell, G.A., *Chem. Rev*., 1976, **76**, 425–460 (*biosynth*)
Dewick, P.M., *Nat. Prod. Rep*., 2002, **19**, 181–222 (*biosynth*)
Fraga, B.M., *Nat. Prod. Rep*., 2004, **21**, 669–693 (*sesquiterpenoids*)

6.3.1 Simple farnesane sesquiterpenoids (VS1300)

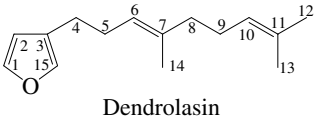
The simple farnesanes are named semi-systematically in this Dictionary although the systematic trimethyldodecane naming is also used extensively in the literature and often leads to numbering from the other end of the chain. The farnesane numbering system is used as a biogenetic numbering system for many sesquiterpenoid skeletons.



Farnesane
2,6,10-Trimethyldodecane, 9Cl

6.3.2 Furanoid farnesane sesquiterpenoids (VS1320)

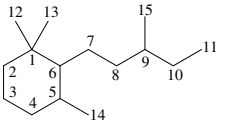
Although many numbering systems have been used for furanoid farnesanes, such as **Dendrolasin**, it is logical to use the farnesane numbering system for this group.



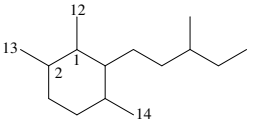
Dendrolasin

6.3.3 Cyclofarnesane and rearranged cyclofarnesane sesquiterpenoids (VS1450, VS1460, VS1470)

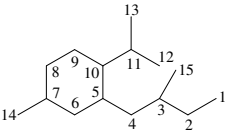
Cyclofarnesanes arise by formation of a six-membered ring between carbons 6 and 11 of farnesane, e.g. Aplysistatin. Methyl group migration gives the rearranged cyclofarnesane skeleton. The herbertianes, included in this group, (not to be confused with herbertanes) are 5,10-cyclofarnesanes.



Cyclofarnesane
1,1,3-Trimethyl-2-(3-methyl-pentyl)cyclohexane



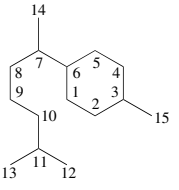
Rearranged cyclofarnesane skeleton
1,2,4-Trimethyl-3-(3-methyl-pentyl)cyclohexane



Herbertiane
4-Methyl-2-(2-methylbutyl)-1-(1-methylethyl)cyclohexane

6.3.4 Bisabolane sesquiterpenoids (VS1500)

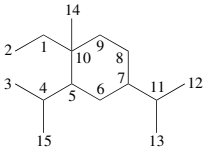
The bisabolanes are a fairly large group mainly found as constituents of higher plants, with some marine occurrences. The numbering system used for bisabolanes is the same as the farnesane system. Since the cyclohexane ring has a plane of symmetry, substituents in this ring should be numbered where possible avoiding the compound locant, 1(6), for a double bond and keeping the numbers for the substituents in the cyclohexane ring as low as possible.



Bisabolane
1-(1,5-Dimethylhexyl)-4-methylcyclohexane, 9Cl

6.3.5 Elemane sesquiterpenoids (VS1600)

Elemanes are numbered consistently with eudesmanes (see below) and germacranes. They are rapidly formed *in vitro* by Cope rearrangement of the corresponding 1(10),4-germacradienes and it is possible that they are artifacts produced during the isolation procedures.

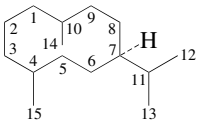


Elemane
1-Ethyl-1-methyl-2,4-bis-(1-methylethyl)cyclohexane, 9CI

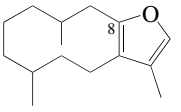
6.3.6 Germacranes (VS1650–VS1700)

These are extremely common as higher plant products but are scarce among marine algae. The numbering of the germacrane skeleton poses a problem since there is a plane of symmetry through carbons 2 and 7. Germacranes are normally drawn in a conventional way as shown below with *H*-7 in the α-configuration. Care should be taken with the small number of germacranes with a double bond at *C*-7 as the ring can be numbered in either direction. Germacranes frequently have double bonds in the 1(10) and 4 positions. A further problem with the representation of germacranes arises from substituents at carbons drawn as reentrant angles. Wherever possible germacranes should be drawn without substituents at reentrant centres as in this Dictionary, and care should be exercised when reading the literature.

The germacrane group is divided into simple germacranes, which is those without a lactone or furan ring (VS1650), 12,6-germacranolides (VS1660), 12,8-germacranolides and furanogermacranes (VS1670), nor- and homo-germacranes (VS1680), secogermacranes (VS1690) and cyclogermacranes (VS1700).



Germacrane
1,7-Dimethyl-4-(1-methyl-ethyl)cyclodecane, 9Cl

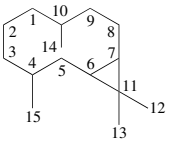


Furanogermacrane
4,5,6,7,8,9,10,11-Octahydro-3,6,10-trimethylcyclodeca[*b*]-furan, 9Cl

Fischer, N.H. *et al, Progress in the Chemistry of Organic Natural Products*, (eds, Herz, W. *et al*), SpringerWien, New York, 1979, **Vol. 38**, 47–390 (*sesquiterpene lactones*)
Fischer, N.H., *Recent Adv. Phytochem*., 1990, **24**, 161–201 (*biogenesis*)
Tashkhodzhaev, B. *et al*, *Chem. Nat. Compd*., 1997, **33**, 382–388 (*germacranes*)

6.3.7 Lepidozanes and bicyclogermacrane sesquiterpenoids (VS1710)

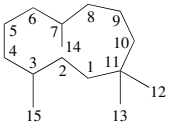
Bicyclogermacranes, found largely in higher plants, have a *cis*-fused cyclopropane ring junction whereas the stereoisomeric lepidozanes from liverworts and marine organisms have a *trans*-fused ring junction.



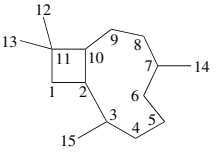
Bicyclogermacrane
3,7,11,11-Tetramethylbicyclo[8.1.0]undecane, 9Cl

6.3.8 Caryophyllane sesquiterpenoids (VS1730)

Cyclisation of the humulane skeleton between carbons 2 and 10 produces the caryophyllane skeleton. Several numbering systems are in use for caryophyllanes; the one chosen for this Dictionary is that based on farnesane.



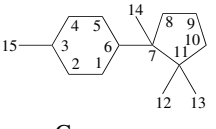
Humulane
1,1,4,8-Tetramethylcycloundecane, 9Cl



Caryophyllane
2,6,10,10-Tetramethylbicyclo[7.2.0]undecane, 9Cl

6.3.9 Cuparane sesquiterpenoids (VS1750)

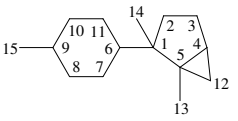
Cuparane is formed by cyclisation between carbons 6 and 11 of the bisabolane skeleton and the numbering system used here takes account of this fact. Cuparanes are found in liverworts, higher plants and marine organisms.



Cuparane
(Most have an aromatic ring and are named in CA as substituted benzenes)

6.3.10 Cyclolaurane sesquiterpenoids (VS1760)

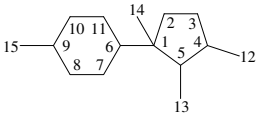
Cyclolauranes found in marine organisms may be considered as cyclocuparanes but as they co-occur with lauranes, the numbering system has been chosen to agree with the accepted laurane system.



Cyclolaurane
1,2-Dimethyl-2-(4-methylcyclohexyl)bicyclo[3.1.0]hexane, 9Cl

6.3.11 Laurane sesquiterpenoids (VS1850)

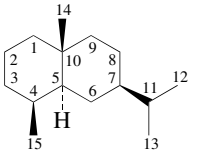
Lauranes are found in marine organisms, particularly *Laurencia* spp.



Laurane
(Mostly named as substituted benzenes in 9Cl)

6.3.12 Eudesmane sesquiterpenoids (VS1950–VS2000)

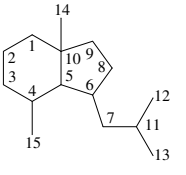
Eudesmanes are called selinanes in the older literature. As with the germacrane group, the eudesmanes are divided into groups comprising simple eudesmanes (VS1950), eudesman-12,6-olides (VS1970), eudesman-12,8-olides and furanoeudesmanes (VS1975), secoeudesmanes (VS1990), and noreudesmanes (VS2000). Within the eudesmane group there is some confusion concerning the numbering of carbons 14 and 15. The numbering given here should be adopted. Like the germacranes, they are common as higher plant products but only a few have been characterised from marine sources.



Eudesmane
Decahydro-1,4*a*-dimethyl-
7-(1-methylethyl)-
naphthalene, 9Cl

6.3.13 Oppositane sesquiterpenoids (VS2020)

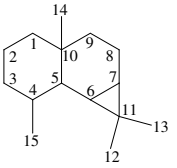
The oppositanes are 8(7 → 6)-abeoeudesmanes and are found in plants and marine organisms.



Oppositane
Octahydro-3*a*,7-dimethyl-1-(2-methylpropyl)-1*H*-indene, 9Cl

6.3.14 Cycloeudesmane sesquiterpenoids (VS2050)

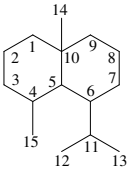
Various cycloeudesmanes are included in this section including the maalianes from marine organisms.



Maaliane
Decahydro-1,1,3*a*,7-tetramethyl-
1*H*-cyclopropa[*a*]naphthalene, 9CI

6.3.15 Gorgonane sesquiterpenoids (VS2060)

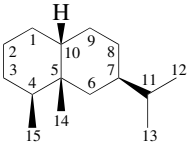
The gorgonanes are derived from eudesmanes by isopropyl group migration to C-6.



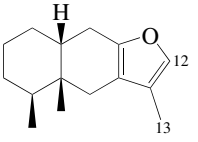
Gorgonane
Decahydro-1,4*a*-dimethyl-8-(1-methylethyl)naphthalene, 9Cl

6.3.16 Eremophilane sesquiterpenoids (VS2100–VS2130)

The eremophilanes have been shown to be derived from eudesmanes by migration of the methyl group at *C*-10 to *C*-5. There is confusion in the literature about the numbering of carbons 14 and 15; the biogenetic numbering given below should be used. The normal stereochemistry is shown, although there are several exceptions to this.



Eremophilane
Decahydro-1,8*a*-dimethyl-
7-(1-methylethyl)-
naphthalene, 9Cl

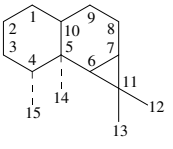


Furanoeremophilane
4,4*a*,5,6,7,8,8*a*,9-Octahydro-
3,4*a*,5-trimethylnaphtho-
[2,3-*b*]furan, 9Cl

Pinder, A.R., *Progress in the Chemistry of Organic Natural Products*, (eds, Herz, W. *et al*), SpringerWien, New York, 1977, **Vol. 34**, 81–186 (*eremophilanes*)

6.3.17 Aristolane sesquiterpenoids (VS2150)

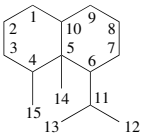
The aristolanes are 6,11-cycloeremophilanes.



Aristolane
Decahydro-1,1,7,7*a*-tetramethyl-1*H*-cyclopropa-
[*a*]naphthalene, 9Cl

6.3.18 Nardosinane sesquiterpenoids (VS2160)

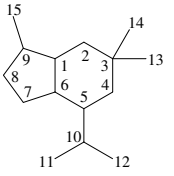
The nardosinanes, isolated from marine organisms, are eremophilanes in which the isopropyl group has migrated to carbon 6.



Nardosinane
Decahydro-1,8*a*-dimethyl-8-(1-methylethyl)naphthalene

6.3.19 Brasilane sesquiterpenoids (VS2170)

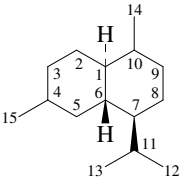
The brasilanes are rearranged sesquiterpenoids largely from *Laurencia* and *Aplysia* species.



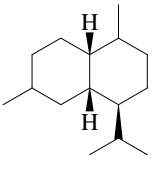
Brasilane
Octahydro-1,6,6-trimethyl-4-(1-methylethyl)-1*H*-indene

6.3.20 Cadinane sesquiterpenoids (VS2250, VS2260)

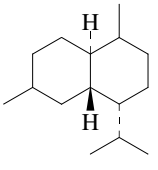
The nomenclature, numbering and absolute stereochemistry of this group is somewhat confused. Biogenetic (germacrane) numbering is used here, but many other numbering systems have been used in the literature. Historically, the names of the skeletons depended on the relative stereochemistries at carbons 1, 6 and 7 as indicated, but in this Dictionary the various stereoisomeric forms are merged into the same entry with these obsolescent names given as synonyms. The aromatised skeletons have also in the past been given different names, calamenene and cadalene, and these have often been given different numbering systems. Nor-and seco-cadinanes are grouped separately (VS2260).



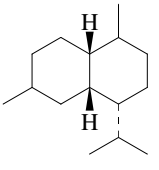
Cadinane
Decahydro-1,6-dimethyl-
4-(1-methylethyl)naphthalene, 9Cl



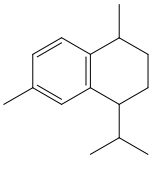
Muurolane



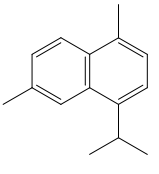
Bulgarane



Amorphane



Calamenene

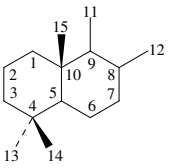


Cadalene

Bordoloi, M. *et al*, *Phytochemistry*, 1989, **28**, 2007–2037 (*cadinanes*)

6.3.21 Drimane sesquiterpenoids (VS2300)

The drimanes, mainly from terrestrial fungi and higher plants but also from marine organisms, arise by direct cyclisation of a farnesane derivative. The accepted numbering system is shown.

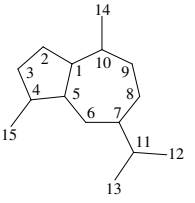


Drimane
Decahydro-1,1,4*a*,5,6-pentamethylnaphthalene

Vlad, P.F. *et al*, *Russ. Chem. Bull*., 1997, **46**, 855–873 (*synth*)

6.3.22 Guaiane sesquiterpenoids (VS2400–VS2440)

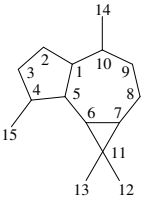
This large group is divided into simple guaianes (VS2400), 12,6-guaianolides (VS2410), 12,8-guaianolides (VS2420), guaiane dimers (VS2430), and seco-, cyclo- and abeo- and norguaianes (VS2440). They are very common in higher plants but are also found in marine organisms.



Guaiane
Decahydro-1,4-dimethyl-7-(1-methylethyl)azulene, 9Cl

6.3.23 Aromadendrane sesquiterpenoids (VS2500)

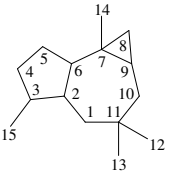
The aromadendranes are 6,11-cycloguaianes.



Aromadendrane
Decahydro-1,1,4,7-tetramethyl-1*H*-cycloprop[*e*]azulene, 9Cl

6.3.24 Africanane sesquiterpenoids (VS2750)

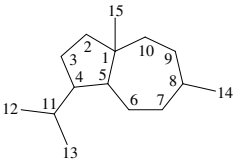
The farnesane numbering system is used for the africanane skeleton although the biosynthesis has not been established conclusively. Some compounds (e.g. **Africanone**) have been named as africananes but have since been shown to have a different skeleton.



Africanane
Decahydro-3,3,5,7*b*-tetramethyl-1*H*-cycloprop[*e*]azulene

6.3.25 Daucane sesquiterpenoids (VS3180)

Many numbering systems have been used for the daucanes; that chosen here is related to the guaiane system. They are mostly from terrestrial organisms but some are from marine sources.

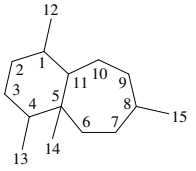


Daucane
Decahydro-3*a*,6-dimethyl-1-(1-methylethyl)azulene

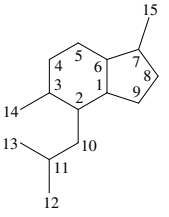
Ghisalberti, E.L., *Phytochemistry*, 1994, **37**, 597–623 (*daucanes*)

6.3.26 Perforane and pacifigorgiane sesquiterpenoids (VS3200, VS3350)

The perforanes form a small group found in *Laurencia* spp. Pacifigorgianes are found in liverworts, higher plants and marine organisms.



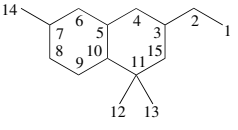
Perforane
Decahydro-1,4,7,9*a*-tetramethyl-1*H*-benzocycloheptane



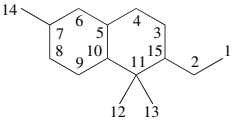
Pacifigorgiane
Octahydro-1,5-dimethyl-4-(2-methylpropyl)-1*H*-indene

6.3.27 Furodysin and furodysinin sesquiterpenoids (VS3550, VS3560)

A farnesane numbering system is used for the furodysin and the rearranged furodysinin groups from *Dysidea* spp.



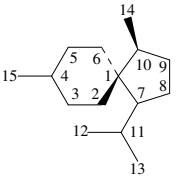
Furodysin skeleton
3-Ethyldecahydro-1,1,6-trimethylnaphthalene



Furodysinin skeleton
2-Ethyldecahydro-1,1,6-trimethylnaphthalene

6.3.28 Acorane sesquiterpenoids (VS3750)

The acoranes and the enantiomeric alaskanes have a symmetrical six-membered ring. It has been suggested that *C*-2 should be chosen to be *syn*- to *C*-14.

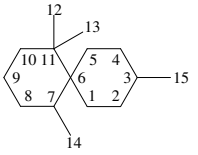


Acorane
1,8-Dimethyl-4-(1-methylethyl)spiro[4.5]decane, 9Cl

Marshall, J.A. *et al*, *Progress in the Chemistry of Organic Natural Products*, (eds, Herz, W. *et al*), SpringerWien, New York, 1974, **Vol. 31**, 283–376 (*acoranes*)

6.3.29 Chamigrane sesquiterpenoids (VS3800)

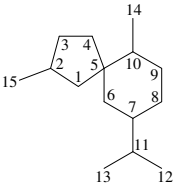
The chamigranes are a group of mainly marine natural products, mostly from *Laurencia* and *Aplysia* spp. The numbering system is based on farnesane. There are also some secochamigranes known (VS3810).



Chamigrane
1,1,5,9-Tetramethylspiro[5.5]undecane, 9Cl

6.3.30 Spiroaxane sesquiterpenoids (VS3820)

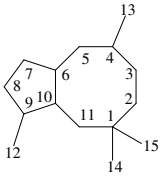
The spiroaxanes are marine natural products that appear to be rearranged cadinane derivatives.



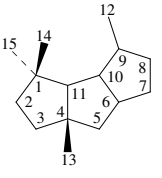
Spiroaxane
2,6-Dimethyl-9-(1-methylethyl)spiro[4.5]decane

6.3.31 Precapnellane and capnellane sesquiterpenoids (VS4200, VS4250)

Precapnellanes and capnellanes are of marine origin. Capnellanes are 4,11-cycloprecapnellanes.



Precapnellane
Decahydro-1,5,8,8-tetramethyl-1*H*-cyclopentacyclooctene



Capnellane
Decahydro-3,3,4,7*a*-tetramethyl-1*H*-cyclopenta[*a*]pentalene, 9Cl

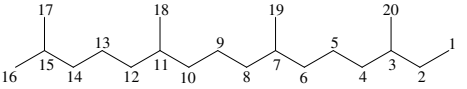
6.4 Diterpenoids (VS5350–VS7340)

The diterpenoids constitute a large group of compounds derived from geranylgeranyl pyrophosphate. They are found in higher plants, fungi, insects and marine organisms.

Hanson, J.R., *Progress in the Chemistry of Organic Natural Products*, (eds, Herz, W. *et al*), SpringerWien, New York, 1971, **Vol. 29**, 395–419 (*biosynth*)
West, C.A., *Biosynthesis of Isoprenoid Compounds*, (eds. Porter, J.W. *et al*), Wiley, New York, 1981, **Vol. 1**, 375
Dewick, P.M., *Nat. Prod. Rep*., 2002, **19**, 181–222 (*biosynth*)
Hanson, J.R., *Nat. Prod. Rep*., 2005, **22**, 594–602 (*diterpenoids*)

6.4.1 Phytane diterpenoids (VS5350)

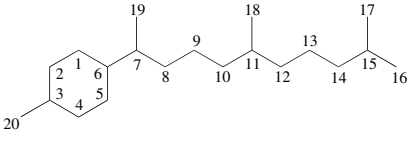
Phytanes are regular acyclic diterpenoids. The phytane numbering system is shown here.



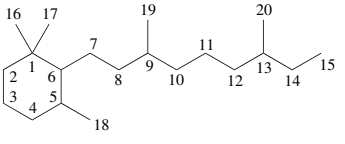
Phytane
2,6,10,14-Tetramethylhexadecane

6.4.2 Prenylbisabolane and 10,15-cyclophytane diterpenoids (VS5380, VS5390)

The prenylbisabolanes arise by cyclisation between carbons 1 and 6 of the phytane skeleton. They retain their phytane numbering system. The 10,15-cyclophytanes are important compounds including the retinal group. Since 10,15-cyclophytanes resemble carotenoids, a carotenoid-like numbering system has usually been adopted. It is possible to view 10,15-cyclophytanes as 9,10-secolabdanes and some are named and numbered as such in the literature.



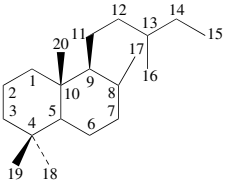
Prenylbisabolane
1-Methyl-4-(1,5,9-trimethyldecyl)cyclohexane



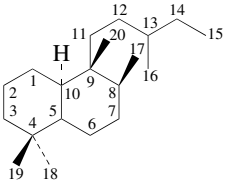
10,15-Cyclophytane
1,1,3-Trimethyl-2-(3,7-dimethylnonyl)cyclohexane

6.4.3 Labdane and halimane diterpenoids (VS5400–VS5470)

Labdanes form a large group and occur in both enantiomeric series. The halimanes are derived from labdanes by migration of the *C*-20 methyl group to *C*-9. Nor-, seco- and rearranged labdanes are given separate codes.



Labdane
Decahydro-1,1,4*a*,6-tetramethyl-5-(3-methylpentyl)naphthalene, 9Cl

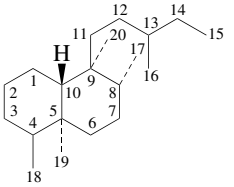


Halimane
Decahydro-1,1,5,6-tetramethyl-5-(3-methylpentyl)naphthalene

Singh, M. *et al*, *Planta Med*., 1999, **65**, 2–8 (*activity*)

6.4.4 Clerodane diterpenoids (VS5500–VS5530)

Clerodanes arise from labdanes by two methyl migrations. They are abundant in terrestrial plants, particularly in *Teucrium* spp., but are also found in marine species. In the past *ent*-clerodanes have been named as neoclerodanes and kolavanes but these names are not widely used. There is some confusion in the literature concerning the numbering of *C*-18 and *C*-19 in clerodanes.

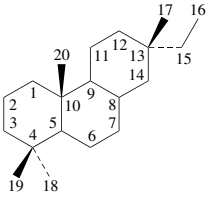


ent-Clerodane
Decahydro-1,2,4*a*,5-tetramethyl-1-(3-methylpentyl)naphthalene, 9Cl

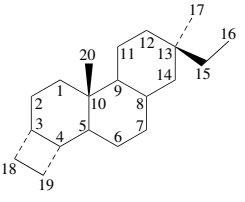
Merritt, A.T. *et al*, *Nat. Prod. Rep*., 1992, **9**, 243–287 (*clerodanes*)
Tokoroyama, T., *Synthesis*, 2000, 611–633 (*synth*)

6.4.5 Parguerane, isoparguerane and isopimarane diterpenoids (VS5730–VS5750)

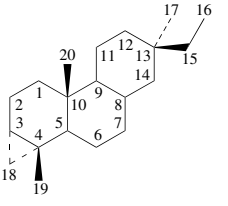
The isopimaranes (VS5750) (formerly called sandaracopimaranes) arise by further cyclisation of the labdane skeleton. The isopimaranes are largely of terrestrial origin but do occur in some marine species. Parguerenes (VS5730) and Isoparguerenes (VS5735), mainly from *Laurencia* and *Aplysia* species, are derived from the isomeric pimarane skeleton.



Isopimarane
7-Ethyltetradecahydro-1,1,4*a*,7-tetramethylphenanthrene



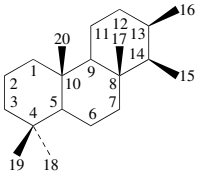
Isoparguerane
6-Ethyltetradecahydro-6,8*b*-dimethylcyclobuta[*a*]-phenanthrene



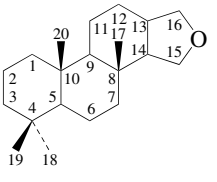
Parguerane
5-Ethyltetradecahydro-1*a*,5,7*b*-trimethyl-1*H*-cyclopropa[*a*]phenanthrene

6.4.6 Isocopalane and spongiane diterpenoids (VS5950)

Isocopalanes and spongianes are of marine origin and both have the same carbon skeleton. A spongiane or spongian is a 15,16-epoxyisocopalane.



Isocopalane
Tetradecahydro-1,1,4*a*,7,8,8*a*-hexamethylphenanthrene

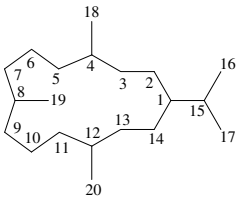


Spongiane skeleton

Keyzers, R.A. *et al*, *Nat. Prod. Rep*., 2006, **23**, 321–334 (*spongianes*)

6.4.7 Cembrane diterpenoids (VS6400–VS6410)

The cembranes form a large group of diterpenoids found in higher plants, insects and marine organisms. The cembrane nucleus has a plane of symmetry and is conventionally drawn with *C*-7 at the top as defined by the *C*-1, *C*-8 axis, *C*-7 being chosen as bearing a double bond or equivalent. The numbering system shown is generally accepted. Many polycyclic diterpenoids can be regarded as formally arising by cyclisation of the cembrane skeleton. Care is necessary in interpreting published configurations at centres involving reentrant angles.

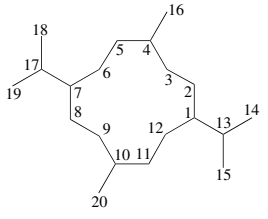


Cembrane
1,7,11-Trimethyl-4-(1-methylethyl)cyclotetradecane, 9Cl

Weinheimer, A.J. *et al*, *Progress in the Chemistry of Organic Natural Products*, (eds, Herz, W. *et al*), SpringerWien, New York, 1979, **Vol. 36**, 285–387 (*cembranoids*)
Tius, M.A., *Chem. Rev*., 1988, **88**, 719–732 (*synth*)
Marshall, J.A., *Studies in Natural Products Chemistry*, (ed. Atta-ur-Rahman), Elsevier, Amsterdam, 1992, **Vol. 10**, 3–42 (*synth*)
Wahlberg, I. *et al*, *Progress in the Chemistry of Organic Natural Products*, (eds, Herz, W. *et al*), SpringerWien, New York, 1992, **Vol. 59**, 141–294; **Vol. 60**, 1–141 (*cembranoids*)
Bernardelli, P. *et al*, *Heterocycles*, 1998, **49**, 531–556 (*marine cembranoids*)
Sung, P.-J. *et al*, *Heterocycles*, 2002, **57**, 1705–1715 (*gorgonian cembranoids*)

6.4.8 Rearranged cembrane diterpenoids (VS6420) and pseudopterane diterpenoids (VS6425)

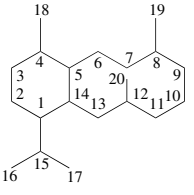
Various rearranged cembranes are found in marine organisms including the pseudopteranes from *Pseudopterogorgia* species.



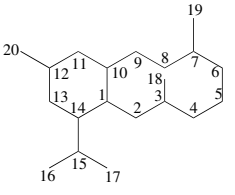
Pseudopterane
1,7-Dimethyl-4,10-bis(1-methylethyl)-
cyclododecane

6.4.9 Eunicellane and asbestinane diterpenoids (VS6440, VS6450)

These are marine natural products. The eunicellane (cladiellane) skeleton is formally a 5,14-cyclocembrane and the cembrane numbering system is preferred. The closely related asbestinane group has been assigned a different numbering system.



Eunicellane
Tetradecahydro-4,7,11-
trimethyl-1-(1-methylethyl)-
benzocyclodecene, 9CI

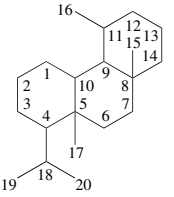


Asbestinane
Tetradecahydro-3,7,11-
trimethyl-1-(1-methylethyl)-
benzocyclodecene

Sung, P.-J. *et al, Heterocycles*, 2002, **57**, 1705–1715 (*eunicellanes, asbestinanes*)

6.4.10 Sphaerane diterpenoids (VS6460)

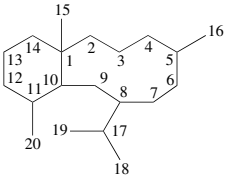
The bromosphaerol group of marine natural products contains an unusual carbon skeleton. The numbering system is as shown. Bicyclic (lacking the 1,10-bond) and tetracyclic (with a 2,17-bond) derivatives are known. (N.B. Sphaeranes are not to be confused with sphaeroanes, see below).



Sphaerane
Tetradecahydro-5,8*a*,10*a*-trimethyl-1-(1-methylethyl)-
phenanthrene

6.4.11 Briarane diterpenoids (VS6470)

The briaranes are a large group of marine diterpenoids with the numbering system as shown. The carbon skeleton is formerly a 3,8-cyclocembrane.

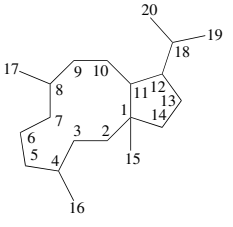


Briarane
Tetradecahydro-1,4*a*,8-trimethyl-
11-(1-methylethyl)benzocyclodecene

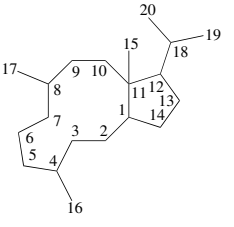
Sung, P.-J. *et al*, *Heterocycles*, 2002, **57**, 535–579; 2005, **65**, 195–204 (*briaranes*)

6.4.12 Dolabellane and modified dolabellane diterpenoids (VS6500, VS6510)

Dolabellanes are found in marine organisms and in liverworts. Several numbering systems have been used in the literature. We have used the one shown. The modified dolabellane group includes the neodolabellanes in which a methyl has migrated from *C*-1 to *C*-11.



Dolabellane
Tetradecahydro-3*a*,6,10-
trimethyl-1-(1-methylethyl)-
cyclopentacycloundecene

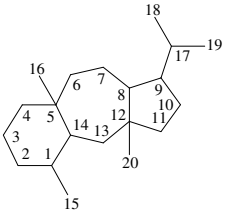


Neodolabellane
Tetradecahydro-6,10,12*a*-
trimethyl-1-(1-methylethyl)-
cyclopentacycloundecene

Rodriguez, A.D. *et al*, *Tetrahedron*, 1998, **54**, 11683–11729 (*dolabellanes*)
Hiersemann, M. *et al*, *Topics in Current Chemistry*, (ed. Mulzer, J.), Springer, Berlin, 2005, **Vol. 243**, 73–136 (*synth*)

6.4.13 Dolastane and modified dolastane diterpenoids (VS6540, VS6550)

The name clavularane was originally used for this group of marine natural products but now dolastane appears to be widely accepted. Dolastane is a 3,8-cyclododolabellane but a different numbering system is used. The modified dolastane group contains 8,9-secodolastanes and a chromophycane, a skeletal type related to dolastane by migration of the methyl *C*-20 to *C*-13.

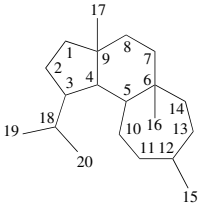


Dolastane
Tetradecahydro-3*a*,5,8*a*-trimethyl-1-(1-methylethyl)-
benz[*f*]azulene, 9Cl

Hiersemann, M. *et al*, *Topics in Current Chemistry*, (ed. Mulzer, J.), Springer, Berlin, 2005, **Vol. 243**, 73–136 (*synth*)

6.4.14 Cyathane diterpenoids (VS6560)

The cyathanes found in marine sponges are also fungal metabolites. The biosynthesis of this unusual skeleton has been studied. The accepted numbering system is as shown.

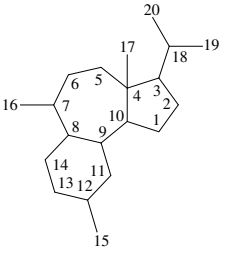


Cyathane
Tetradecahydro-3*a*,5*a*,8-trimethyl-1-(1-methylethyl)-
cyclohept[*e*]indene

Turner, W.B. *et al*, *Fungal Metabolites II*, Academic Press, London, 1983

6.4.15 Sphaeroane diterpenoids (VS6570)

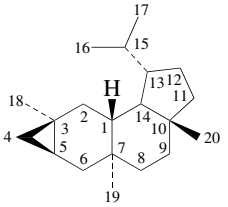
The sphaeroanes are marine algal products with a skeleton which is formally a 2,7-cyclodolabellane though the numbering system is different from that of dolabellanes.



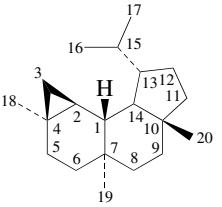
Sphaeroane
Dodecahydro-3*a*,6,9-trimethyl-3-(1-methylethyl)-
benz[*e*]azulene, 9Cl

6.4.16 Verrucosane and modified verrucosane diterpenoids (VS6580, VS6590)

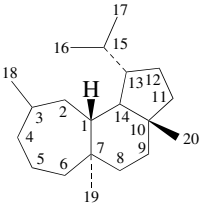
Verrucosanes and their modifications, including neoverrucosanes and 3,5-secoverrucanes, are constituents of marine sponges. The tetracyclic verrucosane skeleton is formally related to dolabellane by 4,10- and 6,8-bond formation. A different numbering system from that of dolabellane is used. The isomeric neoverrucosane has the cyclopropane bridging *C*-2 and *C*-3.



Verrucosane
Tetradecahydro-3*a*,5*a*,7*a*-trimethyl-
1-(1-methylethyl)cyclopenta-
[*a*]cyclopropa[*g*]naphthalene, 9Cl



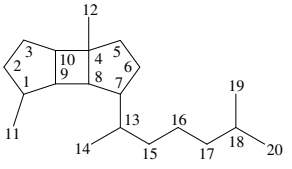
Neoverrucosane
Tetradecahydro-1*a*,3*a*,5*a*-trimethyl-
8-(1-methylethyl)cyclopenta-
[*a*]cyclopropa[*h*]naphthalene



3,5-Secoverrucane
Tetradecahydro-3*a*,5*a*,9-trimethyl-
1-(1-methylethyl)cyclohept[*e*]indene

6.4.17 Spatane diterpenoids (VS6800, VS6810)

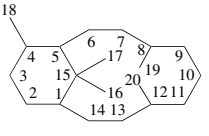
The spatane skeleton is formally derived from a prenylgermacrane by 1,5- and 6,10-cyclisation. The numbering system unfortunately does not reflect this derivation. Spatanes and the related 4,10-secospatanes are marine natural products.



Spatane
Decahydro-3*a*,6-dimethyl-1-(1,5-dimethylhexyl)cyclo-
buta[1,2:3,4]dicyclopentene, 9Cl

6.4.18 Verticillane diterpenoids (VS6880)

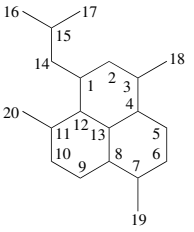
The verticillane group is formally derivable from cembrane by an 11,15-cyclisation. A non-cembrane numbering system is used. The Cespitularins from a soft coral are verticillane derivatives.



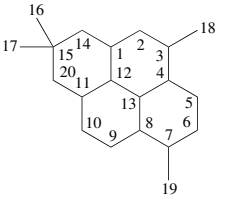
Verticillane
4,8,12,15,15-Pentamethylbicyclo[9.3.1]pentadecane, 9Cl

6.4.19 Amphilectane, cycloamphilectane, adociane and neoamphilectane diterpenoids (VS7020, VS7030, VS7040)

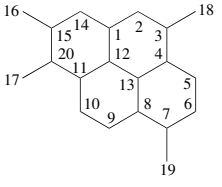
The amphilectanes (including the pseudopterosins), the cycloamphilectanes and adocianes (also called is isocycloamphilectanes) and neoamphilectanes are marine products. They are found with serrulatane derivatives from which amphilectanes are derived by cyclisation. Cycloamphilectanes represent a further cyclisation and adocianes have undergone a methyl migration. Neoamphilectanes are 2(1→12)-abeoamphilectanes. Many marine natural products from these groups contain isocyanate, isothiocyanate and isonitrile functional groups.



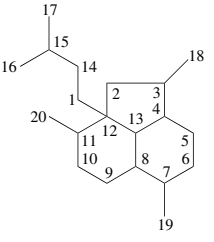
Amphilectane
Dodecahydro-1,4,7-trimethyl-3-(2-methylpropyl)-1*H*-phenalene, 9Cl



Cycloamphilectane
Hexadecahydro-1,4,7,7-tetramethylpyrene



Adociane
Hexadecahydro-1,2,5,8-tetramethylpyrene, 9Cl

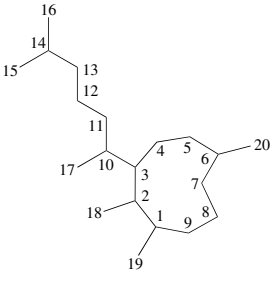


Neoamphilectane
Dodecahydro-1,3,6-trimethyl-2*a*-(3-methylbutyl)-acenaphthylene

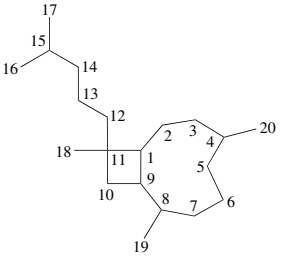
König, G.M., *J. Org. Chem*, 1996, **61**, 3259–3267 (*isocyanates, isothiocyanates, isonitriles*)
Kohl, A.C. *et al, J. Ind. Microbiol. Biotechnol*., 2003, **30**, 495–499 (*biosynth*)
Gross, H. *et al*, *Phytochem. Rev*., 2006, **5**, 115–141 (*rev*)

6.4.20 Xenicane and xeniaphyllane diterpenoids (VS7100, VS7110, VS7150)

Xenicanes and xeniaphyllanes are marine natural products. Xeniaphyllanes are the diterpenoid equivalent of the caryophyllane skeleton. Xenicanes are cleaved xeniaphyllanes.



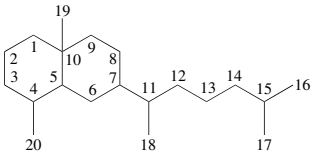
Xenicane
1,2,6-Trimethyl-3-(1,5-dimethylhexyl)-cyclononane



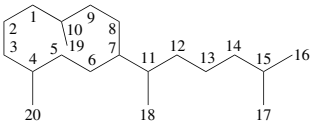
Xeniaphyllane
2,6,10-Trimethyl-10-(4-methylpentyl)-bicyclo[7.2.0]undecane

6.4.21 Prenyleudesmane, prenylgermacrane and prenylbicyclogermacrane diterpenoids (VS7190, VS7200, VS7210)

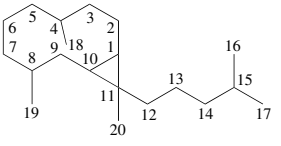
These three groups of 'extended' sesquiterpenoid skeletons are largely of marine origin.



Prenyleudesmane
Decahydro-7-(1,5-dimethylhexyl)-1,4*a*-dimethylnaphthalene



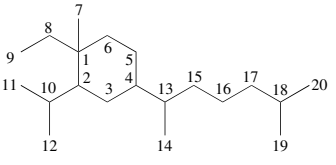
Prenylgermacrane
4-(1,5-Dimethylhexyl)-1,7-dimethylcyclodecane



Prenylbicyclogermacrane
3,7,11-Trimethyl-11-(4-methylpentyl)bicyclo-
[8.1.0]undecane

6.4.22 Lobane diterpenoids (VS7220)

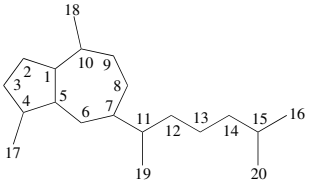
Lobanes are of marine origin and are 'extended' elemanes. A most unusual non-standard numbering system is used in the literature.



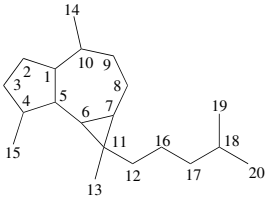
Lobane
4-(1,5-Dimethylhexyl)-1-ethyl-1-methyl-2-
(1-methylethyl)cyclohexane

6.4.23 Pachydictyane and cneorubine diterpenoids (VS7230, VS7240)

These two groups are also 'extended' sesquiterpenoids. The pachydictyanes are prenylguaianes from marine organisms and the cneorubine group are prenylaromadendranes found in marine species as well as leaves of *Cneorum tricoccon*.



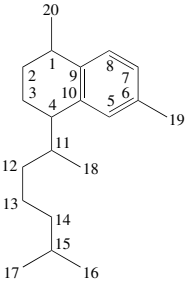
Pachydictyane
Decahydro-7-(1,5-dimethyl-
hexyl)-1,4-dimethyl-
azulene



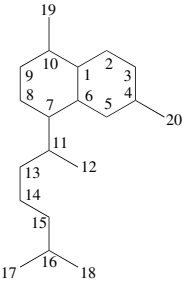
Cneorubine skeleton
Decahydro-1,4,7-trimethyl-1-
(4-methylpentyl)-1*H*-
cycloprop[*e*]azulene

6.4.24 Serrulatane and biflorane diterpenoids (VS7250)

The biflorane skeleton is found in marine organisms, insects and *Eremophila* spp. The skeleton is an 'extended' cadinane. The serrulatane name is given to the aromatic analogue. Unfortunately different numbering systems have been given to serrulatanes and bifloranes.



Serrulatane
4-(1,5-Dimethylhexyl-
1,2,3,4-tetrahydro-1,6-
dimethylnaphthalene

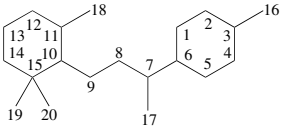


Biflorane
Decahydro-4-(1,5-dimethyl-
hexyl)-1,6-dimethyl-
naphthalene

Hechrodt, T.J. *et al*, *Topics in Current Chemistry*, (ed. Mulzer, J.), Springer, Berlin, 2005, **Vol. 244**, 1–41 (*serrulatanes*)

6.4.25 Obtusane diterpenoids (VS7280)

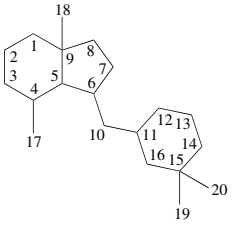
The obtusanes, of marine origin, are bicyclic phytanes. The numbering system is almost the same as for phytane (Note that the terpenoid **Obtusane** itself is a chamigrane).



Obtusane
1,1,3-Trimethyl-2-[3-(4-methylcyclohexyl)butyl]-
cyclohexane

6.4.26 Irieol diterpenoids (VS7290)

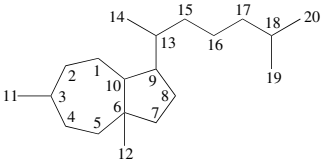
The irieol group, also of marine origin, represents an unusual diterpenoid skeleton.



Irieol skeleton
Octahydro-1-[(3,3-dimethylcyclohexyl)methyl]-
3*a*,7-dimethyl-1*H*-indene

6.4.27 Sphenolobane diterpenoids (VS7300)

The sphenolobane skeleton is an 'extended' daucane skeleton.



Sphenolobane
Decahydro-1-(1,5-dimethylhexyl)-3*a*,6-dimethylazulene

6.4.28 Miscellaneous diterpenoids (VS7310–VS7340)

Diterpenoids that do not easily fit into the other categories are collected here. Mono-, bi-, tri- and tetracyclic diterpenoids are given separate codes.

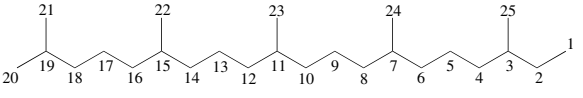
6.5 Sesterterpenoids (VS7400–VS7580)

Sesterterpenoids are a group of natural products that arise from five isoprene units. Although sesterterpenoids strictly have 25 carbons, there are many nor- and alkylated members. Also included here are the C_{21} acyclic terpenoids although their biosynthetic relationship with the sesterterpenoids has not been established with certainty. Sesterterpenoids are found in fungi, higher plants, insects and particularly in marine organisms.

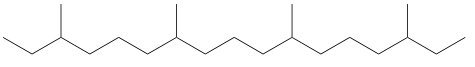
Cordell, G.A., *Progress in Phytochemistry*, (eds. Reinhold, L. *et al*), Pergamon Press, Oxford, 1977, **Vol. 4**, 209–256 (*sesterterpenoids*)
Crews, P. *et al, Progress in the Chemistry of Organic Natural Products*, (eds, Herz, W. *et al*), SprigerWien, New York, 1985, **Vol. 48**, 203–269 (*sesterterpenoids*)
Hanson, J.R. *et al*, *Nat. Prod. Rep*., 1996, **13**, 529–535 (*sesterterpenoids*)
Dewick, P.M., *Nat. Prod. Rep*., 2002, **19**, 181–222 (*biosynth*)

6.5.1 Acyclic and noracyclic sesterterpenoids (VS7400, VS7410)

The acyclic sesterterpenoids arise by a head to tail fusion of isoprene units. The accepted numbering system is used here. The noracyclic sesterterpenoids (VS7410) are numbered in a similar way; however, a problem arises with the symmetry of the C_{21} compounds as they may be numbered from either end. The acyclic sesterterpenoids frequently contain furanoid rings.



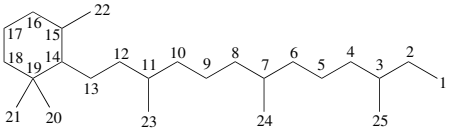
Acyclic sesterterpenoid skeleton
2,6,10,14,18-Pentamethyleicosane



C_{21} sesterterpenoid skeleton
3,7,11,15-Tetramethylheptadecane

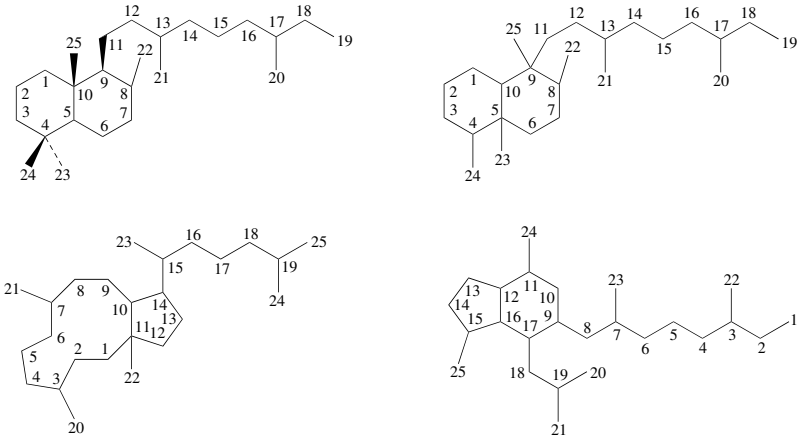
6.5.2 Cyclohexane sesterterpenoids (VS7420)

Most of the cyclohexane sesterterpenoids arise by cyclisation of the acyclic skeleton between carbons 14 and 19.



6.5.3 Bicyclic sesterterpenoids (VS7460)

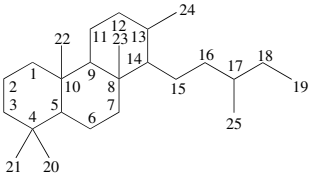
Various bicyclic sesterterpenoids are known. Some are prenylated analogues of diterpene skeletons and the numbering systems are related to the corresponding diterpenoid systems. Others have biogenetic numbering systems.



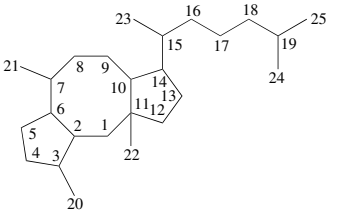
Some bicyclic sesterterpenoid skeletons

6.5.4 Cheilanthane and ophiobolane sesterterpenoids (VS7500, VS7520)

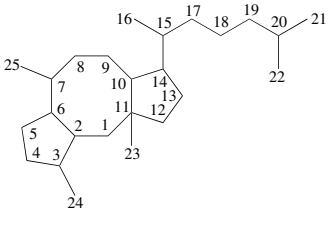
The accepted numbering systems for the cheilanthanes and ophiobolanes are shown here. *Chemical Abstracts* uses ophiobolane as a stereoparent; however it uses a different numbering system for the non-ring carbons.



Cheilanthane
4,4,8-Trimethyl-*D*(15),24-dinor-13,17-secocholane, 9Cl



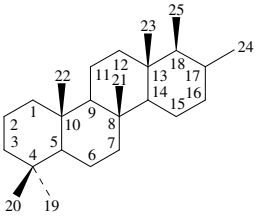
Ophiobolane



Ophiobolane, CA numbering

6.5.5 Scalarane sesterterpenoids (VS7540, VS7550)

The scalarane numbering system is shown here. Carbons 12, 24 and 25 are generally oxygenated in this skeleton. Several methyl and dimethylscalaranes are found in marine organisms. The additional methyl groups attached to *C*-24 and *C*-20 are numbered 26 and 27 respectively.

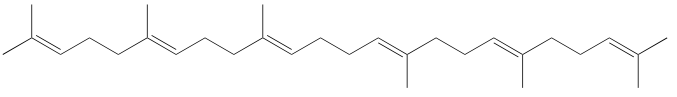


Scalarane
4,4,8,17,17*a*-Pentamethyl-*D*-homoandrostane, 9Cl

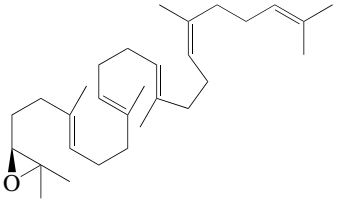
Ungur, N. *et al, Recent Res. Dev. Org. Chem*., 2003, **7**, 241–258 (*synth*)

6.6 Triterpenoids (VS7600–VS9450)

The triterpenoids constitute a large diverse group of natural products derived from squalene or, in the case of 3β-hydroxytriterpenoids, the 3*S*-isomer of squalene 2,3-epoxide. The conformation that *all-trans*-squalene 2,3-epoxide adopts when the initial cyclisation takes place determines the stereochemistry of the ring junctions in the triterpenoid produced. Thus cyclisation of the chair-boat-chair-boat conformation gives the protostane cation and cyclisation of the chair-chair-chair-boat conformation leads to the dammarane cation. The initially formed cation intermediate may undergo a series of 1,2-hydride and methyl migrations, commonly called backbone rearrangements, to give a variety of skeletal types.

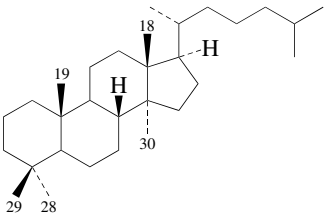


Squalene

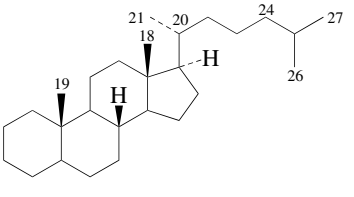


Squalene 2,3-epoxide

Backbone rearrangement of the protostane cation gives the lanostane skeleton; **Lanosterol** is the biogenetic precursor of the steroids in animals. The methyl groups at carbons 4 and 14 are removed during steroid biosynthesis. The steroid numbering system is adopted for lanostane and related tetracyclic triterpenoids. The three methyl groups that were removed during the biosynthesis of steroids are currently numbered 28, 29 and 30 as shown. However, older literature uses the numbers 31, 30 and 32, respectively. This was based on the assignment of carbon numbers 28 and 29 to the stigmastane ethyl group, even though most lanostanes do not have such an ethyl group. The numbering used here follows the currently accepted convention. (See also Steroid section following).



Lanostane numbering



Steroid numbering

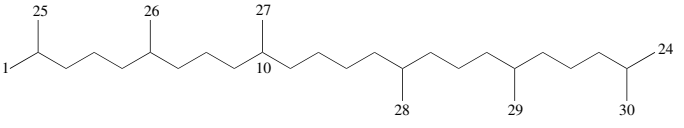
Abe, I. *et al*, *Chem. Rev*., 1993, **93**, 2189–2206 (*biosynth*)
Spencer, T.A., *Acc. Chem. Res*., 1994, **27**, 83–90 (*biosynth*)
Mahato, S.B., *Progress in the Chemistry of Organic Natural Products*, (eds, Herz, W. *et al*), SpringerWien, New York, 1998, **Vol. 74**, 1–96 (*saponins*)
Brown, G.D., *Nat. Prod. Rep*., 1998, **15**, 653–696 (*biosynth*)
Connolly, J.D. *et al*, *Nat. Prod. Rep*., 2005, **22**, 487–503 (*triterpenoids*)

The main tetracyclic triterpenoid skeletons have the steroid numbering for the skeleton including the side chain and only the methyl groups will be numbered in the structures that follow. As a general rule the methyls which migrate during terpenoid biosynthesis retain their numbering.

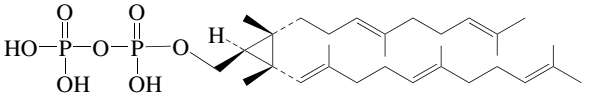
CA names most tetracyclic triterpenoids as derivatives of the steroid stereoparents. This has the disadvantage that some are assigned different names from those commonly used.

6.6.1 Linear triterpenoids (VS7600)

This group contains simple derivatives of squalene. The preferred numbering system is shown and is used for the related polyether derivatives found in marine algae, e.g. *Laurencia* spp. Also included are C_{30} polyprenols, and some homo- and nor-squalenes. Squalene is formed biosynthetically from farnesyl pyrophosphate *via* presqualene pyrophosphate.



Squalane
2,6,10,15,19,23-Hexamethyltetracosane, 9Cl



Presqualene pyrophosphate

6.6.2 Lanostane triterpenoids (VS7750)

The lanostanes are very common in higher plants and fungi. **Lanosterol** is a key intermediate in steroid biosynthesis. The metabolites of sea cucumbers or holothurians are characterised by lanostane glycosides with most aglycones possessing the 18,20-lactone of the holostane skeleton. Many of the glycosides of these metabolites are sulfated.

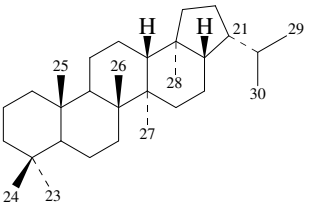
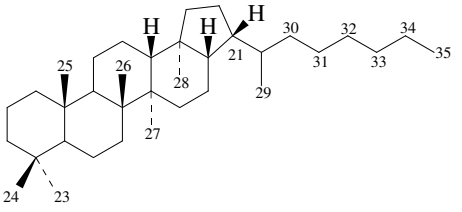
Kalinin, V.I. *et al, Phytochem. Rev*., 2005, **4**, 221–236 (*holothurian glycosides*)

6.6.3 Hopane triterpenoids (VS8720, VS8730)

Cyclisation of squalene in the chair-chair-chair-chair-chair conformation affords the hopane skeleton. Degraded and extended hopanes, the bacteriohopanoids, occur widely in natural sediments and the latter are important components of archaeal lipid membranes and have been identified in marine sponges.



Hopane
A' -Neogammacerane, 9Cl



Bacteriohopane

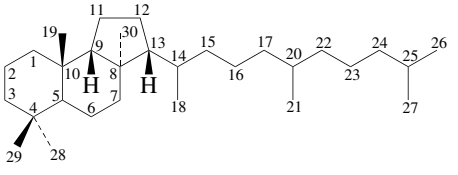
Costantino, V. *et al, Tetrahedron*, 2001, **57**, 4045–4048 (*sponge bacteriohopanoids*)

6.6.4 Isomalabaricane triterpenoids (VS9100)

Partial cyclisation of squalene 2,3-epoxide from one end leads to the isomalabaricane skeleton of marine triterpenoids. The 8,9-diepimeric malabaricane skeleton is found in terrestrial triterpenoids.

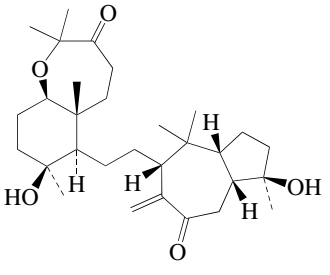


Isomalabaricane
Dodecahydro-3*a*,6,6,9*a*-tetramethyl-
3-(1,5,9-trimethyldecyl)-
1*H*-benz[*e*]indene

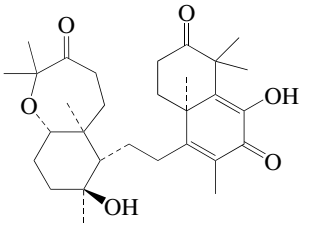
Fouad, M. *et al*, *J. Nat. Prod*., 2006, **69**, 211–218 (*bibl*)

6.6.5 Miscellaneous triterpenoids (VS9300)

This group contains assorted triterpenoid skeletons which are less easily classified. It includes intriguing group of compounds, such as **Sipholenone C**, from the sponge *Siphochalina siphonella* and **Sodwanone A** from *Axinella weltneri*.



Sipholenone C

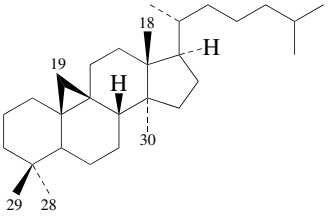


Sodwanone A

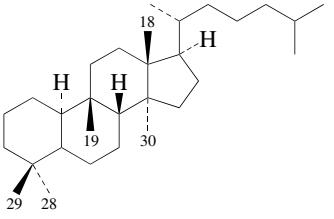
Kashman, Y. *et al Phytochem. Rev*., 2004, **3**, 309–323 (*bibl*)

6.6.6 Other marine triterpenoids

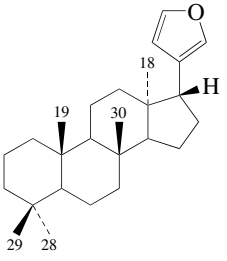
Triterpenoids are characteristic metabolites of terrestrial higher plants and are rare in the marine environment apart from the groups listed above. Many triterpenoids are important biomarkers in marine sediments. The triterpenoid groups are listed below for reference.



Cycloartane



Cucurbitane



Tetranortriterpenoid skeleton

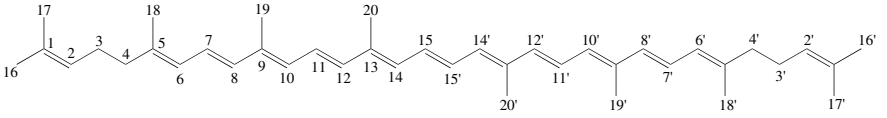
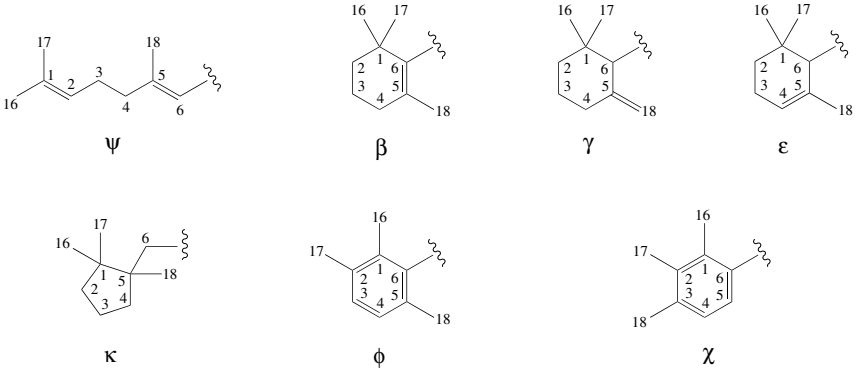
6.7 Tetraterpenoids (VS9400)

The tetraterpenes arise by head to head coupling of two geranylgeranyl diphosphate molecules.



ψψ-Carotene



ψ β γ ε

κ ϕ χ

Carotenoid end-groups

Spurgeon, S.L. *et al*, *Biosynthesis of Isoprenoid Compounds*, (eds. Porter, J.W. *et al*), Wiley, New York, 1981, **Vol. 2**, 1

6.7.1 Carotenoids

These include the hydrocarbons (carotenes) and their oxygenated derivatives (xanthophylls). Carotenoid nomenclature is based on a stem name, carotene, and two Greek letters as prefixes to define the two end groups. The numbering system and end groups are given below.

IUPAC treats 'hydro' prefixes in carotenoid names as non-detachable. This Dictionary follows IUPAC recommendations for nomenclature except that the 'hydro' prefix is treated as detachable and is placed alphabetically with the other prefixes. CA also uses a detachable 'hydro' prefix but it does not use hypothetical parents such as β-caroten-6-ols which are incapable of existence (see current *Chemical Abstracts Index Guide*). The following examples illustrate this point.

IUPAC name	**Chemical Abstracts name**
5,6-Dihydro-β,β-caroten-3-ol	5,6-Dihydro-β,β-caroten-3-ol
5,6-Dihydro-β,β-caroten-6-ol	5,6-Dihydro-6-hydroxy-β,β-carotene

6.7.2 Apocarotenoids (VS9700)

Apocarotenoids are carotenoids in which the carbon skeleton has been shortened by the formal removal of fragments from one or both ends. A locant is used to indicate that all of the molecule beyond the carbon with that locant has been removed. It is not necessary to give a Greek-letter end group designation if the apo-locant is greater than 5.

6.8 Meroterpenoids (VS9900)

Meroterpenoids are of mixed biogenesis containing terpenoid and non-terpenoid derived fragments. This broad definition could include the vast number of simple prenylated phenolics but is normally reserved for compounds where the terpenoid fragment comprises a large part of the molecule. Many marine meroterpenoids have interesting biological activities such as **Avarol**, with a rearranged drimane terpenoid moiety, from the sponge *Dysidea avara*. The tunicate *Aplidium longithorax* contains a range of meroterpenoids such as **Longithorone B** with a sesquiterpenoid chain in paracyclophane arrangement. Meroditerpenoid and merotriterpenoid representatives include the tetraprenyltoluquinol **Sindurol** from the soft coral *Sinularia dura* and **Toxiusol** from the sponge *Toxiclona toxius*.

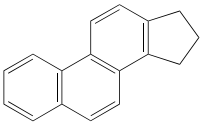
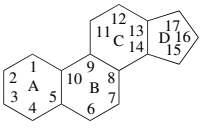
7. STEROIDS (VT)

For general information on the biogenesis of steroids, see the preceding terpenoid section.

The steroid structure is based on four carbocyclic rings arranged as in cyclopenta[*a*]phenanthrene, which is normally fully or partially reduced so that only limited unsaturation, if any, is present. The four steroid rings are labelled, and their carbon atoms are numbered according to the universal convention illustrated.

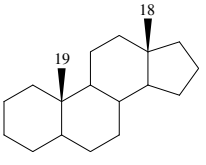


Cyclopenta[*a*]phenanthrene



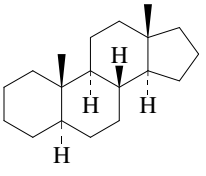
Basic steroid structure

The great majority of steroids also have one or two methyl groups present at the bridgehead positions *C*-10 and *C*-13; the methyl carbon atoms are numbered *C*-19 and *C*-18, respectively.



Methyl groups, hydrogen atoms, or substituents at the bridgehead positions *C*-8, 9, 10, 13, and 14 are assumed to have the 8β, 9α, 10β, 13β, 14α configurations unless otherwise specified. *C*-5 is a special case, as there are many steroids of each of the 5α and 5β configurations, and it is therefore necessary to specify the *C*-5 configuration for any steroid which is saturated at *C*-5 (e.g. 5α-Androstane or 5β-Androstane).

It is worth noting here some changes in *Chemical Abstracts* indexing policy. Prior to the 8th Collective Index (1967), the indexing of steroid stereoisomers gave priority to the *C*-5 configuration which effectively led to a separation of 5α- and 5β-steroids. Users should be alert to this when searching the literature before 1967.

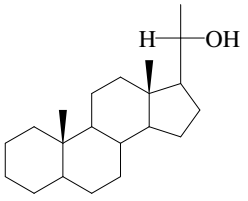


5α-Androstane

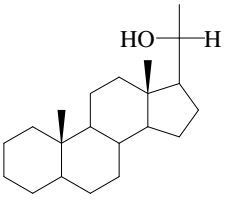
The hydrogen atoms at *C*-8, 9 and 14 are generally omitted from formulae if they have the natural configurations shown here.

Any side-chain at *C*-17 is assumed to have the 17β-configuration unless otherwise indicated. This is shown either by using a wedge bond or, where there is any possibility of uncertainty owing to substitution at *C*-20, by drawing in the *C*-17 α-hydrogen atom.

Configurations of substituents in the side chain were formerly also indicated by α or β, (Fieser convention), whereby the side-chain is drawn in Fischer projection, with the highest numbered locant at the top.



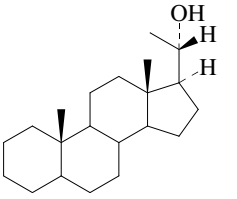
20α-form



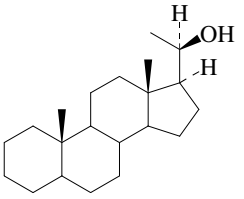
20β-form

The Fieser convention for pregnan-20-ols

The unambiguous Cahn-Ingold-Prelog sequence rule descriptors (*R* or *S*) are now recommended for side-chain configurations.

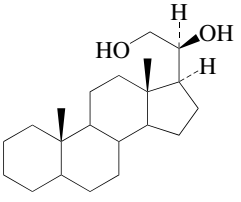


20*S* (= 20α)

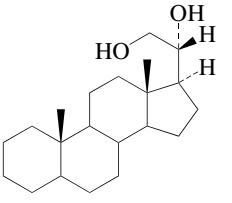


20*R* (= 20β)

The presence of substituents at *C*-17 or *C*-21 may change the priority of groups so that 20*S* is no longer equivalent to 20α. This happens for example in the pregnane-20,21-diols.

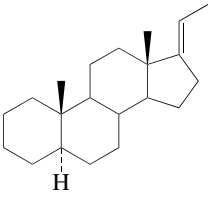


20*S* (= 20β)

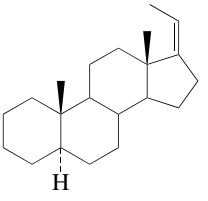


20*R* (= 20α)

The sequence rule descriptors (*E*-) and (*Z*-) are required for defining side-chain double bond configurations. The configuration of additional side-chain methyl or other alkyl groups, which are common in steroids produced by sponges and other marine organisms, are denoted by *R*- and *S*- (or ξ if unknown).



5α-Pregn-17(20)*E*-ene



5α-Pregn-17(20)*Z*-ene

(Note that both locants for unsaturation are required when the numbers are non-consecutive)

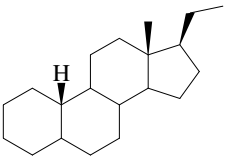
7.1 Steroid classes

7.1.1 C_{20} steroids (VT0400)

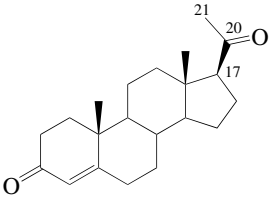
These are scarce among natural products. A few 19-norpregnanes, with the pregnane skeleton (see below) but lacking the bridgehead methyl group (*C*-19) occur in marine organisms. Alternative names based upon 17-ethylestrane are also often used for this series of compounds (see pregnanes).



19-Norpregnane

7.1.2 Pregnane steroids (C_{21}) (VT0450)

Pregnane is the parent hydrocarbon of the pregnancy hormone progesterone (pregn-4-ene-3,20-dione), and of the great majority of the corticosteroids and many other natural products, which together make the pregnanes the largest single group of steroids. Many pregnane derivatives have hydroxyl or a related group at *C*-17. To avoid any ambiguity as to the configuration, epimeric forms of 17-substituted pregnanes are specified as 17αOH or 17βOH.



Pregn-4-ene-3,20-dione (Progesterone)

7.2 The sterols

The sterols comprise several major groups of steroids characterised by having a hydroxyl group at *C*-3, normally in the β-configuration, and branching side chains of from eight to ten or more carbon atoms at *C*-17. They occur widely throughout the animal and particularly the plant kingdoms. They have both structural roles, as membrane constituents, and a key place in the biosynthetic sequences which lead to the steroid hormones and other biologically active steroidal species.

The following sections detail the main features of the various parent hydrocarbons which provide the structural basis and classification of the sterols.

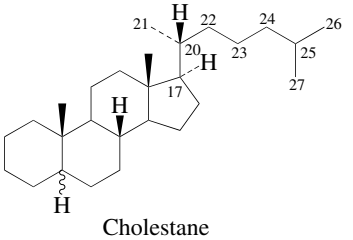
7.2.1 Cholestane steroids (C_{27}) (VT1050, VT1100)

The cholestane skeleton, which derives its name from the longest-known and most familiar compound of its class, **Cholesterol**, can be regarded as the parent from which almost all other sterols are derived. This is true structurally, if not necessarily in terms of the detailed biosynthetic pathway.



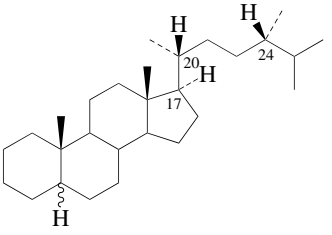
Cholestane

Other classes of sterols are derived from cholestane by the addition of one or more carbon atoms at side-chain positions, most commonly *C*-24 (see ergostanes, stigmastanes, etc, below).

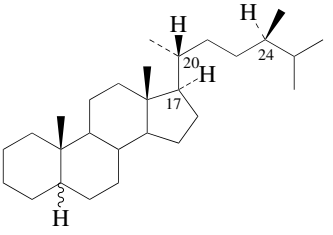
Alkylated cholestanes of many types occur widely in plants, fungi, and marine organisms. The very large classes of 24-methylcholestanes (ergostanes and campestanes) and 24-ethylcholestanes (stigmastanes and poriferastanes) are sufficiently important that their parent hydrocarbons have been assigned these special systematic names (not used in *Chemical Abstracts* however). They are treated in separate sections below. The 4,4,14-trimethylcholestanes (lanostanes) are covered in the preceding terpenoid section. Many alkylcholestane derivatives, however, fall outside these major groups, and have not been signified by special class names. They can be named as derivatives of cholestane, or alternatively if they contain a 24-methyl or 24-ethyl group can be named as substituted ergostanes or stigmastanes respectively. Both forms are usually given in the Dictionary to aid location. Others are homocholestanes, in which additional carbon atoms lengthen the side-chain, rather than branching off it. Many of these unusual sterols are best known by trivial names that reflect their biological origins.

7.2.2 Ergostane steroids (VT1300)

The 24-methylcholestane structure is termed ergostane. While the saturated and Δ^{25}-unsaturated ergostane side-chains have the 24*S* configuration, the altered priorities of groups around *C*-24 give ergost-22-ene the 24*R* configuration.

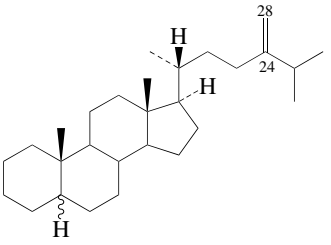


Ergostane

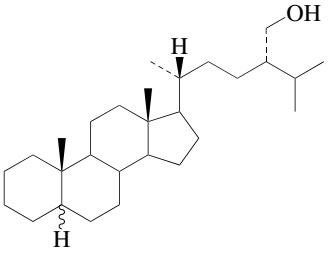


Campestane

A further complication, firmly rooted in historical precedent, is the use of the locant *C*-28 for the carbon atom of the 24-methyl group. The latest IUPAC-IUB recommendation is that the locant *C*-28 be reserved for the 4α-methyl group in lanostanes, and in other 4,4-dimethylsterols of terpenoid type, with *C*-29 and *C*-30 allocated, respectively, to the 4β- and 14α-methyl groups. The locant *C*-28 has therefore acquired two distinct meanings, according to context. In this Dictionary the *C*-24 methyl group in ergostanes and campestanes retains its original locant as *C*-28, allowing the use of derivative names containing such expressions as ergost-24(28)-ene (for 24-methylenecholestanes) or ergostan-28-ol (for 24-hydroxymethylcholestanes). The cholestane-based synonyms favoured by IUPAC-IUB are also given, where necessary, for clarity.



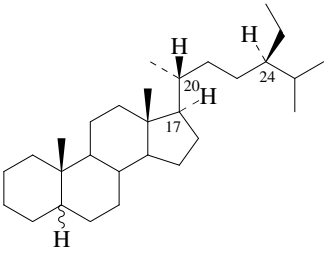
24-Methylenecholestane
[Ergost-24(28)-ene]



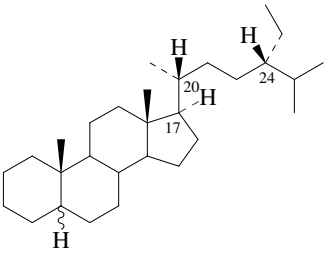
24-Hydroxymethylcholestane
(Ergostan-28-ol)

7.2.3 Stigmastane steroids (C_{29}) (VT1550)

These are the 24-ethylcholestanes, stigmastanes and poriferastanes being epimeric at *C*-24. The long history of stigmastane-based nomenclature, derived from the common plant sterol Stigmasterol, has ensured that this is by far the more widely used of the two names. In the Fieser system, stigmastanes have the 24α configuration, and poriferastanes are 24β. Again the sequence rule is now preferred, with 24*R* or 24*S* depending upon local substitution and/or unsaturation.

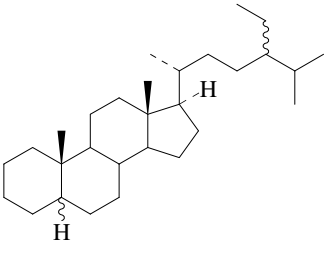


Stigmastane

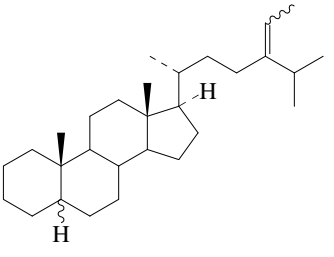


Poriferastane

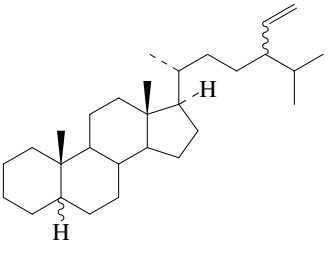
As with ergostanes, common usage over several decades has favoured the locants *C*-28 and *C*-29 for the two ethyl carbon atoms, and these are used here. The IUPAC-IUB recommendation is that the two ethyl carbon atoms be designated 24^1 and 24^2 whenever locants are needed. Synonyms based upon 24-ethylcholestane, 24-ethylidenecholestane, or 24-vinylcholestane are given in the Dictionary where suitable.



24-Ethylcholestane



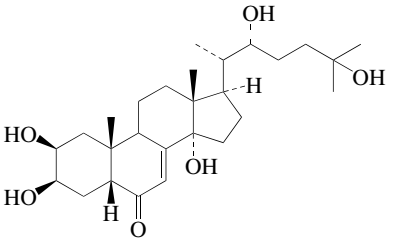
24-Ethylidenecholestane



24-Vinylcholestane

7.2.4 Ecdysteroids (C_{27}) (VT1150)

Ecdysteroids or ecdysones are moulting hormones of insects and crustaceans. They have also been isolated from many plants. The first ecdysone to be isolated was α-Ecdysone from the silkworm (*Bombyx mori*). Most ecdysteroids have a 2β,3β,14α,20,22-pentahydroxy-5β-cholest-7-en-6-one skeleton with further hydroxylation.



α-Ecdysone

Dauphin-Villemant, C., *Ann. NY Acad. Sci*., 1998, **839**, 306–310 (*biosynth*)

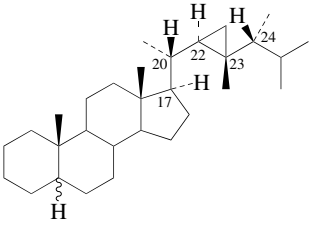
Lafont, R. *et al*, *Comprehensive Molecular Insect Science*, (eds. Gilbert. L. *et al*), Elsevier, 2005, **Vol. 3**, 125–195 (*ecdysteroids*)

7.2.5 Gorgostane and other cyclopropacholestane steroids (C_{30}) (VT1700)

Gorgostane is the parent hydrocarbon of a widely-occurring group of sterols in marine organisms. Its skeleton comprises ergostane with an additional methyl group at *C*-23, and a methylene bridge between *C*-22 and *C*-23, forming a cyclopropane ring. Configurations in the side chain are as illustrated unless otherwise specified.



Gorgostane

A wide variety of at least 100 diverse C_{30} and C_{31} marine sterols in the gorgostane and related structural classes are known. Sponges are the most prolific source. Sponge sterols are characterised by multiply alkylated side chains, frequent presence of cyclopropane/cyclopropene functionality in the side chain, and wide variation in the steroid A-D ring skeleton, including many examples of A-nor and 19-nor variants.

Djerassi, C., *Studies in Natural Products Chemistry*, (ed. Atta-ur-Rahman), Elsevier, Amsterdam, 1991, **Vol. 9**, 25–50 (*marine cyclopropane sterols*)

8. AMINO ACIDS AND PEPTIDES (VV)

8.1 Amino acids (VV0050–VV0140)

8.1.1 Protein α-amino acids (VV0050)

The common α-amino acids are characterised by the structure $RCH(NH_2)COOH$, where R is an aliphatic (including hydrogen), aromatic or heterocyclic group. The exception is **Proline**, strictly an iminoacid, in which the N atom is incorporated into a 5-membered pyrrolidine ring.

They are the primary products of nitrogen anabolism in plants, where they are produced from ammonia (derived *ab initio* by nitrate reduction or nitrogen fixation) by a process called the glutamate synthetase cycle. This produces glutamate which is then transformed into the other amino acids by a variety of processes.

The amino acids thus represent the most important nitrogenous component (in terms of volume and accessibility) of the chiral pool produced by living organisms and are of great importance in chiral synthesis.

Several hundred natural amino acids are known. Of these, only 20 (known as the primary protein amino acids) are incorporated by all organisms into peptides and proteins (not all of these 20 amino acids can be biosynthesised by animals). This protein synthesis occurs in the ribosomes by a process involving ribonucleic acid (RNA), the nucleoside chain of which transmits the template instructions of the DNA genetic material to the protein sequences, each primary amino acid in the chain being coded for by one or more nucleoside base triplets or codons.

There is an IUPAC-IUB standard 3-letter code for each of the protein amino acids (as well as for the common non-protein amino acids). For ease of computerised documentation of large peptide structures, one-letter codes have more recently been introduced.

8.1.2 IUPAC-IUB abbreviations

Amino acids and their corresponding 3-letter and 1-letter codes

1.	Alanine	Ala	A
2.	Arginine	Arg	R
3.	Asparagine	Asn	N
4.	Aspartic acid	Asp	D
5.	Cysteine	Cys	C
6.	Glutamic acid	Glu	E
7.	Glutamine	Gln	Q
8.	Glycine	Gly	G
9.	Histidine	His	H
10.	Isoleucine	Ile	I
11.	Leucine	Leu	L
12.	Lysine	Lys	K
13.	Methionine	Met	M
14.	Phenylalanine	Phe	F
15.	Proline	Pro	P
16.	Serine	Ser	S
17.	Threonine	Thr	T
18.	Tryptophan	Trp	W
19.	Tyrosine	Tyr	Y
20.	Valine	Val	V

Various posttranslational protein amino acids, known as secondary amino acids, may then arise in the protein by various processes such as conjugation of OH, SH or NH groups, *N*-methylation or hydroxylation (especially to produce **4-Hydroxyproline**). A special case of posttranslational change is the reversible oxidation of cysteine residues to produce the disulfide, **Cystine**, thus linking different parts of the peptide chain by disulfide bridges as part of the secondary structure of the protein.

With the exception of **Glycine**, all of the genetically coded protein amino acids are chiral and belong to the L-series. In all cases, except Cysteine, this corresponds to the *S*-form according to the Cahn-Ingold-Prelog convention. In Cysteine, the higher priority of the CH_2SH group over the COOH group means that L- corresponds to the *R*-form.

Amino acids of the opposite D-series can be detected in hydrolysates of aged proteins in which they arise by slow racemisation (they are also produced as artifacts of racemisation during acid or especially alkaline hydrolysis of polypeptides). D-Amino acids are common constituents of antibiotics and bacterial proteins.

8.1.2 Non-protein α-amino acids (VV0100)

In addition to the proteinaceous amino acids, there are several hundred known natural non-protein amino acids which arise by a variety of metabolic routes. Some of these have demonstrated functions, for example as defence chemicals; the plant amino acids probably perform a generalised nitrogen storage function.

A considerable number of atypical α-amino acids have been isolated from microbial sources. They inhibit the growth of a range of microorganisms but their effects can be readily reversed by supplementing the growth medium by the requisite principal amino acid.

Atypical amino acids are encountered in the hydrolysates of microbial peptide antibiotics. These do not always occur in the free state but a number have been included in DMNP since a given amino acid may be present in a range of different peptides.

Hatanaka, S.I. *et al*, *Progress in the Chemistry of Organic Natural Products*, (eds. Hertz, W. *et al*), SpringerWien, New York, 1992, **59**, 1 (*fungi amino acids*)

8.1.3 β-Amino acids (VV0120)

A small number of β-amino acids occur in the marine environment, especially in sponges. Of these the most widespread is 2-(aminomethyl)-2-propenoic acid and associated amides.

Drey, C.N.C., *Chemistry and Biochemistry of the α-Amino Acids*, (ed. Barrett, G.C.), Chapman & Hall, London, 1985

8.2 Peptides (VV0150–VV0500)

Peptides are oligomers and polymers notionally derived from amino acids by condensation to produce amide linkages. The boundary between oligopeptides and polypeptides is arbitrary and in DMNP has been set at 10 amino acid residues. The configuration of amino acid residues in polypeptides is assumed to be L- when not indicated otherwise.

There is evidence that in higher organisms small peptides (hormones) can arise only by cleavage of protein prohormones.

A large number of biologically-active atypical peptides have been isolated from bacteria, actinomycetes, cyanobacteria, fungi and higher animals. Structurally they represent an extremely diverse group, encompassing those metabolites containing two or more amino acid residues linked by a peptide bond, but possessing some additional features not characteristic of proteins. These may include unusual amino acid residues, protein amino acids with D-configuration or increased to a higher oxidation level, or non-peptide linkages between residues (e.g. ester, lactone or a γ-glutamyl amide). In addition, the molecules may be linear or cyclic, contain one or a combination of the above mentioned features, be modified by further interactions between the side chains of amino acid units within the peptide, or conjugated with either lipids or sugar units. They can possess a wide range of biological activities, e.g. the neuropeptides **Carcinustatins**, the hormone **Salcatonin**, and the enzyme inhibitor **Cyclotheonamide A**. Also worthy of note are the **Conotoxins**, a group of marine venoms isolated from snails with interesting biological properties, as well as many other toxins isolated from higher marine animals.

8.2.1 Diketopiperazines (dipeptide anhydrides) (VV0150)

These are among the most numerous of all naturally occurring peptides. They range from simple cyclic dipeptides, e.g. **Dysamide A**, to highly complex fused ring systems such as the cytotoxic **Leptosins** and related compounds. Nomenclature of the simple diketopiperazines is complicated by the proliferation of different ways of naming them. In this Dictionary, systematic *Chemical Abstracts* names are usually used as their entry names, but the entries contain a full range of possible synonyms.

8.2.2 Cyclic oligo- and polypeptides (VV0500)

No cyclic homodetic tripeptides with or without biological activity have been observed to date. Cyclic peptides derived from 4–11 amino acid residues linked by peptide bonds have been isolated from a variety of microorganisms, particularly those associated with sponges and algae, e.g. **Phakellistatins**. Their biological properties are diverse, ranging from antitumour/cytotoxic activities and antifungal and antibacterial properties.

8.2.3 Depsipeptides (VV0600, VV0610)

Cyclic heterodetic peptides or peptide lactones are those in which one or more of the peptide bonds have been replaced by ester linkages, examples include **Dolastatin 11** and **Aplidine** which has been used in clinical trials.

8.2.4 Large peptides and proteins (VV1000, VV2000)

Entries are given in DMNP for the majority of bioactive peptides secreted by marine plants and animals for which reasonable structural information exists, including many neuropeptides which are an active field of research. Entries are presented for the most important non-enzyme proteins and for some enzymes (VV1000), but full structures are not given in individual entries, the structures where known can be assessed *via* the cited references.

9. ALKALOIDS (VX)

Alkaloids are a large group of nitrogen-containing secondary metabolites of plant, microbial or animal origin. Biogenetically and structurally the alkaloids are diverse, and because of the structural complexity of many marine alkaloids, some of them are classified here under more than one heading.

In general, less is known about the biogenesis of marine alkaloids than their terrestrial counterparts because of experimental difficulties and the complexity of the ecosystems. There are many synthetic studies, but comparatively few biosynthetic ones. Few characteristic key intermediates have been identified in the later stages of marine alkaloid biosynthesis; an exception is Oroidine. Some types of marine alkaloid are of mixed biogenesis, different stages of the biosynthesis being affected by different organisms.

Where structural similarities exist between certain marine alkaloids and their terrestrial counterparts, this is frequently indicated in the following sections, but this should not be taken to imply that their biosynthesis takes place by identical routes. There may be cases of biochemical parallelism arising from convergent evolution. In many cases the relevant information is just not available for the marine alkaloids.

The order of the following sections, and the accompanying Type of Compound codes that can be used for searching the electronic version of the database, follows that of the parent *Dictionary of Natural Products* database, which is loosely based on biogenetic considerations (for example, ornithine-derived alkaloids precede those derived from lysine). However, in considering marine alkaloids, these considerations may not necessarily apply and the order is more arbitrary. Sections dealing with structurally related types of alkaloid are, though, usually close together. Some types have been extensively studied biosynthetically, for others there is currently no, or only fragmentary, information. In addition, details are now being uncovered about formerly unsuspected enzyme systems present in marine organisms, which superpose new biosynthetic possibilities on top of the traditional routes, thus blurring the traditional alkaloid subtypes. Foremost among these are the 'Diels-Alderases' (not confined to alkaloids) which are capable of catalysing the formation of new carbon skeletons from known types. The Type of Compound categories in the database are therefore subject to future revision in the light of new research results.

The term alkaloid originally implied pharmacologically active bases, but the definition has subsequently been broadened so that it is now generally considered to include the majority of nitrogen-containing natural products with the exception of the simple amino acids, proteins and nitrogen-containing substances of polyketide origin such as aminoglycosides. Basic properties may be weak or absent as in the various types of amide alkaloids. The term 'imperfect alkaloid' has been used for miscellaneous nitrogenous natural products, including amides that do not fall into one of the well-defined traditional alkaloid types. Nitrogenous compounds of novel structural type are of obvious medicinal interest.

Garson, M.J., *Chem. Rev*., 1993, **93**, 1699–1733 (*rev, biosynth*)
Oikawa, H. *et al, Nat. Prod. Rep*., 2004, **21**, 321–352 (*rev, Diels-Alder enzymes*)
Newman, D.J. *et al, J. Nat. Prod*., 2004, **67**, 1216–1238 (*rev, marine compounds in clinical trial*)
Moore, B.S., *Nat. Prod. Rep*., 2005, **22**, 580–593; 2006, **23**, 615–629 (*rev, biosynth*)

The following codes occur at the beginning of the sequence and refer to simple and miscellaneous amines, amides and related compounds;

9.1.1 Simple acyclic amine alkaloids with one N (VX0100)

These include simple amines of mostly widespread biological occurrence such as choline and ethylamine.

9.1.2 Simple acyclic amine alkaloids with two N (VX0120)

These include a variety of linear diamines such as the **Clathculines** and **Calyxoside**.

9.1.3 Simple guanidines (VX0150)

This heading covers low MW guanidinoid bases. The guanidine or modified guanidine group is common as a structural component of higher MW alkaloids, including hybrid polyketide alkaloids and peptide-alkaloids which have been classified elsewhere as polyketides or peptides.

Berlinck, R.G.S. *et al, Nat. Prod. Rep*., 2002, **19**, 617–649; 2005, **22**, 516–550 (*rev*)
Nagasawa, K. *et al, Chem. Rec*., 2003, **3**, 201–211 (*rev, synth*)

9.1.4 Nitriles, isonitriles and related compounds (VX0200)

Compounds containing the -NC, -NCS and -NHCHO groups frequently occur together and are biogenetically related. They are usually included in the same entry. It now appears that the thiocyanates are central in their biosynthesis.

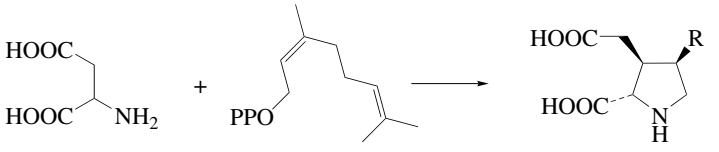
Garson, M.J. *et al, Nat. Prod. Rep*., 2004, **21**, 164–179 (*rev*)

9.1.5 Simple amide alkaloids (VX0250)

These include a variety of simple amides such as the **Variceramides**.

9.1.6 Pyrrolidine alkaloids (VX0300, VX0380)

These may arise by different biosynthetic pathways. The kainoids, e.g. **α-Kainic acid**, **Domoic acid**, are a group of non-proteinogenic pyrrolidinedicarboxylic acids. α-Kainic acid was first isolated from a rhodophyte alga but has since been found in terrestrial organisms. The kainoids are biosynthesised from glutamate and geranyl pyrophosphate. Other marine pyrrolidines such as the **Sarcotrines** are degraded pyrrolosesterterpenes, while many others are presumably proline-derived.



e.g. Domoic acid, R = $C(CH_3)$=CHCH=CHCH(CH_3)COOH

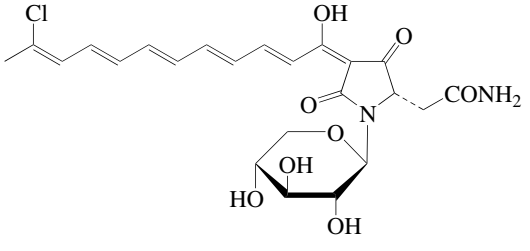
Parsons, A.F., *Tetrahedron*, 1996, **52**, 4149–4174 (*kainoids, rev*)

9.1.7 Chromone alkaloids (VX0340)

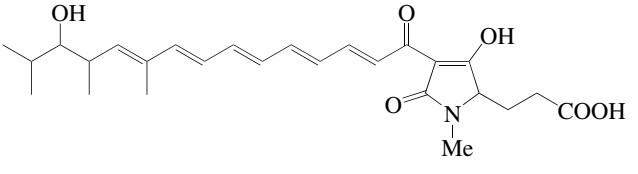
Chromone alkaloids, moderately common in higher plants, are currently represented only by **Tubastraine**, which appears doubtful.

9.1.8 Tetramic acids (VX0390)

These are longer-chain pyrrolidines exemplified among marine examples by the halogenated **Aurantosides** and **Rubrosides** from sponges (microbial products). They are polyketide in origin and are most closely related to nonhalogenated tetramic acids from terrestrial microorganisms such as Erythroskyrin and the Lipomycins.



Aurantoside G

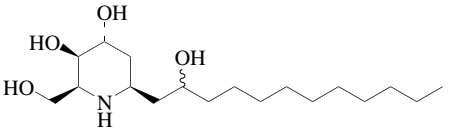


β-Lipomycin
(terrestrial)

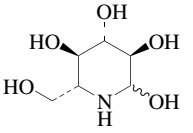
9.1.9 Piperidine alkaloids (VX0620, VX0680, VX0700)

The majority of the alkaloids in this group are plant-derived, but **Anabaseine** and several related alkaloids have been isolated from a hoplonemertean worm. Like the pyrrolidines, these alkaloids may arise by different biosynthetic routes, so the class is structural rather than biosynthetic. They may be derived from lysine, acetate, acetoacetate, etc. but the longer-chain **Batzellasides**, present in sponges, are iminoglycosides structurally related to the intensively-studied terrestrial iminosugars such as **Nojirimycin**, evidently with the incorporation of a fatty-acid derived fragment.

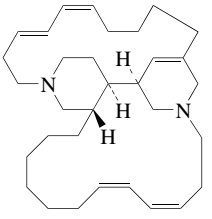
Other piperidine alkaloids included here include the **Halicyclamines** and relations, which are classified under miscellaneous piperidine alkaloids (VX0700), but which are the first of several types of alkaloids including the Xestospongins and the Manzamines below, which appear to be closely related and are based on elaboration of a macrocycle-linked 1,3-linked bispiperidine theme.



Batzellaside A



Nojirimycin
(terrestrial)

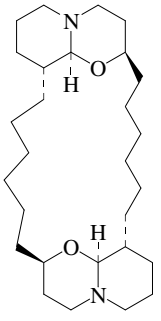


Halicyclamine A

Jaspars, M. *et al, J. Org. Chem*., 1994, **59**, 3253–3255 (*Halicyclamines, biosynth*)
Andersen, R.J. *et al, Alkaloids: Chemical and Biological Perspectives*, (ed. Pelletier, S.W.), Elsevier, Amsterdam, 1996, **10**, 301 (*rev, 3-alkylpiperidines*)

9.1.10 **Xestospongins** (VX0690)

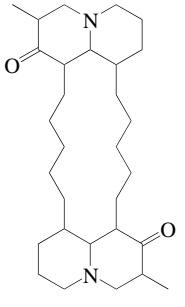
These are a group of exclusively marine elaborated piperidines. Their biosynthesis would appear to imply the involvement of a C_{10} dialdehyde equivalent as hypothesised for the Manzamine group (VX2250) below, and they appear closely related to intermediates postulated in the Baldwin scheme.



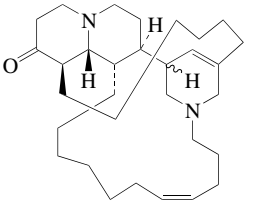
Xestospongin A

9.1.11 **Quinolizidine alkaloids** (VX0900, VX0980)

A few relatively simple marine quinolizidine alkaloids are known such as **Pictamine** and the **Clavepictines**. The **Saraines** are more complex sponge products classified under miscellaneous quinolizidines (VX0980), together with Halichlorine, a popular synthetic target, and the **Petrosines**, further examples of dimeric alkaloids in which the units are linked in a medium-sized aliphatic ring as in the Xestospongins.



Petrosines
(various stereoisomers)

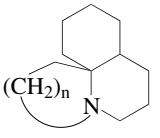


Saraine 1

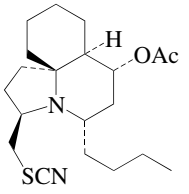
Michael, J.P., *Nat. Prod. Rep*., 2002, **19**, 719–741; 2004, **21**, 625–649 (*revs*)

9.1.12 **Cylindricines** (VX0960)

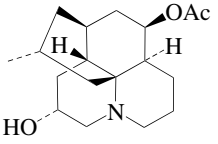
This small group of alkaloids is based on the perhydrobenzo[*i*]quinolizine and perhydrocyclopenta[*i*]quinoline skeletons. There are structural similarities to some of the terrestrial *Lycopodium* alkaloids such as **Paniculine**. The isolation of both thiocyanates and isothiocyanates is noteworthy.



n = 2-3



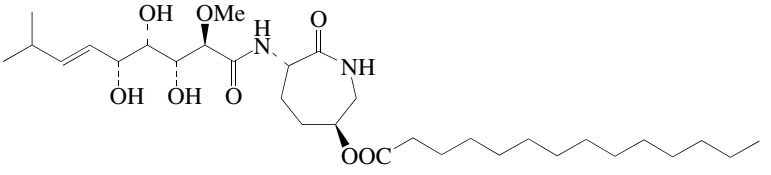
Cylindricine H



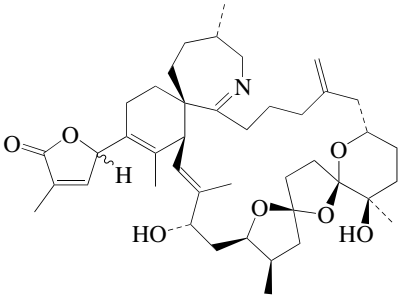
Paniculine (terrestrial)

9.1.13 **Azepine alkaloids** (VX1000)

These include the **Bengamides** and the **Spirolides**. The former are thought to be symbiotic products deriving from bacterial fatty acids, cyclised lysine and a 4-carbon diketide. The spirolides are shellfish toxins related to the Pinnatoxins (which are classified under VC0550, polyketides; the division is arbitrary) and like them presumably arising by a Diels-Alder process from a long-chain polyketides precursor.



Bengamide A



Spirolide A

9.1.14 **Pyridine alkaloids** (VX1040)

As well as some simple nicotinic acid-related bases (VX1040), a considerable number of pyridines carrying a long-chain substituent at *C*-3 have been isolated mostly from sponges. Examples include the **Xestamines**, **Ikimines** and **Niphatesines**. Small pyridinium betaine alkaloids such as **Trigonelline** are widespread in marine plants and animals as well as terrestrial organisms.

Almeida, A.M.P. *et al, Quim. Nova, 1997*, **20**, 170 (*rev, alkylpyridines from sponges*)
Sepčić, K., *J. Toxicol., Toxin Rev*., 2000, **19**, 139–160 (*rev, alkylpyridinium compounds from sponges*)

9.1.15 Cytochalasan alkaloids (VX1300)

Cytochalasins are metabolites of several different and unrelated fungi. They are characterised structurally by the presence of a perhydroisoindolone system fused to a macrocyclic ring of 11, 13 or 14 atoms. The macrocycle may be a carbocycle, a lactone or a carbonate. In addition the isoindole ring carries either a phenyl or an indolyl substituent at position 10; the latter group includes the Chaetoglobosins.

Biosynthetically, cytochalasins arise from phenylalanine or tryptophan and a polyketide derived from acetate and methionine. Cytochalasins possess a range of distinctive biological properties. These include inhibition of cytoplasmic cleavage leading to polynucleate cells, nuclear extrusion and the inhibition of cell mobility.

Some members of this important class of metabolites have been obtained from marine ascomycetes. It can be anticipated that other members of the series will be found in marine fungal cultures in future.

9.1.16 Indolizidine alkaloids (VX1360)

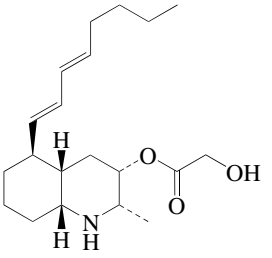
A few simple indolizidines (e.g. the **Stelletamides**) have been isolated from sponges. Indolizidines of a different structural type are commoner in terrestrial animals, esp. as frog toxins.

Michael, J.P., *Nat. Prod. Rep*., 2004, **21**, 625–649; 2005, **22**, 603–626 (*revs*)

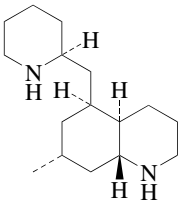
9.1.17 Quinoline alkaloids (VX1480, VX1580)

The majority of these are from higher plants, but a variety of simple heteroaromatic quinolines (VX1480) have been isolated from various marine sources including **2-Heptyl-4-hydroxyquinoline** from a marine pseudomonad, and **4,8-Quinolinediol** from cephalopod ink. There are also more elaborated hydrogenated quinolines (VX1580), especially the **Lepadins** from tunicates and flatworms. Bryozoans contain a number of simple quinolinequinone pigments and there are also the **Trididemnic acids** from ascidians. **Halitulin** from a sponge has been the subject of a recent major collaborative synthesis effort.

Quinoline alkaloids occur across a wide range of organisms and there are some structural similarities between marine octahydroquinolines such as **Lepadin A** and terrestrial alkaloids such as Phlegmarine from *Lycopodium* spp.



Lepadin A

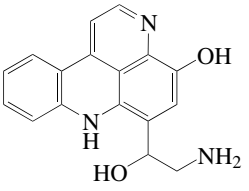


Phlegmarine
(terrestrial)

Michael, J.P., *Nat. Prod. Rep*., 2004, **21**, 650–668; 2005, **22**, 627–646 (*revs*)

9.1.18 Pyrido[2,3,4-*kl*]acridines (VX1700)

This is a group of exclusively marine alkaloids which includes the **Kuanoniamines**, the **Ascididemins**, the **Cystodytins**, the **Styelsamines**, the **Varamines** and others. The isolation of some of them from a variety of organisms argues for a microbial origin, but it could alternatively be a case of convergent evolution. They are biosynthesised from common amino acids.



Styelsamine A

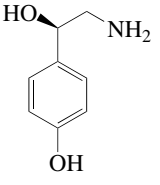
Ding, Q. *et al, Curr. Med. Chem*., 1999, **6**, 1–28 (*rev*)
Salomon, C.E. *et al, Mar. Biol*., 2001, **139**, 313–319 (*biosynth*)
Moore, B.S., *Nat. Prod. Rep*., 2006, **23**, 615–629 (*rev*)

9.1.19 Benzodiazepine alkaloids (VX1760)

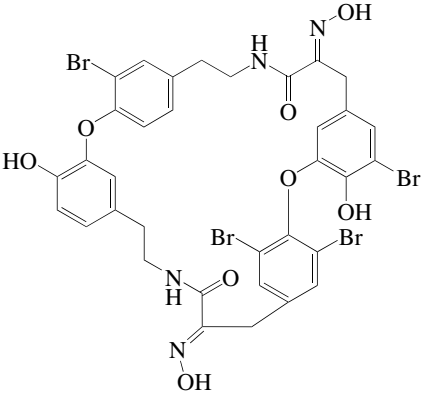
These are rare and among non-microbial products are currently limited to **Aplysepine** and **Diazepinomicin**. They are clearly derived from anthranilic acid and phenylalanine.

9.1.20 Phenethylamine alkaloids (VX2000–VX2015)

The simplest derivatives of phenylalanine or tyrosine are the β-phenylethylamines resulting from decarboxylation and obvious oxidation/alkylation, which are widespread among marine natural products. Compounds showing side-chain hydroxylation (VX2005), common among higher plants, are rare (e.g. **Octopamine**, which is an endometabolic neurotransmitter of molluscs); the majority of marine representatives are brominated compounds (VX2008) such as the **Purpuramines** and the **Bastadins** (including macrocyclic oligomers), produced by Verongid sponges. These are biosynthesised from the simple brominated tyrosines.



Octopamine



Bastadin 9

Bentley, K.W., *Nat. Prod. Rep*., 2004, **21**, 395–424; 2005, **22**, 249–268; 2006, **23**, 444–463 (*revs*)

9.1.21 Cinnamic acid amides (VX2020)

Simple cinnamate residues are scarcer among marine alkaloids than among terrestrial plant products. Examples are found for example in the **Tunichromes**, for which phenylalanine can function as a biosynthetic precursor.

Taylor, S.W. *et al, Chem. Rev*., 1997, **97**, 333–346 (*rev, tunichromes*)

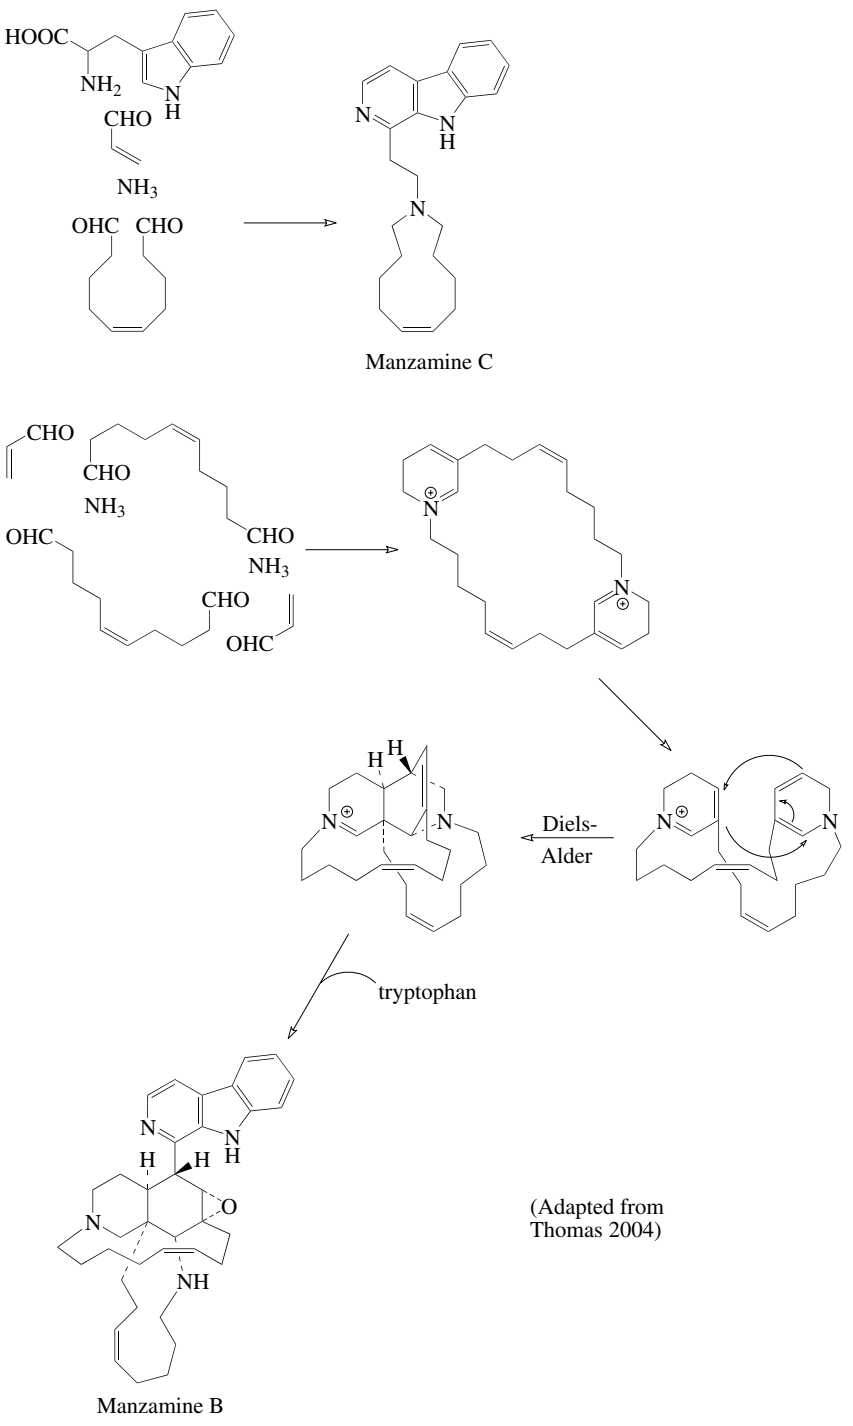
9.1.22 Simple isoquinoline alkaloids (VX2200)

These too are less widespread than in terrestrial sources, and isolated examples are restricted to some bases related to **Reneirol** and the **Cribrostatins**. However the isolation of one or two marine benzylisoquinoline alkaloids (VX2320) (**Imbricatine**; **Theoneberine**) is noteworthy.

Baker, B.J., *Alkaloid: Chemical and Biological Perspectives*, (ed. Pelletier, S.W.), Elsevier, Amsterdam, 1996, **10**, 357 (*rev, marine isoquinolines*)
Bentley, K.W., *Nat. Prod. Rep*., 2004, **21**, 395–424: 2005, **22**, 249–268; 2006, **23**, 444–463 (*revs*)

9.1.23 Manzamine alkaloids (VX2250)

This fairly extensive group is exclusively marine and represents the most structurally complex and characteristic type of marine alkaloid for which a biosynthetic scheme has been proposed. Their biosynthesis has been postulated to involve the condensation of tryptamine with one or more C_3 units and one or more straight-chain C_{10} dialdehyde equivalents, followed by an enzyme-assisted Diels-Alder cyclisation. The origin of the C_3 and C_{10} units is uncertain but it has been suggested that they could arise by oxidative fission of a hydroxylated fatty acid.



Manzamine C

Manzamine B

(Adapted from Thomas 2004)

Baldwin, J. *et al*, *Chem. Eur. J.*, 1999, **5**, 3154–3161 (*biosynth*)
Thomas, R., *Nat. Prod. Rep.*, 2004, **21**, 224–248 (*rev, biosynth*)

9.1.24 Indole alkaloids (VX4000-VX5950)

Indole alkaloids are numerous in marine organisms but the range of structural types differs from those found in terrestrial counterparts, and many of the 'traditional' indole alkaloid types produced by land plants have not been found. Halogenation is common.

Pindur, U. *et al, Curr. Med. Chem.*, 2001, **8**, 1681–1698 (*rev*)

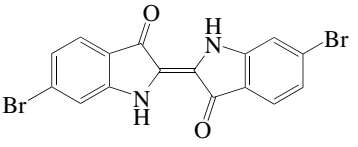
9.1.25 Simple indole alkaloids (VX4000)

Under this heading appear various halogenated indoles together with some higher MW alkaloids containing unsubstituted indole ring systems, such as **Aplysinopsin** and its relatives (which are also imidazoles).

Somei, M. *et al, Nat. Prod. Rep*., 2004, **21**, 278–311; Kawasaki, T. *et al*, *ibid*, 2005, **22**, 761–793 (*revs*)

9.1.26 Simple biindoles (VX4020)

This category includes **Indirubin**, **6,6′-Dibromoindigotin** and other biindoles, mostly polybrominated.

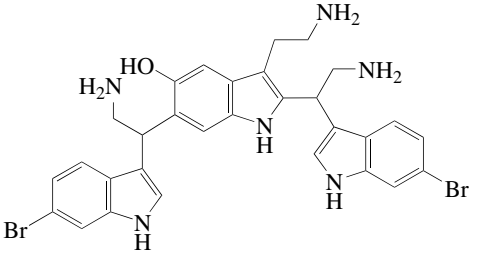


6,6'-Dibromoindigotin

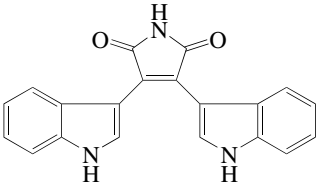
Yang, C.-G. *et al, Curr. Org. Chem*., 2004, **8**, 1691–1720 (rev, bisindole alkaloids from sponges)

9.1.27 Simple tryptamines (VX4040, VX4140, VX4160)

Tryptamine itself and some simple relatives have been isolated from marine tissues, and it noteworthy that **Bufotenine**, long known as an amphibian product, has more recently been detected in a gorgonian. More highly elaborated marine alkaloids containing a (dehydro)tryptamine residue include the **Kottamides**. There are also some simple tryptamine dimers (VX4140) and oligomers (VX4160) such as the **Gelliusines**. The bisindolylmaleimides such as the **Arcyriarubins** listed here are closely related to the indolo[2,3-*a*]carbazoles (VX4350) below.



Gelliusines A-B



Arcyriarubin A

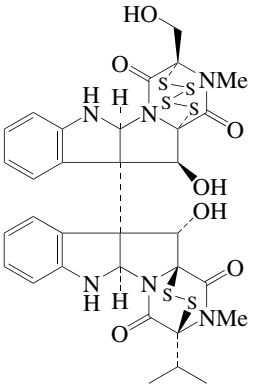
Somei, M. *et al*, *Nat. Prod. Rep*., 2004, **21**, 278–311; Kawasaki, T. *et al*, *ibid*, 2005, **22**, 761–793 (*revs*)

9.1.28 Physostigmine-like alkaloids (VX4100)

Physostigmine itself was originally isolated from a land plant, and has also been isolated from microorganisms. Alkaloids sharing the physostigmine (hexahydropyrrolo[2,3-*b*]indole) nucleus such as the **Flustramines** have however been isolated from marine animals, as well as from land animals, especially amphibians.

9.1.29 Chaetocin-like alkaloids (VX4110)

Also called Epipolythiodioxopiperazines, although some members of the series lack the polysulfur bridge. These are microbial products, but a considerable number, including Chaetocin itself and the extensive series of **Leptosins**, have been isolated from marine sources. They are thought to be biosynthesised from diketopiperazines (VV0150).

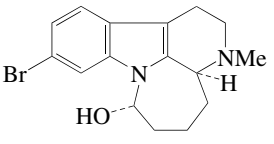


Leptosin A

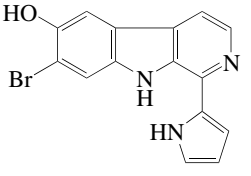
Somei, M. *et al, Nat. Prod. Rep*., 2004, **21**, 278–311; Kawasaki, T. *et al*, *ibid*, 2005, **22**, 761–793 (*revs*)
Gardiner, D.M. *et al*, *Microbiology*, 2005, **151**, 1021–1032 (*biosynth*)

9.1.30 β-Carboline alkaloids (VX4240)

Long known as terrestrial alkaloids, these are also widespread in marine organisms. β-Carboline (Norharman) itself has been found in an ascidian and in dinoflagellates, and examples of simple brominated analogues include the **Eudistomins** and some of the **Arborescidines**. Another group of β-carboline derivatives, presumably derived from tryptophan and cysteine, have been isolated from *Eudistoma olivaceum*, a Caribbean tunicate. The β-carboline nucleus is also found in some of the **Manzamines** and other more complex alkaloids.



Arborescidine C

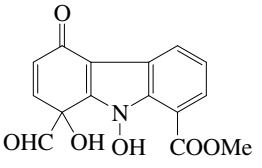


Eudistomin A

Baker, B.J., *Alkaloids: Chemical and Biological Perspective*, (ed. Pelletier, S.W.), Elsevier, Amsterdam, 1996, **Vol. 10**, 357 (*rev, marine β-carbolines*)
Somei, M. *et al, Nat. Prod. Rep*., 2004, **21**, 278–311; Kawasaki, T. *et al*, *ibid*, 2005, **22**, 761–793 (*revs*)
Fresneda, P.M. *et al*, *Synlett*, 2004, 1–17 (*rev, synth*)

9.1.31 Carbazole alkaloids (VX4300)

A few simple halogenated carbazoles have been isolated such as **3,6-dibromo-** and **3,6-diiodocarbazoles**. **Coproverdine** exemplifies a small number of unhalogenated carbazoles so far isolated.

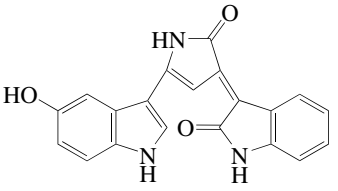


Coproverdine

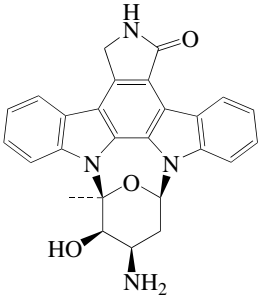
Knölker, H.-J. *et al, Chem. Rev*., 2002, **102**, 4303–4428 (*rev*)
Somei, M. *et al, Nat. Prod. Rep*., 2004, **21**, 278–311; Kawasaki, T. *et al*, *ibid*, 2005, **22**, 761–793 (*revs*)
Knölker, H.-J., *Curr. Org. Synth*, 2004, **1**, 309–331 (*rev, synth*)

9.1.32 Indolo[2,3-*a*]carbazole alkaloids (VX4350)

These are a class of alkaloids exemplified by **Staurosporine**, which was first isolated in 1977 from a terrestrial microorganism but which has since been found to be widely distributed. They are essentially microbial metabolites from a variety of organisms (field-collected or cultured), and show a wide range of biological activities. The isolation of **4′-*N*,*O*-Didemethylstaurosporine** from a flatworm *Pseudoceros* sp. is noteworthy. Their biosynthesis has been intensively studied; they are produced from diindolyl precursors resembling **Violacein**; the indolyl residues are derived from tryptophan *via* 7-chlorotryptophan followed by an oxidative ring closure.



Violacein

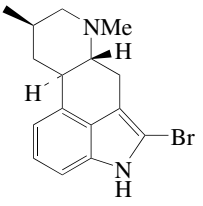


4'-*N*,*O*-Didemethylstaurosporine

Sánchez, C. *et al, Nat. Prod. Rep*., 2006, **23**, 1007–1045 (*rev, biosynth*)
Walsh, C.T. *et al, Nat. Prod. Rep*., 2006, **23**, 517–531 (*rev, biosynth*)

9.1.33 Ergot alkaloids (VX4460)

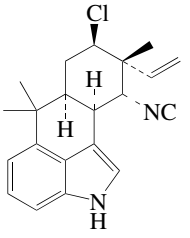
These have been considered exclusively the metabolites of terrestrial fungi and microorganisms, but the recent isolation of the **Pibocines**, simple brominated analogues of Festuclavine, from *Eudistoma* ascidians, have provided a first marine occurrence. In terrestrial fungi these bases are derived from 4-prenyltryptophan by cyclisation. The presence of the bromine substituent in the Pibocines argues for their being genuine ascidian products, and this is presumably a case of biochemical parallelism.



Pibocine A

9.1.34 Hapalindoles (VX5950)

The extensive series of hapalindoles, from *Hapalosiphon* and other cyanophytes, have mostly been characterised from freshwater species but are included in the Dictionary for completeness. They are mostly based on the naphth[1,2,3-*cd*]indole skeleton as shown by **Hapalindole A**.

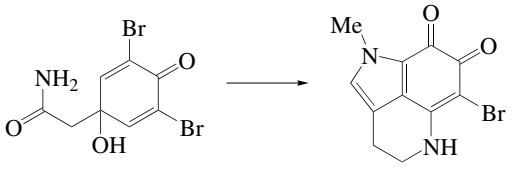


Hapalindole A

Somei, M. *et al, Nat. Prod. Rep*., 2004, **21**, 278–311; Kawasaki, T. *et al*, *ibid*, 2005, **22**, 761–793 (*revs*)

9.1.35 Pyrrolo[4,3,2-*de*]quinoline alkaloids (VX6070)

This skeleton is characteristic of and almost exclusive to marine (sponge) alkaloids. Major subgroups include the simple **Batzellines**, **Makaluvamines** and **Damirones**, and those in which the pyrroloquinoline nucleus forms part of a larger skeleton such as in the **Discorhabdins** and the closely related **Epinardines**. They are thought to be biosynthesised from tyrosine via **3,5-Dibromoverongiaquinol**.



3,5-Dibromoverongiaquinol Makaluvone

Ding, Q. *et al, Curr. Med. Chem*., 1999, **6**, 1–28 (*rev*)

9.1.36 Miscellaneous indole alkaloids (VX6100)

Under this heading are listed a large number of miscellaneous types of marine indole alkaloids for which a classification remains premature, either because they currently belong to a very limited subtype, and/or because there has been no work on their biosynthesis. Many of them probably represent minor branches on the biosynthetic pathways to the larger groups; for example the **Rhopaladins** are probably biosynthetically close to the indolo[2,3-*a*]carbazole alkaloids (VX4350), but this is not yet established experimentally. **Granulatimide** may represent a lower benzologue of these alkaloids incorporating a histamine residue in place of one tryptamine.

Somei, M. *et al, Nat. Prod. Rep*., 2004, **21**, 278–311; Kawasaki, T. *et al*, *ibid*, 2005, **22**, 761–793 (*revs*)

9.1.37 Sesquiterpene alkaloids (VX6300)

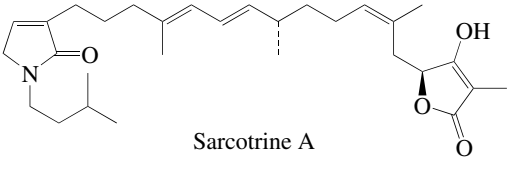
A variety of sesquiterpene alkaloids have been isolated which are nearly all relatively simple amine or amide derivatives of well-known sesquiterpenoid skeletons. These may be acyclic (e.g. **Axinyssimides**), monocyclic (**Siphonodictidine**) or bicyclic (**Nakijiquinones**). The relevant alkaloids are also coded with to the appropriate sesquiterpene (VS) code.

9.1.38 Miscellaneous diterpene alkaloids (VX6480)

There are few reported diterpenoid alkaloids (as opposed to nonalkaloidal diterpenes) reported from marine species. The **Agelasines**, **Agelasimines** and related compounds are a series of guanidinoid- or purinoid-substituted simple acyclic, mono- or bi-cyclic terpenoids, and there are one or two simple amino-substituted cembranoids.

9.1.39 Sesterterpene alkaloids (VX6490)

The number of nitrogen-containing sesterterpenoids so far isolated is relatively low by comparison with the number of nitrogen-free tetracyclic sesterterpenes known. The **Spongidines** and the **Molliorins**, in which a ring-E pyridine or pyrrole ring, respectively, is fused to one of the common tetracyclic skeletons, are the main types. There are also linear pyrrolic compounds including the **Sarcotrines** and **Sarcotragins** which are considered to have a common biosynthetic origin, the latter being degraded norsesterterpenoids.

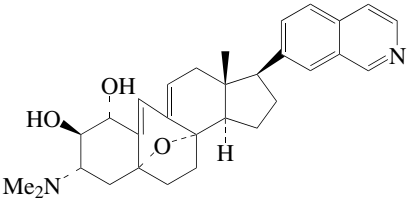


Sarcotrine A

Liu, Y. *et al, Nat. Prod. Rep*., 2006, **23**, 630–651 (*rev*)

9.1.40 Steroidal alkaloids (Buxus type) (VX6760)

Few steroidal alkaloids (as opposed to nitrogen-free steroids) have been isolated from marine organisms. The recent characterisation of the **Cortistatin** alkaloids from a *Corticium* sponge, represent a new development in marine natural products. Structurally their 9(10 →19)-abeosteroid moiety resembles that of one subgroup of the terrestrial *Buxus* alkaloids, but the presence of an isoquinoline ring system at the other end of the molecule is without precedent among terrestrial alkaloids



Cortistatin A

9.1.41 Miscellaneous steroidal alkaloids (VX6790)

This heading covers a small number of marine steroidal alkaloids of novel type such as the **Plakinamines**.

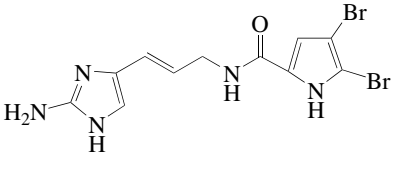
9.1.42 Pyrazole alkaloids (VX6900)

Pyrazole alkaloids are rare in general and there is only one marine example, **1-Methyl-1*H*-pyrazole-5-carboxylic acid**, from a gorgonian.

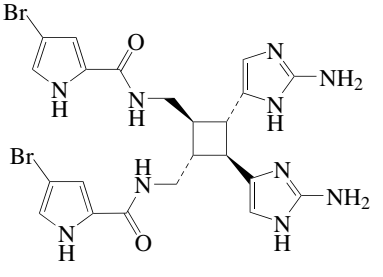
9.1.43 Imidazole alkaloids (VX6920)

This group, obviously derived from histidine, contains many structurally diverse marine examples, for example **Aplysinopsin** and related alkaloids, **Odiline** and the **Rhopaladins**. They show a range of biological activities and considerable pharmaceutical potential.

One of the most important subtypes is the pyrrole-imidazole alkaloids exemplified by **Oroidine** which with various relatives (e.g. the dimeric **Sceptrine**) appears to be a genuine sponge product. A recent biogenetically-based classification (see Hoffmann) recognises a class of nearly 100 pyrrole-imidazole alkaloids arising in various ways from this key intermediate and containing 0-4 further rings, additional to the pyrrole and imidazole rings already present. Future organisation of this database may recognise this category; at present, many of them are placed in the miscellaneous categories VX9000–VX9400.



Oroidine

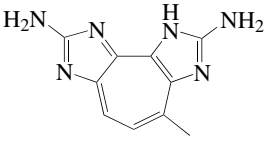


Sceptrine

Hoffmann, H. *et al, Synthesis*, 2003, 1753–1783 (*pyrrole-imidazole alkaloids*)
Jin, Z. *et al, Nat. Prod. Rep.*, 2005, **22**, 196–229; 2006, **23**, 464–496 (*revs*)

9.1.44 Cycloheptadiimidazoles (Zoanthoxanthins) (VX6925)

These are a group of marine alkaloids which are condensed imidazoles closely related in structure, and which in this Dictionary are grouped under just two entries; those for **Pseudozoanthoxanthin A** and **Parazoanthoxanthin A**. Their biosynthesis does not appear to have been studied in detail but they are condensed imidazoles presumably derived from histidine.



Pseudozoanthoxanthin A
(one tautomer)

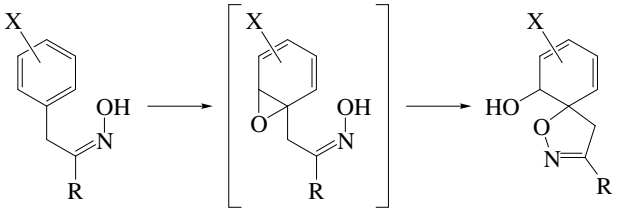
9.1.45 Oxazole and benzoxazole alkaloids (VX6930)

Numerous naturally occurring oxazoles are currently known, isolated from various marine (and terrestrial) sources – nudibranch egg masses (**Ulapualides**), algae and microorganisms. The marine and bacterial oxazoles appear to have been formed from peptides of aliphatic amino acids. Structurally they are diverse and may be open-chain (e.g. **Bengazoles**) or macrocyclic (e.g. **Patellamides**). Like the imidazoles, they show considerable drug potential.

Pattenden, G., *J. Heterocycl. Chem*., 1992, **29**, 607–618 (*rev, synth*)
Yeh, V.S.C., *Tetrahedron*, 2004, **60**, 11995–12042 (*rev, synth*)
Jin, Z. *et al, Nat. Prod. Rep*., 2005, **22**, 196–229; 2006, **23**, 464–496 (*revs*)

9.1.46 Spirobenzoxazoline alkaloids (VX6934)

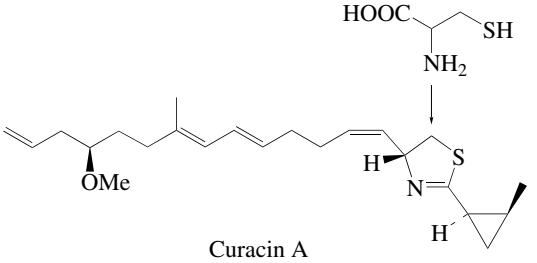
These exclusively marine alkaloids such as the **Psammaplysins** are derived by cyclisation of open-chain halogenated tyrosinoid oxime precursors (see VX2008 above). This is probably via the intermediary of an arene oxide, although attempts to replicate this chemically have given only low yields.



Okamoto, K.T. *et al*, *Tetrahedron Lett*., 1987, **28**, 4969–4972 (*biosynth*)

9.1.47 Thiazole alkaloids (VX6935, VX6937)

More than 100 naturally occurring compounds that incorporate the thiazole ring system have been isolated to date from marine organisms. These alkaloids are a heterogeneous group ranging in complexity from small molecules such as **Herbamide A** (isolated from a sponge) to open-chain or macrocyclic compounds such as the **Lyngbyapeptins**, **Dysidenin** and its relatives. These appear to be essentially microbial products, from cyanobacteria or other microorganisms, although some such as the **Patellamides** were actually isolated from tunicates. The **Latrunculins** (VX6936) are a subclass of mostly macrocyclic tetrahydrothiazoles isolated from sponges. Marine thiazoles show a range of interesting drug activities. The biosynthesis of the thiazole ring in the highly bioactive **Curacin A** has been shown to be from cysteine, with the rest of the carbon chain including the cyclopropane functionality acetate-derived.

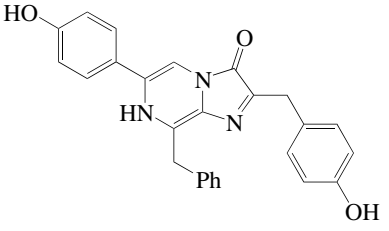


Curacin A

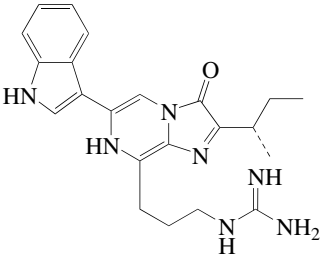
Pattenden, G., *J. Heterocycl. Chem*., 1992, **29**, 607–618 (*rev, synth*)
Jin, Z. *et al*, *Nat. Prod. Rep*., 2005, **22**, 196–229; 2006, **23**, 464–496 (*revs*)

9.1.48 Pyrazine and quinoxaline alkaloids (VX6940)

Pyrazines have been isolated from widely differing biological sources including marine organisms, where some of them are the actual light emitters in bioluminescence processes. Bioluminescence emitters are found scattered throughout different types of organism, which implies multiple independent origins during the course of evolution. The imidazopyrazine **Coelenterazine** and closely related compounds though account for the great majority of observed bioluminescence. There is evidence for Coelenterazine's *de novo* biosynthesis in shrimps. ***Cypridina* Luciferin** is biosynthesised from arginine and tryptophan.



Coelenterazine



Cypridina Luciferin

Rees, J.F. *et al, J. Exp. Biol*., 1998, **201**, 1211–1221 (*rev, bioluminescence*)

9.1.49 Morpholines (VX6955)

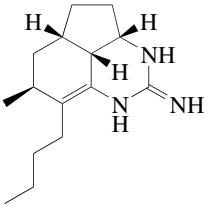
These are relatively few in number, e.g. **Chelonins A**, **B** and **C** and the **Oxazinines**.

9.1.50 Pyrimidines (VX6960)

Simple thymine-derived bases such as **Thyminol** are found in marine organisms together with some more highly elaborated substances such as the **Meridianins**.

9.1.51 Ptilocaulins (VX6970)

This group is based on the (partially hydrogenated) cyclopenta[*de*]quinazoline skeleton, which contains a pyrimidine nucleus. It comprises **Ptilocaulin** and relatives, the **Mirabilins** and a few other related alkaloids, mostly isolated from sponges, but which may be symbiont metabolites. It has been suggested that these arise by a late-stage addition of guanidine to a polyketide precursor.

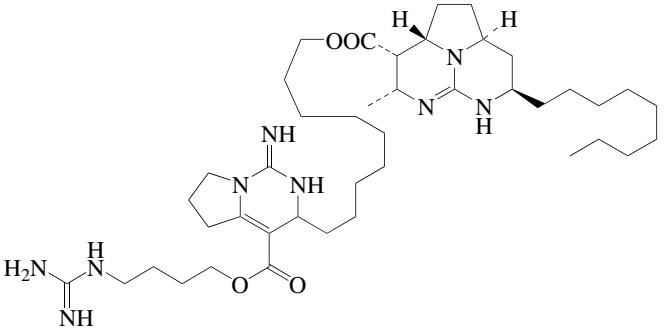


Ptilocaulin

Snider, B.B. *et al, J. Org. Chem*., 1993, **58**, 3828–3839 (*biosynth*)

9.1.52 Triazaacenaphthylene alkaloids (VX6980)

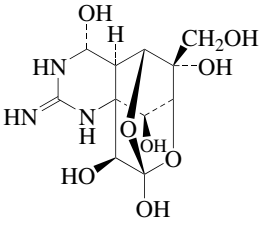
These are another group based on a tricyclic pyrimidine-related nucleus, and include the **Batzelladines** and the **Crambescidins** from sponges and echinoderms. Their biosynthesis does not appear to have been studied in detail, but they are formally composed of a guanidine unit, with which the biological activity is associated, embedded in a linear unbranched perimeter, presumably derived from a lipid precursor.



Batzelladine A

9.1.53 **Tetrodotoxins** (VX6990)

Tetrodotoxin and its homologues are well-known and important causes of human poisoning and are known principally from certain tissues of the Japanese puffer fish, but also found in other organisms and are thought to be *Pseudomonas* products. They have been extensively reviewed. The carbocycle ring in tetrodotoxins may be of isoprenoid origin.



Tetrodotoxin

Miyazawa, K. *et al, Toxin Rev*., 2001, **20**, 11–33 (*rev*)
Yotsu-Yamashita, M., *Toxin Rev*., 2001, **20**, 51–66 (*rev*)
Daly, J.W., *J. Nat. Prod*., 2004, **67**, 1211–1215 (*rev, occur*)

9.1.54 **Phenazine and phenoxazine alkaloids** (VX7000, VX7005)

A limited number of simple phenazines and phenoxazines have been reported from microorganisms, some of them from marine sources.

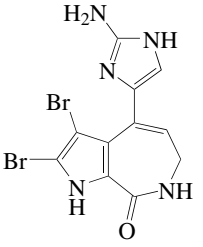
9.1.55 **Pyrrole alkaloids** (VX7010)

The pyrrole alkaloids are a heterogeneous group ranging in complexity from the very simple brominated pyrroles (e.g. **2,3-Dibromo-1*H*-pyrrole**) and peptides to the lipophilic **Malyngamides**, porphyrins and other tetrapyrrole pigments (see following section). Compounds that incorporate the pyrrole nucleus have been isolated from a variety of marine sources (sponges, microorganisms and algae). Further examples are the dimeric **Tambjamines** and a range of alkaloids in which halogenated pyrrole residues are linked to indolic and other heterocyclic nuclei, e.g. **Ageliferin** and its relatives. The pyrrole nucleus is of course a component of the indole alkaloids, but whereas these are tryptophan-derived, the polypyrroles are biosynthesised from 5-Amino-4-oxopentanoic acid (5-aminolaevulinic acid, ALA). Lower-MW alkaloids may arise from either route, or from proline/ornithine pathways via pyrrolidines (see above under VX0300); in the **Prodigiosins**, each of the three pyrrole residues is biosynthesised differently. The process of biohalogenation differs between Cl and Br. Chlorination takes place oxidatively by a combination of chloride ion, dioxygen and reduced FAD producing a Cl^+ equivalent, whilst bromination is mediated by vanadium bromoperoxidases.

Hoffmann, H. *et al, Synthesis*, 2003, 1753–1783 (*pyrrole-imidazole alkaloids*)
Walsh, C.T. *et al, Nat. Prod. Rep*., 2006, **23**, 517–531 (*rev, biosynth*)

9.1.56 Pyrroloazepines (VX7015)

These form a numerically limited but well-defined group consisting of **Hymenialdisine**, **Odiline** and related alkaloids, all with an additional imidazole ring system attached to a pyrrolo[2,3-*c*]azepine residue. Odiline (Stevensine) has been postulated to arise by cyclisation of the open-chain pyrrolic precursor Oroidine (see above).



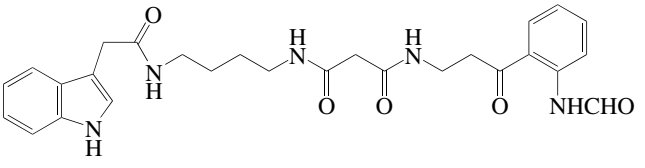
Odiline

Walsh, C.T. *et al*, *Nat. Prod. Rep*., 2006, **23**, 517–531 (*rev, biosynth*)

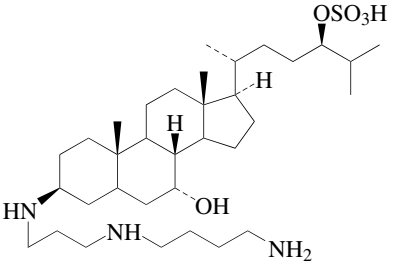
9.1.57 Polyamine alkaloids (VX7020, VX7030, VX7040, VX7050, VX7060, VX7070)

These categories cover the various types of alkaloid containing one or more -N$(CH_2)_n$N- groups, with *n* usually 3 or 4, less often 2 or 5. They show markedly different properties (reactivity, basicity, complexing ability, mass spectrometry) from monobasic amines. Alkaloids based on the ornithine-derived putrescine (*n*=4, classified as PA 4 alkaloids) are common in terrestrial plants but only a few have so far been characterised from marine organisms, such as the **Monodontamides** from gastropods. A number of alkaloids are derived from **Spermine** (PA 343) or **Spermidine**, (PA 34) themselves derived (in plants, certainly) from ornithine *via* putrescine, but again, the number currently characterised is much lower than those known from terrestrial organisms. See for example the **Penaramides** and the unusual medium-ring azaaliphatic **Motuporamines**. Classes PA 33, PA 35, PA 44 and PA 33433 have also been found in nature, but less frequently. The largest number is arachnid toxins, not marine alkaloids. In terrestrial plants it is well established that these alkaloids derive from decarboxylation and coupling of amino acids such as ornithine.

PA structures also occur in more complex alkaloids such as **Crambescidin 816** (PA 34 substructure) and as steroidal conjugates, in **Squalamine** and related compounds from fish livers (PA 34 and PA 343 substructures).



Monodontamide D



Squalamine

Bienz, S. *et al*, *Alkaloids* (N.Y.), 2002, **58**, 83–338 (*rev*)
Bienz, S., *Nat. Prod. Rep*., 2005, **22**, 647–658 (*rev*)

9.1.58 Peptide alkaloids (VX7100)

Several hundred peptide alkaloids are known, many macrocyclic, which by definition are composed of a number of amino acids, among which phenylalanine or tyrosine is frequently found. The boundaries between compounds classified under this heading and those classified under peptides (VV) or macrolide polyketides (VC) are vague and subjective, and these categories should also be scanned when browsing. They occur in both terrestrial and marine organisms, but most peptide alkaloids isolated from higher plants form a relatively homogenous group based on a medium-sized ring incorporating an *ansa*- aromatic ring. The marine peptide alkaloids are much more heterogenous, incorporating unusual, often halogenated, amino acid residues (e.g. the **Dysidenins**, **Geodiamolides**) and/or thiazole and oxazole rings, either open-chain or macrocyclic (**Dolastatins**, **Bistratamides**, **Lissoclinamides**, etc). The **Patellamides** are widely distributed in the tissues and are suspected to be of cyanobacterial origin, but this is by no means established. Peptides play an important role in invertebrate defence mechanisms.

Tincu, J.A. *et al, Antimicr. Agents Chemother*., 2004, **48**, 3645–3654 (*rev, biochem*)
Aneiros, A. *et al, J. Chromatog., B*., 2004, **803**, 41–53 (*rev, isol, pharmacol*)

9.1.59 Pyrrolo[2,3-*d*]pyrimidines (VX7200)

This is a numerically limited group consisting of the nucleosides **Tubercidin**, **Mycalisine B** and related bases and some simple halogenated pyrrolopyrimidines as well as the **Rigidins**. These appear to be microbial products. It has been shown that the pyrimidine ring is derived intact from a purine base precursor which undergoes ring opening and reformation with the incorporation of a C_2 fragment to form the pyrrole ring.

9.1.60 Purines (VX7300)

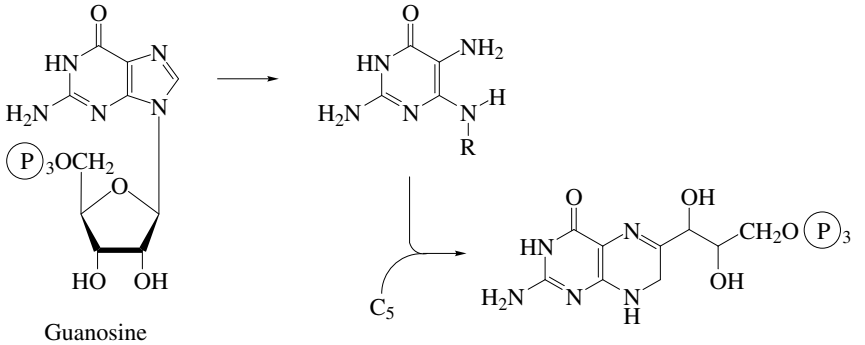
Purines are involved along with pyrimidines as bases in DNA and RNA. The well-known purine bases **Xanthine**, **Inosine**, **Theobromine** and **Theophylline** have been found in marine organisms along with substituted purines (e.g. **Phidolopin**) and terpenoid-purine alkaloid bases (**Agelines** and others).

Rosemeyer, H., *Chem. Biodiversity*, 2004, **1**, 361–401 (*rev*)

9.1.61 Pteridines and analogues (VX7350)

Pteridines are a widely distributed class of naturally occurring compounds. They owe their exceptional position in the field of heterocyclic chemistry mainly to their unusual chemical properties, their conspicuous fluorescence and their importance in metabolism. Pteridine bases were characterised as pigments originally from butterfly wings, but more recently from fish and other marine organisms (see **Isoxanthopterin**). Marine pteridines are also represented by **Leucettidine** and **Urochordamines**, and the pteridine nucleus is also present in the **Pseudoanchynazines**.

The biosynthesis of pteridines pigments has been well studied in terrestrial organisms; as in the case of the pyrrolopyrimidines above, the imidazole ring is derived unchanged from a purine precursor, in this case guanosine triphosphate, and the pyrazine ring is built by ring fission and incorporation of two carbons derived from a ribose fragment. The biosynthesis in marine organisms need not necessarily be the same.

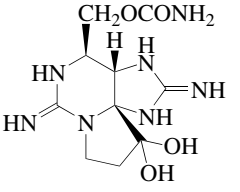


Guanosine triphosphate

Pfleiderer, W., *J. Heterocycl. Chem*., 1992, **29**, 583–605 (*rev*)

9.1.62 **Saxitoxins** (VX7400)

The saxitoxins are a group of over 30 highly important modified purinoid toxins known as Paralytic Shellfish Toxins or PSTs. Originally characterised as a cause of dangerous shellfish poisoning, they are now known definitely to be biosynthesised only by dinoflagellates (and some freshwater cyanobacteria), although it is possible that the red alga *Jania* does so also. Their presence in shellfish tissues probably results by diffusion according to a yet unknown mechanism. Their exact biosynthesis is not yet known but it appears from radiolabelling experiments that the two guanidine groups derive from arginine and the carbamoyl side-chain from methionine.



Saxitoxin

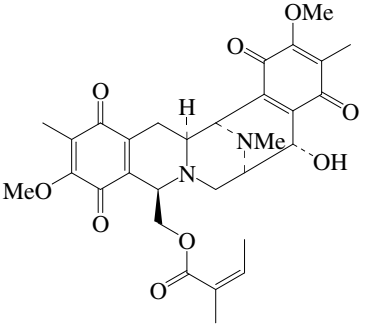
Garson, M.J., *Chem. Rev*., 1993, **93**, 1699–1733 (*rev, biosynth*)
Llewellyn, L.E., *Nat. Prod. Rep*., 2006, **23**, 200–222 (*rev*)

9.1.63 **Naphthyridinomycins** (VX7700)

These are a class of microbial products. Only a handful, so far, have been isolated from marine bacteria.

9.1.64 **Saframycins** (VX7800)

These are representative of the group known as the tetrahydroisoquinoline antitumour antibiotics (also including among terrestrial products some having slightly different skeletons, such as Lemonomycin). The saframycins themselves are microbial products produced by *Streptomyces* spp. of terrestrial origin. Close analogues such as the **Renieramycins** and the **Ecteinascidins** were isolated from marine organisms (sponges or tunicates) and are all presumably microbial products. The skeleton (studied for Saframycin A) is derived from two tyrosine molecules and the methyl groups from methionine.



Renieramycin A

Mikami, Y. *et al*, *J. Biol. Chem*., 1985, **260**, 344–348 (*biosynth*)

9.1.65 **Miscellaneous alkaloids with 0-4+ rings** (VX9000, VX9100, VX9200, VX9300, VX9400)

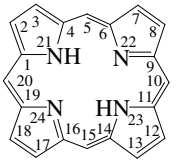
These categories are self-explanatory, and include some fairly well-defined structural groups where the small number of representatives currently known does not appear to justify the creation of individual categories at the present time.

10. POLYPYRROLES (VY)

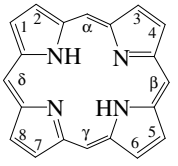
The polypyrroles (tetrapyrroles) are a numerically limited class of natural products that are mostly strictly functional. The main examples are haems, chlorophylls, bilins and Vitamin B_{12}. Only a few polypyrroles included under the miscellaneous category (VY0945) can be considered truly characteristic of marine organisms - the

chlorophylls for example are found in all types of photosynthetic organism, although there are important differences between the chlorophylls present in different phyla of marine plants. For a full description of the different polypyrrole types and their nomenclature and numbering, refer to the *Dictionary of Natural Products on DVD*. All types of organism use tetrapyrroles of one or more of these classes and all the functional tetrapyrroles derive from one common tetrapyrrolic intermediate, Uroporphyrinogen III (Uro'gen III). Uro'gen III is derived entirely from eight molecules of 5-Aminolaevulinic acid (ALA) by the action of three enzymes, *via* Porphobilinogen (PBG) and Hydroxymethylbilane (HMB) as intermediates. A particularly important feature in Uro'gen III is the fact that ring D has been inverted and so the acetate and propionate side-chains are not in the same order as on the other three pyrrolic rings, A to C. This feature can be found in virtually all naturally occurring tetrapyrroles.

The main system of nomenclature used in this Dictionary is that recommended by the IUPAC-IUB Joint Commission on Biochemical Nomenclature. For the cyclic tetrapyrroles this is based on the porphyrin with the carbon atoms numbered 1 to 20 and the nitrogen atoms numbered 21 to 24. This has superseded the older 'Fischer' numbering which numbered only the eight β-positions of the five-membered pyrrole rings and labelled the four bridging *meso*-carbons α, β, γ and δ.

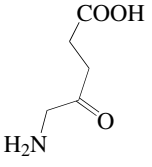


Porphyrin; IUPAC-IUB numbering

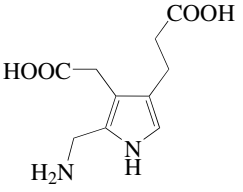


Porphyrin; Fischer numbering

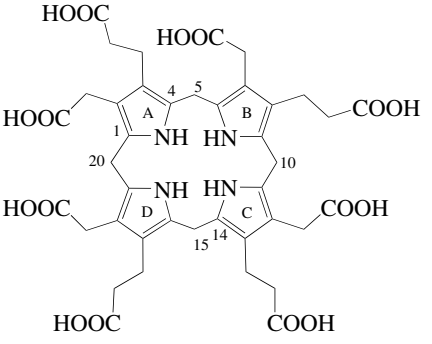
For natural porphyrins the IUPAC-IUB numbering starts on ring A and continues to rings B, C, and D, as shown below for Uro'gen III (ring D is always the inverted ring, see above). *Chemical Abstracts* on the other hand, though it uses the same 1 to 20 numbering for the carbon atoms, starts the numbering at such a position and in such a direction that the propionate side-chains get the lowest possible locants (thus for Uro'gen III the numbering would start at the position shown as 14 and proceed anticlockwise).



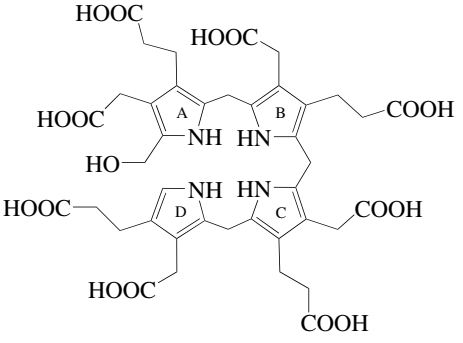
ALA



PBG



Uro'gen III



HMB

10.1.1 Porphyrins and porphyrinogens (VY0905)

The main biosynthetic pathway from Uro'gen III starts with the stepwise decarboxylation of each of the four acetate side-chains to give Coproporphyrinogen III, then oxidative decarboxylation of two of the propionate side-chains to give Protoporphyrinogen. These porphyrinogens and the partly decarboxylated intermediates are always isolated after aerial oxidation to give the corresponding porphyrin which is much more stable. Enzymic oxidation of Protoporphyrinogen gives **Protoporphyrin**, which is the branch point in the pathways to the haems and bilins and to the chlorophylls. Protoporphyrin has been isolated from the cnidarian *Atolla wyvillei*. Other porphyrins that can be found are mostly bacterial degradation products of Protoporphyrin with modification of the vinyl groups, e.g. **Haematoporphyrin**.

10.1.2 Bile pigments (bilins) (VY0915)

In animals the degradative pathway for haem is *via* an oxidative ring cleavage to give **Biliverdin** (Biliverdin IXα). This is then reduced to Bilirubin (10,23-dihydrobiliverdin) and excreted, as a bis-glucuronide ester, through the bile duct into the gut, where further reduction of double bonds by bacteria occurs. The same oxidative cleavage of haem can be affected non-enzymically by the coupled action of oxygen and a reducing agent such as ascorbic acid. In this reaction, cleavage can occur at any one of the four *meso* positions (*C*-5, 10, 15 and 20) and thus four isomeric Biliverdins (IXα, β, γ and δ) are produced.

In plants, the same oxidative cleavage of haem leads to the photoresponsive pigment Phytochromobilin and, in algae, to the light-harvesting pigments such as **Phycocyanobilin**. Both of these are found *in vivo* covalently attached to proteins by thioether links, and their presence or absence is an important taxonomic marker for different types of marine algae (see under the organism descriptions below).

10.1.3 Chlorophylls and derivatives (VY0920)

Insertion of Mg^{2+} is the start of the pathway that leads to the chlorophylls. A key intermediate in this pathway is **Protochlorophyllide**, in which the carbocyclic ring E, found in all chlorophylls and bacteriochlorophylls, has been formed in an oxidative cyclisation reaction. The chlorophyll c family, found in phytoplankton, have a porphyrin skeleton derived from Protochlorophyllide by insertion of a double bond into the propionate side-chain but the plant chlorophylls are all chlorins, having the *C*-17/18 double bond reduced in a photochemical, NADPH-dependent reduction of Protochlorophyllide giving **Chlorophyllide a**. Esterification with phytol gives **Chlorophyll a**.

10.1.4 Bacteriochlorophylls and derivatives (VY0925)

Photosynthetic bacteria rely on a slightly more diverse range of tetrapyrrole pigments. Purple photosynthetic bacteria contain **Bacteriochlorophyll a**, which is a bacteriochlorin, having two opposite pyrrole rings reduced. Green sulfur bacteria on the other hand contain Bacteriochlorophylls c, d and e, which are in fact chlorins, not bacteriochlorins, and are each a family of pigments with varying numbers of extra methyl groups introduced onto the *C*-8 and *C*-12 side-chains.

Bacteriochlorophylls also have a wider range of esterifying groups than do the chlorophylls. Thus, whereas Bacteriochlorophyll a usually has the normal phytyl ester, Bacteriochlorophylls c, d and e commonly have a farnesyl group. Geranylgeranyl and straight-chain hydrocarbon esters are also found in some organisms.

10.1.5 Miscellaneous polypyrroles (VY0945)

Although the majority of tetrapyrroles found in organisms are the ones described above, widely-distributed and having specific well understood catalytic functions, there are a few that are found in individual organisms and have more obscure or unusual functions. Some are present purely as pigments. Among the unusual functions are those of **Bonellin**, produced as a hormone by the females of the annelid worm *Bonella viridis* to determine the ender of the offspring. Other examples, such as **Corallistin A** from a sponge or **Chlorophyllone a** from various molluscs, do not have any recognised function.

Classification of Organisms

1. GENERAL

This introduction gives only a very general overview of the different organism types. The natural products with names given in **heavy type** are only typical representatives of those found. This is particularly true of the prolific groups such as cyanobacteria and sponges, where this introduction can only give general pointers and should not attempt to displace the function of the main body of the Dictionary. To obtain a more comprehensive overview of the natural products present in particular types of organism, it is necessary either (a) to browse the entries given in the main section of the book, or (b) to search the CD-ROM version. This is most effectively done by using the **Type of Organism codes**, which are given in each section below (and above). These can be used alone or combined with other types of search parameter to restrict the result to certain broad classes of organism.

Many natural products pass up the food chain, and what may have been isolated for example from a sponge, may in fact be a cyanobacterial metabolite. This phenomenon reflects the large range of signalling roles (in the widest sense, to include defence chemical and anti-predator substances) that the marine environment involves, and the complexity of the alimentary chains which leads to frequent metabolic modification of molecules taken up from prey organisms.

Wherever possible, the Dictionary carries codes for both types of organism in the entry, but this cannot always be guaranteed. Other marine natural products such as the commoner steroids are just widespread, not necessarily as part of the food-chain.

Kornprobst, J.-M. (ed.), *Substances Naturelles d'Origine Marine*, Lavoisier, Paris, 2005

This recent two-volume work gives much background information on all aspects of marine natural products, including more detailed schemes for correlation of natural product type with taxonomic position of the organism. It was consulted extensively in preparing this introduction.

Tringali, C. (ed.), *Bioactive Compounds from Natural Sources*, Taylor & Francis, 2001

2. TAXONOMIC CONSIDERATIONS

The nineteenth century high-level classification of organisms into plant and animal kingdoms has been abandoned since about the 1960s with the development of cladistic analysis. Since then it has become increasingly clear that certain groups of organisms, some of them previously little studied, such as the cyanobacteria or cyanophytes (so-called blue-green algae; more closely related to bacteria), the chromista (including the brown algae) and the archaebacteria or archaea, show greater differences in both fundamental biochemistry and genetics from each other and from the so-called higher organisms, than higher plants and animals show from each other. Whittaker (1959) proposed that the most fundamental division should be between the prokaryotes and the eukaryotes, a classification that has now been generally accepted, but subsequently modified to include the discovery of the archaea in the 1970s.

Further studies of the genome might in principle lead to a classification scheme of all organisms that can be considered 'absolute', but many ecologists consider this view as essentially simplistic; for example, it does not take into account the possibility of convergent evolution in the genome. Evolutionary pressures are exerted through the phenotype, not the genotype.

Genus names in this Dictionary have, wherever possible, been validated using the *Species 2000/ITIS Catalogue of Life*, with which the Chapman & Hall/CRC chemical database has established a reciprocal relationship. The Catalogue of Life (COL) must be considered the most authoritative resource across the whole of taxonomy in respect of taxa which it currently covers. COL is a cooperative integration and standardisation of the information contained in many of the world's authoritative databases. At the time of finalisation of the dataset for this Dictionary, COL gave a taxonomic view of over half the world's reported species, and is planned to achieve completion in terms of published taxa by 2011. Where the name reported in the primary literature is not yet in COL, the genus name was cross-checked with other internet resources. If a genus name appears unreliable, this is noted in the entry.

There are many different schemes for taxonomic higher-level organisation. The discussion which follows is largely based on schemes given in Kornprobst (2005). Users should be aware, however, that the classification of genera into phyla, classes, subclasses, etc. given in Kornprobst is only one view. In some groups of organism (e.g. molluscs) there is reasonable agreement among biologists; in others (e.g. protozoa) there are huge differences between different schemes. Since most users of this Dictionary are likely to want to search using broad parameters (e.g. 'Find all pyridines in echinoderms', 'find all compounds with MW 300-310 in ascomycetes'), the Type of Organism categories have been kept broad, (largely phyla) and the uncertainties concerning organisation between the level of phylum and the level of genus should not affect the results. Where there are major taxonomic uncertainties, as with protozoa, the phylum is not subdivided; all organisms that can reasonably be considered as protozoa are grouped under the same code heading (**ZD**). Future development of the database may involve some further subdivision of these large categories.

Whittaker, R.H., *Quart. Rev. Biol*., 1959, **34**, 210–226 (*organism classification*)
Cimino, G. *et al, Marine Chemical Ecology*, (eds. McClintock, J.B. *et al*), CRC Press, Boca Raton, 2001, **115** (*rev, taxonomy*)

2.1 Archaea (Archaebacteria) (ZA)

The archaea are prokaryotic organisms inhabiting extreme environments, both marine and terrestrial, such as hydrothermal vents, and also highly saline regions. There are three generally recognised groups; thermophiles (heat-tolerant), halophiles (tolerant of highly saline media such as the Dead Sea; some species are also extremely alkali tolerant, growing in media up to pH 12) and methanogens (some species of which are also highly thermotolerant). It is also convenient to recognise a group of 'psychrophiles' tolerant of cold arctic and antarctic conditions. Although only discovered in the 1970s, it now appears that the archaea are in fact the most numerous bacteria in the marine environment. They show major differences from other prokaryotes in their genome, and these are carried through into fundamental differences in their membrane structure and biochemistry. Their cell walls do not contain the glycopeptides found in the eubacteria. Stabilisation of the membrane structure is affected by esters of glycerol with characteristic branched-chain terpenoid fatty acids, a role which in prokaryotes is performed by carotenoids and/or hopanoids and in eukaryotes by sterols. **Archaeol** is considered the prototype of this type of lipid; there are some unusual structural variations; for example the presence of lipids based on **Calditol** is noteworthy. A number of prenylated naphthoquinones related to vitamin K_1 have also been isolated, and sulfur bacteria contain a range of prenylated and aliphatic sulfur compounds.

2.2 Eubacteria (ZB)

The eubacteria are characterised by their cell wall structure, which is based on a glycoprotein formed of (1→4) linked *N*-acetylglucosamine and *N*-acetylmuramic acid, cross-linked by peptide side chains containing unusual amino acids which render different bacterial strains biochemically and immunologically distinct. In Gram-positive bacteria the glycoprotein coat forms the outermost layer; in Gram-negative bacteria there is an outer membrane coat which prevents this layer being stained by the reagent.

The classification of bacteria is a complex and specialised subject, and there is no official classification scheme. The nearest equivalent is the scheme being evolved for Bergey's Manual (Garrity *et al*), which is work in progress available for inspection online.

Bacteria may be photosynthetic or nonphotosynthetic, and the photosynthetic bacteria may be anaerobic (sulfur bacteria) or aerobic (which includes the cyanobacteria). The former group utilises the bacteriochlorophylls as photosynthetic pigments. Further major subdivisions such as alpha, beta-, gamma- and deltaproteobacteria have been delineated according to various schemes, but the overall picture is complex. Fortunately, within the context of natural products, the majority of investigations have been into two major bacterial subcategories, the actinomycetes and the cyanobacteria. The code ZB0001 is used in this Dictionary for all eubacteria which do not fall into one of these two major groups.

It is possible that some isolations from eubacteria, including actinomycetes, that have not been prominently flagged in the literature as being of marine origin, do not appear in this Dictionary. To search all bacterial isolations, consult the Dictionary of Natural Products on DVD. The coverage of cyanophyte products should be complete.

2.3 Cyanobacteria (ZB1000) (cyanophytes, blue-green algae, Myxophyceae)

The older term blue-green alga is now considered a misnomer, and the cyanobacteria are considered a subdivision of the photosynthetic eubacteria. They are unicellular organisms which are both marine and terrestrial; some marine species also inhabit fresh water. Some are truly monocellular, but when found unassociated with other organisms, many species adhere via their mucilaginous coats into filaments or tufts visible to the naked eye, and are sometimes found as large colonies known as stromatolites. These are well documented in the precambrian fossil record and thus place the cyanobacteria among the earliest known organisms. Schemes for the subclassification of cyanobacteria are based on their mode and degree of such association, or alternatively by the type of spores formed. Attempts have also been made to classify them chemotaxonomically. About 7500 species have currently been described. According to one view as few as 200 of these may be taxonomically distinct, but conversely according to recent chemical studies, a colony appearing to consist of a single species may comprise many genetically distinct strains. Cyanobacteria are responsible for frequent algal blooms, the toxicity of which is associated with their high level of secondary metabolites.

Their cell wall structures contain some sterols, but more characteristically conjugated hopanoids such as **Bacteriohopanetetrol**. The fundamental chemotaxonomic distinction between prochlorophytes and cyanobacteria lies in their photosynthetic pigments; in cyanobacteria there is **Chlorophyll a** but no chlorophyll b, which is replaced by the phycobilins, **Phycoerythrobilin** and **Phycocyanobilin**. These pigments are also found in the red algae, which show other chemical similarities to the cyanobacteria, notably in their polysaccharides. Cyanobacteria contain characteristic xanthophylls such as **Myxoxanthophyll**.

Cyanobacteria are present in the tissues of many sponges, often as a major component of the biomass. In an extreme case, the species *Terpios hoshinota* has been characterised as a 'Cyanobacteriosponge', in which the cyanobacterial cell mass constitutes over 50%. Some of the sponge-associated cyanobacteria are of unique type and have even been assigned to new genera. DNA sequence analysis has shown that different species of *Dysidea* sponge are associated with a different cyanobacterium, which may account for the wide range of different secondary metabolites isolated from them, while mass spectral analysis of colonies of *Microcystis* and *Planktothrix* cyanobacteria has demonstrated the presence in a single colony of multiple strains showing great diversity in their metabolites. Attempts to separately culture these cyanobacterial cells have proved unsuccessful, and evidence as to the true origin of the secondary metabolites is based on cell separation experiments. Peptides such as **13-Demethylisodysidenin** and chlorinated diketopiperazines, such as **Dihydrodysamide C**, were exclusively found in the cyanobacterial cells, whereas several terpenoids, such as **Spirodysin**, were found in the sponge cells. Halogenated aromatics are also associated with the cyanobacterial fraction of *Dysidea* sponges, and resemble metabolites such as **Ambigols** from cultured cyanobacteria.

The most characteristic secondary metabolites of the cyanobacteria, free or associated, however, are nitrogenous. The known metabolites are also characterised by a high degree of halogenation. See for example the extensive series of **Malyngamides**. A high degree of halogenation (notably terminal -CCl_3 groups) is shown by **Dysidenin** and its relatives isolated from sponge-cyanobacterial symbionts. An extensive series of brominated indoles typified by the **Hapalindoles** have been isolated.

Cyanobacteria produce an extensive range of modified depsipeptides, largely cyclic. Examples include the **Lyngbyabellins** and **Majusculamide C**. Acyclic peptides include the **Tasiamides** and the **Microcolins**.

Burja, A.M. *et al*, *Tetrahedron*, 2001, **57**, 9347–9377 (*rev*)
Gerwick, W.H. *et al*, Alkaloids, 2001, **57**, 75–184 (*rev*)
Van Wagoner, R.M. *et al*, *Adv, Appl. Microbiol*., 2007, **61**, 89–217 (rev)

2.4 Actinomycetes (ZB5000)

These are a particular class of Gram-positive eubacteria showing filamentous growth, and some similarities to fungi. (In the past they have often been classified as filamentous fungi and are sometimes called 'higher bacteria'). They also merit special treatment biochemically speaking because of their vast production of different types of natural product, many of them with strong antibiotic or other pharmacological activity. The most important genera by far in terms of natural products are *Streptomyces* and *Actinomyces;* according to which definition is used, the actinomycetes can also include the important pathogenic genera *Nocardia* and *Mycobacterium*.

Actinomycetes occur in marine sediments, and probably as endophytes in many marine organisms, but evidence is fragmentary. As a group they tolerate a wide range of salinities. A typical situation is that of the indolocarbazole alkaloids (VX4350), the Staurosporines. Staurosporine itself is produced by various actinomycetes, both terrestrial and marine, but close homologues have been obtained from ascidians *Eudistoma*, from planarians *Pseudoceros* that prey on them, and from prosiobranch molluscs *Coriocella.* The Holyrines, isolated from actinomycetes present in marine sediments, are probable precursors of these compounds and support the idea that they are all of ultimate actinomycete origin.

Moore, B.S., *Nat. Prod. Rep*., 2005, **22**, 580–593 (*microorganism biosynth*)
König, G.M. *et al, ChemBioChem*, 2006, **7**, 229–238 (*rev, natural products from associated microbes*)

2.5 Protozoa (ZD)

The term 'protozoa' is difficult to define taxonomically and is subject to ongoing modification in the light of biochemical studies, which are leading to the reclassification of many groups. It was formerly used as a blanket term to describe almost any kind of unicellular organism, but it is now known, for example, that the dinoflagellates (see ZH7000) are more closely related to the brown algae than to other unicellular organisms. In this Dictionary the code ZD0001 is used for all unicellular organisms that cannot be placed elsewhere*. The ciliate organisms, for example *Paramecium*, can be placed here, although it now appears that they are biochemically closest to the dinoflagellates. It is convenient to recognise four subdivisions; flagellates, amoebae, sporozoans and ciliates, but the reservations expressed above concerning their fundamental dissimilarities must be borne in mind, and a proper classification remains premature. Genera studied chemically include *Euplotes, Tetrahymena, Litonotus and Pseudokeronopsis*. The ciliates are nonphotosynthetic organisms but can often harbour photosynthetic algae as symbionts.

Chemical studies have been fairly limited, but a range of sesquiterpenoids, and some highly unusual triterpenes, the **Vannusals**, have been isolated.

* Some genera considered dinoflagellates are currently classified in the Dictionary under ZD0001, protozoa, but they are being reclassified under dinoflagellates, ZH7000, for future releases of the database

3. MARINE ALGAE; GENERAL CONSIDERATIONS

The algae considered in their totality, can be described as lower, mostly multicellular plants of a simple body plan, lacking well-defined differentiation into roots, stems and leaves. The higher plants, which show such differentiation, are virtually absent from the oceans, although some species (mangroves; several different spp. of higher plant) are important components of the estuarine saltmarsh environment.

The classification of algae has undergone a number of changes in recent decades and there is no definitive overall plan that takes care of every subgroup. The most fundamental division is between the Brown algal branch and the Green algal branch, two groupings which show large biochemical differences from each other. The 'Green' branch comprises not only the green algae proper (Chlorophyta), but also the red algae (Rhodophyta), which are now considered more closely related to the green algae than either of them are to the brown algae and their relatives. The taxonomic classification codes used here recognise only these major subdivisions, although one scheme for the Chlorophyta for example subdivides them into fourteen orders.

Red and brown algae are of commercial significance, but the commercial exploitation of green algae is very limited. The use of whole plants as food products is mostly confined to Japan, but the extraction of the algal polysaccharides for use in food and medicines is a major industry.

3.1 Chlorophya (green algae) (ZE)

About 7000 species are recognised, of which 1000 are marine, inhabiting mostly surface waters of the calmer seas. Of these, about 20% have so far been investigated chemically, principally in the orders Broypsidales and Ulvales. In their fundamental biochemistry (photosynthetic pigments, storage polysaccharides etc.) they resemble the higher plants. Some members are unicellular, sometimes as endophytes in other species of green algae.

Green algae photosynthesise using the common carotenoids **α- and β-Carotenes**, and contain a range of relatively common xanthophylls such as **Lutein**. The most common storage polysaccharides are amylose and amylopectin, and the commonest structural polysaccharide is cellulose, although some groups also secrete β-1,3-xylan and β-1,4-mannan. The most widespread sterols are Cholesterol, Brassicasterol, Sitosterol and their close relatives, although some rarer sterols such as **Saringosterol** have been characterised from certain classes of green algae. Studies have not always distinguished between sterols involved in the algal membrane structure and those present in the cytoplasm.

The known secondary metabolites of the green algae are rather limited in structural range and are mostly confined to terpenoids of relatively common skeleton, and a range of aromatics including meroterpenoids. Halogenation is uncommon, and the terpenoids are so far limited to sesqui- and diterpenes and a few triterpenes (acyclic and pentacyclic cycloartanes, e.g. **Capisterone B**). Many of the terpenoids contain enoloid functionality, for example **Caulerpenyne** and/or furan rings formed biogenetically by the cyclisation of the related unsaturated aldehydes, such as **Furocaulerpin**. Some of these metabolites have also been isolated from species that feed on green algae, such as molluscs. **Halimedatrial** is the only terpenoid so far isolated from green algae containing a carbon skeleton that has not been found elsewhere. The brominated aromatics are exemplified by **Rawsonol**, and the meroterpenoids by **Cymopol** and related compounds.

Nitrogenous compounds found in green algae tend to be low molecular-weight amines related to the amino acids, such as Agmatine, or peptides and modified peptides such as the **Kahalalides**. There are few more highly elaborated alkaloids except for purines and an unusual 1,3,5-triazine, **Halimedin**. Exceptions to this generalisation are the five-ring nitrogenous pigments **Caulerpin** and **Caulersin** isolated from the structurally atypical algae of the *Caulerpa* genus.

3.2 Rhodophyta (red algae) (ZF)

The red algae are characterised by a unique and complex reproductive cycle involving three alternating generations. The great majority of the 4000 species known are marine, sometimes inhabiting deep water. They may be mono- or multicellular with a complete absence of flagellae. The chloroplasts have a double membrane similar to those of cyanobacteria and presumably arose by endosymbiosis with these organisms. There is no general agreement about the subclassification of red algae. Several schemes have been suggested, and the taxonomy is fluid, for example the genus *Plocamium* has now been moved to a separate order, the Plocamiales. At the highest level, a division into two unequal subclasses is usually recognised. The Bangiophyceae, considered the more primitive group, is the smaller and consists of either unicellular or very simple multicellular organisms. The most studied genus chemically in the Bangiophyceae is *Porphyra.* The larger subgroup is the Florideophyceae, comprising the better-known more highly differentiated macroscopic plants.

An important biochemical similarity between the red algae and the cyanobacteria is the presence of the phycobilins, **Phycocyanobilin** (blue-green) and **Phycoerythrobilin** (red). It is the latter that is responsible for the red colour of the tissues, but the colour may be modified or masked by the presence of phycocyanobilin and/or chlorophylls. The red algae contain chlorophyll a and the characteristic pigment **Chlorophyll d**. The isolation of **Isochlorin e_4** from *Dasya pedicellata* is also noteworthy. The range of carotenoids is rather limited but includes the furanoid cyclised xanthophylls **Aurochrome** and **Auroxanthin** which are also widespread in terrestrial plants.

The storage saccharides consist not only of highly branched amylopectins but of the osmoregulatory galactoglycerols **Floridoside** and **Isofloridoside**. There is some cellulose content but the most abundant and characteristic polysaccharides are the commercially significant **Carrageenan** and **Agar**. These are rarely present in the same species. Red algae have a relatively high content of polyunsaturated fatty acids and phospholipids, as well as some unusual acids such as the cyclopentanoid **Dihydrochaulmoogric acid**. Derived from these unsaturated C_{18} and C_{20} acids are a large number of oxylipins, for example the **Constanolactones** and **Peyssonenynes**.
The range of sterols so far characterised is rather narrow and confined to relatively simple hydroxylated cholestanes such as the **Liagosterols** and **Pinnasterol**. Side-chain methylated steroids are rare; see **11,20-Dihydroxy-23-methylcholesta-1,22-dien-7-one**.

The secondary metabolites of the red algae are characterised by a high proportion of halogenated terpenoids and aromatics, particularly in the intensively studied genus *Laurencia.* The terpene skeletons are strongly

weighted towards the lower MW members of the series (especially sesquiterpenes), and there are many representatives of unique terpene skeletons not found in higher plants or elsewhere in the algae. Kornprobst [Kornprobst, 2005; **1**, 329] attempts a correlation of natural products with taxonomic subgroup (order), but in view of the taxonomic uncertainties referred to above and to the fact that several groups have hardly been investigated chemically, this must be considered tentative; the classification of red algae into orders given by Kornprobst and given here does not correspond with that found in the Catalogue of Life. The Ceramiales (e.g. *Ceramium, Delesseria, Chondria, Laurencia, Polysiphonia*) contain many halogenated sesquiterpenes and brominated aromatics, plus a range of halogenated C_{15} acetogenins which are characteristic of the order. The Gigartinales (e.g. *Chondrococcus*, *Plocamium, Ochtodes, Sphaerococcus*) also contain many halogenated terpenes, mostly monoterpenes such as **Halomon** and **Violacene** but in the case of *Sphaerococcus* some (often brominated) diterpenes based on sphaerane, presphaerane and related carbon skeletons, such as **Sphaerococcenol A** and **Presphaerol**. On the other hand, the Nemaliales (e.g. *Asparagopsis, Bonnemaisonia, Rhodymenia*) and others yield halogenated aliphatic compounds of low molecular weight such as halogenated acetones. The genus *Ochtodes* (Cryptonemiales) yielded a range of halogenated monoterpenoids based on the unusual ochtodane skeleton, such as **Ochtodene**; other genera in this order did not contain terpenoids. Other orders have either not been extensively investigated, or yielded only a limited range of natural products.

The order Ceramiales, especially the genus *Laurencia*, is a rich source of natural products with over 500 compounds so far isolated. The sesquiterpenes of *Laurencia* are based on more than 20 different carbon skeletons, some of them 'traditional' and found also terrestrial organisms, others novel. Many of these have also been isolated from molluscs and other animals that feed on red algae. Using chemotaxonomic evidence, the species in this genus can in fact be divided into three subgenera. The first group contains only halogenated terpenes, the second only acetogenins and the third group both. However, the situation is complex and there may be interbreeding between different chemotypes. [Kornprobst 2005; **1**, 346–347]. There is also a wide range of halogenated (mostly brominated) diterpenes, many derived from the common (marine and terrestrial) skeleton labdane and other skeletons closely related to it. The parguerane skeleton, as found in **Parguerene** and related compounds, is however unique to marine organisms. There is also a series of **Irieols** based on the irieane skeleton. Certain *Laurencia* and *Chondria* species have also yielded a series of triterpenoid polyethers derived from squalene, for example **Thyrsiferol, Enshuol** and the **Armatols**.

The most characteristic class of natural product isolated from these genera, however, is the extensive series of mostly halogenated compounds based on a linear C_{15} skeleton, the first of which to be discovered was **Laurencin** in 1968. A wide variety of structure based on ether formations is founded on this basic skeleton (for example **Obtusenyne**; **Microcladallenes**), which probably arise by loss of a C_1 fragment from a C_{16} precursor. The isolation of **Laurediol** supports this hypothesis. The Ceramiales also contain a range of halogenated phenolics such as **Lanosol**.

Nitrogenous natural products are relatively scarce in the majority of red algae, and mostly limited to widely-distributed small molecules such as **Homarine**, and cyclic peptides such as **Ceratospongamide** (isolated from a red algal-sponge symbiont). A range of simple halogenated indoles was isolated from *Rhodophyllis membranacea.* Once again, it is the Ceramiales that show a much greater range. A characteristic amino acid is **Kainic acid**, together with its homologue **Domoic acid** and other analogues. The range of indoloids is also greater, including some of greater elaboration such as the **Almazoles**.

The chemotaxonomic unpredictability of this group of organisms is shown by studies of *Chondria californica*, which yielded a range of polysulfur compounds such as **Lenthionine**. These were unaccompanied by terpenes, and were not found in apparently closely related species.

3.3 Phaeophyta (brown algae) (ZH1000)

About 1500 species of brown algae are known, almost exclusively marine. The term Phaeophyta is to be preferred, since modern studies have shown that they are only very distantly related to the other algae and the term 'brown alga' is therefore a misnomer, although it remains in widespread use. Together with the diatoms and the chrysophytes, they constitute the Stramenopiles. Whereas the other two subgroups are entirely monocellular, the vast majority of brown algae are multicellular and macroscopic, sometimes attaining very large size. Most species inhabit cold and temperate, often rough, seas, and are sessile, demonstrating a well-defined differentiation into a foot (holdfast), stem (stipe) and frond, and growing in surface or relatively shallow waters. The exception is the brown algae of the Sargasso Sea, which are two free-floating *Sargassum* species inhabiting tropical waters.

Two superorders are recognised, based on life-cycle criteria. The Fucales do not show generational alternation, producing haploid gametes which reproduce the diploid stage (cf. higher plants and animals). The other brown algae show generational alternation between a haploid gametophyte and a diploid sporophyte (cf.

ferns). In some families the two forms are both macroscopic and may be indistinguishable to the naked eye; in others, the gametophyte is microscopic. Kornprobst [Kornprobst, 2005; **1**, 420–421; *ibid*., 481] gives a classification scheme into 11 orders (the Fucales being one), but as with the red algae, there have been several different views of the taxonomy in recent years, with much ongoing research having chemotaxonomic implications. For example, it has been shown that the much-studied *Dictyota dichotoma* must be considered a complex in which several endophytic species can be distinguished.

The photosynthetic pigments of all organisms of the Stramenopiles are **Chlorophylls a, c_1** and **c_2**. (characteristic absence of chlorophyll b). The carotenoid content is limited to **Fucoxanthin** and lesser amounts of **Violaxanthin**; **Diatoxanthin** and **Diadinoxanthins** have also been reported, but may be the result of diatomaceous contamination of samples. Some Fucales have yielded pseudomonoterpenoids related to **Loliolide**, which in other types of organism are known to be degradation products of xanthophylls.

Both the structural and the storage carbohydrates of the phaeophytes differ from those present in other classes of algae. The main storage polysaccharide is **Laminarin**, accompanied by **Mannitol** and **Laminitol** which perform osmoregulatory functions. The matrix polysaccharides are based on **Alginic acid** in which the anions are carboxylate groups rather than the sulfates found in carageenans and agar. Phaeophytes in the orders Fucales and Laminariales also contain smaller amounts of the pharmacologically interesting **Fucoidin**.

As in the red algae, the range of sterols found is limited and mostly based on minor modifications of the **Fucosterol** structure, which is the major steroid. There is a wide range of unusual oxylipins, for example the rare oxa compounds given in the entry for **12-Hydroxy-6,9,11-dodecatrienoic acid**, bridged epoxy compounds such as the **Cymathere ethers**, and prostanoid-like cyclopentanoids such as the **Ecklonialactones**.

Brown algae contain a wide range of terpenoids, phenolics and meroterpenoids, but a striking and somewhat unexpected feature is the paucity of halogenated compounds, and those that are found in small amounts are bromo- and iodo-, rather than chloro-substituted. They are unique in their ability to concentrate iodine (and also arsenic; see below) to concentrations of up to 1% dry weight, and although 99% of the iodine in the tissues is inorganic, the other 1% finds its way into **Thyroxine** and other iodinated tyrosines, and a small number of miscellaneous phenolics. There are also few alkaloids, nitrogen compounds being represented only by compounds of low molecular weight, some peptides such as **Fastigiatine** and one or two other compounds such as the terpenoid amide **Joalin**. However, studies have so far been confined to two orders, the commercially important Fucales and the Dictyotales. No lower terpenoids have been isolated from the former group, and mostly only linear diterpenes such as **Crinitol**, although the presence of the rare cyclobutanoid norditerpene **1-(2-Isopropyl-1-methylcyclobutyl)-4-methyl-4-nonene-1,8-dione** in *Cystophora moniliformis* is noteworthy. On the other hand the Dictyotales contain some sesquiterpenes such as **Zonarene**.

The diterpenoids of the Dictyotales include many examples of prenylogues of well-known sesquiterpenoid skeletons, for example **Dilophol** (prenylgermacrane), **Dictyotin A** (prenylcadinane = biflorane) **Dictyotetraene** (a dictyotane) and other elaborations on this theme (for a tabulation in chart form, see Kornprobst, 2005, **1**, 442-3). Other characteristic skeletons are xenicane and its relatives (pachydictyane, crenulane and others), and dolabellane and dolastane.

The major secondary metabolite content of brown algae is represented by phenols and phenolic meroterpenoids, many of them sulfated and/or halogenated. The content of these in the tissues may reach 20% by weight and they may play a role in the prevention of larval fixation by marine animals and for protection against bacteria. A major series is represented by the phlorotannins (see for example **Trifucol**, **Trifuhalols**, **Eckol** and their numerous homologues) which are radical-induced oligomers of Phlorotannin containing C-C or C-O-C linkages. The genus *Cytoseira* has been much investigated and has yielded a large range of structurally diverse meroterpenoids; for example, **Strictaketal**, the **Cystoseirols** and the **Mediterraneols**.

The reproductive cycle of brown algae is mediated by a range of hydrocarbon pheromones secreted by the female gametes, and which act as attractants for the male cells. In some orders of brown algae the gametes are both mobile and may be either of similar (microscopic) size, or with the female gamete larger. The most advanced form of reproduction is shown by the Fucales, where the female gamete is large and immobile, and the male gamete is attracted to it solely by the very low concentrations (nanomolar to picomolar) of the attractants. These molecules modulate the navigation of the male gametophytes in the marine environment over the very short ranges (~1mm) required for fertilisation. They are small, non-halogenated aliphatic molecules, the secretion of which is a unique feature of phaeophyte biochemistry. The majority are C_{11} compounds which appear to be derived by degradation of unsaturated acids such as eicosahexaenoic, of a type not found in terrestrial plants. They may be acyclic (e.g. **Cystophorene**) or containing 3-, 5-, 6-, 7- or 8-membered rings (e.g. **Dictyopterenes A-B, Multifidene**, **Aucantene**, **Ectocarpene** and **7-(1-Propenyl)-1,4-cyclooctadiene** respectively). Some *Fucus* and

Sargassum species employ the smaller molecule **1,3,5-Octatriene** (various stereoisomers). Unexpectedly, Ectocarpene was also found in terrestrial *Sencecio* spp.

The tissues of brown algae uniquely concentrate inorganic arsenic at concentrations of up to 40ppm and some of this is converted via biomethylation to dimethylarsinate and thence into a range of ribosides such as **2,3-Dihydroxypropyl[5-deoxy-5-(dimethylarsino)]ribofuranoside**.

3.4 Bacillariophytes (diatoms), Chrysophytes (golden algae) and Haptophytes (ZH5000)

These three groups of unicellular organisms belong to the 'brown' major biochemical line and together with the brown algae (mostly multicellular) constitute the Stramenopiles. The term 'algae' formerly applied to some of these groups is now considered on biochemical and submicrostructural studies to be a misnomer (cf. brown algae). Although these organism types are linked together in the classification scheme used here, this is tentative as they may be rather unrelated and biochemically distinct.

These organisms have been relatively little studied chemically by comparison with the brown algae. The diatoms and haptophytes secrete hard exoskeletons of aluminosilicates and calcium salts respectively, while the golden algae do not, though they may contain silica microspicules. There are roughly 200 known species of marine golden algae and 500 of haptophytes, but the number of marine diatom species may be as high at 50,000, constituting the bulk of the phytoplankton at certain times of the year, and therefore of crucial importance to marine ecosystems.

The storage polysaccharide of diatoms and Chrysophyceae is **Chrysolaminarin**. Photosynthetic pigments resemble those of the brown algae, with no phycobilins but with chlorophylls c including the more recently discovered **Chlorophyll c_3**. A number of minor xanthophylls have been detected and *Phaeodactylum triconutum* has yielded some degraded carotenoids such as **Apo-13′-fucoxanthinone**. There have been extensive studies on their lipids on account of their biotechnological importance (cf. algae). The content of sulfur glycerides, especially **1,2-Diacylglycerol 6-sulfoquinovosides** (also found in other classes of organism) is relatively high. The range of known steroids resembles that of the brown algae in being based on limited side-chain modification of the cholestane skeleton, up to C_{30} in the case of **24-Propylidenecholesterol**, with some sulfation, e.g. **Hymenosulfate**. The **Bacillariolides** appear to be oxylipins produced by the arachidonate pathway. The **Prymnesins** are toxic polyethers produced by a haptophyte.

The range of terpenoids isolated is very narrow and limited so far to simple phytanes. It is noteworthy that in two studied diatom species, the biosynthesis of these (in the chloroplasts) is by a non-mevalonate pathway while the steroids, produced in the cytoplasm, are mevalonate-derived.

Nitrogenous compounds are similarly few in number, but the toxic pyrrolidine **Domoic acid**, also found in red algae, was isolated as a shellfish toxin resulting from *Nitzschia* infection.

Moore, B.S., *Nat. Prod. Rep*., 2005, **22**, 580–593 (*diatoms*)

3.5 Dinoflagellates (ZH7000)

Note; Many shellfish toxins are now known to be dinoflagellate metabolites but may not currently be classified as such in the database

These monocellular organisms are economically important as the causative agents of toxic 'red tides'. Biochemical and other studies have shown clearly that they are more closely related to the ciliates and to certain other groups than they are to other flagellate organisms. (Kornprobst 2005 describes them as 'Mesocaryotic', i.e. intermediate between the eukaryotes and the Stramenopiles). About 200 species are known, predominately marine. Only just over half are photosynthetic; some are carnivorous. Their main anatomical characteristic is the possession of two flagellae, one equatorial and one longitudinal. Most are unicellular but some are filamentous. They participate in a range of symbiotic associations, especially with corals and with molluscs.

Those organisms which are photosynthetic contain **chlorophylls a** and **c**. They contain a range of xanthophylls, most characteristically the C_{37} trisnortriterpenoid pigment **Peridinin** and also the structurally unusual **Gyroxanthin**. The characteristic steroids are a range of 4α- methyl compounds such as **Amphisterol** and **Peridinosterol** representing an intermediate stage between the tetracyclic triterpenoids and the cholestane/ergostane type predominant in the brown algae and relatives. **Gorgosterol**, originally isolated from a gorgonian, was found later to be produced by a dinoflagellate symbiont.

The known toxins of dinoflagellates fall into two main groups, though the exact type of toxin produced is genus-specific. The first main group is polyketide-derived, either long-chain with some cyclic ether formation

(**Amphidinols**, **Luteophanols**, **Colopsinols**, **Zooxanthellatoxins**) or with multiple ether rings ('polyether ladders') (**Brevetoxins**, **Ciguatoxins**, **Yessotoxin** and their analogues, together with the giant C_{164} molecule **Maitotoxin**). Another structural subtype is shown by **Okadaic acid**, while other polyketides are macrolides such as the **Amphidinolides**. The **Prorocentrolides**, **Pinnatoxins** and **Spirolides** are cyclic nitrogenous polyketides which have been isolated from shellfish but are known to be dinoflagellate produced. It is notable that in known cases the biosynthesis of polyketides in dinoflagellates is by a totally different pathway from that in other organisms.
The other main class is composed of nitrogenous guanidinoid toxins of which **Saxitoxin** is the prototype.

Moore, B.S., *Nat. Prod. Rep*., 2005, **22**, 580–593

3.6 Fungi (ZG)

Fungi are now considered part of the Eukaryote kingdom, and are characterised by the lack of a photosynthetic mechanism and by a mode of life which is saprophytic, parasitic or symbiotic. Another major biochemical difference from algae lies in their cell wall structure usually based on chitin rather than cellulose. Fungi are found throughout a wide range of terrestrial and marine environments and it is not possible to produce a meaningful definition of 'marine fungi', only to refer to a range of halotolerance among the various fungal species that are widely distributed. Thus marine sediments and marine invertebrate tissues yield fungal species from genera also found terrestrially, but which have developed a preference for growing in saline environments. Of the approximately 100,000 fungal species so far described, about 500 have been found in marine environments, but this figure is certain to increase in the light of further research. Many metabolites, such as **Gliotoxin**, have been isolated from both terrestrial and marine fungi, and when the identical compound has not yet been found in a terrestrial fungus, there are often close relatives. One basidiomycete species, *Coriolus consors* (preferred name *Irpex consors*) has been cultivated in both seawater and freshwater and yielded the same natural products. Since fungi are invariably cultivated on a medium which is then extracted, cross-contamination of cultures by terrestrial fungi or bacteria is a possibility that must be guarded against.

The lower fungi or Chytridiomycotes (ZG1000) are found only to a very limited extent. They are taxonomically difficult to classify, resembling the higher fungi in their lack of photosynthesis, but resembling the monocellular algae in having a cellulosic cell wall structure and a flagellate stage, sometimes with alternation of generations. There are different views as to how they should classified vis-à-vis the simpler Stramenopiles, and several classes of organisms formerly considered to be lower fungi have now been reclassified on biochemical grounds. Chemical studies are limited.

The majority of fungi fall into the category of higher fungi or Eumycetes having typical fungal biochemistry, and which can be subdivided into the four main classes of Zygomycetes (ZG2000), Ascomycetes (ZG3000), Basidiomycetes (ZG4000) and Deuteromycetes (ZG5000). These groups are distinguished by their method of spore formation (zygospores, asci and basidia respectively for the first three groups). The Deuteromycetes are an ill-defined group roughly corresponding with the term fungi imperfecti (the terms Mycelia sterilia and Hyphomycetes are also found according to various schemes). These are fungi in which no reproduction is observable and which are therefore extremely difficult to identify. Spore formation can be induced in some of them under laboratory conditions, work which shows that they are a loose collection of unrelated fungi rather than a true taxonomic group, and can lead to reclassification into one of the other classes. This can lead to taxonomic duplication, with the organism allotted a new name based on the reproductive form (which should take priority) while still retaining its old name.

The Ascomycetes and the Deuteromycetes are the most represented in the marine environment and been the most investigated chemically.

The great majority of fungal secondary metabolites have been isolated from fungi associated with other organisms. Examples of natural products isolated from non-associated marine fungi include the simple polyketide **Phomoxin**, the carotenoid **Neurosporaxanthin** and some indolopeptides from surface waters or marine sediments.

Marine algae (green, red and brown), like higher plants, harbour a wide variety of endophytic fungal species; for example, 116 different fungal strains were cultivated from a single specimen of *Fucus serratus*. It is not in general known whether any particular relationship should be considered as symbiotic, benign or pathogenic. There are usually strong structural similarities between the natural products from these epiphytic marine fungi and their terrestrial equivalents.

Fungal mycelia are also found in marine animal tissues. Evidence for their presence is based entirely on culturing experiments and as yet there is no evidence from direct microscopic examination or other techniques.

Their role is unknown. In general, compounds produced by fungi associated with marine animals are structurally related to other fungal metabolites and are distinct from natural products produced by the animal organisms themselves. It does not appear that fungi are the biogenetic source of natural products isolated from marine invertebrates, unlike the situation found with bacteria. An example of a natural product isolated from a sponge-associated fungus is **Ulocladol**, while **Epicoccamide** is an example of a substance isolated from a fungus associated with a cnidarian (a jellyfish). Other series of characteristic fungal products have been isolated from fungi associated with all other classes of marine invertebrates, as well as from fungi parasitic on fish.

The most characteristic sterols of all fungi are **Ergosterol** and related ergostanes. Reports of 5,7-dienic steroids from other marine species are suggestive of fungal contamination. Other steroids isolated include **Fusidic acid**, and the **Gymnasterones** from an ascomycete-sponge association.

There are very few reports of the incorporation of halogens. Most fungal secondary metabolites are based on a polyketide biogenesis, but some terpenoids are found, for example the unusual nitrobenzoyl esters of **6,7,14-Trihydroxy-8-drimen-12,11-olide** and the **Hirsutanols** from a sponge-associated fungus. The alkaloids obtained from marine fungi are dominated by diketopiperazines/indoles, as is the case with terrestrial fungi.

Very few biosynthetic studies have been reported for natural products specifically from marine fungi.

3.7 Porifera (sponges) (ZS)

The sponges are considered as the most primitive of the multicellular organisms, providing an evolutionary bridge between the monocellular eukaryotes and the rest of the animal kingdom. They are multicellular organisms lacking all organ differentiation (including gonads) and some can uniquely reconstitute themselves after passing through a sieve. They are almost exclusively marine. Sponges are found at all marine depths but the proportion of calcareous sponges diminishes with depth owing to the physicochemical effect of pressure on the ability of the organisms to secrete calcium.

The taxonomy of sponges is particularly difficult owing to the paucity of well-marked morphological feature by which they can be distinguished. Many species have been synonymised and genera renamed (e.g. *Aplysina* = *Verongia*), and there are numerous views on their classification at higher levels; a recent multi-volume treatise (Hooper *et al*, 2002) proposes many changes. Three main subdivisions have been generally recognised, depending on the nature of the skeletons that they secrete; calcareous (ZS1000), siliceous or askeletal. The largest group is the demosponges, about 95% of known species, in which the skeleton is of spongine, a proteinaceous polymer similar to keratin. The Hexactinellida sponges, characterised by silica spicules of 6-fold symmetry, are found only at great depth and have been little studied chemically.

In this database a simple classification into four groups is used, which is based on Hooper (2002) as summarised in tabular form by Kornprobst (2005). This divides sponges into; Calcareous sponges (ZS1000), Homoscleromorphous demosponges (e.g. *Plakortis*) (ZS3000), Tetractinomorphous demosponges (e.g. *Stelletta*) (ZS4000) and Ceractinomorphous demosponges, (e.g. *Agelas*) (ZS5000).

Sponges participate in a wide range of symbiotic/commensal relationships, and a large number of the isolations of natural products earlier reported from them are in fact owing to the presence of cyanophytes in particular. It is estimated that the biomass represented globally by sponge-cyanophyte symbionts is greater than that of the sponges themselves. Given the extent of these associations, it is not surprising that the diversity of natural products reported from sponges and sponge aggregates covers the whole range of known types. Other natural products reported may be true metabolites of the symbionts.

A wide variety of cell membrane components have been isolated, not only extensive series of both straight-chain, branched and methylenic (cyclopropanoid) fatty acids but alkylglycerols (e.g. **Raspailynes**) and hopanoids based on **Bacteriohopanetetrol** and relatives as well as a vast range of steroids. There are also numerous brominated and α-hydroxyacids. Certain linear terpenoids such as the **Furospongins** have also been postulated to play a role in membrane structure. Associated with the membrane structure is a wide variety of glycolipids, many of them of unique structural type. The simpler *N*-containing parents are the **Sphingosines**, the Dictionary entries for which include their *N*-acyl derivatives collectively known as ceramides, and their glycosides, known as

glycosphingolipids or cerebrosides. More complex types of sphingosine such as the **Plakosides** (containing cyclopropa fatty acids) have individual entries. The nitrogen-free glycolipid content also includes some structural types not found elsewhere, such as the **Crasserides** (ether glycerides of a 5-membered cyclitol), which as a class have been suggested to be uniquely diagnostic of the Porifera and found in all species examined. A unique class of compounds so far discovered only in sponges is the range of carotenoids aromatised in one or both rings such as **Renieratene** and **Tethyanin**.

Among calcareous sponges the most investigated genera are *Clathrina* and *Leucetta*. These genera have yielded in particular long-chain unsaturated aminoalcohols such as the **Leucettamols**, a range of imidazole (e.g. the **Naamines**) and other alkaloids, and cyclic peptides, (e.g. **Leucamide A**).

By far the most studied have been the demosponges, reflecting their numerical preponderance and shallow-water accessibility. Demosponges contain a very wide range of steroids, which encompasses not only the conservatively modified structures biogenetically not far removed from cholesterol (ergostanes, stigmastanes) found in the algae, but also a large number showing more profound modification. These include 19-norsteroids such as **Hapaioside** and a range of A-ring abeosteroids (3-hydroxymethyl-A-norsteroids). The most common type of modification, however, is further side-chain methylation which leads to an extensive series of steroids having various branching patterns up to C_{32}, (e.g.; C_{29}, **Aplysterol**; C_{30}, **Stelliferasterol**; C_{31} **Axinyssasterol**; C_{32} (**26,27-Dimethyl-26-methylenestigmast-7-en-3-ol**). Side-chain cyclopropasterols such as **Calysterol** and **Aragusterol A** occur in the range C_{27}-C_{31} and there are also many secosterols with fission at 5,6- (e.g. **Hipposterol**), 8,9- (**Jereisterol A**), 8,14- (**Jereisterol B**) and 9,11- (**Blancasterol**). There are also many polyhydroxylated and sulfated sterols of the type found also in many other marine organisms, and many steroidal glycosides. Halogenated steroids (e.g. **Aragusterol C**) and steroidal alkaloids (e.g. **Plakinamines**) are rare.

Demosponges of the genera *Plakortis* and *Plakinastrella* (order Homosclerophorida) contain a wide range of oxylipins, including many cyclic peroxides such as the **Plakortides**.

Another group of unusual natural products found in sponges are the terpenic isocyanides R-NC such as **7,20-Diisocyanoisocycloamphilectane**, together with their related isothiocyanates R-NCS, isocyanates R-NCO and formamides R-NHCHO. In the appropriate DMNP entries these are grouped as derivatives under the parent isocyanide, reflecting the fact that they have a common biogenetic origin, the isothiocyanates and formamides apparently being derived *in vivo* from the isocyanides (and not the other way round as was formerly proposed). However the biogenetic origin of the isocyanides themselves has not yet been completely solved.

A wide range of alkaloids and terpenoids are found in demosponges. Indole alkaloids range from simple halogenated indoles such as the **Plakohypaphorines** to polycyclics such as the pentacyclic pyridoacridines (e.g. **Meridine**). Demosponges are the most prolific of all marine organisms in terms of the secondary metabolites that have been isolated from (but not necessarily produced by) them. In order to get a good overview, the best route is to search the CD-ROM version of the Dictionary using the search term **ZS*** (all sponges), but further information can also be obtained from the introductory sections dealing with terpenoid and alkaloid types, and of course by perusing the pages of the printed Dictionary.

3.8 Cnidaria (medusae, sea anemones, hydroids and corals) (ZT)

This class of organisms represents the first major development in body-plan over the undifferentiated sponges, showing cellular differentiation into cells with different functions, but in general no well-defined organs. The term Cnidarian replaces the older 'Coelenterate'. This is a class of organisms typified by a carnivorous lifestyle, the presence of specialised stinging cells (cnidocysts) used in the capture of prey and defensively, and a digestive system consisting of a sac with only one opening. They have a basically radial body plan, which may be modified either in the direction of a fixed polyp with a central gastric cavity (hydras), or a free-swimming medusa form (jellyfish) in which the gastric cavity is underneath. Reproduction is sexual, producing a free-swimming larval

planula which develops into a free-swimming followed by a polyp form, although in some species only one of these is formed.

About 10,000 species are documented, classified into two subphyla. The first subphylum (Anthozoa) comprises the sea-anemones, gorgonians, crinoids and corals which have no free-floating phase, and a skeletal structure consisting either of secreted calcareous minerals, or of proteinaceous material (gorgonine, analogous to the spongine found in the sponges). The anthozoa are divided into two groups depending on their symmetry; eightfold in the octocorals, (alcyonians or soft corals and gorgonians) (ZT1000) or sixfold or a multiple of sixfold (hexacorals, including the sea anemones and hard corals) (ZT2000). The former subphylum is the most studied group of the cnidarians chemically.

In general, relatively few nitrogenous secondary metabolites have been isolated. The proportion of halogenated metabolites is also relatively low, except for halogenated briaranes from *Briareum* spp., such as the **Briareins**. Some sea anemones owe their colour to carotenoids including **Peridinin** and **Actinoerythrin**. The former in particular is produced by dinoflagellates, and these carotenoids work their way up the food chain to molluscs. Octocorals are rich in prostanoids, steroids, terpenoids (but only sesqui- and diterpenes) and aromatics. The prostanoids include a number identical with those found in higher organisms of the **Prostaglandin** series (A, B, E and F), but also halogenated prostanoids containing Cl, Br and I such as the **Chlorovulones**, especially from *Clavularia*. Further oxylipins are now being found in other cnidarians and it appears that their presence may be ubiquitous. Series of furanoid compounds similar to **Ancepsenolide** elsewhere in the phylum support this hypothesis. The hexacorals contain a range of polyunsaturated long-chain acids such as **Leiopathic acid** and the **Montiporynes**.

Like the sponges, cnidarians contain a wide range of sterols, both typical cholesterol-related, and those with modified side-chains. An important class is the side-chain cyclopropanoid steroids based around **Gorgosterol**, although it has been shown that these are in fact produced by symbiotic dinoflagellates. **Yonarasterol I** is an example of this group showing halogenation at *C*-6. There are many polyhydroxylated steroids, often showing side-chain epoxidation, for example the **Hippuristerols**, and a considerable number of secosteroids, some of unusual type such as **Nicobarsterol**. Also are encountered pregnane glycosides (**Verrucoside**, **Pregnediosides** and others). In contrast to the sponges, however, *O*-sulfation is absent. The hexacorals produce polyhydroxylated ecdysteroids such as **Zoanthusterone** which are thought to protect the organism against crustacean larvae.

The sesqui- and diterpenes found in the octocorals are diverse and include some skeletons unique to them (nardosinanes, capnellanes, sterpuranes and some others), which in most cases are unique to certain families. In contrast, terpenoids are almost absent from the hexacorals. The sesquiterpene hydrocarbon content of octocoral tissues may be exceptionally high and they are thought to play an ecological role as predator and larval implantation repellents. An important feature is the frequent occurrence of common terpenoids of the enantiomeric series to that familiar from terrestrial plants, as shown for example by **γ-Maaliene** and **α-Copaene**. There is a complete absence of the isocyanides characteristic of the sponges, and only a limited range of terpenoid alkaloids such as **Clavulinin**. The well-known skeletons represented include many furanoterpenes. The hexacorals have yielded only a few sesquiterpenes; some lepidozanes and secolepidozanes, e.g. **Anthoplalone**.

The octocorals are very rich in diterpenoids, with over 1500 belonging to 50 skeletal types isolated. As with the sesquiterpenes, some skeletons are widespread throughout the phylum, while others are restricted to a single family and can be considered as chemotaxonomic markers. Particularly widespread skeletons include cembrane (including norcembranes and some dimers such as **Sinuflexlin**), xenicanes, lobanes, briaranes, cladiellanes, dolabellanes and amphilectanes. As with the sponges, many skeletons are prenylogues of widespread sesquiterpenoid skeletons. The briaranes are particularly numerous and unlike most other skeletons, frequently halogenated (chlorine only).

Some diterpene alkaloids have been found such as the **Sarcodictyins** (imidazoles containing the eunicellane skeleton, closely related to briarane). The hexacorals produce a range of ceramides, often containing unusual sphingosines, and some other acyclic amides such as **Sinulamide**. Their range of cyclic alkaloids is restricted, e.g. the **Villagorgins**, **Calliactine**, but includes the unique class of fluorescent pigments based on the cycloheptadiimidazole skeletons of **Parazoanthoxanthin A** and **Pseudozoanthoxanthin A**.

Hexacorals of the order Zoantharia (genus *Zoanthus*) have yielded a range of polyketide alkaloids similar to **Zooxanthellamine**. Chemically and pharmacologically, the most significant natural product isolated from cnidarians is probably **Palytoxin**. Hexacorals inhabiting surface waters also contain a range of mycosporins such as **Mycosporin-Gly** which are closely related to analogues found in fungi and appear to perform a photoprotective function. They also contain a range of small nitrogenous betaines and other amines, some purines such as **Caissarone**, and some simple indole-imidazole alkaloids centred on **Aplysinopsin**.

The other subphylum of cnidarians (Medusozoa) comprises the Cubozoa (box jellies, ZT5000), Hydrozoa (hydras, ZT6000) and Scyphozoa (true jellyfish, ZT7000). Chemical studies have been mostly confined to their venoms, which are peptides. (See for example the entry for ***Anemonia sulcata* Toxin**). One difficulty associated with studying their secondary metabolites is the large amount of water in the tissues, which can reach 98%. Some steroids have been identified, plus a small range of polyketides e.g. **Solandelactones**, **Lytophilipines**, and some anthracenoids, e.g. **Garvins**, and simple alkaloids, e.g. **Corydendramines**, **Tridentatols**. There are also the nitrogenous compounds associated with the bioluminescence of some species; ***Cypridina* Luciferin** and **Coelenterazine**.

3.9 Platyhelminthes (flukes, tapeworms and free-living flatworms) (ZU1000)

These are the flatworms, characterised by a bilateral body plan and the complete absence of a digestive cavity. About 18,000 species are known. They may be terrestrial, freshwater or marine and many belong to orders which are exclusively parasitic (e.g. flukes). The majority of marine species belong to the class of planarians (turbellarians). These are mobile, carnivorous animals having no physical means of defence and relying entirely on substances absorbed or modified from the diet, or produced by symbiotic organisms, as chemical antifeedants. The most studied genus is *Amphiscolops*. These worms are protected by **Amphidinolides** produced by symbiotic dinoflagellates and contain other dinoflagellate products such as **Luteophanols**. Other planarians feeding on ascidians have yielded alkaloids (e.g. **Lepadins**, **Villatamines**).

3.10 Annelida (trueworms) (ZU3000)

These are the segmented worms, having an alimentary canal. They include the polychaetes, oligochaetes (earthworms; mostly terrestrial), hirudineans (leeches; mostly freshwater), echiurians and Vestimentifera. They locomote by means of bristles which can be irritant or venomous. The best-known genus among the echiurians is the spoonworm *Bonellia viridis*, most studied on account of its tetrapyrrole pigment **Bonellin** which also plays a role in inducing sexual differentiation in the larva. The Vestimentifera include the recently-discovered giant hydrothermal vent dwellers *Riftia* which coexist with sulfur bacteria, and store elemental sulfur in the tissues.

There has so far been little study of lipid or steroid content. Their carotenoid pigments appear to be mainstream components such as **Astaxanthin**, derived dietetically. Other annelid pigments are anthracenes and anthraquinones, such as **Hallachrome**. Annelids also contain brominated phenols (e.g. **2,6-Dibromophenol**) and derived aromatics such as **Thelepin**, which protect them against bacteria.

Certain annelids bioluminesce and in *Odontosyllis* spp. this is based on pteridines such as **6-Propionyllumazine**. **Nereistoxin** is a simple aminodithiolane with powerful cytotoxic properties produced by *Lumbriconereis* sp. Some annelids contain large amounts of **Hypotaurine** and **Thiotaurine**.

3.11 Other vermiform groups (ZU5000)

The ribbon-worms or nemerteans have yielded the powerful nicotinic receptor agonist **Anabaseine**, used as a venom by the worm, together with several related oligopyridines. Toxins of the tetrodotoxin series are also found in the tissues, and also some peptide toxins, which have only been investigated fully for one species, *Cerebratulus lacteus* (see **Neurotoxin B-IV**)

The unsegmented phoronidian worms *Phoronopsis* have yielded antibacterial bromophenols like those obtained from the annelids.

3.12 Bryozoa (ZU6000)

These colonial organisms are entirely aquatic and mostly marine. They are distinguished by their unique form of gastric cavity, which is surrounded by tentacles forming an organ called the lophophore. The colonies are produced by budding and therefore consist of genetically identical individuals, each of which is surrounded by a bilayered exoskeleton, the inner layer calcareous (not always continuous) and the outer layer chitinous. They are suspension feeders, feeding on plankton and bacteria, and are found at all depths.

Bryozoans have so far been less studied than the number of known species (5700) would justify given the range of interesting natural products already isolated from them. This is probably a consequence of the difficulty of harvesting them.

Terpenoids and steroids have been little studied. A number of common mono-, di- and triterpenes (e.g. Cuminol, Neoabietic acid, Ursolic acid or a stereoisomer) were reported from *Conopeum* sp., but this work needs confirmation. The single diterpenoid **Murrayanolide** that has been obtained apart from this work has a unique skeleton which implies that many more unusual terpenoids may exist on other bryozoans. The similarly limited studies of steroid content have yielded only relatively common types based on cholestane methylated in the side chain and/or hydroxylated. One or two anthraquinone pigments have been characterised, of which the most unusual is **Bryoanthrathiophene**.

The most numerous metabolites from bryozoans are defence chemicals, which comprise numerous alkaloids, and the **Bryostatins**, an important series of polyether polyketide toxins with anticancer properties, some of which have also been found in other marine organisms. The ultimate source of these may be *Candidatus* bacteria.

The range of alkaloids is extensive taking into account the limited amount of work that has so far been done. There are simple halogenated phenethylamines (**Convolutamines**, **Volutamides**). Pyrroles and pyrrolidines include **Tambjamines** (originally isolated from animals higher up the food chain, and which could be tetrapyrrole degradation products), **Amathamides**, **Amathaspiramides** and **Convolutamides**. Indoles are mostly brominated simple indoles (**Flusrabromine**, **Alternatamides**) but *Flustra foliacea* yielded a series of **Flustramines** and related alkaloids of the physostigmine type (VX4100) unique in the marine environment. The **Securamines**, **Chartellines** and **Chartellamides** represent a further elaboration of this structural type up to a maximum of seven rings. There are also a number of quinolinequinones, halogenated or bearing thioether substituents (**Perfragilins**, **Caulibugulones**). The presence of nitro groups in a few alkaloids including the purinoid **Phidolopin** is notable.

3.13 Mollusca (ZV)

This is a diverse and widely distributed phylum of organisms. The body plan is basically nonsegmented and bilateral, although in some molluscs (the gastropods) it is often modified by torsion into a spiral surrounded by a shell. There are well- developed organs inside a more or less thickened outer layer, the mantle, which secretes a shell formed of calcareous matter and protein. This shell may be external, as in the gastropods, internal as in squids, or may be totally lacking (octopuses and nudibranchs). There is generally a muscular foot and a cephalic region which may be highly developed into tentacles and other organs, as in the cephalopods. The alimentary canal is well developed and furnished with a rasping radula used in feeding. Different classes of molluscs show variation in this general body plan, for example the bivalves have a hinged shell, no cephalic region and no radula, and some of them also lack the foot. Many species of mollusc are known, present in marine, freshwater and terrestrial environments, ranging in size from microscopic to very large. They show a wide range of dietary behaviour (carnivores, herbivores, filter feeders and detritus feeders) and undergo a wide range of symbiotic relationship. In particular, in some molluscs the mantle incorporates symbiotic algae providing toxic antipredator substances.

The phylum is usually divided taxonomically into seven unequal classes, but of these four (including Chitons, ZV1000) are numerically limited and have been studied chemically little or not at all. The most important classes both in terms of number of species, economic importance and chemical studies are the gastropods (ZV2000, ZV3000, ZV4000), the bivalves (ZV6000) and the cephalopods (ZV8000). However, the bivalves with their well-developed physical protective mechanism of the double shell, appear to have less need for chemical defence mechanisms and their secondary metabolites are less profuse. They have mostly been studied in terms of their economically important shellfish toxins, which are in fact microbial/dinoflagellates products. The cephalopods too have been rather little studied; their most characteristic metabolites are **Adenochromines**. The most studied organisms chemically have been various types of gastropod which have little or no physical defence and rely almost entirely on chemical defence against predators.

The numerous gastropods are sometimes further divided into three subclasses, the Prosobranchia (ZV2000) the Opisthobranchia (ZV3000) and the Pulmonata (ZV4000). (This division is not recognised by the Catalogue of Life, but since it is a convenient subdivision of a large group of natural product-producing organisms it is followed here). A table of these subdivisions is given in Kornprobst (2005), Chapter 23, which also gives a more detailed description of the secondary metabolites of gastropods organised by class and subclass.

Terpenoids are numerous. The genus *Planaxis* (Gastropoda, Prosobranchia) has provided a series of cembranoids such as **Jeunicin** and **Planaxool**. Among the opisthobranchs, the sea hares or aplysians, which are herbivorous, feed on cyanobacteria and algae, and their digestive systems and mantles contain a wide variety of unchanged and metabolised secondary metabolites which perform an antifeedant function. These alimentary chains are complex and have been much studied. The two most studied genera are *Aplysia* and *Dolabella;* the former feed mostly on red algae and contain many halogenated and nonhalogenated terpenoids (**Kurodainol**, **Aplysin 20**, **Brasilenol**, **Punctatol** and many others), cyclic halogenated ethers (**Dactylyne**, **Aplyparvunin**, etc.), lactones (e.g. **Aplyolides**, **Aplyronines**), and both peptide and nonpeptidal alkaloids (**Aplaminone**). *Dolabella* spp. feed on brown algae, and in accordance with the terpenoid profile shown by these, contain mostly nonhalogenated diterpenoids (**Auriculol**, **Dolatriol**) as well as lactones (**Dolabelides**), peptides (notably the extensive range of highly cytotoxic **Dolastatins**, from cyanobacterial symbiosis) and alkaloids. A few *Aplysia* spp. feed on brown algae and also contain nonhalogenated diterpenes, e.g. **4-Hydroxycrenulide**. Other products isolated from this type of mollusc appear to derive from symbiotic/commensal green algae (**Aplyolides**) and even fungi (**Aplysiatoxin**).

The shell-less nudibranchs can incorporate cnidocysts obtained from cnidarians into their mantle, and also rely heavily on compounds, especially terpenes, ingested in the diet as a means of defence. A wide range of skeletal types have been isolated, and include sponge-derived terpenoid isocyanides and compounds derived metabolically from them, such as the **Acanthenes**, and sponge-derived scalarane sesterterpenoids such as **Deoxoscalarin**. However, nudibranchs also synthesise terpenoids *de novo via* the mevalonate pathway. Many terpenoids are present as glyceryl esters such as the **Anisodorins** and the **Verrucosins**. In general it is possible to predict with a fair degree of accuracy what types of compound (though not necessarily the exact compounds) that will be isolable from nudibranch tissues by studying the prey of the different species. The sacoglossan gastropods also contain a range of terpenoids, but these animals are herbivorous and the terpenoids derive from commensal green algae entering into the tissues (e.g. **Ascobullins**). A number of degraded chlorophylls such as **Chlorophyllone a** have been isolated from bivalve molluscs, which have also yielded modified carotenoids (**Pectenoxanthin**, **Crassostreaxanthins**)

Nudibranchs contain a narrow range of carotenoids (e.g. **Hopkinsiaxanthin**) and steroids (**Lovenone**, a secosteroid, for example). Other defence allomones include quinonoid and related meroterpenoids, and macrocyclic lactones (**Laulimalide**, **Sphinxolides**, the isoxazolide lactone **Kabiramides** and others, some of these at least probably cyanobacterially derived). Also noteworthy is the isolation of prostanoid lactones from *Tethys fimbria*.

The distribution of polyketides in molluscs is patchy. They are found only in some classes of the gastropods, for example the **Auripyrones** (strictly, polypropionates) from *Dolabella*, the **Aglajnes** from *Bulla* spp. which are preyed upon by carnivorous molluscs *Aglaja*, and **Tridachiapyrones** from the herbivourous sacoglossans. Pulmonarians have afforded a number such as **Muamvatin, Maurapyrone C** and the **Onchitriols**.

Long chain aromatic and heteroaromatic metabolites, which do not appear to be derived from the diet, are found in *Navanax* spp. (**Navenones**, which play a role as alarm pheromones), *Haminoea* spp. (**Haminols**) and other genera.

Peptides, especially cyclic oligopeptides often containing unusual amino acid residues, are probably widely distributed and show structural resemblances to similar compounds found further down the food chain, e.g. in sponges. See for example the **Kulolides** from *Philinopsis* spp. Peptides such as the **Kahalalides** have also been isolated from sacoglossans, and **Onchidin** is an example of a cyclic oligopeptide isolated from a pulmonarian. Nudibranchs also contain some characteristic nucleosides such as **Doridosine**.

Among other nitrogenous metabolites, the best-known from gastropods is the dyestuff **6,6'-Dibromoindigotin**, known since ancient times. The genus *Lamellaria* (Gastropoda; Prosobranchia) yielded a wide range of the pyrrole alkaloids. The **Lamellarins**, which, however, are also found in ascidians on which the molluscs feed and in sponges, are probably biosynthesised symbiotically. Other gastropods (nudibranchs) prey on bryozoans, and yield the **Tambjamines**, which are also pyrroles. There are also guanidine alkaloids, e.g. **Triophamine**.

Similarly, the **Kuanoniamines** from *Chelynotus* (Gastropoda; Mesogastropoda) are closely similar to, though not identical with, **Dercitine** and similar alkaloids isolated from sponges. Other compounds isolated bearing a close structural relationship to sponge products include **Jorumycin**, which closely resembles the **Renieramycins** from sponges.

Carnivorous gastropods of the genus *Conus* produce a vast series (there appear to be tens of thousands of chemically distinct compounds) of highly toxic peptides the **Conotoxins**, which are delivered to the prey by means of a highly specialised injecting organ. Other toxic molluscs lack this specialised delivery system and administer

toxins through the radula. Such toxins are complex alkaloids related to **Tetrodotoxin** and **Surugatoxin** and are bacterial products (see also under fish, below).

The bivalve toxins (**Yessotoxins**, **Pectenotoxins**, **Pinnatoxins**, **Azaspiracids**, **Saxitoxins**) responsible for various kinds of shellfish poisoning are mostly produced by commensal dinoflagellates and have been mentioned above. There are differences in the distribution of different members of the saxitoxin series between the tissues of the bivalves and the originating dinoflagellates.

The kidneys of the giant clam *Tridacna maxima* concentrate up to 0.1% of arsenic, the function of which is unknown. It is stored as various dimethylarsinoylribosides.

Molluscs: From Chemico-ecological Study to Biotechnological Application; Progress in Molecular and Submolecular Biology, (eds. Cimino, G. *et al*), Springer, 2006, **Vol. 43** (*book*)

3.14 Echinodermata (ZW)

These organisms are characterised by a radially symmetrical body plan, (which is acquired in the adult stage, the larvae being bilaterally symmetrical) and a unique system of respiration through water-filled tube feet which also provide locomotion. There is a calcareous endoskeleton. This is the largest phylum of exclusively marine animals, with about 7000 species known. They may be herbivores, suspensivores, detritivores, carnivores or necrophages, and the carnivorous species may prey for example on corals or other echinoderms. There are many examples of commensalism and parasitism between echinoderms and other organisms.

Although various classification schemes for echinoderms differ in detail, five main groups are generally recognised. The taxonomy used in this Dictionary follows the Catalogue of Life scheme. The most primitive, widely represented in the fossil record, are the Crinoids (ZW1000) in which the mouth and anus are on the same surface. They have a planktonic larval form followed by an adult form which may be sessile (sea lilies) or mobile (feather stars). The other four groups, in which the mouth and anus are on opposing faces, are the starfish (Asteriodea) (ZW2000), sea urchins (Echinoidea) (ZW3000), sea cucumbers (Holothuroidea) (ZW4000) and brittle stars (Ophiurioidea) (ZW5000).

The presence of steroidal saponins of different types in the starfish and in the sea urchins is unique in the animal kingdom, and serves to delineate them from the other echinoderms and from each other. Other characteristic markers are the dominance of 3α-hydroxylated steroids in the ophiurians, and of quinonoid pigments of different types in the crinoids and in the sea urchins.

The various types of echinoderm produce a variety of specialised polysaccharides, the study of which is still in its infancy. One which has been characterised is **Frondecaside**. The lipid content of sea urchins and ophiurians is high in polyunsaturates. The starfish have been relatively little investigated but appear to follow the same pattern, with some prostanoid precursors. A high proportion of branched-chain acids have been isolated from sea cucumbers, but these are probably of bacterial origin. Phospholipids and glycosphingolipids appear to be universally present in echinoderms and a wide range of structural types of ceramides and cerebrosides have been isolated from starfish (see **Acanthacerebrosides**, **Astrocerebrosides** and similar compounds) and holothuroids.
About 30 different carotenoids have been characterised from sea urchins, mostly from the gonads, including the apocarotenoid **Paracentrone**, and others from ophiuroids (**Ophioxanthin**). The starfish are pigmented by carotenoids derived from the food chain and often modified by the introduction of oxo functions to give pigments of bluer colour, such as **Adonixanthin**.

Throughout the echinoderms, halogenation is rare and found only in a few anthraquinone pigments such as the **Gymnochromes** (from crinoids). There are also few alkaloids of greater complexity than a range of aliphatic amines. The few exceptions to this generalisation are very probably derived from organisms such as dinoflagellates present in the food chain. **Asterina 330** is a mycosporin analogue related to such compounds found in cnidarians. The identification of some unusual sulfur compounds is also noteworthy, for example the **Hedathiosulfonic acids**.

As noted above, the type and extent of steroid content is a major distinguishing feature of different types of echinoderm. The crinoids and echinoids have been little studied, but appear to contain exclusively 'classical' steroid types closely related structurally to cholesterol. The ophiurians, which in some respects are intermediate between the primitive crinoids and the more highly evolved echinoderms, contain many 3α-hydroxysteroids with only one or two glycosides. In the starfish, the range of glycosides and of steroid sulfates is extensive, derived from a wide range of side-chain modified parent steroids, which, however, are mostly 3β-hydroxylated. The side chain may be degraded (e.g. **Asterosterol**, **Hermaphrodiol**) or cyclopropanated (**Acanthasterol**). Polyhydroxylation/

O-sulfation of the steroid nucleus, which is widespread in marine organisms, is at its most extensive here. The glycosides, such as the **Asterosaponins** play a role in chemical defence through their surface-active properties. Both pentose and hexose residues are found.

The holothurians contain many steroids, some biosynthesised *de novo* from acetate via lanostane triterpenes, others apparently derived from the diet. In *Holothuria*, it has been shown that two biosynthetic routes operate, one via **Lanosterol** and the other via **Parkeol**. These biosynthetic routes provide steroids with all combinations of presence or absence of the methyl groups at *C*-4 and *C*-14, as well as side chain variations (cholestane, ergostane and further additional carbons). The chief distinguishing feature of the holothurians, however, is the exclusive occurrence of specialised triterpenoid glycosides of the holostane type, the prototype for which is **Holothurinogenin** but with well over 100 currently known. These appear to be derived biogenetically via Parkeol. A smaller group showing (19→16) lactonisation is based on **Posietogenin**.

Examples of the anthraquinonoid pigments that are readily extracted from crinoids include **Ptilometric acid**. Some of these are O-sulfates, e.g. **Comantherin sulfate**. The sea urchin pigments however are exclusively naphthoquinonoid, e.g. the **Spinochromes**. The number of alkaloid-like compounds isolated from echinoderms is extremely limited, e.g. **Asterina 330** (a palytoxin analogue).

3.15 Crustacea (ZX8000)

The crustaceans, including the decapods, are the only type of animals in the vast arthropod phylum (ZX) that occur to any extent in the sea. (There is also the horseshoe crab *Limulus*, an ancient animal related to the arachnids, and which has a few mentions in this Dictionary, and a few saline-tolerant millipedes living in shore environments). In the past the crustaceans have been considered a separate phylum, but they are now often considered a major subphylum of the arthropods having in common the hard chitinous exoskeleton and the body divided into head, thorax and abdomen. About 60,000 species are known, some of them (ostracods, e.g. *Cypridina*, and copepods, e.g. *Calanus*) very small planktonic organisms. The best-known large species are the decapods (crabs and lobsters). **Chitin**, derived industrially from crab shells, is an important industrial material.

Chemical studies on crustaceans have been fragmentary and are mostly confined to their carotenoid pigments, some of which have also been obtained from other marine organisms but which were originally characterised as crustacean products. These are mostly derived by a variety of oxygenations of the terminal rings of the carotenes, and include **Astaxanthin**, **Crustaxanthin**, **Zeaxanthin** and various others.

The moulting hormones of crustaceans are terpenoid (**Methylfarnesate**) and steroidal (**Ecdysone/Crustecdysone**), the latter being common to insects also. Steroid studies have been fragmentary and have indicated a preponderance of cholesterol and closely related compounds. Various endohormones such as testosterone, similar to their mammalian equivalents, have been shown to be present in crustaceans but these are mostly not included in the Dictionary.

The simple pyridine **Homarine** and the arsenical **Arsenobetaine** are widespread in nature but were first isolated from crustaceans.

3.16 Hemichordata (ZY1000)

This is a numerically limited class of animal (about 100 species recorded), consisting of two surviving types of organism; the acorn worms (Enteropneusts) inhabiting temperate and tropical waters, and the pterobranchs, colonial animals inhabiting chitinous tube galleries and found in polar waters. There is differentiation of the body into three well-defined zones, and they have some but not all of the morphological characters that define the chordates. Two types of natural product have been identified from them. The first is a range of toxic cyclohexanes (e.g. **Bromoxone**), halogenated phenols (e.g. **2,4-Dibromophenol**) and halogenated indoles (**Glossobalol**) isolated from *Ptychodera, Balanoglossus* and *Glossobalanus* spp. respectively. These are used by the worms as defence chemicals, and are of environmental significance. Of greater biochemical interest are the highly cytotoxic disteroidal metabolites the **Cephalostatins** from *Cephalodiscus gilchristi.* Owing to the difficulty of culturing hemichordate species, there is no information currently available concerning their possible distribution elsewhere in the phylum, or on their biosynthesis.

3.17 Protochordata (ZY5000)

These simplest chordate animals are generally divided into two unequal groups; the urochordates (tunicates) and the cephalochordates which are free-swimming bilaterally symmetrical animals (*Amphioxus*). Protochordates are the most developed of the invertebrates and have a notochord which is the evolutionary precursor of the spinal column characteristic of the vertebrates. They are exclusively marine. The larger group of urochordates is divided into three classes. Of these, two, including the free-floating salps, have been little investigated.

Most chemical studies have been on the third group, the sessile ascidians or sea squirts. These are filter feeders, often harbouring commensal cyanobacteria and other organisms which may be the true source of some of the reported natural products. Their chemistry is dominated by the presence of an extraordinary range of mostly biologically potent nitrogen compounds. The ascidians also famously accumulate vanadium to a very high concentration in specialised cells, and some have highly acidic tissues (down to pH 1). Other metals are also accumulated, as shown by the presence of **Tunichlorin**, probably the product of metabolism of a commensal organism.

The epidermis of ascidians contains a range of sulfated glycans, including some unusual residues such as L-Iduronic acid, and the unusual polysulfated polymannose **Kakelokelose**. The membrane lipids have been little studied, and presumably are close to those of other higher organisms in structure. A few oxylipins have been isolated, such as **Didemnilactone** and **Lissoclinolide**. Ceramides and cerebrosides appear to be widespread as in the echinoderms, with some unusual types such as **Didemniserinolipids** isolated. Ascidians contain a range of carotenoids, both common ones and some rarer ones such as **Halocynthiaxanthin** and **Amarouciaxanthins** probably derived from metabolic alteration of commoner carotenoids present in the filtered plankton. The steroids so far identified lack the wide structural range shown by the echinoderms and are mostly straightforward cholestanes and ergostanes, with some 5,8-epidioxysteroids and secosteroids, e.g. **Aplidiasterols**. The **Ritterazines** from *Ritterella* have disteroid structures linked by a central pyrazine ring, showing close structural similarity to the cephalostatins from hemichordates.

Non-nitrogenous secondary metabolites are few in number. These include some small acetogenins such as the **Didemnenones**. Terpenoids are rare; the **Haterumaimides** are unusual not only in being diterpenes but also in being chlorinated; however, they may derive from *Prochloron* symbionts. *Ritterella* spp. provided some furanoterpenoids related to Dendrolasin such as **8-Hydroxydendrolasin** but Dendrolasin itself was not present, and the depth of dredging would rule out a sponge symbionts, so their origin is obscure. Several series of meroterpenoids have been isolated, especially from the Polyclinidae, such as the **Verapliquinones** and the structurally complex ansa-compounds the **Longithorones** from *Aplidium*.

Among the nitrogenous metabolites, many of which doubtless also spring from commensal organisms, there is a very wide range of structure including some with, and some without, analogies in other phyla.

Firstly, there is an extensive range of modified peptides and depsipeptides. Several series of these are macrocyclic thiazoles and oxazoles, for example the **Comoramides**, the **Bistratamides**, the **Lissoclinamides** and the **Patellamides**. Other cyclic depsipeptides are more strictly peptide-related, although containing a range of unusual amino acids. The most studied have been the **Didemnins** and their relatives.

Heterocyclic alkaloids are numerous and include the extensive range of pyrroloisoquinolines the **Lamellarins** which were first isolated from molluscs but which are the products of ascidians on which they prey, or possibly of a symbiotic association involving sponges. These, like the **Ningalins**, are probably derived biosynthetically from **DOPA**. Quinoline alkaloids are represented by the **Trididemnic acids** and the basic quinoline ring system is further elaborated into pyridoacridines, e.g. **Ascididemin** and other polycycles. These too are also found in other marine organism classes. In the ascidians they fulfil the role of pigmentation, and are also mostly cytotoxic.

Indole alkaloids are also numerous, again known mostly as polycyclic condensed systems, e.g. **Fascaplysin**. For a fuller count of the numerous ascidian alkaloids, it is necessary to search the main body of the Dictionary.
Ascidians also contain a wide range of sulfur compounds, both sulfur-heterocycles and polysulfides, such as the aromatic **Lissoclinotoxins**.

Davidson, B.S., *Chem. Rev.,* 1993, **93**, 1771–1791 (*rev*)

3.18 Pisces (fish) (ZZ1000)

The fish represent the most numerous of marine vertebrates. They are well studied taxonomically and extensively documented in the online database *Fishbase* (a contributor database to the Catalogue of Life). They can be divided into cartilaginous fishes (e.g. sharks), and the larger category of bony fishes, considered to be the more highly evolved. Their commercially important lipids have been extensively studied; see for example **Squalene**.

The cartilaginous fishes contain a wide range of polyhydroxylated nitrogenous and non-nitrogenous sterols, based on 5β-cholestane. Examples are **Chimaerol** and the important drug **Squalamine**. The colour of different fish is due to the presence of various carotenoids and xanthophylls, including **Astaxanthin**, **Salmoxanthin**, **Idoxanthin** and **Tunaxanthins**.

The sexual development of many species of fish is determined by the presence of steroids in the water. Many of the studies have been on freshwater species such as the goldfish, but 17α,20β-Dihydroxypregn-4-en-3-one as its 20-sulfate is known to be a hormone of the male Atlantic salmon together with Testosterone.

The fish products that have received the most chemical attention, apart from the lipids, are the toxins produced by various species. These may be steroidal (e.g. **Pavoninins**), peptide (**Grammistins**) or alkaloid-like, such as the much-studied **Tetrodotoxin** and its relatives from fugu fish (various species of the Tetraodontidae). The latter, however, are metabolites of *Pseudomonas* bacteria or dinoflagellates in the fish, and are also found in other marine organisms and even terrestrial ones.

Some fish secrete peptide venoms in specialised spines to deter prey. An example is the powerful poison **Stonustoxin** from the stonefish.

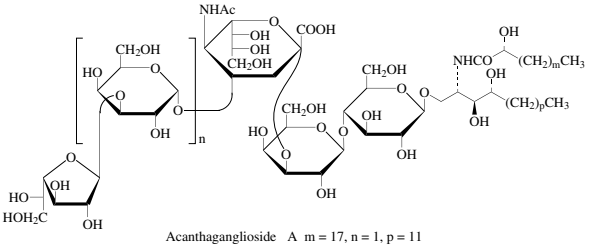
Acanthacerebroside F A-42

[110744-76-8]
As Acanthacerebroside D, A-40 with
R = $(CH_2)_{21}CH_3$
$C_{48}H_{91}NO_9$ 826.248
Cerebroside from the starfish *Acanthaster planci*. Needles + $2H_2O$ (MeOH). Poorly sol. H_2O, Me_2CO.
Mp 193-194°. $[\alpha]_D$ +1.2 (c, 0.5 in propanol).

Kawano, Y. *et al., Annalen*, 1988, 19-24 (*isol, pmr, cmr, struct*)
Sugiyama, S. *et al., Annalen*, 1988, 619-625 (*abs config*)

Acanthagangliosides A-H A-43



Acanthaganglioside A m = 17, n = 1, p = 11
B m = 13, n = 1, p = 17
C m = 21, n = 1, p = 11
D m = 13, n = 2, p = 17
E m = 21, n = 2, p = 11
F m = 18, n = 1, p = 11
G m = 20, n = 1, p = 11
H m = 21, n = 1, p = 12

Glycosphingolipid complex. Struct. revised in 1997. Constit. of the water soluble lipid fraction of the starfish *Acanthaster planci*.

Acanthaganglioside A [121038-38-8]
$C_{71}H_{130}N_2O_{33}$ 1539.802
Needles (MeOH aq.). Mp 156-158°. $[\alpha]_D^{25}$ +27.9 (c, 0.2 in MeOH aq.).

Acanthaganglioside B [121038-37-7]
$C_{73}H_{134}N_2O_{33}$ 1567.855
Needles (MeOH aq.). Mp 155-157°. $[\alpha]_D^{25}$ +16.7 (c, 0.2 in MeOH aq.).

Acanthaganglioside C [121038-31-1]
$C_{75}H_{138}N_2O_{33}$ 1595.909
Needles (MeOH aq.). Mp 157-159°. $[\alpha]_D^{25}$ +19.4 (c, 0.2 in MeOH aq.).

Acanthaganglioside D [121038-32-2]
$C_{79}H_{144}N_2O_{38}$ 1729.997
Needles (MeOH aq.). Mp 161-163°. $[\alpha]_D^{25}$ +10.3 (c, 0.2 in MeOH aq.).

Acanthaganglioside E [121038-33-3]
$C_{81}H_{148}N_2O_{38}$ 1758.051
Needles (MeOH aq.). Mp 164-166°. $[\alpha]_D^{25}$ +8.1 (c, 0.2 in MeOH aq.).

Acanthaganglioside F
$C_{72}H_{132}N_2O_{33}$ 1553.828
Amorph. powder. Mp 160-162° dec. $[\alpha]_D^{27}$ +10 (c, 0.08 in $CHCl_3$/MeOH).

Acanthaganglioside G
$C_{74}H_{136}N_2O_{33}$ 1581.882
Amorph. powder. Mp 163-165° dec. $[\alpha]_D^{27}$ +16.8 (c, 0.3 in $CHCl_3$/MeOH).

Acanthaganglioside H
$C_{76}H_{140}N_2O_{33}$ 1609.936
Amorph. powder. Mp 163-165° dec. $[\alpha]_D^{27}$ +15.5 (c, 0.5 in $CHCl_3$/MeOH).

Kawano, Y. *et al., Annalen*, 1990, 43 (*isol*)

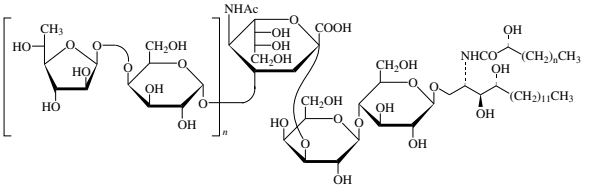
Acanthagangliosides I-J A-44



Acanthaganglioside I, n = 19
J, n = 21

Differ from Acanthagangliosides A-H, A-43 in having a terminal 4-fucofuranosyl residue in place of 3-galactofuranosyl. Isol. from lipid fraction of the starfish *Acanthaster planci*.

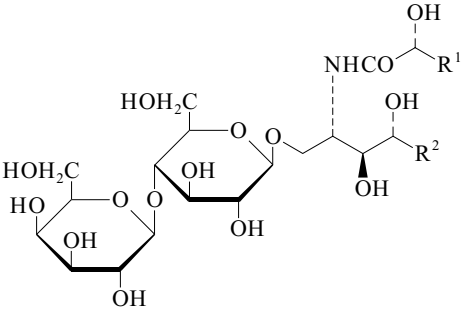
Acanthaganglioside I
Amorph. powder. Mp 159-161° dec. $[\alpha]_D^{24}$ +33 (c, 0.024 in $CHCl_3$).

Acanthaganglioside J
Amorph. powder. Mp 170-172° dec. $[\alpha]_D^{24}$ +40.8 (c, 0.015 in $CHCl_3$/MeOH 1:1).

Miyamoto, T. *et al., Eur. J. Org. Chem.*, 2000, 2295-2301 (*isol, pmr, cmr, struct*)

Acanthalactoside A A-45

[116635-90-6]



R^1 = $(CH_2)_{21}CH_3$, R^2 = $(CH_2)_{11}CH_3$

$C_{52}H_{101}NO_{15}$ 980.368
Constit. of the starfish *Acanthaster planci*. Needles + $2H_2O$ (MeOH).
Mp 196-198°. $[\alpha]_D$ +5.3 (c, 0.8 in $CHCl_3$/MeOH).

Kawano, Y. *et al., Annalen*, 1988, 1181-1183 (*isol, struct*)
Sugiyama, S. *et al., Annalen*, 1991, 349-356 (*synth*)

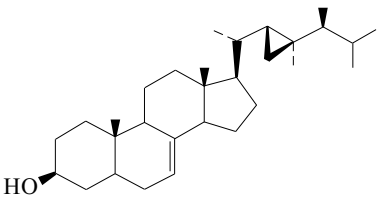
Acanthalactoside B A-46

[116635-91-7]
As Acanthalactoside A, A-45 with
R^1 = $-(CH_2)_{13}CH_3$, R^2 = $-(CH_2)_8CH{=}CH(CH_2)_7CH_3$(*Z*-)
$C_{50}H_{95}NO_{15}$ 950.298
Constit. of the starfish *Acanthaster planci*. Needles + $1H_2O$ (MeOH).
Mp 188-190°. $[\alpha]_D$ +8.5 (c, 0.5 in $CHCl_3$/MeOH).

Kawano, Y. *et al., Annalen*, 1988, 1181-1183 (*isol, struct*)

Acanthasterol A-47

Acansterol
[31653-84-6]

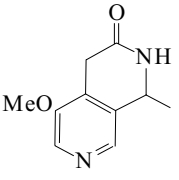


$C_{30}H_{50}O$ 426.724
Constit. of *Acanthaster planci*. Cryst.
Mp 179-180°. $[\alpha]_D^{21}$ +5 ($CHCl_3$).

Gupta, K.C. *et al., Tetrahedron*, 1968, **24**, 5831 (*isol*)
Sheikh, Y.M. *et al., Chem. Comm.*, 1971, 217 (*isol*)

Acanthicifoline A-48

[76193-60-7]

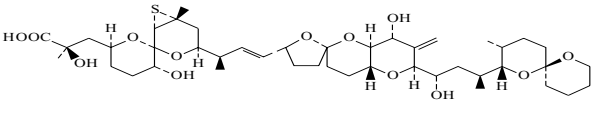


$C_{10}H_{12}N_2O_2$ 192.217
Alkaloid from *Acanthus ilicifolius* (Acanthaceae).
Mp 168-170°. $[\alpha]_D^{24}$ -31.6 ($CHCl_3$).

Tiwara, K.P. *et al., Pol. J. Chem. (Rocz. Chem.)*, 1980, **54**, 857 (*isol, uv, ir, pmr, ms, struct*)

Acanthifolicin A-49

Acanthifolic acid
[77739-71-0]



$C_{44}H_{68}O_{13}S$ 837.079
Polyether antibiotic. From *Pandaros acanthifolium*, prob. a metab. of a symbiotic bacterium. Shows cytotoxic and antitumour activity. Useful as growth stimulant or in treatment of coccidiosis. Ichthyotoxin. Phycotoxin. Protein phosphatase inhibitor. Smooth muscle contractor. Ionophoric agent. Cryst. ($CHCl_3/C_6H_6$). Sol. MeOH, hexane; poorly sol. H_2O, hexane. Mp 167-169°. $[\alpha]_D$ +25.3 (c, 0.08 in $CHCl_3$).
▶ LD_{50} (mus, ivn) 0.14 mg/kg.

Schmitz, F.J. *et al., J.A.C.S.*, 1981, **103**, 2467 (*isol, cryst struct, spectra*)

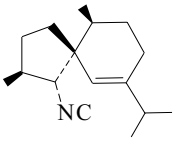
Acanthisonitrile 3 A-50

[112766-99-1]



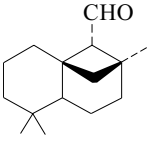
$C_{16}H_{25}N$ 231.38
Metab. of marine sponge *Acanthella acuta*. Oil. $[\alpha]_D$ -31.5 (c, 1.2 in $CHCl_3$).

Isothiocyanate: ***Acanthisothiocyanate 3***
[112767-00-7]
$C_{16}H_{25}NS$ 263.446
Metab. of *Acanthella acuta*. Oil. $[\alpha]_D$ -12.9 (c, 0.3 in $CHCl_3$). Has -NCS replacing -NC.

Mayol, L. *et al., Tetrahedron*, 1987, **43**, 5381-5388

Acanthodoral A-51

[90857-63-9]



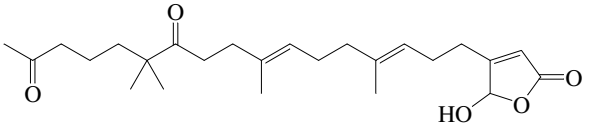
$C_{15}H_{24}O$ 220.354
Constit. of *Acanthodoris nanaimoensis.*
$[\alpha]_D^{22}$ +15.2 (c, 0.23 in $CHCl_3$). Optical rotation of natural product not detd., rotation refers to synthetic material.

4-Bromophenylurethane:
Cryst. (hexane). Mp 109-110°.

Ayer, S.W. *et al., J.O.C.*, 1984, **49**, 2653-2654 (*isol*)
Zhang, L. *et al., Org. Lett.*, 2004, **6**, 537-540 (*synth*)

Acantholide C A-52

[799808-30-3]



$C_{25}H_{38}O_5$ 418.572
Constit. of an *Acanthodendrilla* sp. Oil. $[\alpha]_D$ -58.2 (c, 1 in $CHCl_3$). λ_{max} 210 (MeOH).

Elkhayat, E. *et al., J. Nat. Prod.*, 2004, **67**, 1809-1817 (*isol, pmr, cmr*)

α-D-Pyranose-*form*

$C_{11}H_{19}NO_9$ 309.272

See also Sialic acids, S-172. Isol. from eggs, milk, colostrum, submaxillary mucin and meconium by acid or enzymic hydrol. of the constit. sialoproteins and oligosaccharides. Present in urine of patients with sialuria. Most abundant source is Collocalia mucoid, the nest cementing glycoprotein substance of the Chinese Swiftlet. Occurs in sialic acids of the starfish *Asterias rubens*. Chiral synthon. Antiinflammatory, antiviral and antitussive agent. Involved with blood protein half-life regulation, bacterial adhesion, toxin neutralisation, glycoprotein lytic protection.
Mp 185-187° dec. $[\alpha]_D^{22}$ -32 (H_2O). The only sialic acid formed in human tissues. Store below 0° in the dark.

α-Pyranose-*form*

8-Me ether: [41341-17-7]
$C_{12}H_{21}NO_9$ 323.299
Occurs in gangliosides of the starfish *Distolasterias nipon* and *Patiria pectinifera*.

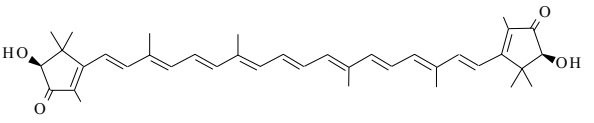
Actinioerythrol A-96

[22453-07-2]



$C_{38}H_{48}O_4$ 568.795
Constit. of *Actinia equina*. Red cryst. (MeOH).

Diacyl: ***Actinoerythrin***
[69020-32-2]
Isol. from *Actinia equina* and *Tealia felina*.
Red cryst.
Mp 91°. Nature of acylating residues not yet identified.

Diketone: 2,2′-Dinor-β,β-carotene-3,3′,4,4′-tetrone. Violerythrin
[22453-06-1]
$C_{38}H_{44}O_4$ 564.763
Obt. by alkaline hydrol. of Actinoerythrin. First known blue carotenoid. Blue cryst. ($CHCl_3$/hexane).
Mp 243° (236-238°). λ_{max} 544 (Me_2CO).

Dialcohol: 2,2′-Dinor-β,β-carotene-3,3′,4,4′-tetrol. Violerythrol
[22467-23-8]
$C_{38}H_{52}O_4$ 572.826
Cryst. (Et_2O). Mp 138°. Obt. as a mix of diastereoisomers.

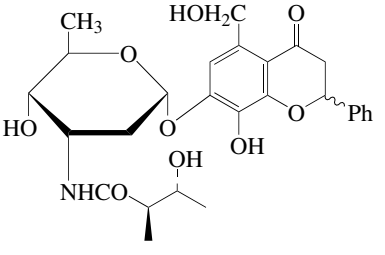
Actinoflavoside A-97

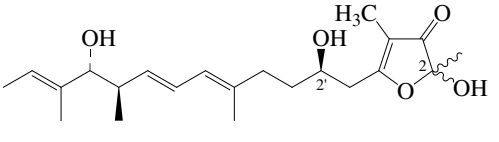
[194873-80-8]



$C_{27}H_{33}NO_9$ 515.559
Prod. by a marine *Streptomyces* sp. Non-cryst. solid. $[\alpha]_D$ -110 (c, 1.3 in MeOH). λ_{max} 232 (ϵ 19000); 282 (ϵ 18000); 325 (ϵ 4500) (MeOH).

Jiang, Z.-D. *et al., Tet. Lett.*, 1997, **38**, 5065-5068 (*isol, uv, ir, pmr, cmr*)

Actinofuranone A A-98



$C_{22}H_{34}O_5$ 378.508
1:1 Mixt. of C-2 epimers. Prod. by a marine-derived *Streptomyces* sp. (strain CNQ766). Yellow oil. $[\alpha]_D$ -20 (c, 0.1 in MeOH). λ_{max} 241 (log ϵ 4); 282 (log ϵ 3.8) (MeOH).

*2′-Deoxy, 2′,3′-didehydro(*E-*):* ***Actinofuranone B***
$C_{22}H_{32}O_4$ 360.492

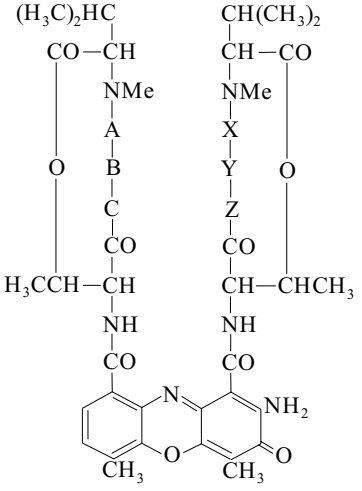
Prod. by *Streptomyces* sp. (strain CNQ766). Yellow oil. $[\alpha]_D$ -37 (c, 0.07 in MeOH). λ_{max} 241 (log ϵ 4); 317 (log ϵ 3.7) (MeOH).

Cho, J.Y. *et al., J. Nat. Prod.*, 2006, **69**, 425-428 (*isol, pmr, cmr*)

Actinomycin D, 9CI, 8CI, JAN A-99

Dactinomycin, BAN, INN. *Actinomycin IV. Actinomycin A_{IV}. Actinomycin Au_3. Actinomycin B_1†. Actinomycin B_{IV}. Actinomycin C_1. Actinomycin D_{IV}. Actinomycin Fo. Actinomycin I_1. Actinomycin S_2. Actinomycin X_1. Auranthin A 3. Auranthin C. Cosmegen. Cosmogen. Meractinomycin. Oncostatin K. NSC 3053. Chuoungwamycin B*

[50-76-0]



A = X = Sar,
B = Y = L–Pro
C = Z = D–Val

$C_{62}H_{86}N_{12}O_{16}$ 1255.432

Depsipeptide antibiotic. Isol. from *Streptomyces parvulus* and other *Streptomyces* spp. Active against gram-positive bacteria and malignant neoplasms. Red rhomboids + $3H_2O$ (EtOH). Mp 246-247°. $[\alpha]_D^{28}$ -315 (c, 0.25 in MeOH). Log P 7.32 (uncertain value) (calc). Intercalates DNA and can cause single strand breaks in DNA. λ_{max} 288 (ϵ 12500); 342 (ϵ 21200); 445 (ϵ 5770) (pH 13/5 h) (Derep). λ_{max} 240 (ϵ 30000); 426 (ϵ 21000); 427 (sh) (ϵ); 442 (ϵ 22300) (MeOH) (Derep).

▶ Skin irritant. Dermatitis, gastrointestinal effects and bone-marrow depression reported when used therapeutically. LD_{50} (rat, orl) 7.2 mg/kg. Exp. carcinogenic, reprod. and teratogenic effects. AU1575000

N,N′-*Di-de-Me:* **N,N′-*Didemethylactinomycin D.*** *Auranthin 3B*
$C_{60}H_{82}N_{12}O_{16}$ 1227.379
Prod. by *Streptomyces* sp. Orange-yellow powder. Sol. MeOH, C_6H_6; poorly sol. H_2O, hexane. λ_{max} 240; 442 (MeOH).

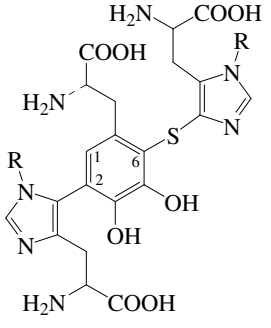
Adenochrome A-104



R = H or Me
Adenochromine A

Iron containing compd. which has been isolated as its deferri-deriv. Consists of a mixture of peptides derived from glycine and 3 isomeric amino acids Adenochromines A, B and C. Struct. of Adenochromine A shown. B and C have ortho- and meta- arrangements respectively of the two (histidinylthio) groups. Pigment from the branchial heart of *Octopus vulgaris*. Violet.

$C_{36}H_{54}O_9S_2$ 694.949
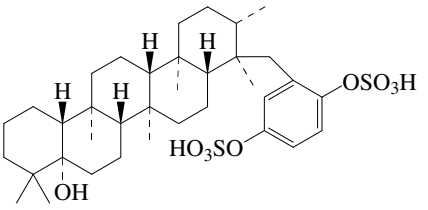
Constit. of a *Haliclona* (*Adocia*) sp. Amorph. solid. $[\alpha]_D$ -10.9 (c, 0.15 in MeOH). λ_{max} 265 (ϵ 415) (MeOH).

Blackburn, C.L. *et al., J.O.C.*, 1999, **64**, 5565-5570 (*isol, pmr, cmr*)

Adociasulfate 8 **A-114**

[242486-90-4]

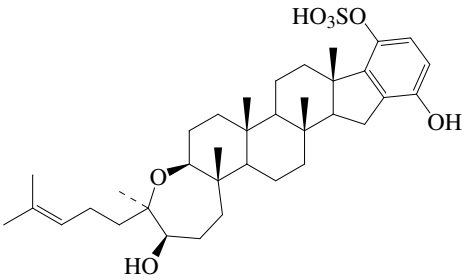


$C_{36}H_{56}O_9S_2$ 696.965
Constit. of an *Adocia* sp. Amorph. powder. $[\alpha]_D^{26}$ +18 (c, 0.19 in MeOH). λ_{max} 296 (ϵ 982) (MeOH).

Kalaitzis, J.A. *et al., J.O.C.*, 1999, **64**, 5571-5574 (*isol, pmr, cmr*)

Adociasulfate 9 **A-115**

[252034-37-0]

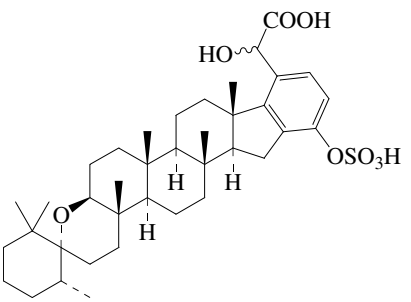


$C_{36}H_{54}O_7S$ 630.884
Constit. of *Adocia aculeata*. Powder. $[\alpha]_D^{25}$ +6.9 (c, 0.14 in MeOH). λ_{max} 216 (log ϵ 8.45); 272 (log ϵ 7.24) (no solvent reported).

Kalaitzis, J.A. *et al., J. Nat. Prod.*, 1999, **62**, 1682-1684 (*isol, pmr, cmr*)

Adociasulfate 10 **A-116**

[313503-82-1]



$C_{38}H_{56}O_8S$ 672.922
Constit. of a *Haliclona* (*Adocia*) sponge. Solid. $[\alpha]_D$ -30.2 (c, 0.57 in MeOH). λ_{max} 265 (ϵ 978) (MeOH).

Blackburn, C.L. *et al., Tetrahedron*, 2000, **56**, 8429-8432 (*isol, pmr, cmr*)

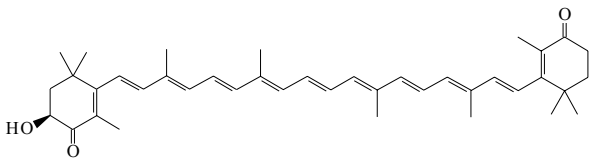
Adociavirin **A-117**

Homodimeric protein. Isol. from the New Zealand sponge *Adocia* sp. Shows anti-HIV activity.

O'Keefe, B.R. *et al., FEBS Lett.*, 1998, **431**, 85-90 (*isol*)

Adonirubin A-118

3-Hydroxy-β,β-carotene-4,4′-dione. Phoenicoxanthin
[4418-72-8]

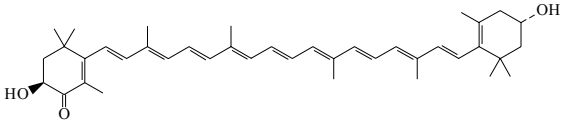


$C_{40}H_{52}O_3$ 580.849
Red pigment from feathers of flamingos (e.g. *Phoenicopterus ruber*) and from flowers of *Adonis annua*. Constit. of various crustaceans and sea urchins. Serves as prosthetic group for carotenoprotein alloporin. Red-violet plates (CH_2Cl_2/MeOH). Mp 214-216°. λ_{max} 478 (C_6H_6).

Englert, G. *et al., Helv. Chim. Acta*, 1975, **58**, 2367 (*cmr*)
Cooper, R.D.G. *et al., J.C.S. Perkin 1*, 1975, 2195
Bernhard, K. *et al., Helv. Chim. Acta*, 1981, **64**, 2469 (*synth*)
Berger, H. *et al., Comp. Biochem. Physiol., B: Comp. Biochem.*, 1982, **71**, 253 (*biochem*)
Straub, O. *et al., Key to Carotenoids*, 2nd edn., Birkhauser Verlag, Basel and Boston, 1987, 391 (*bibl*)

Adonixanthin A-119

3,3′-Dihydroxy-β,β-caroten-4-one. β-Doradexanthin. 3,3′-Dihydroxyechinenone. 4-Ketozeaxanthin
[80183-56-8]



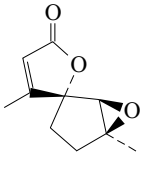
$C_{40}H_{54}O_3$ 582.865
Synth. by Wittig reaction. Isol. from green algae, red flowers of *Adonis annua*, various crustaceans and sponges. Red-violet cryst. (CH_2Cl_2/MeOH).
Mp 180-181°. λ_{max} 304, 481 nm ($CHCl_3$); 296, 458 nm (hexane); 474 nm (C_6H_6); 299, 468 nm (EtOH).

3-O-β-D-Glucopyranoside:
$C_{46}H_{64}O_8$ 745.007
Constit. of *Agrobacterium aurantiacum*. λ_{max} 476 nm (C_6H_6).

Egger, K. *et al., Phytochemistry*, 1965, **4**, 609 (*isol*)
Bernhard, K. *et al., Helv. Chim. Acta*, 1981, **64**, 2469 (*synth*)
Czeczuga, B. *et al., Comp. Biochem. Physiol., B: Comp. Biochem.*, 1984, **78**, 259 (*occur*)
Yokoyama, A. *et al., J. Nat. Prod.*, 1995, **58**, 1929 (*glucoside*)

Adriadysiolide A-120

[113540-73-1]

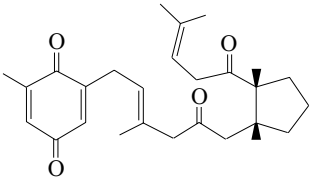


$C_{10}H_{12}O_3$ 180.203
Constit. of a *Dysidea* sp. of the Adriatic Sea. Powder.
Mp 76-77°. $[\alpha]_{435}^{20}$ +2.1 (c, 0.625 in MeOH).

Mancini, I. *et al., Helv. Chim. Acta*, 1987, **70**, 2011

Adriaticone A-121

2-[6-[1,2-Dimethyl-2-(4-methyl-1-oxo-3-pentenyl)cyclopentyl]-3-methyl-5-oxo-2-hexenyl]-6-methyl-2,5-cyclohexadiene-1,4-dione, 9CI
[97730-90-0]

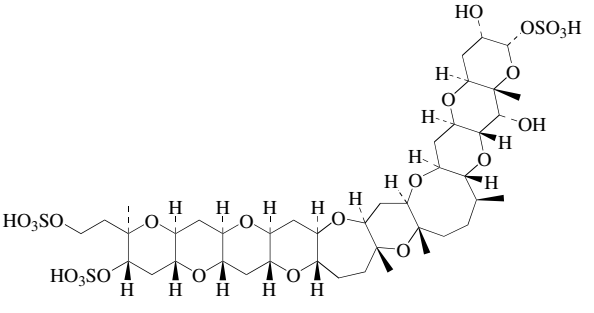


$C_{27}H_{36}O_4$ 424.579
Found in the brown alga *Cystoseira jabukae* and *Cystoseira adriatica*. Yellow oil. $[\alpha]_D^{20}$ +9.7 (c, 0.9 in EtOH). Poss. artifact.

Hydroquinone: ***Dihydroadriaticone****. 6-(2,5-Dihydroxy-3-methylphenyl)-1-[1,2-dimethyl-2-(4-methyl-1-oxo-3-pentenyl)cyclopentyl]-4-methyl-4-hexen-2-one, 9CI*
[97743-94-7]
$C_{27}H_{38}O_4$ 426.595
From *Cystoseira jabukae* and *Cystoseira adriatica*. Oil. $[\alpha]_D^{20}$ +8.5 (c, 2 in EtOH).

Amico, V. *et al., Phytochemistry*, 1985, **24**, 1047 (*isol, uv, ir, pmr, cmr, ms*)

Adriatoxin A-122



$C_{42}H_{66}O_{24}S_3$ 1051.167
Toxic constit. of the mussel *Mytilus galloprovincialis* from northern Adriatic Sea. λ_{max} 230 (MeOH) (Berdy).

Ciminiello, P. *et al., Tet. Lett.*, 1998, **39**, 8897-8900 (*isol, pmr*)

Aequorin A-123

Photoprotein, MW *ca.* 19500, containing 189 amino acid residues. Isol. from the jellyfish *Aequorea victoria*. Used in luminoassay of $Ca^{2\oplus}$ in biol. systems.

Shimomura, O. *et al., J. Cell. Comp. Physiol.*, 1962, **59**, 223-229 (*isol*)
Charbonneau, H. *et al., Biochemistry*, 1985, **24**, 6762-6771 (*struct*)

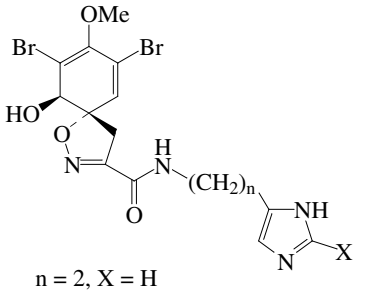
Aerophobin 1 A-124

[87075-24-9]



n = 2, X = H

$C_{15}H_{16}Br_2N_4O_4$ 476.124
Isol. from the sponges *Verongia aerophoba* and *Verongula rigida*. Also from *Tylodina perversa*.
Mp 164-167° (Ac). $[\alpha]_D$ +187 (c, 2.0 in MeOH).

Cimino, G. *et al., Tet. Lett.*, 1983, **24**, 3029 (*isol, pmr, cmr, ms, struct*)
Nishiyama, S. *et al., Bull. Chem. Soc. Jpn.*, 1985, **58**, 3453 (*synth*)

Teeyapant, R. *et al., Z. Naturforsch., C*, 1993, **48**, 640-644 (*isol*)

Aerophobin 2 A-125

[87075-23-8]
As Aerophobin 1, A-124 with
n = 3, X = NH_2
$C_{16}H_{19}Br_2N_5O_4$ 505.165
Isol. from the sponges *Verongia aerophoba* and *Aiolochroia crassa*.
$[\alpha]_D$ +139 (c, 1.9 in MeOH).

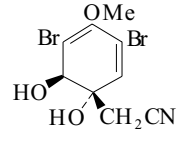
N-*Me (X = NHMe):* **N-*Methylaerophobin 2***
[209472-96-8]
$C_{17}H_{21}Br_2N_5O_4$ 519.192
Alkaloid from the sponge *Aiolochroia crassa*.

13,14-Dihydro, 14-oxo: ***14-Oxoaerophobin 2***
[232259-26-6]
$C_{16}H_{19}Br_2N_5O_5$ 521.165
Isol. from *Aplysina insularis.*

Cimino, G. *et al., Tet. Lett.*, 1983, **24**, 3029 (*Aerophobin 2*)
Assmann, M. *et al., Z. Naturforsch., C*, 1998, **53**, 398-401 (*N-Methylaerophobin 2*)
Fendert, T. *et al., Z. Naturforsch., C*, 1999, **54**, 246-251 (*14-Oxoaerophobin 2*)

Aeroplysinin 1 A-126

3,5-Dibromo-1,6-dihydroxy-4-methoxy-2,4-cyclohexadiene-1-acetonitrile, 9CI. 3,5-Dibromo-1-cyanomethyl-4-methoxy-3,5-cyclohexadiene-1,2-diol



(+)–*form*

$C_9H_9Br_2NO_3$ 338.983

(+)-*form* [28656-91-9]
Constit. of the sponges *Aplysina aerophoba (Verongia aerophoba*), *Aplysina archeri*, *Aiolochroia crassa*, *Verongula rigida*, *Psammaplysilla purpurea*, *Ianthella* sp. and others. Cytotoxic. Protein-tyrosine kinase inhibitor. Algicide, molluscicide. Sol. MeOH, Et_2O, Me_2CO; poorly sol. hexane.
Mp 120-121° (112-113°). $[\alpha]_D$ +193 (c, 0.63 in Me_2CO). $[\alpha]_D^{20}$ +185 (c, 0.17 in MeOH). λ_{max} 284 (ϵ 4910) (MeOH) (Derep). λ_{max} 231 (ϵ 3220); 284 (ϵ 4910) (MeOH) (Berdy).
▶ GU4735000

Di-Ac:
Cryst. (C_6H_6/petrol). Mp 114°. $[\alpha]_D$ +218 ($CHCl_3$).

(-)-*form*
Constit. of the sponges *Ianthella ardis*, *Verongula gigantea*, *Suberea creba*, *Psammaplysilla arabica* and *Pseudoceratina crassa*.
Mp 116-117°. $[\alpha]_D^{20}$ -176 (c, 0.125 in MeOH). $[\alpha]_D$ -198 (c, 0.5 in Me_2CO). λ_{max} 284 (ϵ 4910) (MeOH) (Derep).

(±)-*form*
Constit. of *Verongula gigantea* and *Aiolochroia crassa*.
Mp 153-154°. λ_{max} 284 (ϵ 4910) (MeOH) (Derep).

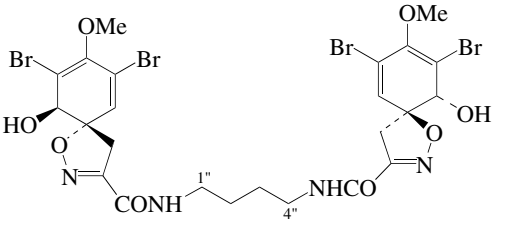
Aerothionin A-128

[28714-26-3]



$C_{24}H_{26}Br_4N_4O_8$ 818.107
Metab. from the sponges *Aplysina aerophoba* (*Verongia aerophoba*), *Aplysina fistularis* and *Aplysina thiona*, also from *Pseudoceratina durissima* and *Psammaplysilla purpurea*. Plates (Me_2CO/C_6H_6).
Mp 134-137° dec. $[\alpha]_D$ +252 (Me_2CO). λ_{max} 234 (ϵ 14450); 284 (ϵ 13490) (EtOH) (Derep). λ_{max} 284 (ϵ 12660) (MeOH) (Berdy).

Di-Ac:
Needles (Me_2CO). Mp 206-208°. $[\alpha]_D$ +236 ($CHCl_3$).

2′′-Hydroxy: ***11-Hydroxyaerothionin***
[73622-27-2]
$C_{24}H_{26}Br_4N_4O_9$ 834.107
Metab. from the verongid sponge *Pseudoceratina durissima* and by *Aplysina lacunosa*. Glass. $[\alpha]_D$ +189 (c, 0.15 in MeOH). λ_{max} 233 (ϵ 19780); 284 (ϵ 11100); 295 (ϵ 18900) (MeOH) (Berdy).

2′′,3′′-Dihydroxy: ***Dihydroxyaerothionin***
[122759-72-2]
$C_{24}H_{26}Br_4N_4O_{10}$ 850.106
Metab. of *Verongula rigida*. Powder.
Mp 162-164°. $[\alpha]_D^{25}$ -64.2 (c, 0.1 in MeOH).

2′′-Oxo: ***11-Oxoaerothionin***
[73622-23-8]
$C_{24}H_{24}Br_4N_4O_9$ 832.091
Metab. from the Caribbean sponge *Aplysina lacunosa* and from *Verongia cavernicola*. Exhibits pronounced and selective antitumour activity against human colon (HCT116) cell line. Powder. Sol. MeOH, $CHCl_3$; poorly sol. H_2O.
Mp 174.6-176.6° dec. $[\alpha]_D^{25}$ +181.15 (c, 2.17 in DMSO). λ_{max} 262 (ϵ 11600); 284 (ϵ 11500) (MeOH) (Berdy).

*2′′-Oxo, 3′′*R*-hydroxy:* ***12R-Hydroxy-11-oxoaerothionin***
[157544-68-8]
$C_{24}H_{24}Br_4N_4O_{10}$ 848.09
Metab. from the Caribbean sponge *Aplysina fistularis* forma *fulva*. $[\alpha]_D^{25}$ +160.7.

*2′′-Oxo, 3′′*S*-hydroxy:* ***12S-Hydroxy-11-oxoaerothionin***
[157497-57-9]
$C_{24}H_{24}Br_4N_4O_{10}$ 848.09
Metab. from the sponge *Aplysina fistularis* forma *fulva*. $[\alpha]_D^{25}$ +152.5.

Homologue: ***Homoaerothionin***
[34232-66-1]
[35036-48-7]
$C_{25}H_{28}Br_4N_4O_8$ 832.134
Constit. of the sponges *Aplysina aerophoba*, *Verongia thiona* and *Verongia cavernicola*. Amorph. solid.
Mp 166-167° (as di-Ac). $[\alpha]_D$ +191.5 ($CHCl_3$) (di-Ac). Has a C_5 bridging chain instead of C_4. λ_{max} 289 (ϵ 13348) (MeOH) (Berdy).

Homologue, 2′′-oxo: 11-Oxohomoaerothionin
[191112-17-1]
$C_{25}H_{26}Br_4N_4O_9$ 846.118
Constit. of *Aplysina cavernicola*. Has a C_5 bridging chain instead of C_4. λ_{max} 232 (ϵ 19000); 284 (10500) (MeOH).

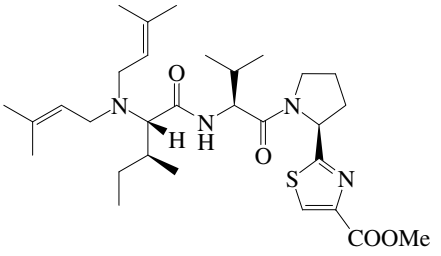
Aeruginosamide A-129

[241483-64-7]

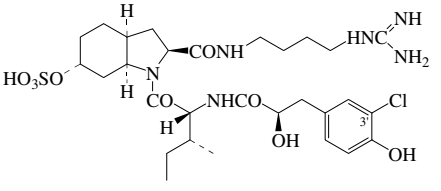


$C_{30}H_{48}N_4O_4S$ 560.8
Modified peptide antibiotic. Isol. from *Microcystis aeruginosa*. Moderate cytotoxic agent. Pale green oil. $[\alpha]_D$ -71.4 (c, 0.01 in $CHCl_3$).

Lawton, L.A. *et al., J.O.C.*, 1999, **64**, 5329-5332 (*isol, pmr, cmr, ir, ms*)

Aeruginosin 98A A-130

[167172-80-7]



Absolute Configuration

$C_{29}H_{45}ClN_6O_9S$ 689.228
Isol. from the blue-green alga *Microcystis aeruginosa* NIES98. Inhibitor of trypsin, thrombin and serine proteases. Amorph. powder. Sol. MeOH, H_2O. $[\alpha]_D$ -7.6 (c, 0.2 in H_2O). λ_{max} 279 (ϵ 1472) (H_2O) (Berdy).

5′-Chloro: ***Aeruginosin 101***
$C_{29}H_{44}Cl_2N_6O_9S$ 723.673
Isol. from *Microcystis aeruginosa*. Protease inhibitor. $[\alpha]_D$ -11 (c, 0.5 in MeOH aq.). λ_{max} 290 (ϵ 1810) (MeOH).

3′-Dechloro: ***Aeruginosin 98B***
[167228-01-5]
$C_{29}H_{46}N_6O_9S$ 654.783
Isol. from *Microcystis aeruginosa* NIES98. Inhibitor of trypsin, thrombin, plasmin and serine proteases. Amorph. powder. Sol. MeOH, H_2O. $[\alpha]_D$ -5.2 (c, 0.2 in H_2O). λ_{max} 276 (ϵ 1177) (H_2O) (Berdy).

3′-Dechloro, 3′-bromo: ***Aeruginosin 98C***
[167172-73-8]
$C_{29}H_{45}BrN_6O_9S$ 733.679
Isol. from *Microcystis aeruginosa* NIES98. Serine protease inhibitor. Powder. Sol. MeOH, H_2O. $[\alpha]_D$ -13 (c, 0.25 in H_2O). λ_{max} 281 (ϵ 860) (H_2O).

Murakami, M. *et al., Tet. Lett.*, 1995, **36**, 2785-2788 (*isol, pmr, cmr*)

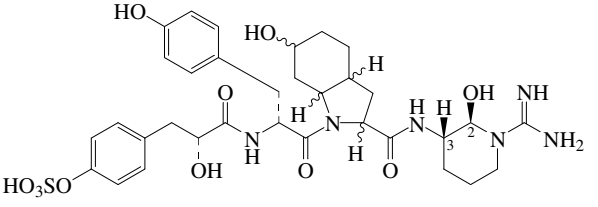
Aeruginosin 102A A-131

[173357-14-7]



$C_{33}H_{44}N_6O_{11}S$ 732.81

Isol. from the cyanobacterium *Microcystis aeruginosa* NEIS 102. Thrombin inhibitor. Amorph. powder. λ_{max} 275 (ϵ 1500) (MeOH).

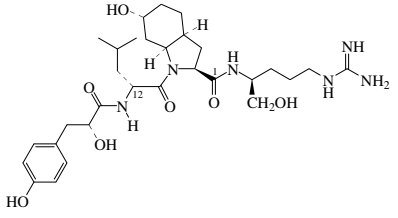
2-Et ether, O-*desulfo:* ***Aeruginosin 103A***
[211428-63-6]
$C_{35}H_{48}N_6O_8$ 680.8
Isol. from *Microcystis viridis* NEIS 102. Thrombin inhibitor. Amorph. powder. $[\alpha]_D$ -7.6 (c, 0.1 in MeOH). λ_{max} 224 (ϵ 11600); 274 (ϵ 2100) (H_2O).

3-Epimer: ***Aeruginosin 102B***
[173401-69-9]
$C_{33}H_{44}N_6O_{11}S$ 732.81
Isol. from *Microcystis viridis* NEIS 102. Thrombin inhibitor. Amorph. powder. λ_{max} 275 (ϵ 2300) (MeOH).

Matsuda, H. *et al., Tetrahedron*, 1996, **52**, 14501-14506 (*Aeruginosins 102A, 102B*)
Kodani, S. *et al., J. Nat. Prod.*, 1998, **61**, 1046-1048 (*Aeruginosin 103A*)

Aeruginosin 298A A-132

[156312-05-9]



Absolute Configuration

$C_{30}H_{48}N_6O_7$ 604.745
Abs. config. finally confirmed in 2001 after synth. Isol. from the freshwater blue-green alga *Microcystis aeruginosa* (NIES-298). Thrombin and trypsin inhibitor. Amorph. powder. Sol. H_2O, butanol, MeOH; poorly sol. Et_2O. $[\alpha]_D$ +22.3 (c, 0.36 in H_2O). λ_{max} 275 (ϵ 1166) (H_2O) (Berdy).

N^1-*De(argininolyl):* ***Aeruginosin 298B***
[249282-92-6]
$C_{24}H_{35}N_3O_6$ 461.557
Isol. from *Microcystis aeruginosa* (NIES-298). Obt. as a C-12 epimeric mixt. λ_{max} 277 (ϵ 2030) (MeOH).

N^1-*De(argininolyl), stereoisomer:* ***Aeruginosin EI 461***
$C_{24}H_{35}N_3O_6$ 461.557
Isol. from *Microcystis aeruginosa*. Oil. $[\alpha]_D^{25}$ +5 (c, 0.006 in MeOH).

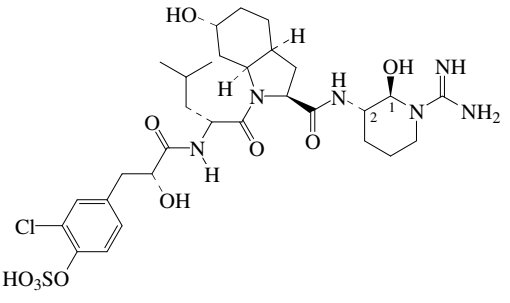
Aeruginosin 89B A-133

[249298-28-0]



$C_{30}H_{45}ClN_6O_{10}S$ 717.238
Isol. from *Microcystis aeruginosa*. Protease inhibitor. $[\alpha]_D^{23}$ +9.4 (c, 0.1 in MeOH). λ_{max} 283 (ϵ 1660) (MeOH).

Diastereoisomer: ***Aeruginosin 89A***
[249282-93-7]
$C_{30}H_{45}ClN_6O_{10}S$ 717.238
Isol. from *Microcystis aeruginosa*. Epimeric with Aeruginosin 89B at C-2. C-1 config. not determined.

Ishida, K. *et al., Tetrahedron*, 1999, **55**, 10971-10988

AF Toxin A-134

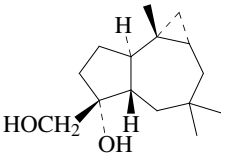
Anthopleura fuscoviridis *Toxin*
[109020-92-0]
Complex of two peptides designated AFT-I and AFT-II which consist of 47 and 48 amino acid residues respectively, and are crosslinked with 3 disulfide bridges. The sequences have high homology to those of toxins I and II from *Anemonia sulcata* and Anthopleurins A and B from *Anthopleura xanthogrammica*. Isol. from the sea urchin *Anthopleura fuscoviridis*. Not related to AF Toxin II.

[109020-93-1]

Sunahara, S. *et al., Toxicon*, 1987, **25**, 211-219 (*isol, struct*)

3,15-Africananediol A-135

9,15-Africananediol



3α-*form*

$C_{15}H_{26}O_2$ 238.369

3α-form [251453-75-5]
Constit. of *Sinularia intacta*.
Cryst. (Me_2CO/hexane).
Mp 122-125°. $[\alpha]_D^{25}$ +15.3 (c, 1.2 in $CHCl_3$).

3-Me ether: 3-Methoxy-15-africananol
[251453-76-6]
$C_{16}H_{28}O_2$ 252.396
Constit. of *Sinularia intacta*. Cryst. (Me_2CO/hexane).
Mp 118-120°. $[\alpha]_D^{25}$ -22 (c, 1.2 in $CHCl_3$).

3β-form [236126-36-6]
Constit. of *Sinularia dissecta*.
Cryst.
Mp 113°. $[\alpha]_D^{25}$ +13.8 (c, 1.25 in $CHCl_3$).

15-Ac: [251453-77-7]
$C_{17}H_{28}O_3$ 280.406
Constit. of *Sinularia intacta*. Oil. $[\alpha]_D^{25}$ -26 (c, 1.5 in $CHCl_3$).

Ramesh, P. *et al., J. Nat. Prod.*, 1999, **62**, 1019-1021 (*isol, pmr, cmr*)

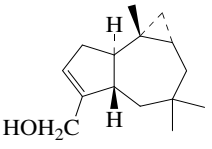
Ramesh, P. *et al., J. Nat. Prod.*, 1999, **62**, 1019-1021 (*epoxide*)

3-Africanen-15-ol A-139

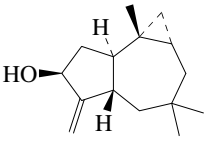
9-Africanen-15-ol
[376597-20-5]



$C_{15}H_{24}O$ 220.354
Constit. of *Sinularia dissecta*. Oil. $[\alpha]_D$ +6.43 (c, 0.45 in $CHCl_3$).
Ramesh, P. *et al., Indian J. Chem., Sect. B*, 2001, **40**, 867-868 (*isol, pmr, cmr*)

3(15)-Africanen-4-ol A-140

9(15)-Africanen-10-ol



$C_{15}H_{24}O$ 220.354

4β-*form* [236126-34-4]
Constit. of *Sinularia dissecta*.
Cryst. (hexane).
Mp 98°. $[\alpha]_D^{25}$ +19.1 (c, 1.2 in $CHCl_3$).
Ramesh, P. *et al., J. Nat. Prod.*, 1999, **62**, 1019-1021 (*isol, pmr, cmr*)

Agar A-141

Agar-agar. Gum agar. Gelose. Japan agar. Bengal isinglass. Ceylon isinglass. Chinese isinglass. Japan isinglass. FEMA 2012. E406
[9002-18-0]
See also Agarose, A-144. Consists of a mixt. of 2 polysaccharides, Agarose A-144 and Agaropectin, which has essentially the same struct. except that a variable proportion of the sugars in the polymer are replaced by 4,6-*O*-(1-carboxyethylidene)galactose or by sulfated or methylated sugar residues such as to retain the alternating sequence of 3-linked β-D- and 4-linked α-L- units. Distinguished from Carrageenan, C-140 by the presence of L-galacto residues and by the generally lower MW (mean ca. 120kDa but with a range of approx. 70-700). Mucilaginous substance extracted from red marine algae (Rhodophyceae); *Gelidiella acerosa*, various *Gelidium* spp. *Gracilaria confervoides*, *Pterocladia capillacea* and *Pterocladia lucida* are used in various parts of the world. There is some species variation in gel structure and strength. An important thickener, stabiliser and gelling agent in the food industry. Also used as protective colloid in photometric detn. of Sn, Mg, Si, $SO_4^{2\ominus}$. Solid medium for the cultivation of bacteria. Laxative-cathartic. Strips or fine powder. Sl. sol. in hot H_2O.

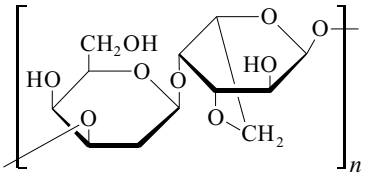
Agarose A-144

Neutral agarose. Indubiose A4
[9012-36-6]
[9036-61-7]



See also Agar, A-141. Composed of repeating units of β-D-Gal*p*-(1→4)-3,6-anhydro-α-L-Gal*p*-(1→3). Has a domain struct. of double helixes aggregating into a three-dimensional framework holding water molecules. Isol. from red seaweed agar (*Gelidium* spp.). Gives gels of high strength at low concs. in water which are nearly transparent. These are used commercially as gelling agents and for biomedical applications, e.g. electrophoresis media, chromatography and immunology assays.
There are two other polysaccharides in agar, one is similar to agarose but with 4,6-acetals of pyruvic acid at some of the D-galactose units. The other contains fewer 3,6-anhydro-L-galactose units and is sulfated.

Poly(6-aminohexyl) ether: Agarose (6-aminohexyl)carbamimidate. Sepharose AH
[58856-73-8]
Intermed. for the prepn. of affinity chromatog. absorbents. Non-stoichiometric.

Poly(5-carboxypentyl) ether: [55128-01-3]
Intermed. for the prepn. of affinity chromatog. absorbents. Non-stoichiometric.

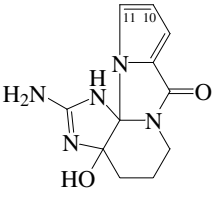
Agelaspongin A-160

[122893-39-4]



$C_{11}H_{13}N_5O_2$ 247.256

CA numbering shown. Synthetic. Cryst. (MeOH). Mp 220° dec.

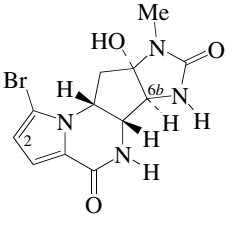
Hydrochloride:
Cryst. (EtOH). Mp 250° dec.

10,11-Dibromo: ***Dibromoagelaspongin***
[122893-38-3]
$C_{11}H_{11}Br_2N_5O_2$ 405.048
Glucanase inhibitor. Yellow-green cryst. (MeOH/Me_2CO) (as hydrochloride). Mp 233-235° dec. (hydrochloride). λ_{max} 235 (ϵ 11250); 290 (ϵ 7420) (MeOH) (Berdy).

Fedoreyev, S.A. *et al., Tetrahedron*, 1989, **45**, 3487 (*isol, uv, ir, pmr, cmr, ms, cryst struct*)

Agelastatin A A-161

[152406-28-5]



Absolute Configuration

$C_{12}H_{13}BrN_4O_3$ 341.164
Alkaloid from the sponge *Agelas dendromorpha* and *Cymbastela* sp. Exhibits marked cytotoxicity; insecticide. $[\alpha]_D^{20}$ -84.3 (c, 0.3 in EtOH) (as *N,N,O*-tri-Me). Not obt. completely pure. λ_{max} 203 (ϵ 12400); 232 (ϵ 8400); 279 (ϵ 11900) (EtOH) (Derep).

N-*De-Me:* ***Agelastatin D***
$C_{11}H_{11}BrN_4O_3$ 327.137
Alkaloid from the sponge *Cymbastela* sp. Insecticide. Solid. λ_{max} 227 (ϵ 7900); 277 (ϵ 10800) (MeOH).

2-Bromo: ***Agelastatin B***
[159903-65-8]
$C_{12}H_{12}Br_2N_4O_3$ 420.06
Minor alkaloid from *Agelas dendromorpha*.
$[\alpha]_D$ -84.4 (c, 0.49 in EtOH) (as *N,N,O*-tri-Me). Obt. as insep. mixt. with Agelastatin A but characterised as the tri-Me deriv.

*6*b-*Hydroxy:* ***Agelastatin C***
$C_{12}H_{13}BrN_4O_4$ 357.163
Alkaloid from the sponge *Cymbastela* sp. Cytotoxic; insecticide. Solid. $[\alpha]_D$ -5 (c, 0.06 in MeOH). λ_{max} 228 (ϵ 7900); 278 (ϵ 11000) (MeOH).

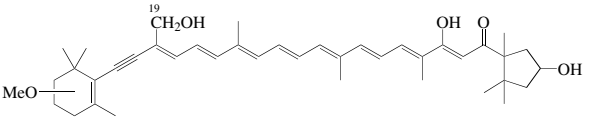
Agelaxanthin C A-163

[65684-23-3]



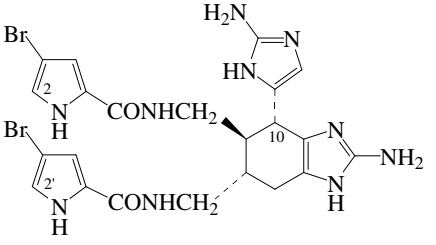
$C_{41}H_{56}O_5$ 628.89
Constit. of *Agelas schmidtii*. Cryst. (Et_2O/hexane).

19-Me ether: ***Agelaxanthin B***
[65497-25-8]
$C_{42}H_{58}O_5$ 642.917
Constit. of *Agelas schmidtii*. Tentative struct. assigned.

Buchecker, R. *et al., Helv. Chim. Acta*, 1977, **60**, 2780

Ageliferin A-164

[117417-64-8]



$C_{22}H_{24}Br_2N_{10}O_2$ 620.305
Alkaloid from the marine sponges *Agelas conifera*, *Agelas novaecaledoniae*, *Agelas* cf. *mauritiana* and *Xestospongia* sp. Potent actomyosin ATPase activator. Antifouling agent. Somatostatin antagonist. Sol. MeOH, EtOAc, $CHCl_3$; poorly sol. H_2O.

$[\alpha]_D^{33}$ +15.5 (c, 0.11 in MeOH). λ_{max} 204 (ϵ 25500); 220 (ϵ 27100); 267
(ϵ 25900); 393 (ϵ 300) (MeOH) (Derep).

1′-N-*Me:* ***1′*-N-*Methylageliferin***
[175861-97-9]
$C_{23}H_{26}Br_2N_{10}O_2$ 634.332
Alkaloid from the sponge *Astrosclera willeyana*. Pale yellow glass (as bis(trifluoroacetate)). $[\alpha]_D$ +40 (c, 0.01 in MeOH).

1,1′-Di-N-*Me:* ***N*^{1},N$^{1′}$-*Dimethylageliferin***
[175861-98-0]
$C_{24}H_{28}Br_2N_{10}O_2$ 648.359
Alkaloid from the sponge *Astrosclera willeyana*. Pale buff glass (as dihydrochloride). $[\alpha]_D$ +40 (c, 0.01 in MeOH).

2-Bromo: ***Bromoageliferin***
[117417-67-1]
$C_{22}H_{23}Br_3N_{10}O_2$ 699.201
Alkaloid from the sponges *Agelas conifera*, *Agelas* cf. *mauritiana* and *Astrosclera willeyana*. Potent actomyosin ATPase activator. Sol. MeOH, EtOAc, $CHCl_3$; poorly sol. H_2O. $[\alpha]_D^{33}$ +8.8 (c, 0.08 in MeOH). λ_{max} 203 (ϵ 30600); 220 (ϵ 26300); 270 (ϵ 24500); 396 (ϵ 700) (MeOH) (Derep). λ_{max} 204 (ϵ 15000); 222 (ϵ 12200); 274 (ϵ 12500); 396 (ϵ 700) (EtOH) (Berdy).

2-Bromo, 1′-N-*Me:* ***1′*-N-*Methyl-2-bromoageliferin***
[175862-01-8]
$C_{23}H_{25}Br_3N_{10}O_2$ 713.228
Alkaloid from the sponge *Astrosclera willeyana*. Off-white glass (as bis(trifluoroacetate)). $[\alpha]_D$ +50 (c, 0.01 in MeOH).

2′-Bromo, 1′-N-*Me:* ***1′*-N-*Methyl-2′-bromoageliferin***
[175862-02-9]
$C_{23}H_{25}Br_3N_{10}O_2$ 713.228
Alkaloid from the sponge *Astrosclera willeyana*. Off-white glass (as bis(trifluoroacetate)). $[\alpha]_D$ +40 (c, 0.01 in MeOH).

2,2′-Dibromo: ***Dibromoageliferin***
[117417-69-3]
$C_{22}H_{22}Br_4N_{10}O_2$ 778.098
Alkaloid from the sponges *Agelas conifera*, *Agelas* cf. *mauritiana* and *Astrosclera willeyana*. Potent actomyosin ATPase activator. Sol. MeOH, EtOAc, $CHCl_3$; poorly sol. H_2O. $[\alpha]_D^{33}$ +3 (c, 0.1 in MeOH). λ_{max} 204 (ϵ 12200); 220 (ϵ 9100); 278 (ϵ 8200); 394 (ϵ 300) (no solvent reported) (Derep). λ_{max} 202 (ϵ 24300); 214 (ϵ 24500); 274 (ϵ 25000) (MeOH) (Derep). λ_{max} 204 (ϵ 12200); 220 (ϵ 9100); 278 (ϵ 8200); 394 (ϵ 300) (EtOH) (Berdy).

2,2′-Dibromo, 1′-N-*Me:* ***1′*-N-*Methyl-2,2′-dibromoageliferin***
[175862-03-0]
$C_{23}H_{24}Br_4N_{10}O_2$ 792.124
Alkaloid from the sponge *Astrosclera willeyana*. Off-white glass (as bis(trifluoroacetate)). $[\alpha]_D$ +30 (c, 0.01 in MeOH).

3′-Debromo, 2′-bromo, 1′-N-*Me:* ***1′*-N-*Methylisoageliferin***
[175861-99-1]
$C_{23}H_{26}Br_2N_{10}O_2$ 634.332
Alkaloid from the sponge *Astrosclera willeyana*. Pale yellow glass (as bis(trifluoroacetate)). $[\alpha]_D$ +40 (c, 0.01 in MeOH).

3′-Debromo, 2′-bromo, 1,1′-di-N-*Me:* ***N*^{1},N$^{1′}$-*Dimethylisoageliferin***
[175862-00-7]
$C_{24}H_{28}Br_2N_{10}O_2$ 648.359
Alkaloid from the sponge *Astrosclera willeyana*. Off-white glass (as dihydrochloride). $[\alpha]_D$ +40 (c, 0.01 in MeOH).

10-Epimer: ***Nagelamide E***
[690627-58-8]
$C_{22}H_{24}Br_2N_{10}O_2$ 620.305
Alkaloid from an *Agelas* sp. Amorph. solid. $[\alpha]_D^{17}$ -11.3 (c, 1 in MeOH). λ_{max} 202 (ϵ 32000); 215 (sh) (ϵ 18000); 272 (ϵ 17200) (MeOH).

10-Epimer, 2-bromo: ***Nagelamide F***
[690627-59-9]
$C_{22}H_{23}Br_3N_{10}O_2$ 699.202
Alkaloid from an *Agelas* sp. Amorph. solid. $[\alpha]_D^{17}$ -14.1 (c, 1 in $CHCl_3$). λ_{max} 202 (ϵ 24000); 216 (sh) (ϵ 20100); 272 (ϵ 17700) (MeOH).

10-Epimer, 2,2′-dibromo: ***Nagelamide G***
[690627-60-2]
$C_{22}H_{22}Br_4N_{10}O_2$ 778.098
Alkaloid from an *Agelas* sp. Inhibitor of protein phosphatase 2A. Amorph. solid. $[\alpha]_D^{17}$ +6.7 (c, 1 in MeOH). λ_{max} 202 (ϵ 32000); 215 (sh) (ϵ 28900); 277 (ϵ 27400) (MeOH).

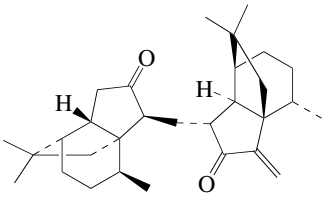
Alertenone A-194

[222735-88-8]



$C_{30}H_{44}O_2$ 436.676
Constit. of an *Alertigorgia* sp.
$[\alpha]_D$ +15.4 (c, 0.23 in $CHCl_3$). Dimer of Suberosenone, in S-529. λ_{max} 231 (ϵ 3500) (hexane).

Bokesch, H.R. *et al., J. Nat. Prod.*, 1999, **62**, 633-635 (*isol, pmr, cmr*)

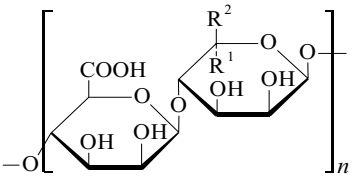
Alginate synthase A-195

E.C. 2.4.1.33. GDP-D-mannuronate:alginate D-mannuronyltransferase. Mannuronosyl transferase
[37257-31-1]
Hexosyltransferase enzyme. Isol. from the marine brown alga *Fucus gardneri*. Catalyses the reaction of GDP-D-mannuronate with $(alginate)_n$ to give GDP and $(alginate)_{n+1}$.

Lin, T.-Y. *et al., J. Biol. Chem.*, 1966, **241**, 5284-5297

Alginic acid, BAN A-196

Gum levan. Levan gum. Kelacid. Norgine. Sazio. E400
[9005-32-7]



R^1 = H, R^2 = COOH
or R^1 = COOH, R^2 = H

$[C_6H_8O_6]$

A polymer consisting of various proportions of β-D-Mannuronic acid and α-L-Guluronic acid linked 1 →4 and arranged in a block fashion. To a first approximation there are poly-M , poly-G and $(M\text{-}G)_n$ blocks of about 20 units with an overall degree of polymerisation of 1000-10,0000. Occurs as the major matrix polysaccharide in brown seaweed (Phaeophyceae) as an insol. complex of K, Na, Ca and Mg alginates. Extracted commerically from various genera incl. *Laminaria* (Europe and Japan), *Macrocystis* (N. America pacific coast), *Ascophyllum* (Europe) and *Ecklonia* (S. Africa). Alginates are used to improve food texture, e.g. in ice cream, pie fillings. Used in tablet disintegrants and paper coatings. Food additive: emulsifier, stabiliser, thickener. Pharmaceutical aid for preparation of water-miscible pastes, creams and gels. Co-administered with antacid or H_2-receptor agonist for management of gastro-oesophageal reflux. $[\alpha]_D$ -120 (as Na salt in H_2O). Approx. 200 grades of the acid and its salts (ammonium, Ca, K, Na) comly. available. Alginates with the highest guluronic acid content display the strongest gel-forming activity.

▶ AZ5775000

Na salt: Sodium alginate. Algin. E401
[9005-38-3]
Stabiliser, emulsifier, thickener, formulation aid; used in food processing.
Pale yellow-brown powder. Sol. H_2O; poorly sol. EtOH, hexane. λ_{max} 260 (H_2O) (Berdy).

▶ AZ5820000

K salt: Potassium alginate. E402
[9005-36-1]
Stabiliser, emulsifier, thickener, formulation aid; used in food processing. Insol. EtOH, Et_2O.

Ca salt: Calcium alginate. E404
[9005-35-0]
Stabiliser, emulsifier, thickener, formulation aid; used in food processing. Sl. sol. EtOH; insol. H_2O, Et_2O.

NH_4 salt: Ammonium alginate. E403
[9005-34-9]
Stabiliser, emulsifier, thickener, formulation aid; used in food processing. Insol. EtOH, Et_2O.

2-Hydroxypropyl ester: Propylene glycol alginate. Colloid 602. Dricoid. Kelcoloid. FEMA 2941. E405. Many other trade names
[39306-87-1, 51374-11-9, 52441-26-6, 57762-73-9, 59125-52-9, 95328-14-6]
Manuf. by reaction of alginic acid with propylene oxide.
White to yellowish fibrous or granular powder. Sol. H_2O.
Composition varies acc. to the degree of esterification.

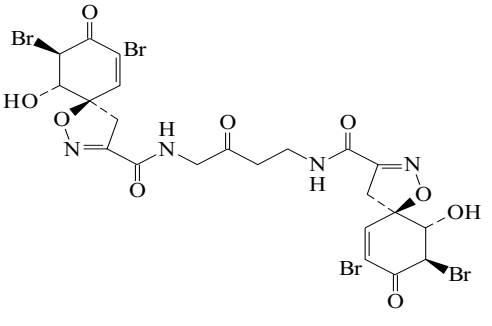
$C_{15}H_{25}Br_2ClO_2$ 432.622
Constit. of *Aplysia dactylomela*. Cryst. (EtOAc/hexane).
Mp 152-155°. $[\alpha]_D^{22}$ +18 (c, 0.4 in $CHCl_3$).

1-Deacetoxy, 8-deoxy: ***Deacetoxy-8-deoxyalgoane***
[251450-54-1]
$C_{15}H_{25}Br_2ClO$ 416.623
Constit. of *Aplysia dactylomela*. Cryst. (EtOAc/hexane).
Mp 138-142°. $[\alpha]_D^{22}$ +22.5 (c, 1.15 in $CHCl_3$).

McPhail, K.L. *et al., J. Nat. Prod.*, 1999, **62**, 1618-1623 (*isol, pmr, cmr, cryst struct*)

Aplysina archeri Alkaloid A-199

[179523-37-6]

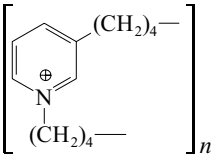


$C_{22}H_{20}Br_4N_4O_9$ 804.037

Probable abs. config. illus. Metab. from the Caribbean sponge *Aplysina archeri*. Shows antifungal activity. λ_{max} 252 (ϵ 7850) (MeOH).

Ciminiello, P. *et al., Tetrahedron*, 1996, **52**, 9863 (*isol, uv, ir, pmr, cmr, cd, struct*)

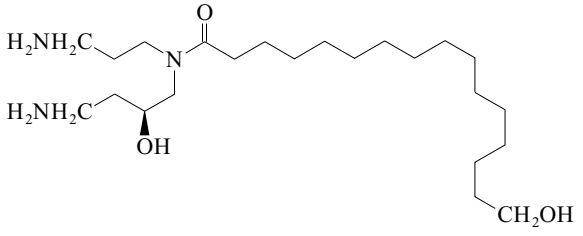
Callyspongia fibrosa Alkaloid A-200



High molecular weight oligomer or polymer. Alkaloid from the Micronesian sponge *Callyspongia fibrosa*. Inhibitor of the epidermal growth factor receptor.

Davies-Coleman, M.T. *et al., J.O.C.*, 1993, **58**, 5925

Fromia monilis Alkaloid A-201



$C_{23}H_{49}N_3O_3$ 415.658

(*S*)-*form* [162340-03-6]

Alkaloid from the New Caledonian starfish *Fromia monilis*. Cytotoxic agent. $[\alpha]_D$ +3.5.

Palagiano, E. *et al., Tetrahedron*, 1995, **51**, 3675 (*isol, pmr, cmr, struct*)

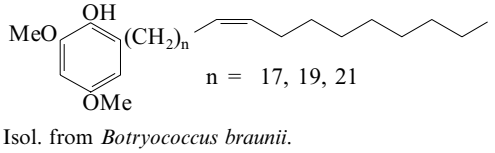
Pseudaxinyssa Alkaloid A-202

$C_9H_{14}BrN_5O$ 288.146

Struct. unknown. Isol. from the marine sponge *Pseudaxinyssa cantharella*. Amorph. $[\alpha]_D$ +15.

De Nanteuil, G. *et al., Tetrahedron*, 1985, **41**, 6019

2-Alkenyl-4,6-dimethoxyphenols A-203



Isol. from *Botryococcus braunii*.

2-(18-Heptacosenyl)-4,6-dimethoxyphenol [123219-94-3]

$C_{35}H_{62}O_3$ 530.873
n = 17.

2,4-Dimethoxy-6-(20-nacosenyl)phenol [123219-95-4]

$C_{37}H_{66}O_3$ 558.927
n = 19.

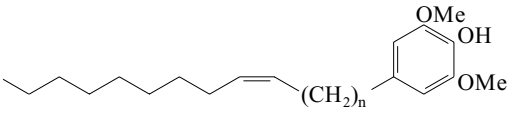
2-(22-Hentriacontenyl)-4,6-dimethoxyphenol [123219-96-5]

$C_{39}H_{70}O_3$ 586.98
n = 21.

[132210-27-6, 132210-28-7, 132210-29-8]

Metzger, P. *et al., Phytochemistry*, 1989, **28**, 2097; 1995, **40**, 543 (*isol*)

4-Alkenyl-2,6-dimethoxyphenols A-204



Isol. from *Botryococcus braunii*.

2,6-Dimethoxy-4-(16-pentacosenyl)phenol [168981-76-8]

$C_{33}H_{58}O_3$ 502.819
n = 15.

4-(18-Heptacosenyl)-2,6-dimethoxyphenol [168981-77-9]

$C_{35}H_{62}O_3$ 530.873
n = 17.

2,6-Dimethoxy-4-(20-nonacosenyl)phenol [168981-78-0]

$C_{37}H_{66}O_3$ 558.927
n = 19.

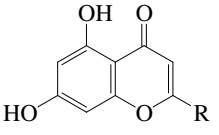
4-(22-Hentriacontenyl)-2,6-dimethoxyphenol [168981-79-1]

$C_{39}H_{70}O_3$ 586.98
n = 21.

Metzger, P. *et al., Phytochemistry*, 1995, **40**, 543-554 (*isol, ms*)

2-Alkyl-5,7-dihydroxy-4*H*-1-benzopyran-4-ones A-205

2-Alkyl-5,7-dihydroxychromones



5,7-Dihydroxy-2-pentadecyl-4*H*-1-benzopyran-4-one
5,7-Dihydroxy-2-pentadecylchromone
[82513-78-8]

$C_{24}H_{36}O_4$ 388.546
Isol. from the brown alga *Zonaria tournefortii*.
Mp 79-80°.

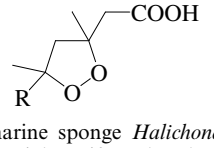
5,7-Dihydroxy-2-nonadecyl-4*H*-1-benzopyran-4-one
5,7-Dihydroxy-2-nonadecylchromone
[82513-79-9]

$C_{28}H_{44}O_4$ 444.653
Constit. of *Antidesma membranaceum*.

*4′,5′Z,7′,8′Z,10′,11′Z,13′,14′Z,16′,17′Z-Decakisdehydro: 5,7-Dihydroxy-2-(4,7,10,13,16-nonadecapentaenyl)-4*H*-1-benzopyran-4-one. 5,7-Dihydroxy-2-(4,7,10,13,16-nonadecapentaenyl)chromone*
[82513-77-7]
$C_{28}H_{34}O_4$ 434.574
Constit. of the brown alga *Zonaria tournefortii*.
Mp 53-54°.

Tringali, C. *et al., Tet. Lett.*, 1982, **23**, 1509-1512 (*Zonaria constits*)
Blackman, A.J. *et al., J. Nat. Prod.*, 1988, **51**, 158-160 (*nonadecapentaenyl, isol*)

5-Alkyl-3,5-dimethyl-1,2-dioxolane-3-acetic acids A-206



Isol. from a marine sponge *Halichondria* sp. Cytotoxic agents. Exhibit antibacterial, antifungal and antitumour activities.

3,5-Dimethyl-5-tridecyl-1,2-dioxolane-3-acetic acid, 9CI [115082-90-1]
$C_{20}H_{38}O_4$ 342.518
R = -$(CH_2)_{12}CH_3$.

3,5-Dimethyl-5-tetradecyl-1,2-dioxolane-3-acetic acid [115082-91-2]
$C_{21}H_{40}O_4$ 356.545
R = -$(CH_2)_{13}CH_3$.

3,5-Dimethyl-5-pentadecyl-1,2-dioxolane-3-acetic acid, 9CI [115102-78-8]
[175410-41-0, 175410-46-5]
$C_{22}H_{42}O_4$ 370.571
R = -$(CH_2)_{14}CH_3$.

5-Hexadecyl-3,5-dimethyl-1,2-dioxolane-3-acetic acid, 9CI [115082-92-3]
$C_{23}H_{44}O_4$ 384.598
R = -$(CH_2)_{15}CH_3$.

5-Heptadecyl-3,5-dimethyl-1,2-dioxolane-3-acetic acid, 9CI [115082-93-4]
$C_{24}H_{46}O_4$ 398.625
R = -$(CH_2)_{16}CH_3$.

[175410-23-8, 175410-28-3, 175410-32-9, 175410-37-4]

Pat. Coop. Treaty (WIPO), 1987, 87 04 708; *CA*, **109**, 17027f (*isol*)

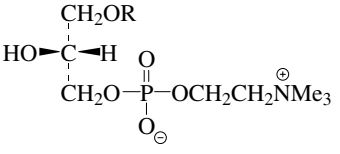
1-*O*-Alkylglycero-3-phosphocholines A-207

Lyso-PAF



The biol. significant compds. have the *R*-config. illus.

1-Hexadecylglycero-3-phosphocholine [78119-19-4]
[52691-62-0, 77249-80-0]
$C_{24}H_{52}NO_6P$ 481.652
Isol. from *Solanderia secunda* and *Spirastrella abata*. Powder. Mp 250° dec. $[\alpha]_D^{25}$ -6.09 (c, 1.04 in $CHCl_3$/MeOH).

*2-Ac: 2-*O*-Acetyl-1-*O*-hexadecylglycero-3-phosphocholine. 1-*O*-Hexadecyl-PAF. PAF(C-16)*
[74389-68-7]
$C_{26}H_{54}NO_7P$ 523.689
Powerful mediator in physiological processes such as anaphylaxis and inflammation. Amorph. solid. Mp 247° dec. $[\alpha]_D^{20}$ -3.3 (c, 0.53 in $CHCl_3$/MeOH). Major molecular form of Platelet activating factor.

*2-*O*-(N-Methylcarbamoyl): 1-*O*-Hexadecyl-2-*N*-methylcarbamoylglycero-3-phosphocholine. C-PAF*
[110406-02-5]
$C_{26}H_{55}N_2O_7P$ 538.703
Biologically potent non-metabolisable PAF analogue. Stimulates human neutrophils to synthesise PAF. No phys. props. reported.

*2-Me ether: 1-*O*-Hexadecyl-2-*O*-methylglycero-3-phosphocholine. 2-*O*-Methyl PAF (C-16)*
[78858-44-3]
$C_{25}H_{54}NO_6P$ 495.678
Potential antineoplastic agent. Cryst. $[\alpha]_D^{20}$ -5.41 (c, 0.95 in $CHCl_3$/MeOH).

*2-Et ether: 1-*O*-Hexadecyl-2-*O*-ethylglycero-3-phosphocholine. 7-Ethoxy-4-hydroxy-*N,N,N*-trimethyl-3,5,9-trioxa-4-phosphapentacosan-1-aminium hydroxide inner salt 4-oxide, 9CI. AEGPC. E-PAF*
[78858-42-1]
$C_{26}H_{56}NO_6P$ 509.705
Degranulates human neutrophils and desensitises neutrophils to PAF. $[\alpha]_D^{23}$ -0.19 (c, 1.3 in MeOH/$CHCl_3$). PAF-analogue.

*2-Benzyl ether: 2-*O*-Benzyl-1-*O*-hexadecylglycero-3-phosphocholine. 2-*O*-Benzyl PAF (C-16)*
[91326-84-0]
$C_{31}H_{58}NO_6P$ 571.776
Amorph. solid. Mp 200°. $[\alpha]_D^{20}$ +2.41 (c, 2.32 in MeOH). Stable PAF analogue.

1-Octadecylglycero-3-phosphocholine
*4,7-Dihydroxy-*N,N,N*-trimethyl-3,5,9-trioxa-4-phosphaheptacosan-1-aminium hydroxide inner salt 4-oxide. Lyso-PAF (C-18). 1-Octadecyl-*sn*-glycero-3-phosphocholine*
[74430-89-0]
$C_{26}H_{56}NO_6P$ 509.705
Mp 240° dec. $[\alpha]_D^{20}$ -4.65 (c, 1.00 in $CHCl_3$/MeOH).

*2-Ac: 2-Acetyl-1-octadecyl-sn-glycero-3-phosphocholine. PAF (C-18). 1-*O*-Octadecyl-PAF*
[74389-69-8]
$C_{28}H_{58}NO_7P$ 551.742
Powerful mediator in physiological processes such as anaphylaxis and inflammation. Mp 260° (214-215° dec.). $[\alpha]_D^{20}$ -3.46 (c, 0.90 in $CHCl_3$/MeOH). Major molecular form of PAF.

► YK0715000

2-Me ether: See Edelfosine in *The Combined Chemical Dictionary.*

*2-Benzyl ether: 2-Benzyl-1-octadecyl-sn-glycero-3-phosphocholine. 2-*O*-Benzyl PAF (C-18)*
[80483-86-9]
$C_{33}H_{62}NO_6P$ 599.83
Mp 220° dec. $[\alpha]_D^{20}$ +2.24 (c, 2.18 in MeOH).

1-(9*Z*-Octadecenyl)glycero-3-phosphocholine
$C_{26}H_{54}NO_6P$ 507.69

*2-Ac: 2-*O*-Acetyl-1-*O*-oleyl-sn-glycero-3-phosphocholine. 2-*O*-Acetyl-1-*O*-(9-octadecenyl)-sn-glycero-3-phosphocholine. Oleyl-PAF*
[85966-90-1]
$C_{28}H_{56}NO_7P$ 549.727
$[\alpha]_D^{20}$ -0.25 (c, 5.0 in MeOH/$CHCl_3$).

1-(11*Z*-Octadecenyl)glycero-3-phosphocholine [153534-79-3]
$C_{26}H_{54}NO_6P$ 507.689
Isol. from the sea cucumber *Cucumaria frondosa* and sponge *Spirastrella abata*. Oil. $[\alpha]_D^{20}$ -2.9 (c, 0.1 in $CHCl_3$/MeOH).

1-Tetradecylglycero-3-phosphocholine [93824-39-6]
[102268-55-3 (*R*)]
$C_{22}H_{48}NO_6P$ 453.598
Isol. from the hydroid *Solanderia secunda*.

1-(15-Methylhexadecyl)glycero-3-phosphocholine [147163-19-7]
Isol. from the sponge *Spirastrella abata*.
Amorph. solid.

1-(3*Z*-Hexadecenyl)glycero-3-phosphocholine [339984-37-1]
$C_{24}H_{50}NO_6P$ 479.636
Constit. of *Spirastrella abata*.

1-(4*Z*-Hexadecenyl)glycero-3-phosphocholine [339984-36-0]
Constit. of *Spirastrella abata*.

1-(2-Methoxyhexadecyl)glycero-3-phosphocholine [340023-96-3]
Constit. of *Spirastrella abata*.

1-(2-Methoxy-4*Z*-hexadecenyl)glycero-3-phosphocholine [340023-97-4]
$C_{25}H_{52}NO_7P$ 509.662
Constit. of *Spirastrella abata*.

1-(3*Z*-Octadecenyl)glycero-3-phosphocholine [251092-28-1]
$C_{26}H_{54}NO_6P$ 507.69
Isol. from *Spirastrella abata*. Amorph. solid.

1-(4*Z*-Octadecenyl)glycero-3-phosphocholine [251092-29-2]
$C_{26}H_{54}NO_6P$ 507.69
Isol. from *Spirastrella abata*. Amorph. solid.

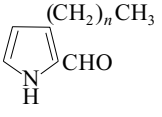
3-Alkyl-1*H*-pyrrole-2-carboxaldehydes A-208

3-Alkyl-2-formylpyrroles



Isol. as a mixt. of 3.3% n = 18, 12.5% n = 19, 49% n = 20, 25% n = 21, and 10.2% n = 22. The substitution pattern of these constits. has been questioned (Stierle *et al*). Metabs. of the marine sponge *Oscarella lobularis*.

3-Nonadecyl-1*H*-pyrrole-2-carboxaldehyde [57992-51-5]
$C_{24}H_{43}NO$ 361.61
n = 18.

3-Eicosyl-1*H*-pyrrole-2-carboxaldehyde
*3-Icosyl-1*H*-pyrrole-2-carboxaldehyde*
[57992-52-6]
$C_{25}H_{45}NO$ 375.637
n = 19.

3-Heneicosyl-1*H*-pyrrole-2-carboxaldehyde [57992-53-7]
$C_{26}H_{47}NO$ 389.663
n = 20.

*12′,13′-Didehydro (*E*-): 13-(12-Heneicosenyl)-1*H*-pyrrole-2-carboxaldehyde, 9CI*
[57992-57-1]
$C_{26}H_{45}NO$ 387.648
Isol. from the marine sponge *Oscarella lobularis*.

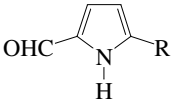
3-Docosyl-1*H*-pyrrole-2-carboxaldehyde [57992-54-8]
$C_{27}H_{49}NO$ 403.69
n = 21.

3-Tricosyl-1*H*-pyrrole-2-carboxaldehyde [57992-55-9]
$C_{28}H_{51}NO$ 417.717
n = 22.

Cimino, G. *et al., Experientia*, 1975, **31**, 1387 (*isol, uv, ir, pmr, ms, struct*)
Stierle, D.B. *et al., J.O.C.*, 1980, **45**, 4980

5-Alkyl-1*H*-pyrrole-2-carboxaldehydes A-209

2-Alkyl-5-formylpyrroles



5-Nonyl-1*H*-pyrrole-2-carboxaldehyde [89631-84-5]
$C_{14}H_{23}NO$ 221.342
Isol. from a soft coral, *Telesto* sp., and its associated, but unidentified, demosponge. Yellow oil. Not possible to identify the exact source of the natural product since it perfused both organisms.

5-Pentadecyl-1*H*-pyrrole-2-carboxaldehyde [75233-97-5]
$C_{20}H_{35}NO$ 305.503
Metab. from a marine sponge *Laxosuberites* sp. Isol. in admixture (46%) with the hexadecyl (12%), heptadecyl (23%) and nonadecyl (19%) homologues. λ_{max} 297 (ϵ 16000) (MeCN) (Derep).

*6′,7′*E*-Didehydro: 5-(6-Pentadecenyl)-1*H*-pyrrole-2-carboxaldehyde*
$C_{20}H_{33}NO$ 303.487
Metab. of the sponge *Mycale tenuispiculata*. Pale yellow solid. Mp 42-44°. λ_{max} 297 (ϵ 15400) (MeCN).

5-(13-Methyltetradecyl)-1*H*-pyrrole-2-carboxaldehyde [233744-63-3]
$C_{20}H_{35}NO$ 305.503
Isol. from the sponges *Desmapsamma anchorata* and *Mycale microsigmatosa*.

5-Hexadecyl-1*H*-pyrrole-2-carboxaldehyde [75233-98-6]
$C_{21}H_{37}NO$ 319.529
Metab. from *Laxosuberites* sp. See note under pentadecyl above.

5-(14-Methylpentadecyl)-1*H*-pyrrole-2-carboxaldehyde [233744-64-4]
$C_{21}H_{37}NO$ 319.529
Isol. from the sponges *Desmapsamma anchorata* and *Mycale microsigmatosa*.

5-Heptadecyl-1*H*-pyrrole-2-carboxaldehyde [75233-99-7]
$C_{22}H_{39}NO$ 333.556
Metab. from *Laxosuberites* sp. See note under pentadecyl above.

*9,10*Z*-Didehydro: 5-(9*Z*-Heptadecenyl)-1*H*-pyrrole-2-carboxaldehyde*
[233744-73-5]
$C_{22}H_{37}NO$ 331.54
Isol. from the sponges *Desmapsamma anchorata* and *Mycale microsigmatosa*.

5-Octadecyl-1*H*-pyrrole-2-carboxaldehyde [262351-87-1]
$C_{23}H_{41}NO$ 347.583
Isol. from *Mycale mytilorum*. Pale yellow flakes. Mp 56-58°. λ_{max} 302 (ϵ 16000) (EtOH).

5-(16-Methylheptadecyl)-1*H*-pyrrole-2-carboxaldehyde
Mycalazal 6
[705973-02-0]
$C_{23}H_{41}NO$ 347.583
Isol. from the sponge *Mycale cecilia*. Amorph. powder. λ_{max} 203 (ϵ 6260); 249 (ϵ 2080); 300 (ϵ 9790) (MeOH).

5-Nonadecyl-1*H*-pyrrole-2-carboxaldehyde [75234-00-3]
$C_{24}H_{43}NO$ 361.61
Metab. from *Laxosuberites* sp. See note under pentadecyl above.

*9,10*Z*-Didehydro: 5-(9*Z*-Nonadecenyl)-1*H*-pyrrole-2-carboxaldehyde*
[233744-74-6]
$C_{24}H_{41}NO$ 359.594

Isol. from the sponges *Desmapsamma anchorata* and *Mycale microsigmatosa*.

*12,13Z-Didehydro: 5-(12Z-Nonadecenyl)-1*H*-pyrrole-2-carboxaldehyde.* ***Mycalazal 4***
[705972-97-0]
$C_{24}H_{41}NO$ 359.594
Isol. from the sponge *Mycale cecilia*. Amorph. powder. λ_{max} 202 (ϵ 7585); 249 (ϵ 2340); 300 (ϵ 11760) (MeOH).

5-Eicosyl-1*H*-pyrrole-2-carboxaldehyde [233744-67-7]
$C_{25}H_{45}NO$ 375.637
Isol. from the sponges *Desmapsamma anchorata* and *Mycale microsigmatosa*.

5-(9*Z*-Heneicosenyl)-1*H*-pyrrole-2-carboxaldehyde [233744-65-5]
$C_{26}H_{45}NO$ 387.648
Isol. from the sponges *Desmapsamma anchorata* and *Mycale microsigmatosa*.

5-(14*Z*-Heneicosenyl)-1*H*-pyrrole-2-carboxaldehyde
Mycalazal 8
[705973-25-7]
Isol. from the sponge *Mycale cecilia*.
Amorph. powder. λ_{max} 202 (ϵ 7800); 248 (ϵ 2320); 300 (ϵ 11290) (MeOH).

5-(12*Z*,15*Z*-Heneicosadienyl)-1*H*-pyrrole-2-carboxaldehyde
Mycalazal 5
[705972-98-1]
$C_{26}H_{43}NO$ 385.632
Isol. from the sponge *Mycale cecilia*. Oil. λ_{max} 204 (ϵ 9250); 248 (ϵ 2390); 300 (ϵ 11150) (MeOH).

5-(12*Z*,15*Z*,18*Z*-Heneicosatrienyl)-1*H*-pyrrole-2-carboxaldehyde
Mycalazal 3
[705972-95-8]
$C_{26}H_{41}NO$ 383.616
Isol. from the sponge *Mycale cecilia*. Oil. λ_{max} 204 (ϵ 14690); 248 (ϵ 3440); 300 (ϵ 15400) (MeOH).

5-(12*Z*-Docosenyl)-1*H*-pyrrole-2-carboxaldehyde [233744-66-6]
$C_{27}H_{47}NO$ 401.674
Isol. from the sponges *Desmapsamma anchorata* and *Mycale microsigmatosa*. Indexed as the Δ^{11}-isomer in CAS.

5-Tricosyl-1*H*-pyrrole-2-carboxaldehyde [233744-70-2]
$C_{28}H_{51}NO$ 417.717
Isol. from the sponges *Desmapsamma anchorata* and *Mycale microsigmatosa*.

*9,10Z-Didehydro: 5-(9Z-Tricosenyl)-1*H*-pyrrole-2-carboxaldehyde*
[233744-68-8]
$C_{28}H_{49}NO$ 415.701
Isol. from the sponges *Desmapsamma anchorata* and *Mycale microsigmatosa*.

*14,15Z-Didehydro: 5-(14Z-Tricosenyl)-1*H*-pyrrole-2-carboxaldehyde*
[233744-69-9]
$C_{28}H_{49}NO$ 415.701
Isol. from the sponges *Desmapsamma anchorata* and *Mycale microsigmatosa*.

*14,15Z,17,18Z-Tetradehydro: 5-(14Z,17Z-Tricosadienyl)-1*H*-pyrrole-2-carboxaldehyde.* ***Mycalazal 9***
[705973-27-9]
$C_{28}H_{47}NO$ 413.685
Isol. from the sponge *Mycale cecilia*. Oil. λ_{max} 201 (ϵ 14170); 248 (ϵ 4060); 300 (ϵ 21160) (MeOH).

*14,15Z,17,18Z,20,21Z-Hexadehydro: 5-(14Z,17Z,20Z-Tricosatrienyl)-1*H*-pyrrole-2-carboxaldehyde.* ***Mycalazal 7***
[705973-15-5]
$C_{28}H_{45}NO$ 411.67
Isol. from the sponge *Mycale cecilia*. Oil. λ_{max} 204 (ϵ 9250); 248 (ϵ 2390); 300 (ϵ 11150) (MeOH).

5-(11*Z*-Pentacosenyl)-1*H*-pyrrole-2-carboxaldehyde [233744-71-3]
$C_{30}H_{53}NO$ 443.755
Isol. from the sponges *Desmapsamma anchorata* and *Mycale microsigmatosa*.

5-(15*Z*-Pentacosenyl)-1*H*-pyrrole-2-carboxaldehyde [233744-72-4]
$C_{30}H_{53}NO$ 443.755
Isol. from the sponges *Desmapsamma anchorata* and *Mycale microsigmatosa*.

5-(16*Z*-Pentacosenyl)-1*H*-pyrrole-2-carboxaldehyde
Mycalazal 12
[705973-36-0]
$C_{30}H_{53}NO$ 443.755
Isol. from the sponge *Mycale cecilia*.

5-(18*Z*-Pentacosenyl)-1*H*-pyrrole-2-carboxaldehyde
Mycalazal 13
[705973-38-2]
$C_{30}H_{53}NO$ 443.755
Isol. form the sponge *Mycale cecilia*.

5-(16*Z*,19*Z*-Pentacosadienyl)-1*H*-pyrrole-2-carboxaldehyde
Mycalazal 11
[705973-35-9]
Isol. from the sponge *Mycale cecilia*.
Oil. λ_{max} 202 (ϵ 6040); 248 (ϵ 1800); 301 (ϵ 7630) (MeOH).

5-(16*Z*,19*Z*,22*Z*-Pentacosatrienyl)-1*H*-pyrrole-2-carboxaldehyde
Mycalazal 10
[705973-28-0]
Isol. from the sponge *Mycale cecilia*.
Oil. λ_{max} 204 (ϵ 11920); 248 (ϵ 3690); 300 (ϵ 16900) (MeOH).

5-(10*Z*,13*Z*,16*Z*,19*Z*,22*Z*-Pentacosapentaenyl)-1*H*-pyrrole-2-carboxaldehyde, 9CI
Mycalazal 2
[185389-83-7]
$C_{30}H_{45}NO$ 435.692
Metab. from *Mycale micracanthoxea*. Cytotoxic agent. Oil.

5-(7*Z*,10*Z*,13*Z*,16*Z*,19*Z*,22*Z*-Pentacosahexaenyl)-1*H*-pyrrole-2-carboxaldehyde
Mycalazal 1
[185389-71-3]
Metab. of the sponge *Mycale micracanthoxea*.
Oil.

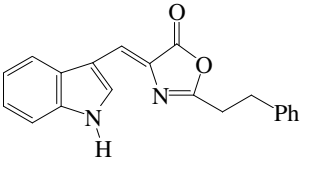
[878143-16-9]
[878143-13-6 (*E*–form), 878143-15-8 (*Z*-form)]

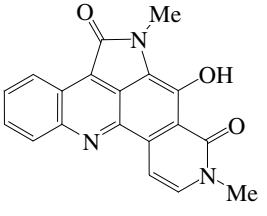


(*Z*)-*form*

$C_{20}H_{16}N_2O_2$ 316.359
Isol. from the red alga *Haraldiophyllum* sp. Yellow powder. Mp 245-247°. Isol. as an 80:20 mixt. of (*Z*/*E*)-isomers to which data refers.

Guella, G. *et al., Tetrahedron*, 2006, **62**, 1165-1170 (*isol, synth, pmr, cmr, ms*)

Alpkinidine A-216

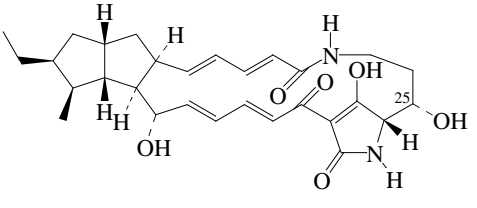


$C_{19}H_{13}N_3O_3$ 331.33
Alkaloid from *Xestospongia* cf. *carbonaria*. Purple solid.

Thale, Z. *et al., J.O.C.*, 2002, **67**, 9384-9391 (*isol, pmr, cmr, cryst struct*)

Alteramide A A-217

[142131-06-4]



$C_{29}H_{38}N_2O_6$ 510.629

Macrocylic lactam antibiotic. Isol. from an *Alteromonas* sp. associated with the sponge *Halichondria okadai*. Exhibits cytotoxicity against murine leukaemia P388 cells, murine lymphoma L1210 cells and the human epidermoid carcinoma KB cells *in vitro*. Yellow powder. Sol. MeOH, EtOAc, $CHCl_3$; poorly sol. H_2O.
Mp 200° (dec.). $[\alpha]_D^{22}$ +36.2 (c, 0.1 in MeOH). λ_{max} 268 (ϵ 30300); 347 (ϵ 11000) (MeOH) (Derep).

25-Deoxy: ***Alteramide B***
$C_{29}H_{38}N_2O_5$ 494.63
From an *Alteromonas* sp. Sol. MeOH, EtOAc, $CHCl_3$; poorly sol. H_2O. λ_{max} 268; 347 (MeOH) (Berdy).

[142131-07-5]

Shigemori, H. *et al., J.O.C.*, 1992, **57**, 4317-4320 (*isol, ir, uv, pmr, cmr, struct*)

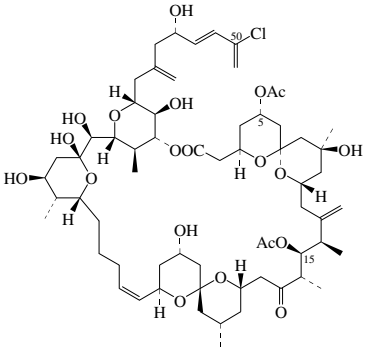
Altohyrtin A A-223

Spongistatin 1

[149715-96-8]



Absolute configuration

$C_{63}H_{95}ClO_{21}$ 1223.884

Macrocyclic lactone antibiotic. Altohyrtin A and Spongistatin 1 have same gross struct. Stereochem. shown here is for Altohyrtin A. Isol. from marine sponges *Spongia* sp. and *Hyrtios altum*. Antitumour agent. Amorph. powder (as Na salt).
Mp 161-162° (Na salt). $[\alpha]_D^{22}$ +26.2 (c, 0.32 in MeOH) (Na salt). λ_{max} 216 (ϵ 8490) (MeOH) (Derep). λ_{max} 227 (ϵ 19000) (MeOH) (Derep).

50-Bromo analogue: ***Altohyrtin B***
[151656-54-1]
$C_{63}H_{95}BrO_{21}$ 1268.335
Isol. from *Hyrtios altum*. Antitumour agent. Amorph. solid.
$[\alpha]_D$ +45 (c, 0.2 in MeOH). λ_{max} 228 (ϵ 20000) (MeOH) (Derep).

50-Dechloro: ***Altohyrtin C****. Spongistatin 2*
[151717-16-7]
$C_{63}H_{96}O_{21}$ 1189.439
Isol. from *Hyrtios altum* and *Spongia* sp. Cytotoxic agent. Amorph. solid.
Mp 140-141°. $[\alpha]_D$ +24.5 (c, 0.39 in MeOH). λ_{max} 220 (ϵ 16200); 273 (ϵ 891) (MeOH) (Derep). λ_{max} 226 (ϵ 17000) (MeOH) (Derep).

*5-*O*-De-Ac:* ***Spongistatin 3****. 5-De-*O*-acetylaltohyrtin A*
[150642-07-2]
$C_{61}H_{93}ClO_{20}$ 1181.846
Isol. from *Hyrtios altum* and *Spongia* sp. Cytotoxic agent. Powder.
Mp 148-149°. $[\alpha]_D$ +28.1 (c, 0.15 in MeOH). λ_{max} 227 (ϵ 13800); 268 (ϵ 1740) (MeOH) (Derep). λ_{max} 227 (ϵ 20000) (MeOH) (Derep).

*15-*O*-De-Ac: 15-De-*O*-acetylaltohyrtin A*. ***Spongistatin 4****. Cinachyrolide A*
[153745-94-9]
[148439-44-5]
$C_{61}H_{93}ClO_{20}$ 1181.846
Isol. from the sponges *Spirastrella spinispirulifera* (Porifera) and *Cinachyra* sp. Cytotoxic agent. Solid.
Mp 153-154°. $[\alpha]_D^{22}$ +23 (c, 0.2 in MeOH). λ_{max} 227 (ϵ 13800); 268 (ϵ 1740) (MeOH) (Derep).

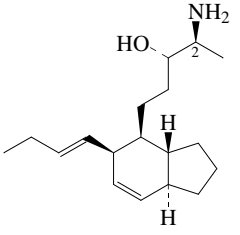
Amaminol A A-224

[261622-18-8]



Absolute Configuration

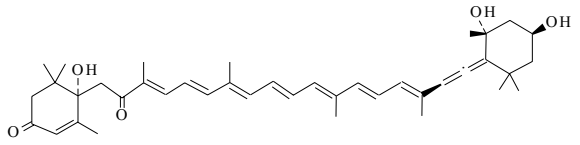
$C_{18}H_{31}NO$ 277.449

Isol. from an unidentified tunicate of the family Polyclinidae. Cytotoxic agent. Pale yellow oil. $[\alpha]_D^{24}$ -170.8 (c, 0.2 in MeOH).

2-Epimer: ***Amaminol B***
[261622-22-4]
$C_{18}H_{31}NO$ 277.449
Isol. from an unidentified tunicate of the family Polyclinidae. Cytotoxic agent. Pale yellow oil. $[\alpha]_D^{24}$ -112.4 (c, 0.2 in MeOH).
Sata, N.U. *et al., Tet. Lett.*, 2000, **41**, 489-492 (*isol, pmr, cmr*)

Amarouciaxanthin A A-225

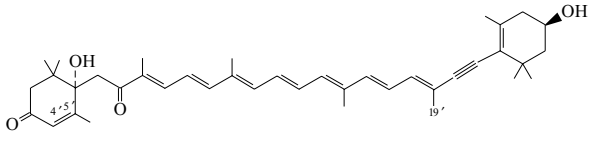
6,7-Didehydro-5,6,7′,8′-tetrahydro-3,5,6′-trihydroxy-β,ϵ-carotene-3′,8′-dione
[100667-78-5]



$C_{40}H_{54}O_5$ 614.864
Constit. of *Amaroucium pliciferum*. Red needles (petrol). Sol. MeOH, hexane; poorly sol. H_2O.
Mp 160°. λ_{max} 230; 269; 457 (Et_2O) (Berdy).
Matsuno, T. *et al., J. Nat. Prod.*, 1985, **48**, 606

Amarouciaxanthin B A-226

7,8-Didehydro-7′,8′-dihydro-3,6′-dihydroxy-β,ϵ-carotene-3′,8′-dione. Sidnyaxanthin
[92121-55-6]



$C_{40}H_{52}O_4$ 596.848
Constit. of the tunicates *Sidnyum argus* and *Amaroucium pliciferum*. Shows weak cytotoxic activity. Dark reddish cryst. (Et_2O); reddish needles (petrol/Et_2O). Sol. MeOH, hexane; poorly sol. H_2O.
Mp 88-89° Mp 154°. $[\alpha]_D$ +1.6 (c, 0.9 in $CHCl_3$). λ_{max} 230; 281; 463 (Et_2O) (Berdy).

4,5β-Dihydro: 7,8-Didehydro-5′,6′,7′,8′-tetrahydro-3,6′-dihydroxy-β,β-carotene-3,8-dione. ***Isomytiloxanthin***
[50906-60-0]
$C_{40}H_{54}O_4$ 598.864
Isol. from the edible mussel (*Mytilus edulis*). Red gum. Tentative abs. config. λ_{max} 451 (no solvent reported).

19′-Hexanoyloxy, 4,5β-dihydro: ***19′-Hexanoyloxymytiloxanthin***
$C_{46}H_{64}O_6$ 713.008
Isol. from the edible mussel (*Mytilus edulis*).

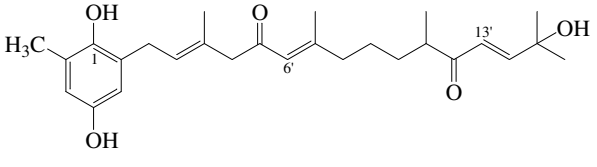
Amentadione A-241



$C_{27}H_{38}O_5$ 442.594
Constit. of *Cystoseira stricta* var. *amentacea*. Oil. $[\alpha]_D$ -0.44 (c, 1.6 in EtOH).

1-Me ether:
$C_{28}H_{40}O_5$ 456.621
Constit. of *Cystoseira tamariscifolia* and *Cystoseira abies-marina*. Oil. $[\alpha]_D^{20}$ -2.4 (c, 2.4 in EtOH). λ_{max} 221 (ϵ 34560); 227 (ϵ 11000) (MeOH).

13′,14′-Dihydro, 1-Me ether: [128397-54-6]
$C_{28}H_{42}O_5$ 458.637
Constit. of *Cystoseira sauvageauana*.

13′,14′-Dihydro, 1,4-di-Me ether: [128443-58-3]
$C_{29}H_{44}O_5$ 472.664
Constit. of *Cystoseira dubia*. Oil. $[\alpha]_D^{20}$ +1.2 (c, 1 in EtOH). λ_{max} 224 (ϵ 13400); 242 (ϵ 12000); 282 (ϵ 2800) (EtOH).

6′Z-isomer, 1-Me ether:
$C_{28}H_{40}O_5$ 456.621
Constit. of *Cystoseira tamariscifolia* and *Cystoseira abies-marina*. Oil. $[\alpha]_D^{20}$ -1 (c, 3.9 in EtOH). λ_{max} 222 (ϵ 29690); 279 (ϵ 4600) (MeOH).

6Z-Isomer, 13′,14′-dihydro, 1-Me ether: [128397-53-5]
$C_{28}H_{42}O_5$ 458.637
Constit. of *Cystoseira sauvageauana*.

6Z-Isomer, 13′,14′-dihydro, 1,4-di-Me ether: [128443-57-2]
$C_{29}H_{44}O_5$ 472.664
Constit. of *Cystoseira dubia*. Oil. $[\alpha]_D^{20}$ +1 (c, 1 in EtOH). λ_{max} 222 (ϵ 13600); 244 (ϵ 11000); 283 (ϵ 3000) (EtOH).

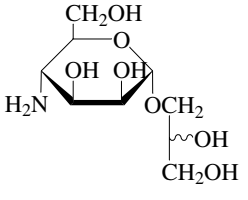
$C_{22}H_{38}N_2O_{16}$ 586.546
Prod. by the marine bacterium *Alteromonas marinoglutinosa* NCIMB 1770.

Komandrova, N.A. *et al., Biokhimiya (Moscow)*, 2001, **66**, 894-897 (*isol*)

1-*O*-(4-Amino-4-deoxy-α-D-mannopyranosyl)glycerol A-264

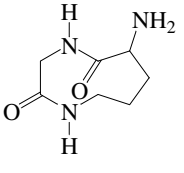
Glycerol 1-(4-amino-4-deoxy-α-D-mannopyranoside)
[205448-98-2]



$C_9H_{19}NO_7$ 253.252
Constit. of the red alga *Caloglossa leprieurii*.

Xu, X. *et al., CA*, 1998, **129**, 38766z (*isol*)

6-Amino-1,4-diazacyclononane-2,5-dione A-265



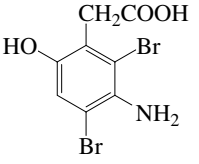
$C_7H_{13}N_3O_2$ 171.199

(-)-*form*
Prod. by a marine-derived *Streptomyces acrimycini*.
Glassy solid. $[\alpha]_D$ -6.8 (c, 0.08 in MeOH). CAS no. not found in CA 140 or 141.

Hernandez, I.L.C. *et al., J. Braz. Chem. Soc.*, 2004, **15**, 441-444 (*isol, pmr, cmr*)

2-(3-Amino-2,4-dibromo-6-hydroxyphenyl)acetic acid A-266

3-Amino-2,4-dibromo-6-hydroxybenzeneacetic acid, 9CI

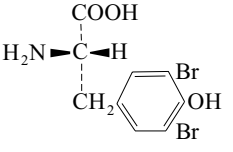


$C_8H_7Br_2NO_3$ 324.956
Isol. from *Aplysina cauliformis*. Antimycobacterial agent. Glassy solid. λ_{max} 228 (log ϵ 4.1); 304 (log ϵ 3.98) (MeOH).

De Oliveira, M.F. *et al., Planta Med.*, 2006, **72**, 437-441 (*isol, pmr, cmr, ms*)

2-Amino-3-(3,5-dibromo-4-hydroxyphenyl)propanoic acid A-267

3,5-Dibromotyrosine
[537-24-6]



$C_9H_9Br_2NO_3$ 338.983

(*S*)-*form*
L-form
[300-38-9]
Isol. from sponges and gorgonians. Mp 245°.

N-Ac:
$C_{11}H_{11}Br_2NO_4$ 381.02
Resolving agent. Cryst. + ½ H_2O (MeOH aq.). Mp 118°.
$[\alpha]_D^{25}$ +34.5 (c, 4 in MeOH).

4-Me ether:
$C_{10}H_{11}Br_2NO_3$ 353.01
Cryst. + H_2O (95% EtOH) (as hydrochloride). Mp 212-215° dec. (hydrochloride). $[\alpha]_D^{26}$ +4 (c, 1.0 in MeOH).

(±)-*form* [5741-93-5]

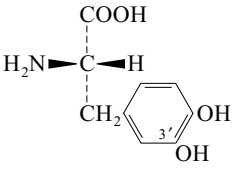
2-Amino-3-(3,4-dihydroxyphenyl)propanoic acid A-270

3-Hydroxytyrosine, 9CI. 3,4-Dihydroxyphenylalanine. DOPA

[587-45-1]



(*S*)–*form*

$C_9H_{11}NO_4$ 197.19

Used in treatment of the Parkinsonian syndrome. The immediate precursor of the neurotransmitter dopamine. Usually administered with a peripheral DOPA decarboxylase inhibitor. Intermed. in biosynth. of various marine alkaloids, e.g. the Lamellarins. Log P -2.82 (uncertain value) (calc).

(*S*)-*form*

L-form. ***Levodopa, BAN, INN, JAN, USAN****. Bendopa. Brocadopa. Dopar. Larodopa. Levopa. Veldopa. Many other names*

[59-92-7]

Occurs in seedlings and pods of *Vicia faba*, in *Mucuna pruriens, Sarothamnus scoparius, Stizolobium deeringianum, Stizolobium hassjoo, Aristolochia clematitis* and other plants. Also prod. by *Bacillus* spp.

Prisms, needles (H_2O + SO_2) or plates (EtOH aq.).

Mp 285.5° dec. $[\alpha]_D^{20}$ -12.15 (c, 4 in 1*N* HCl). Pharmacol. active isomer. Rapidly turns green in air, aq. solns. darken in air. Green col. with $FeCl_3$. Reduces $AgNO_3$, NH_3 and acid $KMnO_4$.

Component of Sinemet. High-mol.-wt. polymers have been synth.

▶ Systemic (e.g. CNS) and adverse effects when used therapeutically. LD_{50} (rat, orl) 1780 mg/kg. Exp. reprod. and teratogenic effects. AY5600000

3′-O-Sulfate: 3-(Sulfooxy)tyrosine, 9CI

[96253-55-3]

$C_9H_{11}NO_7S$ 277.254

Constit. of the brown alga *Ascophyllum nodosum*.

3′-Me ether: 4-Hydroxy-3-methoxyphenylalanine. 3-Methoxytyrosine

[300-48-1]

$C_{10}H_{13}NO_4$ 211.217

Isol. from *Cortinarius brunneus, Pachymatisma johnstoni* and the blood of Parkinsonian patients. Cryst. (H_2O). $[\alpha]_D$ -34 (c, 0.39 in H_2O). $[\alpha]_D$ -15.4 (c, 0.36 in 0.1*M* HCl).

$C_{11}H_{14}N_2O_2S_2$ 270.376
Prod. by *Xenorhabdus* spp. Possesses antimicrobial and insecticidal props. Sol. MeOH, EtOAc, DMSO; fairly sol. hexane; poorly sol. H_2O. Mp 192-193°. Related to Thiolutin, 4-Me, N^6-*Ac and Aureothricin, 4-Me,* N^6*-propanoyl. λ_{max} 243 (sh) (ϵ 6000); 300 (ϵ 3100); 387 (ϵ 11000) (MeOH) (Derep). λ_{max} 250; 310; 390 (MeOH) (Berdy).*

N^6-*Octanoyl:* ***Xenorhabdin 3***
[92680-91-6]
$C_{13}H_{18}N_2O_2S_2$ 298.429
Prod. by *Xenorhabdus* spp. Possesses antimicrobial and insecticidal props. Sol. MeOH, DMSO, EtOAc; fairly sol. hexane; poorly sol. H_2O. Mp 360°. λ_{max} 243 (sh) (ϵ 6000); 300 (ϵ 3100); 387 (ϵ 11000) (MeOH) (Derep). λ_{max} 250; 310; 390 (MeOH) (Berdy). λ_{max} 300; 387 (MeOH) (Berdy).

N^6-*Tetradecanoyl:* N-*Tetradecanoylholothin*
$C_{19}H_{30}N_2O_2S_2$ 382.59
Prod. by a marine-derived *Alteromonas* sp.

N^6-*(5-Methylhexanoyl):* ***Xenorhabdin 2***
[92680-90-5]
$C_{12}H_{16}N_2O_2S_2$ 284.403
Prod. by *Xenorhabdus* spp. Possesses antimicrobial and insecticidal props. Sol. MeOH, EtOAc, DMSO; fairly sol. hexane; poorly sol. H_2O. Mp 210-213°. λ_{max} 243 (sh) (ϵ 6000); 300 (ϵ 3100); 387 (ϵ 11000) (MeOH) (Derep). λ_{max} 244; 300; 387 (MeOH) (Berdy).

*4-Me: 6-Amino-4-methyl-1,2-dithiolo[4,3-*b*]pyrrol-5(4*H*)-one.* ***Pyrrothine***
[642-77-3]
$C_6H_6N_2OS_2$ 186.258
Isol. from a *Streptomyces* sp. Active against gram-positive and -negative bacteria. Amorph. yellow solid.
Mp 191-194° dec.

4-Me; hydrochloride:
Yellow prisms + $1H_2O$. Sinters at *ca.* 200°.

4-Me, N^6*-Ac:* ***Thiolutin***. N-*Acetylpyrrothine. Farcinicine. Acetopyrrothine*
[87-11-6]
$C_8H_8N_2O_2S_2$ 228.295
Prod. by *Streptomyces albus*, *Streptomyces pimprina*, *Streptomyces thioluteus* other *Streptomyces* spp. and *Saccharothrix* sp. SA 233. Antibiotic which inhibits microbiological growth in beer. Phytotoxic in high concentrations. Shows platelet aggregation props. Brilliant yellow needles (1-butanol). Sol. MeOH, $CHCl_3$; poorly sol. H_2O, C_6H_6, Et_2O, hexane.
Mp 273-276° dec. $Bp_{0.1}$ 200° subl. λ_{max} 248 (ϵ 6300); 311 (ϵ 5700); 388 (ϵ 10800) (MeOH) (Derep). λ_{max} 250 (ϵ 6030); 311 (ϵ 5600); 388 (ϵ 10960) (MeOH) (Berdy).

▶ LD_{50} (mus, scu) 25 mg/kg. JP1355000

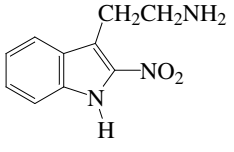
3-(2-Aminoethyl)-2-nitroindole A-293

*2-Nitro-1*H-*indole-3-ethanamine. 2-Nitrotryptamine*



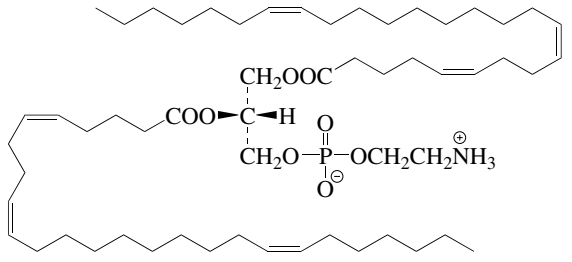
$C_{10}H_{11}N_3O_2$ 205.216

N^b-*Ac:* N^b-***Acetyl-2-nitrotryptamine***
$C_{12}H_{13}N_3O_3$ 247.253
Isol. from the marine-derived *Flavobacterium* sp. T436.

Schuhmann, I. *et al., Dissertation*, Univ. of Göttingen, 2005, (*Ac, isol*)

1-*O*-(2-Aminoethylphospho)-2,3-bis(5,9,19-hexacosatrienoyl)glycerol A-294

1,2-Di-(5,9,19-hexacosatrienoyl)-sn-*glycero-3-phosphocholine*



$C_{57}H_{102}NO_8P$ 960.409

(***R***)-(***all-Z***)-*form* [107447-10-9]
Isol. from the phospholipids of the sponge *Microciona prolifera*.

19,19′,20,20′-Tetrahydro: 1-O-*(2-Aminoethylphospho)-2,3-bis(5,9-hexacosadienoyl)glycerol*
[99824-60-9]
$C_{57}H_{106}NO_8P$ 964.44
Isol. from the sponges *Microciona prolifera* and *Paresperella psila*.

Mena, P.L. *et al., Chem. Phys. Lipids*, 1985, **37**, 257 (*synth, pmr, ms*)
Dasgupta, A. *et al., Chem. Phys. Lipids*, 1986, **41**, 335 (*isol, ms*)

(2-Aminoethyl)phosphonic acid, 9CI A-295

Ciliatine. *AEP*
[2041-14-7]
$H_2NCH_2CH_2P(O)(OH)_2$
$C_2H_8NO_3P$ 125.064
Constit. as glyceryl esters of rumen protozoan, *Tetrahymena pyriformis*, sea anemones, bovine brain, mycobacteria, and a fungus *Pythium prolatum*. Rhombic cryst. or needles (EtOH aq.). Mp 295-297° dec. pK_{a1} 2.45; pK_{a2} 7; pK_{a3} 10.8. pK_{a1} 1.3; pK_{a2} 6.51; pK_{a3} 11.5 (25°). The metastable rhombic form is difficult to prepare. First known natural compd. contg. the C–P bond.

Di-Et ester: [41468-36-4]
$C_6H_{16}NO_3P$ 181.171
Liq. $Bp_{0.025}$ 54-56°.

N-*Benzoyl: 2-(Benzoylamino)ethylphosphonic acid*
$C_9H_{12}NO_4P$ 229.172
Solid. Mp 191-192°.

N-*Me:* N-*Methylciliatine. 2-(Methylamino)ethylphosphonic acid*
[14596-55-5]
$C_3H_{10}NO_3P$ 139.091
Isol. from the sea anemone *Anthopleura xanthogrammica*. Needles (MeOH aq.).
Mp 291° dec.

N,N-*Di-Me: 2-Dimethylaminoethylphosphonic acid.* N,N-*Dimethylciliatine*
[14596-56-6]
$C_4H_{12}NO_3P$ 153.117
Isol. from *Anthopleura xanthogrammica*. Pale yellow cryst. (MeOH aq.).
Mp 249.5° dec.

N,N-*Di-Me, Et ester:* [41948-36-1]
$C_6H_{16}NO_3P$ 181.171
Bp_1 100°.

N-*Phthalimide, di-Et ester: Diethyl (2-phthalimidoethyl)phosphonate*
$C_{14}H_{18}NO_5P$ 311.274
Cryst. (Et_2O/petrol). Mp 58°.

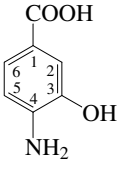
4-Amino-3-hydroxybenzoic acid A-317

[2374-03-0]



$C_7H_7NO_3$ 153.137
Microbial degradation product of Chloramphenicol, C-292.
Plates (EtOH aq.).
Mp 216°. pK_a 4.59.

Me ester: [63435-16-5]
$C_8H_9NO_3$ 167.164
Local anaesthetic (no longer in widespread use). Plates (C_6H_6 or H_2O). Mp 120-121°. Log P 1.28 (calc).

Et ester: [87081-52-5]
$C_9H_{11}NO_3$ 181.191
Plates ($CHCl_3$/petrol). Mp 98°.

5-Dodecenyl ester: 5-Dodecenyl 4-amino-3-hydroxybenzoate. ***Antibiotic B 5354A****. B 5354A*
[207570-66-9]
$C_{19}H_{29}NO_3$ 319.443
Prod. by marine bacterium SANK 71896. Sphingosine kinase inhibitor. λ_{max} 229 (ϵ 10200); 281 (ϵ 9200); 295 (ϵ 16100); 309 (ϵ 12700) (MeOH).

7-Z-Tetradecenyl ester: 7-Tetradecenyl 4-amino-3-hydroxybenzoate. ***Antibiotic B 5354C****. B 5354C*
[207570-68-1]
$C_{21}H_{33}NO_3$ 347.497
Prod. by marine bacterium SANK 71896. Sphingosine kinase inhibitor. Powder. λ_{max} 203 (ϵ 16300); 229 (ϵ 9700); 281 (ϵ 8500); 309 (ϵ 11800) (MeOH).

2,7-Tetradecadienyl ester (2E,7ξ): 2,7-Tetradecadienyl 4-amino-3-hydroxybenzoate. ***Antibiotic B 5354B****. B 5354B*
[207570-67-0]
$C_{21}H_{31}NO_3$ 345.481
Prod. by marine bacterium SANK 71896. Sphingosine kinase inhibitor. λ_{max} 203 (ϵ 16600); 229 (ϵ 16600); 283 (ϵ 8800); 309 (ϵ 12200) (MeOH).

N-*Ac:* [10098-40-5]
$C_9H_9NO_4$ 195.174
Solid. Mp 249-250°.

Me ether: 4-Amino-3-methoxybenzoic acid
[2486-69-3]
$C_8H_9NO_3$ 167.164
Mp 186-188°.

Me ether; Me ester: [41608-64-4]
$C_9H_{11}NO_3$ 181.191
Prisms (MeOH). Mp 126-127°.

Hexyl ether: 4-Amino-3-hexyloxybenzoic acid
[61566-68-5]
$C_{13}H_{19}NO_3$ 237.298
Cryst. (CCl_4). Mp 114-116°.

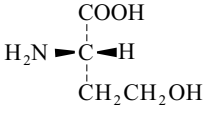
2-Amino-4-hydroxybutanoic acid A-319

Homoserine, 9CI
[498-19-1]



(*S*)–*form*

$C_4H_9NO_3$ 119.12

(*S*)-*form*
L-form
[672-15-1]
Present in germinating peas, Jack bean seeds (*Canavalia ensiformis*) and the seedlings of many leguminous plants. Intermediate in the conversion of Aspartic acid, A-697 into 2-Amino-4-mercaptobutanoic acid and α-ketobutyrate in microbia and fungi.
Mp 203° dec. $[\alpha]_D^{26}$ -8.8 (c, 5 in H_2O).

N,N,N-*Tri-Me, betaine:*
$C_7H_{15}NO_3$ 161.2
Occurs as diacylglycerol esters in *Xerocomus langbianensis*. Also in green alga *Monostroma nitidum*.

$C_{35}H_{67}NO_3$ 549.919
Isol. from the mushroom *Panellus serotinus*. Amorph. powder. $[\alpha]_D^{21}$ -11.6 (c, 0.09 in $CHCl_3$).

N-*Hexadecanoyl, 1*-O-α-D-*glucopyranoside:* ***Thraustochytroside B***
[251565-81-8]
$C_{41}H_{77}NO_8$ 712.061
Isol. from *Thraustochytrium globosum*. Amorph. solid.

N-*(9Z,12Z-Octadecadienoyl):* [448933-55-9]
$C_{37}H_{67}NO_3$ 573.941
Isol. from the mushrooms *Lyophyllum connatum* and *Panellus serotinus*. Amorph. powder. $[\alpha]_D^{30}$ -13.3 (c, 0.08 in $CHCl_3$).

N-*(2*R*-Hydroxytetradecanoyl):* [448933-57-1]
$C_{33}H_{63}NO_4$ 537.865
Isol. from the mushroom *Amanita pantherina*. Amorph. powder. $[\alpha]_D^{20}$ +6.3 (c, 0.2 in $CHCl_3$).

N-*(2*R*-Hydroxypentadecanoyl):* [448933-56-0]
$C_{34}H_{65}NO_4$ 551.892
Isol. from the mushrooms *Amanita pantherina* and *Sarcodon aspratus*. Amorph. powder. $[\alpha]_D^{21}$ +7 (c, 0.1 in $CHCl_3$).

N-*(2*R*-Hydroxyhexadecanoyl):* [95673-08-8]
$C_{35}H_{67}NO_4$ 565.919
Isol. from the mushrooms *Amanita pantherina*, *Lepista nuda* (wood blewit) and *Sarcodon aspratus*. Amorph. powder. $[\alpha]_D^{19}$ +7.5 (c, 0.1 in $CHCl_3$).

N-*(2*R*-Hydroxyhexadecanoyl), 1*-O-β-D-*glucopyranoside:* ***Cerebroside B***
[88642-46-0]
$C_{41}H_{77}NO_9$ 728.061
From *Pachybasium* sp., *Clitocybe* spp. and *Schizophyllum commune*. Shows elicitor activity. Cell differentiation inducer; fruiting body formation enhancer. Antifungal agent.
Mp 180-190°. $[\alpha]_D^{20}$ +5.2 (c, 1 in MeOH). $[\alpha]_D^{19}$ -7.4 (c, 0.3 in $CHCl_3$).

N-*(2*R*-Hydroxy-3-hexadecenoyl), 1*-O-β-D-*glucopyranoside:* ***Cerebroside A***
[115681-40-8]
$C_{41}H_{75}NO_9$ 726.045
Isol. from a *Pachybasium* sp. Shows elicitor activity. Cell differentiation inducer; fruiting body formation enhancer. Antifungal agent. Cryst. Sol. MeOH.
Mp 170-178°. $[\alpha]_D^{20}$ -6.7 (c, 1 in MeOH).

N-*(2*R*-Hydroxyheptadecanoyl), 1*-O-β-D-*glucopyranoside:*
[120029-71-2]
$C_{42}H_{79}NO_9$ 742.087
Isol. from *Polyporus ellisii*. Amorph. powder.
Mp 154-156°. $[\alpha]_D^{26}$ +4.9 (c, 0.4 in MeOH).

N-*(2*R*-Hydroxyoctadecanoyl):* ***Lactariamide B***
[372178-04-6]
$C_{37}H_{71}NO_4$ 593.972
Isol. from the fungus *Lactarius volemus* (tawny milkcap mushroom). Amorph. powder. $[\alpha]_D^{20}$ +8.4 (c, 0.39 in MeOH). Stereochem. not confirmed.

N-*(2*R*-Hydroxyoctadecanoyl), 1*-O-β-D-*glucopyranoside:* ***Cerebroside D***
[113773-89-0]
$C_{43}H_{81}NO_9$ 756.114
From a *Pachybasium* sp. Shows elicitor activity. Cell differentiation inducer; fruiting body formation enhancer. Cryst. Sol. MeOH.
Mp 178-189°. $[\alpha]_D^{20}$ +4.9 (c, 1 in MeOH).

N-*(2*R*-Hydroxy-3-octadecenoyl), 1*-O-β-D-*glucopyranoside:* ***Cerebroside C***
[98677-33-9]
$C_{43}H_{79}NO_9$ 754.098
Isol. from a *Pachybasium* sp. and *Penicillium funiculosum*. Also isol. (without full stereochem. assignment) from marine fungus *Microsphaeropsis olivacea*. Shows elicitor activity. Cell differentiation inducer; fruiting body formation enhancer. Antifungal agent. Cryst.
Mp 159-169°. $[\alpha]_D^{20}$ -6.2 (c, 1 in MeOH).

N-*(2*R*-Hydroxynonadecanoyl), 1*-O-β-D-*glucopyranoside:*
[852627-54-4]
$C_{44}H_{83}NO_9$ 770.141
Constit. of the soft coral *Lobophytum* sp. Solid.
Mp 218-220°. $[\alpha]_D^{28}$ -13.2 (c, 0.05 in MeOH).

N-*(2*R*-Hydroxyeicosanoyl), 1*-O-β-D-*glucopyranoside:* ***Ircicerebroside***
[854008-50-7]
$C_{45}H_{85}NO_9$ 784.168
Isol. from *Cladiella* sp., *Lobophytum* sp. and *Sinularia* sp. Also from the sponge *Ircinia fasciculata*. Amorph. powder. $[\alpha]_D^{20}$ +9.1 (c, 0.02 in MeOH).

N-*(2*R*-Hydroxyheneicosanoyl), 1*-O-β-D-*glucopyranoside:*
$C_{46}H_{87}NO_9$ 798.195
Isol. from *Cladiella* sp. and *Sinularia* sp.

N-*(2*R*-Hydroxydocosanoyl), 1*-O-β-D-*glucopyranoside:*
$C_{47}H_{89}NO_9$ 812.221
Isol. from *Cladiella* sp. and *Sinularia* sp.

N-*(2*R*-Hydroxy-17Z-tetracosenoyl), 1*-O-β-D-*glucopyranoside:* ***Catacerebroside A***
$C_{49}H_{91}NO_9$ 838.259
Isol. from the fungus *Catathelasma ventricosa*. Amorph. solid. $[\alpha]_D^{20}$ -5 (c, 1.1 in MeOH).

N-*(2*E*-Octadecenoyl), 1*-O-β-D-*glucopyranoside:* [849544-01-0]
$C_{43}H_{79}NO_8$ 738.099
Prod. by a mangrove fungus.

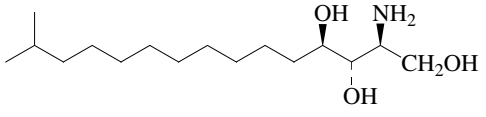
N-*(2*R*-Hydroxytetracosanoyl), 1*-O-*β-*D*-galactopyranoside:*
[126960-09-6]
$C_{49}H_{95}NO_{10}$ 858.29
Isol. from the sponge *Chondropsis* sp. Cryst.
Mp 218-220°. $[\alpha]_D^{27}$ +18 (c, 0.34 in $CHCl_3$/MeOH).

Endo, M. *et al., Pure Appl. Chem.*, 1986, **58**, 387-394 (*isol*)
Honda, M. *et al., Chem. Pharm. Bull.*, 1991, **39**, 1385-1391 (*synth, pmr, cmr*)

2-Amino-14-methyl-1,3,4-pentadecanetriol A-364



$C_{16}H_{35}NO_3$ 289.457

(2S,3S,4R)-form

N-*(2*R*-Hydroxydocosanoyl):*
$C_{38}H_{77}NO_5$ 628.03
Isol. from the tunicate *Cystodytes* cf. *dellechiajei*. Amorph. powder. $[\alpha]_D$ +9.6 (c, 0.05 in MeOH).

N-*(2*R*-Hydroxydocosanoyl), 1*-O-*(2-acetamido-2-deoxy-β-*D*-glucopyranoside):* ***Halicylindroside B₁***
[161842-90-6]
$C_{46}H_{90}N_2O_{10}$ 831.224
Isol. from the sponge *Halichondria cylindrata*. Solid. $[\alpha]_D^{23}$ -9.2 (c, 0.15 in Py).

N-*(2*R*-Hydroxytricosanoyl), 1*-O-*(2-acetamido-2-deoxy-β-*D*-glucopyranoside):* ***Halicylindroside B₂***
[161842-91-7]
$C_{47}H_{92}N_2O_{10}$ 845.251
Isol. from the sponge *Halichondria cylindrata*. Solid. $[\alpha]_D^{23}$ -9 (c, 0.15 in Py).

Li, H.-Y. *et al., Tetrahedron*, 1995, **51**, 2273-2280 (*Halicylindrosides*)
Loukaci, A. *et al., J. Nat. Prod.*, 2000, **63**, 799-802 (*isol*)

2-(Aminomethyl)-2-propenoic acid, 9CI A-365

3-Amino-2-methylenepropanoic acid. α-Methylene-β-alanine
[4452-16-8]
$H_2C{=}C(COOH)CH_2NH_2$
$C_4H_7NO_2$ 101.105
Toxic amino acid from the sponge *Fasciospongia cavernosa* and other sponges. Also prod. by a *Streptomyces* sp. Shows herbicidal props. Sol. H_2O.

Hydrochloride: [75509-28-3]
Cryst. (MeOH/Me_2CO). Mp 153-154°.

Me ester: [87375-90-4]
$C_5H_9NO_2$ 115.132
From *Fasciospongia cavernosa*.
Mp 107-108° (as hydrochloride).

N-*Tetradecanoyl:* [70290-27-6]
$C_{18}H_{33}NO_3$ 311.464
Isol. from *Spongia* cf. *zimocca*.

N-*Pentadecanoyl:* [70290-28-7]
$C_{19}H_{35}NO_3$ 325.49
Isol. from *Spongia* cf. *zimocca*.

N-*Hexadecanoyl:* [70290-29-8]
$C_{20}H_{37}NO_3$ 339.517
Isol. from *Spongia* cf. *zimocca*.

N-*Tetradecanoyl, Me ester:* [70290-25-4]
$C_{19}H_{35}NO_3$ 325.49
Isol. from *Fasciospongia cavernosa* and *Spongia* cf. *zimocca*.

N-*Pentadecanoyl, Me ester:* [70290-26-5]
$C_{20}H_{37}NO_3$ 339.517
Isol. from *Fasciospongia cavernosa* and *Spongia* cf. *zimocca*.

N-*Hexadecanoyl, Me ester:* [52634-29-4]
$C_{21}H_{39}NO_3$ 353.544
Isol. from *Fasciospongia cavernosa*, a *Hippospongia* sp. and *Spongia* cf. *zimocca*.

N-*(14-Methylpentadecanoyl), Me ester:* ***Hurghamide A***
$C_{21}H_{39}NO_3$ 353.544
Isol. from a *Hippospongia* sp. Wax.

N-*(15-Methylhexadecanoyl), Me ester:* ***Hurghamide B***
$C_{22}H_{41}NO_3$ 367.571
Isol. from a *Hippospongia* sp. Wax.

N-*(Methylhexadecanoyl), Me ester:* ***Hurghamide C***
$C_{22}H_{41}NO_3$ 367.571
Isol. from a *Hippospongia* sp. Wax. Posn. of methyl on *N*-acyl group not determined.

N-*Heptadecanoyl, Me ester:* [52634-30-7]
$C_{22}H_{41}NO_3$ 367.571
Isol. from *Fasciospongia cavernosa* and a *Hippospongia* sp.

N-*(13-Octadecenoyl), Me ester:* ***Hurghamide D***
$C_{23}H_{41}NO_3$ 379.582
Isol. from a *Hippospongia* sp.

N-*Octadecanoyl, Me ester:* [52634-31-8]
$C_{23}H_{43}NO_3$ 381.598
Isol. from *Fasciospongia cavernosa*.

N-*Nonadecanoyl, Me ester:* [52634-32-9]
$C_{24}H_{45}NO_3$ 395.624
Isol. from *Fasciospongia cavernosa*.

N-*Eicosanoyl, Me ester:* [52634-33-0]
$C_{25}H_{47}NO_3$ 409.651
Isol. from *Fasciospongia cavernosa*.

N-*(2-Oxotetradecanoyl), Me ester:* [70290-19-6]
$C_{19}H_{33}NO_4$ 339.474
Isol. from *Spongia* cf. *zimocca* and *Sinularia dissecta*.

N-*(2-Oxopentadecanoyl), Me ester:* [70290-20-9]
$C_{20}H_{35}NO_4$ 353.501
Isol. from *Spongia* cf. *zimocca* and *Sinularia dissecta*.

N-*(2-Oxohexadecanoyl), Me ester:* [70290-21-0]
$C_{21}H_{37}NO_4$ 367.528
Isol. from *Spongia* cf. *zimocca*.

N-*(2-Hydroxytetradecanoyl), Me ester:* [70290-22-1]
$C_{19}H_{35}NO_4$ 341.49
Isol. from *Spongia* cf. *zimocca*.

N-*(2-Hydroxypentadecanoyl), Me ester:* [70290-23-2]
$C_{20}H_{37}NO_4$ 355.517
Isol. from *Spongia* cf. *zimocca*.

N-*(2-Hydroxyhexadecanoyl), Me ester:* [70290-24-3]
$C_{21}H_{39}NO_4$ 369.543
Isol. from *Spongia* cf. *zimocca*.

N-*(2-Acetoxy-2-tetradecenoyl), Me ester:*
$C_{21}H_{35}NO_5$ 381.511
Isol. from *Fasciospongia cavernosa*.

N-*(2-Acetoxy-2-pentadecenoyl), Me ester:*
$C_{22}H_{37}NO_5$ 395.538
Isol. from *Fasciospongia cavernosa*.

$C_{35}H_{67}NO_3$ 549.919
Isol. from *Ulva fasciata* and a *Zoanthus* sp. Amorph. powder.
Mp 86°. $[\alpha]_D^{27}$ +20.1 (c, 0.01 in $CHCl_3$).

N-*Me,* N-*octadecanoyl, 1*-O-*sulfate:* ***Hariamide***
[197703-64-3]
$C_{37}H_{71}NO_6S$ 658.037
Isol. from a *Zoanthus* sp. Cryst.
Mp 165°. $[\alpha]_D^{27}$ +11.3 (c, 0.01 in MeOH).

N-*(2-Hydroxyethyl),* N-*tetradecanoyl:* [684213-91-0]
$C_{34}H_{65}NO_4$ 551.892
Constit. of *Anthopleura pacifica*.

N-*(2-Hydroxyethyl),* N-*hexadecanoyl:* [684213-93-2]
$C_{36}H_{69}NO_4$ 579.945
Constit. of *Anthopleura pacifica*.

N-*(2-Hydroxyethyl),* N-*(9Z-hexadecenoyl):* [684213-92-1]
$C_{36}H_{67}NO_4$ 577.93
Constit. of *Anthopleura pacifica*.

N-*(2-Hydroxyethyl),* N-*(13Z-docosenoyl):* [684213-94-3]
$C_{42}H_{79}NO_4$ 662.09
Constit. of *Anthopleura pacifica*.

(2S,3R,4E,8Z)-form

N-*Hexadecanoyl, 1*-O-*β-D-glucopyranoside:* [127842-89-1]
$C_{40}H_{75}NO_8$ 698.034
Constit. of *Lycium chinense* (Chinese boxthorn). Antihepatotoxic agent. Amorph. powder. $[\alpha]_D^{25}$ +1.2 (c, 0.1 in MeOH).

N-*(2*R-*Hydroxyhexadecanoyl), 1*-O-*β-D-glucopyranoside:* ***Soyacerebroside II****. AS 1-3*
[115074-93-6]
$C_{40}H_{75}NO_9$ 714.034
Isol. from *Tetragonia tetragonoides* (New Zealand spinach), *Glycine max* (soybean) and *Allium sativum*. Antiulcerogenic principle. Hygroscopic granules or amorph. solid.
Mp 192-194° (183°). $[\alpha]_D^{24}$ +13.4 (c, 0.43 in MeOH/$CHCl_3$ 3:2) (+4.6).

N-*(2*R-*Hydroxytetracosanoyl), 1*-O-*β-D-glucopyranoside:* ***Stenochlaena cerebroside****. Longancerebroside II*
[220873-86-9]
$C_{48}H_{91}NO_9$ 826.248
Constit. of *Euphoria longan* and *Stenochlaena palustris.*
$[\alpha]_D^{25}$ +7.9 (c, 0.09 in MeOH).

N-*(15*E-*Tetracosenoyl), 1*-O-*β-D-glucopyranoside: CE 1-2*
[204126-76-1]
$C_{48}H_{89}NO_8$ 808.233
Isol. from the sea cucumber *Cucumaria echinata*. Amorph. powder.
Mp 136-137°. $[\alpha]_D$ -1.9 (c, 0.33 in 1-propanol).

(2ξ,3ξ,4E,8E)-form

N-*(13-Methyltetradecanoyl), 1*-O-*β-D-galactopyranoside:*
$C_{39}H_{73}NO_8$ 684.008
Isol. from sponge *Halichondria panicea*.
$[\alpha]_D$ -11.7 (c, 1.56 in $CHCl_3$) (as penta-Ac).

N-*Hexadecanoyl:* ***Sinumeramide***
[124787-56-0]
$C_{34}H_{65}NO_3$ 535.892
Constit. of the soft coral *Sinularia* sp. Cryst. ($CHCl_3$/MeOH).
Mp 98-100°. $[\alpha]_D^{25}$ +2.8 (c, 0.5 in $CHCl_3$).

N-*Nonadecanoyl:* ***Humesamide***
[300715-39-3]
$C_{37}H_{71}NO_3$ 577.973
Isol. from the soft coral *Cladiella humesi*. Amorph. solid.
Mp 79-80°.

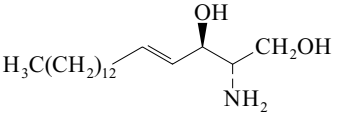
2-Amino-4-octadecene-1,3-diol, 9CI A-384

4-Sphingenine. *C_{18}-Sphingosine*



(2*S*,3*R*,4*E*)–*form*

$C_{18}H_{37}NO_2$ 299.496
See also Gangliosides, G-24. Many syntheses reported of various stereoisomers.

(2*S*,3*R*,4*E*)-*form*
D-erythro-trans-*form*
[123-78-4]
Cryst. (Et_2O). Mp 80-84° (79-81°).
1-Phosphate: Sphingosine-1-phosphate
[26993-30-6]
$C_{18}H_{38}NO_5P$ 379.476
Intermed. in catabolic degradation of sphingosine. Affects cell growth. Amorph. powder.
1-O-β-D-*Glucopyranoside:* ***Glucopsychosine***
[52050-17-6]
$C_{24}H_{47}NO_7$ 461.638
Metab. prod. present in Gaucher's disease.
1-O-β-D-*Galactopyranoside: Psychosine*
[2238-90-6]
[38621-58-8]
$C_{24}H_{47}NO_7$ 461.638
Alkaline hydrol. prod. of the cerebrosides. Cryst. (EtOH or MeOH/MeCN). Mp 195-200° dec. $[\alpha]_D^{20}$ -12.5 (Py).
N-*Ac:* [3102-57-6]
[532-45-6]
$C_{20}H_{39}NO_3$ 341.533
Powder. Mp 85-87°. $[\alpha]_D^{26}$ -10 (c, 13.7 in MeOH).
Tri-Ac: [2482-37-3]
Mp 103.5-104°. $[\alpha]_D^{19}$ -24.1. $[\alpha]_D$ -13 (c, 0.5 in $CHCl_3$).
N-*Hexanoyl:* [124753-97-5]
$C_{24}H_{47}NO_3$ 397.64
Cryst. (MeOH aq.).
N-*Tetradecanoyl:* N-*[2-Hydroxy-1-(hydroxymethyl)-3-heptadecenyl]tetradecanamide, 8CI*. *2-Tetradecanoylamino-4-octadecene-1,3-diol*. N-*Tetradecanoyl-4-sphingenine*
[34227-72-0]
$C_{32}H_{63}NO_3$ 509.855
Present in blood plasma lipids.
N-*Tetradecanoyl, 1*-O-β-D-*galactopyranoside:* N-*Tetradecanoylgalactocerebroside*
[315710-03-3]
$C_{38}H_{73}NO_8$ 671.997
Found in brain tissue.
N-*Pentadecanoyl:* [67492-15-3]
$C_{33}H_{65}NO_3$ 523.881
Constit. of the sponge *Gellius cymiformis*.
N-*(2*R*-Hydroxy-14ξ-methylpentadecanoyl), 1-sulfate:* ***Calyceramide C***
[346425-31-8]
$C_{34}H_{67}NO_7S$ 633.972
Isol. from the sponge *Discodermia calyx*. Neuraminidase inhibitor. Solid (as Na salt). $[\alpha]_D^{20}$ +16.9 (c, 0.1 in MeOH) (Na salt).
N-*Hexadecanoyl:* N-*[2-Hydroxy-1-(hydroxymethyl)-3-heptadecenyl]hexadecanamide, 8CI*. *2-Hexadecanoylamino-4-octadecene-1,3-diol*. N-*Hexadecanoyl-4-sphingenine*
[24696-26-2]
$C_{34}H_{67}NO_3$ 537.908
Present in blood and brain lipids.
N-*Hexadecanoyl, 1*-O-*[*N-*acetyl-α-neuraminosyl-(2→3)-β-D-galactopyranosyl-(1→4)-β-D-glucopyranoside]:* ***Ganglioside GM3***. N-*Acetylganglioside GM3*
[89678-50-2]
$C_{57}H_{104}N_2O_{21}$ 1153.449
Ubiquitous metabolite. Involved in cell differentiation, immunosuppression and other cellular functions. Amorph. solid.
Mp 180-190° (softens). $[\alpha]_D^{22}$ +0.8 (c, 1.2 in $CHCl_3$/MeOH 1:1).
N-*(2-Hydroxyhexadecanoyl): 2-Hydroxy*-N-*[2-hydroxy-1-(hydroxymethyl)-3-heptadecenyl]hexadecanamide, 9CI*. N-*2-Hydroxyhexadecanoyl-4-sphingenine*
[228579-71-3]
$C_{34}H_{67}NO_4$ 553.908
Found in brain tissue.
Mp 100-101°.
N-*(2*R*-Hydroxyhexadecanoyl), 1*-O-β-D-*glucopyranoside: AS 1-5*
[154967-87-0]
$C_{40}H_{77}NO_9$ 716.05
Constit. of *Allium sativum* (garlic) bulbs. Amorph. powder.
Mp 205-210°. $[\alpha]_D^{28}$ +8.3 (c, 0.15 in propanol).
N-*Heptadecanoyl:*
$C_{35}H_{69}NO_3$ 551.935
Isol. from the red alga *Amansia glomerata* and the gorgonian *Pseudopterogorgia australiensis*. Cryst.
N-*Octadecanoyl: 2-Octadecanoylamino-4-octadecene-1,3-diol*. N-*Octadecanoyl-4-sphingenine*

[2304-81-6]
$C_{36}H_{71}NO_3$ 565.962
Isol. from *Styela canopus*. Present in blood and brain lipids.
Mp 97-98° (91-93°). $[\alpha]_D^{25}$ -3.1 (c, 1.1 in $CHCl_3$).

N-*Octadecanoyl, 1*-O-*β-D-galactopyranoside:* N-*Octadecanoylgalactocerebroside*
[36271-49-5]
$C_{42}H_{81}NO_8$ 728.104
Found in brain tissue.

N-*Octadecanoyl, 1*-O-*[6-deoxy-α-L-galactopyranosyl-(1→3)-[β-D-mannopyranosyl-(1→4)]-β-D-glucopyranoside]:* [319922-63-9]
$C_{54}H_{101}NO_{17}$ 1036.388
Isol. from the millipede *Parafontaria laminata armigera*.

N-*(9-Octadecenoyl):* N-*[2-Hydroxy-1-(hydroxymethyl)-3-heptadecenyl]-9-octadecenamide, 9CI*. *2-Octadec-9-enoylamino-4-octadecene-1,3-diol*. N-*Octadec-9-enoylsphingenine*. N-*Oleoyl-4-sphingenine*
[5966-28-9]
$C_{36}H_{69}NO_3$ 563.946
Present in blood and brain lipids.

N-*(9Z,12Z-Octadecadienoyl):* N-*9,12-Octadecadienoyl-4-sphingenine*. N-*Linoleoyl-4-sphingenine*
[34249-39-3]
$C_{36}H_{67}NO_3$ 561.93
Found in brain lipids.

N-*Nonadecanoyl:*
$C_{37}H_{73}NO_3$ 579.989
Isol. from the gorgonian *Junceella juncea*. Cryst. $[\alpha]_D^{25}$ -11.5 (c, 0.1 in $CHCl_3$).

N-*Eicosanoyl:* N-*[2-Hydroxy-1-(hydroxymethyl)-3-heptadecenyl]eicosanamide, 9CI*. *2-Eicosanoylamino-4-octadecene-1,3-diol*. N-*Eicosanoyl-4-sphingenine*. N-*Icosanoyl-4-sphingenine*
[7344-02-7]
$C_{38}H_{75}NO_3$ 594.015
Present in blood and brain lipids.

N-*Docosanoyl:* N-*[2-Hydroxy-1-(hydroxymethyl)-3-heptadecenyl]docosanamide, 9CI*. *2-Docosanoylamino-4-octadecene-1,3-diol*. N-*Docosanoyl-4-sphingenine*
[27888-44-4]
$C_{40}H_{79}NO_3$ 622.069
Present in brain and blood lipids. Isol. from sponge *Callyspongia spinosissima*. Microcryst. solid (MeOH).
Mp 120°. $[\alpha]_D^{27}$ -7 (c, 0.5 in $CHCl_3$/MeOH 1:1).

N-*(13Z-Docosenoyl):* N-*[2-Hydroxy-1-(hydroxymethyl)-3-heptadecenyl]-13-docosenamide, 9CI*. N-*13-Docosenoyl-4-octadecene-1,3-diol*. N-*13-Docosenoyl-4-sphingenine*. N-*Erucoyl-4-sphingenine*
[54135-66-9]
$C_{40}H_{77}NO_3$ 620.053
Present in blood lipids.

N-*Tetracosanoyl:* N-*[2-Hydroxy-1-(hydroxymethyl)-3-heptadecenyl]tetracosanamide, 9CI*. *2-(Tetracosanoylamino)-4-octadecene-1,3-diol*. N-*Tetracosanoyl-4-sphingenine*. ***Lobophytamide L5***
[34435-05-7]
[34227-72-0]
$C_{42}H_{83}NO_3$ 650.123
Present in blood and brain lipids. Cryst. (MeOH).
Mp 93-95°.

N-*(15Z-Tetracosenoyl), 1*-O-*β-D-galactopyranoside:* N-*15Z-Tetracosenoylgalactocerebroside*. ***Nervone***
[17283-91-9]
$C_{48}H_{91}NO_8$ 810.249
Present in brain cerebrosides.
Mp 154-156°. $[\alpha]_D^{22}$ -3.7 (c, 10 in Py).

N-*(2-Hydroxytetracosanoyl), 1*-O-*galactopyranoside:* See *N*-2-Hydroxytetracosanoylgalactocerebroside in *The Combined Chemical Dictionary.*

N-*(2-Hydroxy-15Z-tetracosenoyl), 1*-O-*β-D-galactopyranoside:* N-*(2-Hydroxy-15-tetracosenoyl)galactocerebroside*. ***Oxynervone***
[17283-90-8]
$C_{48}H_{91}NO_9$ 826.248
Brain cerebroside.
Mp 180-181°. $[\alpha]_D^{22}$ +3.8 (c, 10 in Py).

Tribenzoyl:
Cryst. (EtOH). Mp 121.5-123.5°. $[\alpha]_D^{27}$ -11.2.

N,N-*Di-Me:* [119567-63-4]

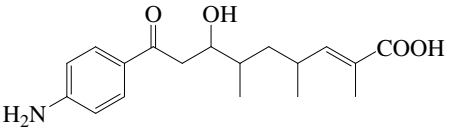
9-(4-Aminophenyl)-7-hydroxy-2,4,6-trimethyl-9-oxo-2-nonenoic acid A-397

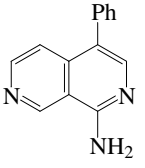


$C_{18}H_{25}NO_4$ 319.4
Prod. by *Streptomyces griseus* ssp. from a mangrove plant. Gum. $[\alpha]_D^{25}$ -320 (c, 0.05 in MeOH). λ_{max} 202 (ϵ 3970); 237 (ϵ 1880); 330 (ϵ 2880) (MeOH).

Guan, S.-H. *et al., J. Nat. Prod.*, 2005, **68**, 1198-1200 (*isol, pmr, cmr*)

1-Amino-4-phenyl-2,7-naphthyridine A-398

*4-Phenyl-2,7-naphthyridin-1-amine, 9CI. **Lophocladine B***

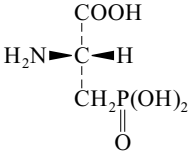


$C_{14}H_{11}N_3$ 221.261
Alkaloid from *Lophocladia* sp. Cytotoxic. Yellowish gum. λ_{max} 220 (log ϵ 4.01); 254 (log ϵ 4.02); 336 (log ϵ 3.89) (MeOH).

Gross, H. *et al., J. Nat. Prod.*, 2006, **69**, 640-644 (*isol, pmr, cmr, ms*)

2-Amino-3-phosphonopropanoic acid A-399

3-Phosphonoalanine, 9CI. AP 3. APPA
[5652-28-8]



$C_3H_8NO_5P$ 169.074
Constit. of *Zoanthus sociatus* and the ciliate, *Tetrahymena pyriformis*.

(*R*)-*form*
Cryst. Mp 224-227°. $[\alpha]_D^{24}$ -8.06 (c, 2 in H_2O).

(*S*)-*form* [23052-80-4]
Cryst. (EtOH aq.). Mp 224-226°. $[\alpha]_D^{24}$ +13.8 (c, 2.0 in 1*M* NaOH). $[\alpha]_D^{24}$ +8.33 (H_2O).

(±)-*form* [20263-06-3]
Solid (EtOH aq.). Mp 226° dec.

N-*Benzoyl:*
$C_{10}H_{12}NO_6P$ 273.182
Cryst. (H_2O or dioxan). Mp 197°.

3-Amino-1-propanesulfonic acid, 9CI A-400

*Homotaurine†. Cerebril. **Tramiprosate, INN***
[3687-18-1]
$H_2NCH_2CH_2CH_2SO_2OH$
$C_3H_9NO_3S$ 139.175
Constit. of marine red algae e.g. *Grateloupia livida* and from the green alga *Cladophora densa*. Inhibits amyloid. A fibril formn. and deposition. Needles (EtOH aq.).
Mp 290-292° dec. (270-271°). pK_a 10.05 (H_2O).

Amide:
$C_3H_{10}N_2O_2S$ 138.19
Cryst. Mp 159-160°.

N-*Ac: 3-Acetylamino-1-propanesulfonic acid, 9CI. **Acamprosate, BAN, INN**. Aotal. Campral*
[77337-76-9]
$C_5H_{11}NO_4S$ 181.212
GABA receptor agonist. Psychotropic agent. Used in treatment of alcoholism. Solid (AcOH). Mp 187-189°. Approved by FDA (2004)

N-*Ac, Ca salt (2:1): Calcium* N-*acetylhomotaurine. **Acamprosate calcium, BAN**. Ca-AOTA*
[77337-73-6]
Mp 270°. Na, K, Li, Mg and Zn salts also reported.

N-*Benzoyl:*
$C_{10}H_{13}NO_4S$ 243.283
Cryst. (EtOH aq.) (as Ag salt).

N-*Me:*
$C_4H_{11}NO_3S$ 153.202
Cryst. (EtOH). Mp 210-212°.

$C_7H_{11}N_3O_2$ 169.183

Alkaloid from the sponge *Agelas dispar*. Amorph. solid. λ_{max} 226 (ϵ 3500); 262 (ϵ 1500) (MeOH).

Cafieri, F. *et al., J. Nat. Prod.*, 1998, **61**, 1171-1173 (*isol, uv, ir, pmr, cmr*)

Ammonium magnesium phosphate (1:1:1), 9CI, 8CI **A-424**

Phosphoric acid ammonium magnesium salt (1:1:1), 8CI

[7785-21-9]

$Mg(NH_4)PO_4$

H_4MgNO_4P 137.315

The anhydrous salt does not appear to have been obtained. Occurs as hexahydrate. Synth. from $Mg(OH)_2$-H_3PO_4-NH_4OH and Na_3PO_4-$MgSO_4$-NH_4OH. Also $MgHPO_4 + NH_3$. Occurs in human urinary calculi, and also guano. Precipitated during course of gravimetric estimation of Mg. Ignited to $Mg_2P_2O_7$. Agricultural fertiliser. Amorph. powder. A trihydrate has been reported.

Monohydrate: [16674-60-5] Obt. from hexahydrate at 80-100°. May be cryst. from aq. solns. containing $MgCl_2$ and $[NH_4]H_2PO_4$. Sol. acids; prac. insol. H_2O (0.023 g per 100 cm^3 at 0°), (0.02 g per 100 cm at 80°); insol. EtOH. Stable below 130-150°.

Hexahydrate: [13478-16-5]
White powder or elongated platelets. Orthorhombic with regular $PO_4^{3\ominus}$ tetrahedra and distorted $Mg(H_2O)_6^{2\oplus}$ octahedra. A slurry in H_2O at 95° → the monohydrate. When heated dry, loses H_2O and NH_3 in three overlapping processes.

Mineral-*form*

Struvite. *Guanite*
[15490-91-2] Found in peat beds and phosphate caves. Associated with Newberyite and Brushite. Found in human urinary sediments; diatomites, and bird and bat guano deposits in Chile and Australia.
Colourless to pale yellowish-brown, transparent to translucent, brittle, bipyramidal cryst. Essentially the hexahydrate.

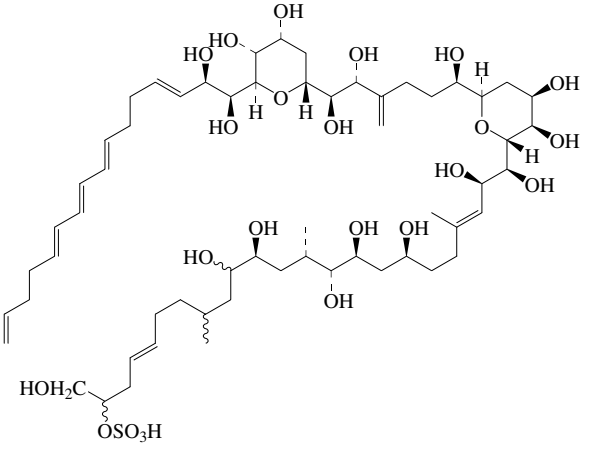
[190781-73-8]
As Amphidinol 5, A-440 with
R = H

$C_{70}H_{120}O_{24}$ 1345.704
Isol. from *Amphidinium klebsii*.

Paul, G.K. *et al., J. Mar. Biotechnol.*, 1997, **5**, 124-128 (*isol, struct*)
Houdai, T. *et al., Tetrahedron*, 2001, **57**, 5551-5555 (*biosynth*)

Amphidinol 7 A-442

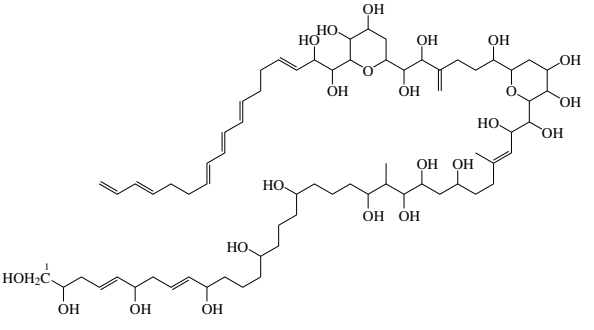


$C_{59}H_{100}O_{23}S$ 1209.491
Constit. of *Amphidinium klebsii*. Pale yellow powder. $[\alpha]_D^{20}$ -14.1 (c, 0.15 in MeOH). λ_{max} 258 (ϵ 19900); 269 (ϵ 25200); 279 (ϵ 19900) (MeOH).

Morsy, N. *et al., Tetrahedron*, 2005, **61**, 8606-8610 (*isol, pmr, cmr, ms*)

Amphidinol 9 A-443

[863453-65-0]



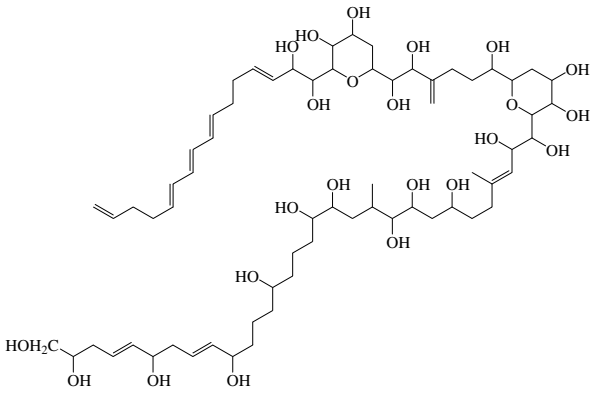
$C_{70}H_{118}O_{23}$ 1327.688
Constit. of *Amphidinium carterae.* Pale yellow solid. $[\alpha]_D^{20}$ -57 (c, 0.03 in MeOH). λ_{max} 230 (ϵ 5600); 279 (ϵ 12400) (no solvent reported).

1-O-*Sulfate:* ***Amphidinol 13***
[863453-66-1]
$C_{70}H_{118}O_{26}S$ 1407.753
Constit. of *Amphidinium carterae.*
$[\alpha]_D^{20}$ -79 (c, 0.02 in MeOH).

Echigoya, R. *et al., Harmful Algae*, 2005, **4**, 383-389 (*isol, pmr, cmr*)

Amphidinol 10 A-444

[863453-67-2]

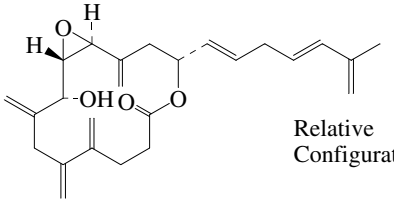


$C_{66}H_{112}O_{23}$ 1273.597
Constit. of *Amphidinium carterae*. Pale yellow oil. $[\alpha]_D^{20}$ -61 (c, 0.02 in MeOH). λ_{max} 269 (ϵ 9940) (no solvent reported).

Echigoya, R. *et al., Harmful Algae*, 2005, **4**, 383-389 (*isol, pmr, cmr*)

Amphidinolide V A-445

[262853-42-9]

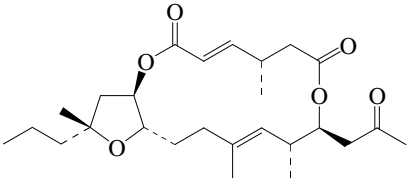


Relative Configuration

$C_{25}H_{32}O_4$ 396.525
Isol. from *Amphidinium* sp. Cytotoxic agent. Oil. λ_{max} 230 (ϵ 11000) (no solvent reported).

Kubota, T. *et al., Tet. Lett.*, 2000, **41**, 713-716

Amphidinolide X A-446



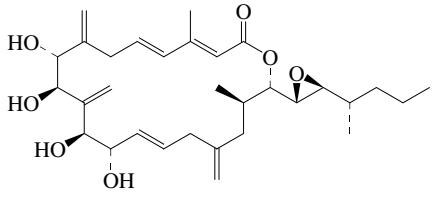
Absolute Configuration

$C_{26}H_{40}O_6$Isol. from *Amphidinium* sp. strain Y-42.
Oil. $[\alpha]_D^{17}$ -12 (c, 1 in $CHCl_3$). λ_{max} 209 (ϵ 6800) (EtOH).

Tsuda, M. *et al., J.O.C.*, 2003, **68**, 5339-5345 (*isol, pmr, cmr, biosynth*)
Fürstner, A. *et al., J.A.C.S.*, 2006, **128**, 9194-9204 (*synth*)

Amphidinolide A A-447

[106463-75-6]



Absolute Configuration

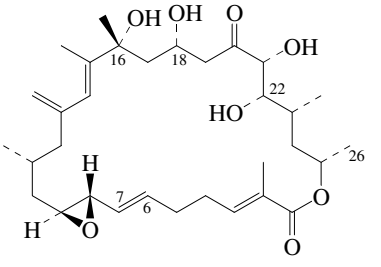
$C_{31}H_{46}O_7$ 530.7

Macrolide antibiotic. Prod. by *Amphidinium* sp. Y5 and *Amphiscolops* sp. Antineoplastic agent. Needles.
Mp 130-133°. $[\alpha]_D^{24}$ +46 (c, 1 in $CHCl_3$). λ_{max} 265 (ϵ 18000) (MeOH) (Derep).

Kobayashi, J. *et al., Tet. Lett.*, 1986, **27**, 5755-5758 (*isol*)
Kobayashi, J. *et al., J. Nat. Prod.*, 1991, **54**, 1435-1439 (*isol, pmr, cmr*)
Trost, B.M. *et al., J.A.C.S.*, 2005, **127**, 13589-13597; 13598-13610 (*synth, abs config*)
Ishiyama, H. *et al., Tetrahedron*, 2006, **62**, 166-170 (*synth, abs config*)

Amphidinolide B A-448

Amphidinolide B_1
[110786-78-2]



Absolute Configuration

$C_{32}H_{50}O_8$ 562.742
Macrolide antibiotic. Isol. from *Amphidinium* sp. Shows antitumour props. Needles (hexane/CH_2Cl_2).
Mp 82-84°. $[\alpha]_D^{25}$ -62.5 (c, 0.4 in $CHCl_3$). $[\alpha]_D^{25}$ -45 (c, 1 in $CHCl_3$). λ_{max} 222 (ϵ 12000) (MeOH).

16-Deoxy: ***Amphidinolide B_4***
$C_{32}H_{50}O_7$ 546.743
Isol. from *Amphidinium* sp. Cytotoxic. Oil. $[\alpha]_D^{23}$ -13 (c, 0.2 in $CHCl_3$). λ_{max} 209 (ϵ 6800) (EtOH).

16-Deoxy, 26-hydroxy: ***Amphidinolide H***. *Amphidinolide H_1*
[134781-24-1]
$C_{32}H_{50}O_8$ 562.742
Isol. from *Amphidinium* sp. and *Amphiscolops* sp. Antitumour agent. Needles (C_6H_6/hexane).
Mp 131-132°. $[\alpha]_D^{18}$ -32.3 (c, 0.2 in $CHCl_3$). λ_{max} 222 (ϵ 12000) (MeOH).

16-Deoxy, 26-hydroxy, 6,7-dihydro: ***Amphidinolide H_4***
$C_{32}H_{52}O_8$ 564.758
Isol. from an *Amphidinium* sp. Oil. $[\alpha]_D^{26}$ -30 (c, 0.1 in $CHCl_3$). λ_{max} 221 (ϵ 9300) (MeOH).

18-Epimer: ***Amphidinolide B_2***
[155683-56-0]
$C_{32}H_{50}O_8$ 562.742
From *Amphidinium* sp. Cytotoxic agent. Amorph. solid. Sol. MeOH, $CHCl_3$; poorly sol. H_2O, hexane. $[\alpha]_D^{25}$ -43.9 (c, 0.4 in $CHCl_3$). There is evidence that Amphidinolides B_2 and D are identical. Further research is taking place (1994). λ_{max} 220 (ϵ 16000) (MeOH).

22-Epimer: ***Amphidinolide B_3***
[155683-57-1]
$C_{32}H_{50}O_8$ 562.742
From *Amphidinium* sp. Cytotoxic agent. Sol. MeOH, $CHCl_3$; poorly sol. H_2O, hexane. $[\alpha]_D^{25}$ -69.4 (c, 0.2 in $CHCl_3$). λ_{max} 220 (ϵ 16000) (MeOH).

22-Epimer, 16-deoxy, 26-hydroxy: ***Amphidinolide H_3***
$C_{32}H_{50}O_8$ 562.742
Isol. from an *Amphidinium* sp. Oil. $[\alpha]_D^{24}$ -61 (c, 0.05 in $CHCl_3$). λ_{max} 222 (ϵ 14900) (MeOH).

16,18-Diepimer: ***Amphidinolide D***
[121350-99-0]
$C_{32}H_{50}O_8$ 562.742
Isol. from an *Amphidinium* sp. and *Amphiscolops* sp. Shows antitumour props. Amorph. solid. $[\alpha]_D^{30}$ -30 (c, 0.5 in $CHCl_3$). λ_{max} 222 (ϵ 12000) (MeOH).

16,18-Diepimer, 16-deoxy: ***Amphidinolide B_5***
$C_{32}H_{50}O_7$ 546.743

Isol. from *Amphidinium* sp. Cytotoxic. Oil. $[\alpha]_D$ -25 (c, 0.2 in $CHCl_3$). λ_{max} 209 (ϵ 6800) (EtOH).

16,18-Diepimer, 16-deoxy, 26-hydroxy: ***Amphidinolide H₂***
$C_{32}H_{50}O_8$ 562.742
Isol. from an *Amphidinium* sp. Oil. $[\alpha]_D^{25}$ -90 (c, 0.1 in $CHCl_3$). λ_{max} 222 (ϵ 20400) (MeOH).

16,18-Diepimer, 16-deoxy, 26-hydroxy, 6,7-dihydro: ***Amphidinolide H₅***
$C_{32}H_{52}O_8$ 564.758
Isol. from an *Amphidinium* sp. Oil. $[\alpha]_D^{26}$ -54 (c, 0.14 in $CHCl_3$). λ_{max} 221 (ϵ 9000) (MeOH).

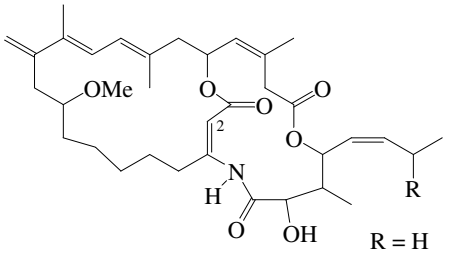
Amphilactam A A-469

[221465-59-4]



$C_{35}H_{51}NO_7$ 597.79

Isol. from sponges of the genus *Amphimedon* spp. Nematocide. Yellow oil. $[\alpha]_D$ +11.8 (c, 0.35 in $CHCl_3$). λ_{max} 270 (ϵ 44800) ($CHCl_3$).

*(2*E*)-Isomer:* ***Amphilactam C***
[221465-61-8]
$C_{35}H_{51}NO_7$ 597.79
Isol. from *Amphimedon* spp. Yellow oil. $[\alpha]_D$ +17.3 (c, 0.48 in $CHCl_3$). λ_{max} 280 (ϵ 14000) ($CHCl_3$).
Ovenden, S.P.B. *et al., J.O.C.*, 1999, **64**, 1140-1144 (*isol, uv, ir, pmr, cmr*)

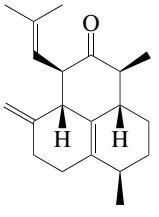
Amphilactam B A-470

[221465-60-7]
As Amphilactam A, A-469 with
R = CH_3
$C_{36}H_{53}NO_7$ 611.817
Isol. from sponges of the genus *Amphimedon* spp. Yellow oil. $[\alpha]_D$ +8.5 (c, 0.38 in $CHCl_3$). λ_{max} 280 (ϵ 18800) ($CHCl_3$).

*(2*E*)-Isomer:* ***Amphilactam D***
[221465-62-9]
$C_{36}H_{53}NO_7$ 611.817
Isol. from *Amphimedon* spp. Yellow oil. $[\alpha]_D$ +2.5 (c, 0.03 in $CHCl_3$). λ_{max} 270 (ϵ 3050) ($CHCl_3$).
Ovenden, S.P.B. *et al., J.O.C.*, 1999, **64**, 1140-1144 (*isol, uv, ir, pmr, cmr*)

8(13),11(20),14-Amphilectatrien-2-one A-471

Sinulobatin B
[189455-96-7]



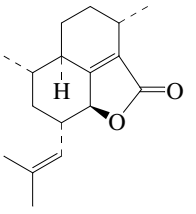
$C_{20}H_{28}O$ 284.441

Constit. of *Sinularia nanolobata*. Amorph. $[\alpha]_D^{25}$ +105.2 (c, 0.1 in $CHCl_3$).

Yamada, K. *et al., Tetrahedron*, 1997, **53**, 4569-4578 (*isol, pmr, cmr*)

Amphilectolide A-472

[290353-50-3]



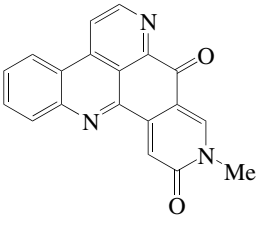
$C_{17}H_{24}O_2$ 260.375

Constit. of *Pseudopterogorgia elisabethae*. Yellow oil. $[\alpha]_D^{25}$ +24.7 (c, 1.7 in $CHCl_3$).

Rodríguez, A.D. *et al., Tet. Lett.*, 2000, **41**, 5177-5180 (*isol, pmr, cmr*)

Amphimedine A-473

*10-Methyl-8*H*-benzo[*b*]pyrido[4,3,2-*de*][1,8]phenanthroline-8,11(10*H*)-dione, 9CI*
[86047-14-5]



$C_{19}H_{11}N_3O_2$ 313.315

Alkaloid from an *Amphimedon* sp. of Pacific sponge and *Xestospongia carbonaria*. Cytotoxic; topoisomerase II inhibitor. Yellow solid. Fairly sol. MeOH; poorly sol. butanol, hexane. Mp 360°. λ_{max} 210 (ϵ 19700); 233 (ϵ 39400); 281 (ϵ 9100); 341 (ϵ 6060) (EtOH) (Derep). λ_{max} 245 (ϵ 38000); 281 (ϵ 10000); 340 (ϵ 7000) (MeOH) (Berdy). λ_{max} 235 (ϵ 38000); 281 (ϵ 10000); 340 (ϵ 7000) (EtOH) (Berdy).

Schmitz, F.J. *et al., J.A.C.S.*, 1983, **105**, 4835 (*isol, uv, ir, pmr, cmr, ms, struct*)

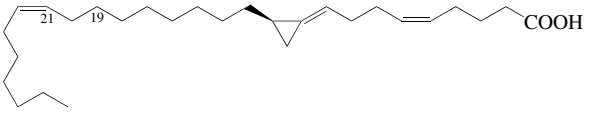
Amphimic acid B A-474

9-(9-Hexadecenylcyclopropylidene)-5-nonenoic acid, 9CI
[195305-10-3]



$C_{28}H_{48}O_2$ 416.686

Isol. from the sponge *Amphimedon* sp. DNA topoisomerase inhibitor. Oil. $[\alpha]_D^{27}$ +6.2 (c, 1 in MeOH). Props. refer to a mixture with Δ^{19}-isomer. λ_{max} 199 (ϵ 9940) (MeOH).

21,22-Dihydro: ***Amphimic acid A***
[195305-03-4]
[200722-44-7, 200722-45-8]
$C_{28}H_{50}O_2$ 418.702
Isol. from *Amphimedon* sp. DNA topoisomerase I inhibitor.

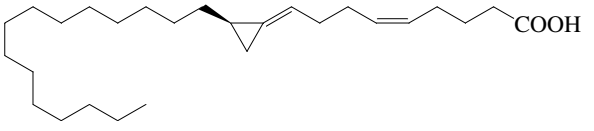
Needles (MeCN/Et_2O).
Mp 39-39.5°. $[\alpha]_D^{22}$ +7.7 (c, 0.5 in MeOH). λ_{max} 196 (ϵ 9210) (MeOH).

21,22-Dihydro, 19,20-didehydro:
$C_{28}H_{48}O_2$ 416.686
Isol. from *Amphimedon* sp.

Nemoto, T. *et al., Tetrahedron*, 1997, **53**, 16699-16710 (*isol, uv, ir, pmr, cmr*)

Amphimic acid C A-475

9-(Pentadecylcyclopropylidene)-5-nonenoic acid, 9CI
[200809-79-6]

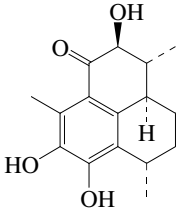


$C_{27}H_{48}O_2$ 404.675
Isol. from the sponge *Amphimedon* sp. Oil. $[\alpha]_D^{27}$ +6.3 (c, 0.1 in MeOH). λ_{max} 199 (ϵ 8210) (MeOH).

Nemoto, T. *et al., Tetrahedron*, 1997, **53**, 16699-16710 (*isol, uv, ir, pmr, cmr*)

Amphiphenalone A-476

[325691-50-7]

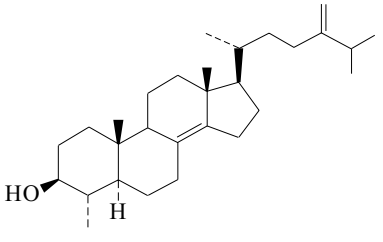


$C_{16}H_{20}O_4$ 276.332
Constit. of *Pseudopterogorgia elisabethae*. Plates.
Mp 218-220°. $[\alpha]_D^{25}$ +86.7 (c, 0.3 in Me_2CO). λ_{max} 216 (ϵ 12000); 288 (ϵ 6000) (MeOH).

Rodríguez, A.D. *et al., Tetrahedron*, 2000, **56**, 9015-9023 (*isol, pmr, cmr*)

Amphisterol A-477

4-Methylergosta-8(14),24(28)-dien-3-ol. 4-Methyl-24-methylene-cholest-8(14)-en-3-ol
[72165-10-7]

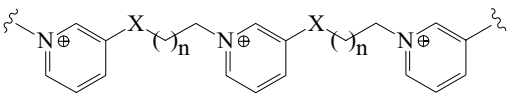


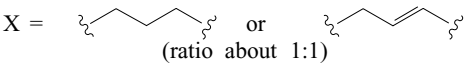
$C_{29}H_{48}O$ 412.698
Constit. of *Amphidinium carterae*. Cryst. (MeOH).
Mp 138-141°. $[\alpha]_D$ +10 (c, 0.07 in $CHCl_3$). Incorrect name in CA.

Withers, N.W. *et al., Phytochemistry*, 1979, **18**, 899-901 (*isol, pmr, ms*)
Kokke, W.C.M.C. *et al., Phytochemistry*, 1981, **20**, 127-134 (*isol, pmr, ms*)

Amphitoxin A-478

[165724-12-9]





n = 5 (mean value)

Polymeric alkaloid from the Caribbean sponge *Amphimedon compressa*. Exhibits antifeedant activity. λ_{max} 266 (H_2O).

Albrizio, S. *et al., J. Nat. Prod.*, 1995, **58**, 647 (*isol, uv, ir, pmr, cmr*)

Amylostreptin A-479

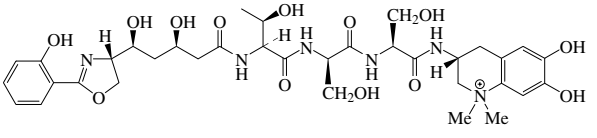
[146479-36-9]

Struct. unknown. Isol. from *Streptomyces corchorusii* ssp. *rhodomarinus* from marine sediment. α-Amylase inhibitor.

Imada, C. *et al., Nippon Suisan Gakkaishi*, 1992, **58**, 2169-2174 (*isol*)

Anachelin 1 A-480

[326490-91-9]



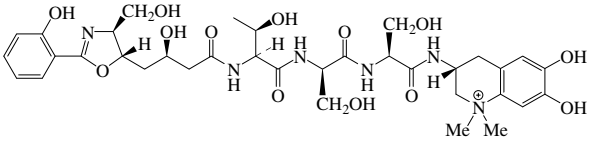
Absolute Configuration

$C_{35}H_{49}N_6O_{13}^{\oplus}$ 761.805
Isol. from *Anabaena cylindrica* NIES-19. Siderophore. Amorph. powder. $[\alpha]_D$ -34.8 (c, 0.05 in H_2O). λ_{max} 286 (ϵ 1900) (H_2O).

Itou, Y. *et al., Tetrahedron*, 2001, **57**, 9093-9099 (*isol, pmr, cmr*)
Gademann, K. *et al., Angew. Chem., Int. Ed.*, 2004, **43**, 3327-3329 (*synth*)
Ito, Y. *et al., Tetrahedron*, 2004, **60**, 9075-9080 (*abs config*)

Anachelin 2 A-481

[387816-76-4]



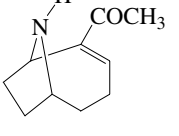
Absolute Configuration

$C_{35}H_{49}N_6O_{13}^{\oplus}$ 761.805
Isol. from *Anabaena cylindrica* NIES-19. Siderophore. Amorph. powder. $[\alpha]_D$ -65.7 (c, 0.06 in H_2O). λ_{max} 286 (ϵ 1800) (H_2O).

Itou, Y. *et al., Tetrahedron*, 2001, **57**, 9093-9099 (*isol, pmr, cmr*)
Ito, Y. *et al., Tetrahedron*, 2004, **60**, 9075-9080 (*abs config*)

Anatoxin a A-482

1-(9-Azabicyclo[4.2.1]non-2-en-2-yl)ethanone, 9CI. 2-Acetyl-9-azabicyclo[4.2.1]non-2-ene



(*R*)-*form*

$C_{10}H_{15}NO$ 165.235

(*R*)-*form*

Very fast death factor. VFDF. AnTx

[64285-06-9]

Alkaloid from *Anabaena flos-aquae* NRC-44h (Euphorbiaceae). Also isol. from *Oscillatoria* spp. *Aphanizomenon flos-aquae* and *Cylindrospermum* sp. Depolarising agent. Potent agonist for the nicotinic acetylcholine receptor. Oil. Sol. H_2O, MeOH. λ_{max} 226 (ϵ 8300) (MeOH) (Berdy). λ_{max} 227 (ϵ 10000) (EtOH) (Berdy).

▶ Exp. reprod. effects. Very toxic by intraperitoneal route; LD_{50} (mus, ipr) .3 mg/kg , LD_{50} (mus, ipr) .2 mg/kg. KM5527000

Hydrochloride: [64314-16-5]

$[\alpha]_D^{24}$ +43.2 (c, 0.676 in EtOH).

▶ KM5528500

N-*Ac:* Mp 117-118°. $[\alpha]_D$ -127 (c, 4.8 in EtOH).

(*S*)-*form* [92142-32-0]

Hydrochloride:

Synthetic. $[\alpha]_D^{23}$ -45 (c, 0.3 in EtOH).

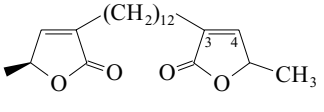
Ancepsenolide A-483

3,3′-Dodecamethylenebis[5-methyl-2(5H)-furanone], 8CI. 3,3′-(1,12-Dodecanediyl)bis[5-methyl-2(5H)-furanone]

[28028-69-5]



$C_{22}H_{34}O_4$ 362.508

λ_{max} 208 (ϵ 28800) (95% EtOH) (Derep).

(*S*)-*form*

Constit. of the marine gorgon *Pterogorgia (Xiphigorgia) anceps*.

Cryst. (MeOH).

Mp 92.8-94.3°. $[\alpha]_D^{24}$ +7.7 (+13.2). Samples exhibiting variable small opt. rotations, both positive and negative, have been encountered. All samples appeared to be homogeneous.

3,4-Dihydro, 4-acetoxy: ***Ancepsenolide acetate***

$C_{24}H_{38}O_6$ 422.561

Constit. of *Pterogorgia citrina*. Amorph. powder.

Mp 53.9-54.9°. $[\alpha]_D^{25}$ -11.2 (c, 1 in $CHCl_3$). Trivial name is misleading.

3,4-Dihydro, 4-acetoxy, stereoisomer: ***Hydroxyancepsenolide acetate***

$C_{24}H_{38}O_6$ 422.561

Constit. of *Pterogorgia citrina*. Semisolid.

Mp 68.3-70.3° (semisynthetic). $[\alpha]_D^{25}$ +3.7 (c, 2 in $CHCl_3$) (semisynth). Epimeric with Ancepsenolide acetate at C-3 and C-4. Trivial name is misleading.

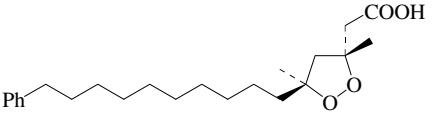
3,5-Dimethyl-5-(10-phenyldecyl)-1,2-dioxolane-3-acetic acid



Relative Configuration

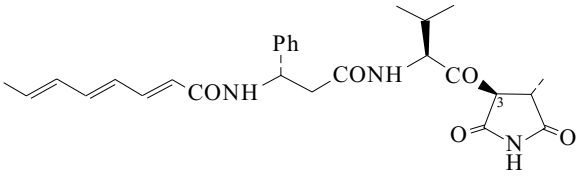
$C_{23}H_{36}O_4$ 376.535

Related to 5-Alkyl-3,5-dimethyl-1,2-dioxolane-3-acetic acids, A-206. Isol. from the sponge *Plakortis* aff. *simplex*. Antitumour agent. Oil. $[\alpha]_D$ +34.7 (c, 0.004 in $CHCl_3$).

Rudi, A. *et al., J. Nat. Prod.*, 2003, **66**, 682-685 (*isol, pmr, cmr, ms*)

Andrimid A-492

[108868-95-7]



$C_{27}H_{33}N_3O_5$ 479.575

Peptide antibiotic. Prod. by a bacterial symbiont from *Nilaparvata lugens*, a marine *Pseudomonas fluorescens* and an *Enterobacter* sp. Active against *Xanthomonas* sp.
Mp 172-173.5°. λ_{max} 297 (ϵ 38000) (MeOH/AcOH) (Derep). λ_{max} 297 (ϵ 51100) (MeOH/NaOH) (Derep). λ_{max} 297 (ϵ 41200) (MeOH) (Derep).

3-Epimer, 3-hydroxy: ***Moiramide C***
[155233-32-2]
$C_{27}H_{33}N_3O_6$ 495.574
Metab. of a marine *Pseudomonas fluorescens*. Amorph. solid. Sol. MeOH, EtOAc. λ_{max} 289 (ϵ 29711) (MeOH) (Berdy).

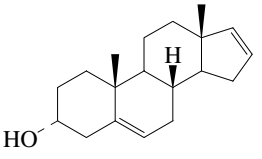
Androsta-5,16-dien-3-ol A-493



3α-*form*

$C_{19}H_{28}O$ 272.43

3α-*form* [30505-67-0]
Cryst. (Me_2CO aq.). Mp 138°. $[\alpha]_D$ -77.5 (c, 1.2 in $CHCl_3$).

3β-*form* [1224-94-8]
Sterol identified in sponge *Damiriana hawaiiana*. Metab. of pregnenolone.
Mp 140-141°. $[\alpha]_D$ -71.9 (c, 1.5 in $CHCl_3$).

Ac: [1236-14-2]
$C_{21}H_{30}O_2$ 314.467
Cryst. (MeOH). Mp 94-95°. $[\alpha]_D$ -81 (c, 0.27 in $CHCl_3$).

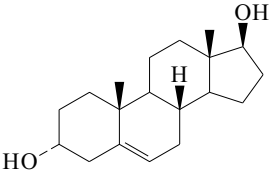
Androst-5-ene-3,17-diol, 9CI A-495



(3α,17β)–*form*

$C_{19}H_{30}O_2$ 290.445

(3β,17β)-*form*
Hermaphrodiol
[521-17-5]
Obt. from the incubation of 3β-hydroxyandrost-5-en-17-one with *Fusidium* sp. Occurs in blood, testes, urine and ovarian follicles. Sterol identified in sponge *Damiriana hawaiiana* and prod. from cholesterol by starfish *Asterias rubens*.
Cryst. (Me_2CO).
Mp 180.5-183°. $[\alpha]_D$ -56 (c, 0.4 in EtOH).
► Exp. reprod. effects. BV8091000

Triakis scyllia Angiotensin I A-498

Dogfish angiotensin I
[152839-32-2]
Asn-Arg-Pro-Tyr-Ile-His-Pro-Phe-Gln-Leu
$C_{61}H_{89}N_{17}O_{14}$ 1284.48
Isol. from plasma and kidney extracts of the dogfish *Triakis scyllia*.

Takei, Y. *et al., J. Endocrinol.*, 1993, **139**, 281-285 (*isol*)

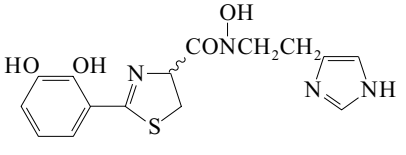
Thunnus albacares Angiotensin-converting enzyme inhibitor A-499

[117620-76-5]
Pro-Thr-His-Ile-Lys-Trp-Gly-Asp
$C_{44}H_{64}N_{12}O_{12}$ 953.063
Isol. from muscle of the yellowfin tuna *Thunnus albacares*.
Inhibitor of angiotensin-converting enzyme.

Kohama, Y. *et al., Biochem. Biophys. Res. Commun.*, 1988, **155**, 332-337 (*isol*)
Kohama, Y. *et al., J. Pharmacobio-Dyn.*, 1989, **12**, 566-571 (*synth, props*)

Anguibactin A-500

2-(2,3-Dihydroxyphenyl)-4,5-dihydro-N-*hydroxy*-N-*[2-(1*H*-imidazol-4-yl)ethyl]-4-thiazolecarboxamide, 9CI*
[117308-63-1]

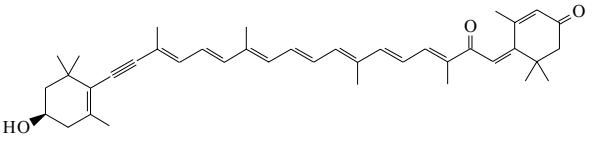


$C_{15}H_{16}N_4O_4S$ 348.382
Isol. from the iron-deficient cultures of a marine *Vibrio anguillarum*. Siderophore. λ_{max} 216; 266; 327 (MeOH) (Berdy). λ_{max} 214; 260 (ε 11000); 315; 410 (pH 7 buffer) (Berdy). λ_{max} 214; 258; 335; 415 (pH 10 buffer) (Berdy).

Actis, L.A. *et al., J. Bacteriol.*, 1986, **167**, 57 (*isol*)
Jalal, M.A.F. *et al., J.A.C.S.*, 1989, **111**, 292-296 (*Anguibactin*)

Anhydroamarouciaxanthin B A-501

6′,7,7′,8-Tetrahydro-6′,8′-dihydro-3-hydroxy-β,ε-carotene-3′,8′-dione
[119286-10-1]

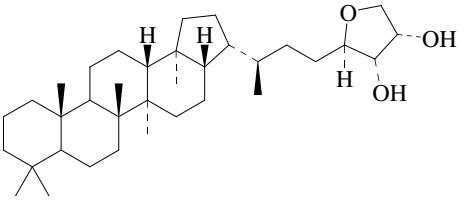


$C_{40}H_{50}O_3$ 578.833
Constit. of *Mytilus edulis* (blue mussel). λ_{max} 458; 485 (hexane).

Hertzberg, S. *et al., Acta Chem. Scand., Ser. B*, 1988, **42**, 495 (*occur, uv, ms, pmr*)

32,35-Anhydrobacteriohopane-33,34-diol A-502

[346578-23-2]

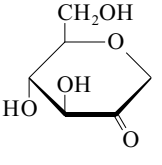


$C_{35}H_{60}O_3$ 528.857
Constit. of *Plakortis simplex*. Powder.
Mp 266-267° dec. $[\alpha]_D$ +17 (c, 2.2 in Py).

Costantino, V. *et al., Tetrahedron*, 2001, **57**, 4045-4048 (*isol, pmr, cmr*)

1,5-Anhydrofructose, 9CI A-503

1,5-Anhydro-arabino-*hex-2-ulose*



$C_6H_{10}O_5$ 162.142
In aq. soln. the oxo form illus. is in equilib. with the 2-enol form (1,5-Anhydro-*arabino*-hex-1-enitol), the 2,3-enediol form and the 3,3-diol covalent hydrate, which is the predominating species. In nonaqueous solvs. exists as a mixt. of two dimers. Acetylation gives spiro-dimers.

D-*form* [75414-43-6]
Prod. by the action of α-1,4-glucan lyase on α-glucans such as starch. Exists in rat liver, fungi and algae. Precursor of 2-Hydroxy-2-(hydroxymethyl)-2*H*-pyran-3(6*H*)-one, H-696 in *Morchella vulgaris* (morel) and of Echinosporin in *Peziza echinospora*. Antioxidant. Amorph. solid.
Mp 107-112°. $[\alpha]_D^{20}$ -32.9 (c, 0.86 in H_2O).

Oxime: [75414-31-2]
$C_6H_{11}NO_5$ 177.157
Mp 178-180°. $[\alpha]_D^{21}$ -43 (c, 0.3 in H_2O).

Tri-Ac: 3,4,6-Tri-O-*acetyl-1,5-anhydro-D*-arabino-*hex-2-ulose*
$C_{12}H_{16}O_8$ 288.254
Mp 93-94° (86-88°). $[\alpha]_D$ -7.2 (c, 1.5 in $CHCl_3$).

Tri-Ac, oxime: [88851-59-6]

[75414-20-9]
$C_{12}H_{17}NO_8$ 303.268
Mp 89-90°. $[\alpha]_D^{21}$ -52.9 (c, 0.3 in $CHCl_3$).

*Tribenzoyl: 1,5-Anhydro-3,4,6-tri-*O*-benzoyl-D-fructose*
[75414-32-3]
$C_{27}H_{22}O_8$ 474.466
Mp 126-127°. $[\alpha]_D^{20}$ -24 (c, 0.8 in $CHCl_3$).

Tribenzoyl, oxime: [82569-81-1]
[75414-21-0]
$C_{27}H_{23}NO_8$ 489.481
Mp 176-177°. $[\alpha]_D^{21}$ -39 (c, 0.4 in $CHCl_3$).

*4,6-Benzylidene, 3-(*tert*-butyldimethylsilyl): 1,5-Anhydro-4,6-*O*-benzylidene-3-*O*-(*tert*-butyldimethylsilyl)-D-fructose*
[89872-98-0]
$C_{19}H_{28}O_5Si$ 364.513
Syrup + $1H_2O$. $[\alpha]_D^{20}$ -49.9 (c, 2.7 in $CHCl_3$).

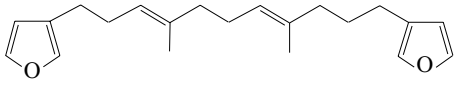
Anhydrofurospongin 1 A-504

[35671-06-8]

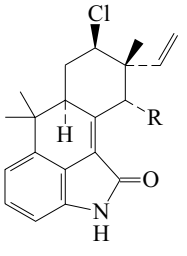


$C_{21}H_{28}O_2$ 312.451
Constit. of *Spongia officinalis* and *Hippospongia communis*. Oil.

Cimino, G. *et al., Tetrahedron*, 1972, **28**, 267

Anhydrohapaloxindole A A-505

[109217-16-5]



R = NC

$C_{21}H_{21}ClN_2O$ 352.862
Minor alkaloid from the blue-green alga *Hapalosiphon fontinalis*. Mp 123° dec. $[\alpha]_D$ +150 (c, 0.4 in EtOH). Appears to be a $^1O_2$ oxidn. prod. of Hapalindole A, H-80, the major alkaloid in this cyanophyte.

Moore, R.E. *et al., J.O.C.*, 1987, **52**, 3773 (*isol, uv, pmr, cmr, struct*)

Anhydrohapaloxindole B A-506

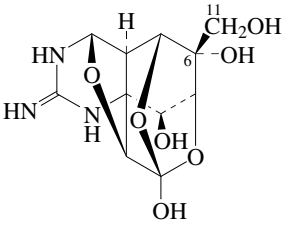
[123519-73-3]
As Anhydrohapaloxindole A, A-505 with
R = NCS
$C_{21}H_{21}ClN_2OS$ 384.928
Minor alkaloid from the blue-green alga *Hapalosiphon fontinalis*.

Dechloro: ***Anhydrohapaloxindole M***
[123498-03-3]
$C_{21}H_{22}N_2OS$ 350.484
Minor alkaloid from *Hapalosiphon fontinalis*.

Moore, R.E. *et al., Phytochemistry*, 1989, **28**, 1565 (*isol, pmr, struct*)

4,9-Anhydrotetrodotoxin A-507

[13072-89-4]



$C_{11}H_{15}N_3O_7$ 301.255
Isol. from puffer fish, newts, other marine animals incl. *Cynops ensicauda*, *Fugu* spp. and *Octopus maculosus*. Bacteria has been suggested as the source within these organisms. Toxic sodium channel blocker; phycotoxin. Amorph.
▶ Paralytic poison.

6-Epimer: ***4,9-Anhydro-6-epitetrodotoxin***
[113565-40-5]
$C_{11}H_{15}N_3O_7$ 301.255
Isol. from the newt *Cynops ensicauda*. Amorph. $[\alpha]_D^{25}$ +10 (c, 0.08 in AcOH aq.).

11-Deoxy: ***4,9-Anhydro-11-deoxytetrodotoxin***
[113507-22-5]
$C_{11}H_{15}N_3O_6$ 285.256
Isol. from the newt *Cynops ensicauda*. Amorph.

Tsuda, K. *et al., Chem. Pharm. Bull.*, 1964, **12**, 634-642; 642-645; 1357-1374

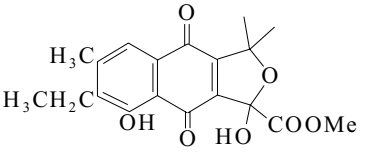
Annulin A A-509

[105335-73-7]

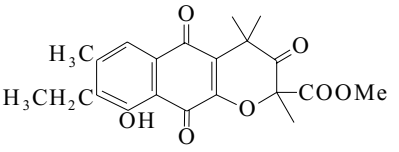


$C_{19}H_{20}O_7$ 360.363
Constit. of *Garveia annulata*. Shows antibacterial activity. Orange cryst. (EtOH). Sol. MeOH, $CHCl_3$; poorly sol. H_2O.
Mp 174-176°. λ_{max} 286 (ϵ); 559 (ϵ) (MeOH/NaOH) (Derep). λ_{max} 217 (ϵ); 247 (ϵ); 439 (ϵ) (MeOH) (Derep).

Fahy, E. *et al., J.O.C.*, 1986, **51**, 5145 (*isol, cryst struct*)

Annulin B A-510

[105335-74-8]



$C_{21}H_{22}O_7$ 386.401
Constit. of *Garveia annulata*. Orange oil. Sol. MeOH, $CHCl_3$; poorly sol. H_2O. $[\alpha]_D$ +8 (c, 0.2 in $CHCl_3$). λ_{max} 235 (ϵ); 270 (sh) (ϵ); 307 (sh) (ϵ); 530 (ϵ) (MeOH/NaOH) (Derep). λ_{max} 208 (ϵ); 255 (ϵ); 293 (ϵ); 425 (ϵ) (MeOH) (Derep).

Fahy, E. *et al., J.O.C.*, 1986, **51**, 5145

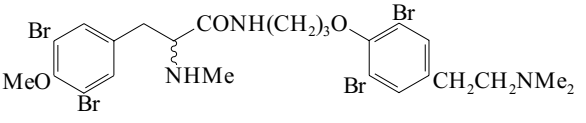
Anodontatachykin A-511

[157171-96-5]
H-5-OxoPro-Tyr-Gly-Phe-His-Ala-Val-Arg-NH_2
$C_{45}H_{62}N_{14}O_{10}$ 959.073
Isol. from the ganglia of the mollusc *Anodonta cygnea*.

Fujisawa, Y. *et al., Pept. Chem.*, 1993, **31**, 161-164 (*isol*)

Anomoian A A-512

[129602-20-6]

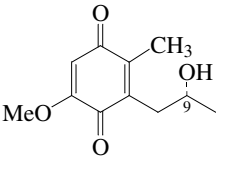


$C_{24}H_{31}Br_4N_3O_3$ 729.143
Metab. of the verongid sponge *Anomoianthella popeae*. Powder (as hydrochloride).
Mp 200° dec. (hydrochloride). $[\alpha]_D$ +5.1 (c, 0.013 in MeOH). λ_{max} 245 (ϵ 12300); 276 (ϵ 9400); 283 (ϵ 7800) (MeOH).

Kernan, M.R. *et al., J. Nat. Prod.*, 1990, **53**, 720-723 (*isol, uv, ir, pmr, cmr, ms*)

Anserinone B A-513

3-(2-Hydroxypropyl)-5-methoxy-2-methyl-1,4-benzoquinone
[190895-96-6]



$C_{11}H_{14}O_4$ 210.229
Abs. config. revised in 2004.

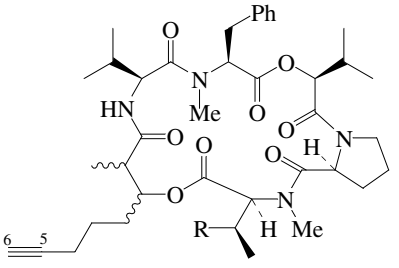
(R)-form
Prod. by *Podospora anserina* and strains of the marine *Penicillium corylophilum*. Exhibits antibacterial, antifungal and cytotoxic props. Yellow oil. $[\alpha]_D$ +43 (c, 1 in MeOH). λ_{max} 233 (ϵ 4500); 275 (ϵ 10000); 369 (ϵ 500) (CH_2Cl_2).

O-*Formyl:* ***Formylanserinone B***
$C_{12}H_{14}O_5$ 238.24
Isol. from a mixture of strains of the marine *Penicillium corylophilum*. Amber cryst. $[\alpha]_D^{27}$ +11.6 (c, 0.2 in MeOH). λ_{max} 279 (log ϵ 3.93); 360 (log ϵ 2.67) (CH_2Cl_2).

Ketone: 5-Methoxy-2-methyl-3-(2-oxopropyl)-1,4-benzoquinone. ***Anserinone A***
[190895-95-5]
$C_{11}H_{12}O_4$ 208.213

Prod. by *Podospora anserina* and *Penicillium corylophilum*. Exhibits antibacterial, antifungal and cytotoxic props. Yellow needles.
Mp 122-124°. λ_{max} 265 (ϵ 7100); 359 (360) (CH_2Cl_2).
Wang, H.-J. *et al., J. Nat. Prod.*, 1997, **60**, 629-631; 2004, **67**, 1637 (*Anserinones*)
Gautschi, J.T. *et al., J. Nat. Prod.*, 2004, **67**, 362-367 (*Formylanserinone B*)

Antanapeptin A **A-514**



R = CH_2CH_3

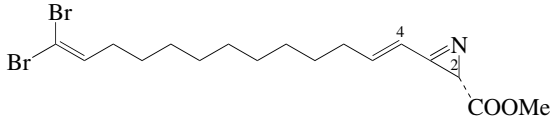
$C_{41}H_{60}N_4O_8$ 736.947
Depsipeptide antibiotic. Isol. from *Lyngbya majuscula*. Pale yellow oil. $[\alpha]_D^{21}$ -50 (c, 0.13 in MeOH). λ_{max} 212 (log ϵ 4.5) (MeOH).

5,6-Dihydro: ***Antanapeptin B***
$C_{41}H_{62}N_4O_8$ 738.963
Isol. from *Lyngbya majuscula*. Pale yellow oil. $[\alpha]_D^{21}$ -42 (c, 0.09 in MeOH). λ_{max} 212 (log ϵ 4.6) (MeOH).

5,5,6,6-Tetrahydro: ***Antanapeptin C***
$C_{41}H_{64}N_4O_8$ 740.979
Isol. from *Lyngbya majuscula*. Pale yellow oil. $[\alpha]_D^{21}$ -42 (c, 0.09 in MeOH). λ_{max} 212 (log ϵ 4.6) (MeOH).
Nogle, L.M. *et al., J. Nat. Prod.*, 2002, **65**, 21-24

Antanapeptin D **A-515**
As Antanapeptin A, A-514 with
R = CH_3
$C_{40}H_{58}N_4O_8$ 722.92
Isol. from *Lyngbya majuscula*. Pale yellow oil. $[\alpha]_D^{21}$ -30 (c, 0.05 in MeOH).
Nogle, L.M. *et al., J. Nat. Prod.*, 2002, **65**, 21-24

Antazirine **A-516**



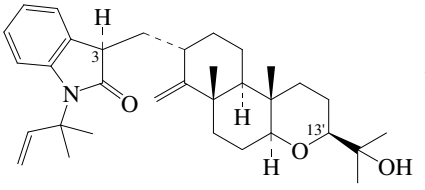
(2*S*,4*E*)-*form*

$C_{17}H_{25}Br_2NO_2$ 435.198

(2*S*,4*E*)-*form* [170385-24-7]
Isol. from the sponge *Dysidea fragilis*.
Oil. $[\alpha]_D$ +10.3 (c, 0.39 in $CHCl_3$). λ_{max} 213; 220 (sh) (MeOH).

(4*Z*)-*form* [170554-75-3]
Very minor constit. of *Dysidea fragilis*.
Oil. C-2 config. not clear. λ_{max} 215; 220 (sh) (MeOH).
Salomon, C.E. *et al., J. Nat. Prod.*, 1995, **58**, 1463-1466 (*isol, uv, ir, pmr, cmr, ms, struct*)

Anthcolorin A **A-517**
[358334-50-6]



Absolute Configuration

$C_{33}H_{47}NO_3$ 505.739
Prod. by *Aspergillus versicolor* OUPS-N136 isol. from the sea urchin *Anthocidaris crassispina*.

3-Hydroxy: ***Anthcolorin G***
[358334-56-2]
$C_{33}H_{47}NO_4$ 521.739
Prod. by *Aspergillus versicolor* OUPS-N136.

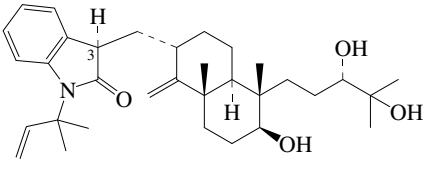
3-Epimer: ***Anthcolorin B***
[358334-51-7]
$C_{33}H_{47}NO_3$ 505.739
Prod. by *Aspergillus versicolor* OUPS-N136.

3-Epimer, 3-hydroxy: ***Anthcolorin H***
[358334-57-3]
$C_{33}H_{47}NO_4$ 521.739
Prod. by *Aspergillus versicolor* OUPS-N136.

13′-Epimer: ***Anthcolorin C***
[358334-52-8]
$C_{33}H_{47}NO_3$ 505.739
Prod. by *Aspergillus versicolor* OUPS-N136.

3,13′-Diepimer: ***Anthcolorin D***
[358334-53-9]
$C_{33}H_{47}NO_3$ 505.739
Prod. by *Aspergillus versicolor* OUPS-N136.
Yamada, K. *et al., CA*, 2001, **135**, 204898 (*isol*)

Anthcolorin E **A-518**
[358334-54-0]

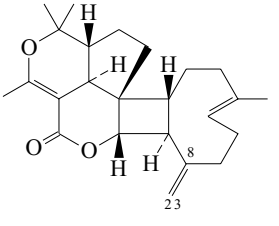


Absolute Configuration

$C_{33}H_{49}NO_4$ 523.754
Prod. by *Aspergillus versicolor* OUPS-N136 isol. from the sea urchin *Anthocidaris crassispina*.

3-Epimer: ***Anthcolorin F***
[358334-55-1]
$C_{33}H_{49}NO_4$ 523.754
Prod. by *Aspergillus versicolor* OUPS-N136.
Yamada, K. *et al., CA*, 2001, **135**, 204898 (*isol*)

Antheliolide A **A-519**
[114915-36-5]



$C_{24}H_{32}O_3$ 368.515

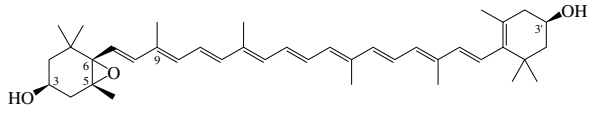
Novel acetoacetylated diterpenoid skeleton. Constit. of soft coral *Anthelia glauca*.
Mp 180°. Exists as mixt. of two conformers. λ_{max} 245 (ϵ 10000) (MeOH) (Derep).

8ξ,23-Epoxide: ***Antheliolide B***
[114933-19-6]
$C_{24}H_{32}O_4$ 384.514
Constit. of *Anthelia glauca*. Oil. λ_{max} 245 (ϵ 10000) (MeOH) (Derep).

Green, D. *et al., Tet. Lett.*, 1988, **29**, 1605 (*isol*)
Smith, A.B. *et al., Tet. Lett.*, 1989, **30**, 3363 (*cryst struct*)

Antheraxanthin A-520

5,6-Epoxy-5,6-dihydro-β,β-carotene-3,3′-diol, 9CI. Zeaxanthin epoxide. 5,6-Epoxyzeaxanthin



(3*S*,3'*R*,5*S*,6*R*,9*E*)-*form*

$C_{40}H_{56}O_3$ 584.881

(3*S*,3′*R*,5*S*,6*R*,9*E*)-*form*
Antheraxanthin A
[25494-44-4]
Constit. of *Lilium* spp., *Euonymus europaeus*, *Capsicum annuum* and other sources. Minor xanthophyll of Chrysophyceae algae. Potential nutriceutical. Cryst. (MeOH).
Mp 197°.

(3*S*,3′*R*,5*S*,6*R*,9*Z*)-*form*
cis-*Antheraxanthin*
[68831-78-7]
Constit. of *Lilium* spp.
Cryst. (MeOH).
Mp 108°.

(3*S*,3′*R*,5*R*,6*S*)-*form*
Antheraxanthin B
[640-03-9]
Constit. of the common freshwater goby *Rhinogobius brunneus*.
λ_{max} 420; 445; 475 (Et_2O).

Tappi, G. *et al., Helv. Chim. Acta*, 1949, **32**, 50 (*isol*)

Anthopleurins A-523

Heart stimulant.

Anthopleurin A, 9CI
Neurotoxin AX1
[60880-63-9]
Isol. from the sea anemone *Anthopleura xanthogrammica*. A single chain peptide of 49 amino acid residues with 3 intramol. disulfide bridges.

Anthopleurin B
Isol. from the sea anemone *Anthopleura xanthogrammica*. A single chain peptide containing 49 amino acids.

Anthopleurin C
Isol. from the sea anemone *Anthopleura elegantissima*. A single chain peptide containing 47 amino acids.

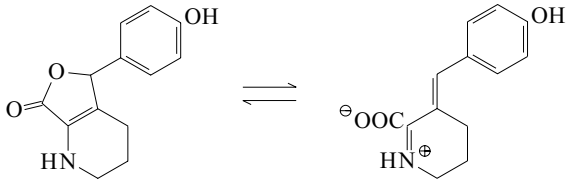
Anthosamine A A-524

3,4,5,6-Tetrahydro-3-[(4-hydroxyphenyl)methylene]-2-pyridinecarboxylic acid, 9CI
[165074-97-5]



$C_{13}H_{13}NO_3$ 231.251

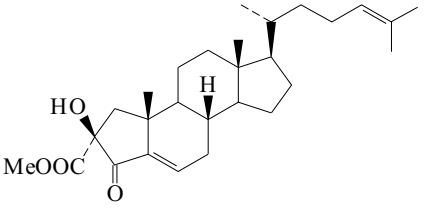
Shows reversible equilib. between lactone and zwitterion form; the latter predominates in protic solv. the former in aprotic solvs. Metab. from the marine sponge *Anthosigmella* aff. *raromicrosclera*. Induces larval metamorphosis in ascidians. Yellow solid. λ_{max} 229 (ϵ 7300); 249 (ϵ 6400); 283 (ϵ 4200); 368 (ϵ 14500) (MeOH) (Berdy). λ_{max} 287 (ϵ 7000) (DMSO) (Berdy).

N-*Me:* ***Anthosamine B****. 1,3,4,5-Tetrahydro-5-(4-hydroxyphenyl)-1-methylfuro[3,4-*b*]pyridin-7(2*H*)-one, 9CI*
[165074-96-4]
$C_{14}H_{15}NO_3$ 245.277
Metab. of *Anthosigmella* aff. *raromicrosclera*. Induces larval metamorphosis in ascidians. Yellow solid. $[\alpha]_D^{24}$ 0 (c, 0.15 in MeOH). λ_{max} 249 (ϵ 7100); 369 (ϵ 18400); 453 (ϵ 1900) (MeOH) (Berdy). λ_{max} 285 (ϵ 6000); 357 (ϵ 2400); 486 (ϵ 3600) (DMSO) (Berdy).

Tsukamoto, S. *et al., Tetrahedron*, 1995, **51**, 6687 (*isol, uv, ir, pmr, cmr, struct*)

Anthosterone A A-525

Methyl 2-hydroxy-3-oxo-4-norcholesta-5,24-diene-2-carboxylate
[116374-18-6]



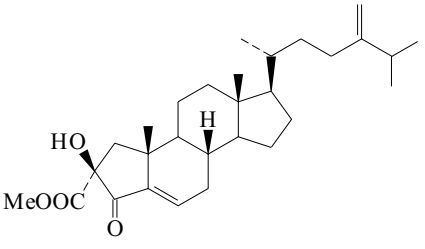
$C_{28}H_{42}O_4$ 442.637
Constit. of sponge *Anthoarcuata graceae*. Needles (MeCN). Mp 142-143°.

24,25-Dihydro: ***Phorbasterone B***
[682808-88-4]
$C_{28}H_{44}O_4$ 444.653
Constit. of *Phorbas amaranthus*. Solid. $[\alpha]_D$ -54.6 (c, 0.28 in $CHCl_3$). λ_{max} 250 (ϵ 9300) (MeCN).

Tischler, M. *et al., Can. J. Chem.*, 1988, **66**, 1173 (*isol, pmr, cmr, cryst struct*)
Masuno, M.N. *et al., J. Nat. Prod.*, 2004, **67**, 731-733 (*Phorbasterone B*)

Anthosterone B A-526

Methyl 2-hydroxy-3-oxo-4-norergosta-5,24(28)-diene-2-carboxylate
[116368-92-4]



$C_{29}H_{44}O_4$ 456.664
Constit. of sponge *Anthoarcuata graceae*. Needles (MeCN). Mp 155-157°.

*22,23-Didehydro(*E-*), 24,28-dihydro:* ***Phorbasterone A***
[682808-87-3]
$C_{29}H_{44}O_4$ 456.664
Constit. of *Phorbas amaranthus*. Solid. $[\alpha]_D$ -45.4 (c, 0.19 in $CHCl_3$). λ_{max} 250 (ϵ 9600) (MeCN).

Tischler, M. *et al., Can. J. Chem.*, 1988, **66**, 1173-1178 (*Anthosterone B*)

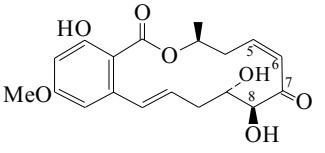
Antibiotic LL-Z1640-2 A-552

LL-Z1640-2. C 292. Antibiotic C 292. Antibiotic L 783278. L 783278
[66018-38-0]



$C_{19}H_{22}O_7$ 362.379

Macrolide-type antibiotic. Isol. from *Deuteromyces* sp. Protein kinase inhibitor, mycotoxin. Cryst. (EtOAc/hexane).
Mp 172-176°. $[\alpha]_D$ -75.9 (c, 0.41 in MeOH). Related to Zearalenone. λ_{max} 234 (ϵ 30900); 271 (ϵ 12000); 314 (ϵ 6100) (MeOH) (Derep).

7-Alcohol: ***Antibiotic LL-Z1640-4***. *LL-Z1640-4. Zeaenol*
[66018-41-5]
$C_{19}H_{24}O_7$ 364.394

Isol. from *Deuteromyces* sp. and *Cochliobolus lunata*. Shows antiviral and antiprotozoal activity. Cryst. (EtOAc/hexane).
Mp 193-195°. $[\alpha]_D$ -102 (c, 0.49 in MeOH). Stereochem. unknown and may not correspond with that of LL-Z1640-2. λ_{max} 234 (ϵ 30900); 271 (ϵ 12000); 314 (ϵ 6100) (MeOH) (Derep).

5,6-Dihydro: ***Antibiotic LL-Z1640-1***. *LL-Z1640-1. Antibiotic L 783279. L 783279*
[66018-37-9]
$C_{19}H_{24}O_7$ 364.394

From *Deuteromyces* sp. Cryst. (C_6H_6/hexane).
Mp 151-153°. $[\alpha]_D$ -80 (c, 0.48 in MeOH). λ_{max} 234 (ϵ 30900); 271 (ϵ 12000); 314 (ϵ 6100) (MeOH) (Derep).

5,6-Dihydro, 7-alcohol: ***Antibiotic LL-Z1540-3***. *LL-Z1640-3*
[66018-40-4]
$C_{19}H_{26}O_7$ 366.41

From *Deuteromyces* sp. Cryst.
Mp 175°. $[\alpha]_D$ -112 (c, 0.28 in MeOH). λ_{max} 234 (ϵ 30900); 271 (ϵ 12000); 314 (ϵ 6100) (MeOH) (Derep).

*11*R*,12*R*-Epoxide:* ***Hypothemycin***
[76958-67-3]
$C_{19}H_{22}O_8$ 378.378

Macrolide antibiotic. Isol. from *Hypomyces trichothecoides*. Also from *Coriolus versicolor* and *Aigialus parvus*. Active against protozoa and plant pathogenic fungi. Cytotoxic. Inhibits MEK kinase. Prisms (MeOH).
Mp 173-174°. $[\alpha]_D^{25}$ -18 (c, 0.5 in $CHCl_3$). Struct. revised in 1993. λ_{max} 220 (ϵ 38000); 267 (ϵ 14000); 307 (ϵ 7000) (MeOH) (Derep).

*11*R*,12*R*-Epoxide, 7*R*-alcohol:* ***Aigialomycin B***
$C_{19}H_{24}O_8$ 380.394
Prod. by *Aigialus parvus* BCC 5311. Cryst.
Mp 82-84°. $[\alpha]_D^{24}$ -10 (c, 0.27 in $CHCl_3$). λ_{max} 220 (log ϵ 4.37); 266 (log ϵ 4.28); 306 (log ϵ 3.74) (MeOH).

*11*R,*12*R-*Epoxide, 5,6-dihydro:* ***Dihydrohypothemycin***
[80325-04-8]
$C_{19}H_{24}O_8$ 380.394
Isol. from *Hypomyces trichothecoides*. Active against protozoa and plant pathogenic fungi. Unstable cryst. Sol. MeOH, EtOAc; poorly sol. H_2O.
Mp 178-179°. $[\alpha]_D^{26}$ -16 (c, 0.17 in $CHCl_3$). λ_{max} 220 (ϵ 31000); 265 (ϵ 14900); 305 (ϵ 7000) (MeOH) (Berdy).

*9-Deoxy, 11*R,*12*R-*epoxide, 7*R-*alcohol:* ***Aigialomycin C***
$C_{19}H_{24}O_7$ 364.394
Prod. by *Aigialus parvus* BCC 5311. Amorph. solid. $[\alpha]_D^{27}$ -20 (c, 0.25 in $CHCl_3$). λ_{max} 219 (log ϵ 4.45); 265 (log ϵ 4.14); 306 (log ϵ 3.82) (MeOH).

*5*E-*Isomer, 11*R,*12*R-*epoxide:* ***Aigialomycin A***
$C_{19}H_{22}O_8$ 378.378
Prod. by *Aigialus parvus* BCC 5311. Cryst.
Mp 166-168°. $[\alpha]_D$ +17 (c, 0.5 in $CHCl_3$). λ_{max} 220 (log ϵ 4.5); 266 (log ϵ 4.04); 306 (log ϵ 3.74) (MeOH).

9-Epimer, 11,12-dihydro: ***Antibiotic L 783277****. L 783277*
[219917-92-7]
$C_{19}H_{24}O_7$ 364.394
Prod. by a *Phoma* sp. Selective inhibitor of MEK kinase. Cryst. (MeOH).

*9-Epimer, 5*E-*isomer, 11,12-dihydro:* ***Antibiotic L 783290****. L 783290*
[219917-93-8]
$C_{19}H_{24}O_7$ 364.394
Prod. by a *Phoma* sp. Selective inhibitor of MEK kinase.

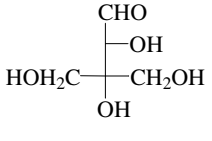
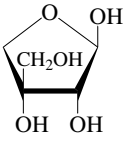
Apiose, 9CI, 8CI A-568

2,3,4-Trihydroxy-3-(hydroxymethyl)butanal. 3-C-*(Hydroxymethyl)*-glycero-*tetrose. Tetrahydroxyisovaleraldehyde*



D-*form*



β-D-erythro-Tetrofuranose-*form*

$C_5H_{10}O_5$ 150.131
Care needed with naming and numbering of derivs. C-3 is not a chiral centre in the acyclic sugar. In L-Apio-α-D-furanose for example, L- defines the config. at C-2 (L-apiose), while D- defines the config. at C-3 (D-furanosyl stereoisomeric form of L-apiose).

D-*form*
(R)-form
[639-97-4]
First found in parsley as the glycoside Apiin, also present in celery, *Dalbergia lanceolaria*, *Hevea brasiliensis*, *Taraxacum koksaghyz*, *Zostera marina*, *Lemna* spp., and *Platycodon grandiflorum*.
Isol. from the marine aquatic plant *Posidonia australis.*
Syrup. $[\alpha]_D$ +7.6 (c, 0.7 in H_2O).

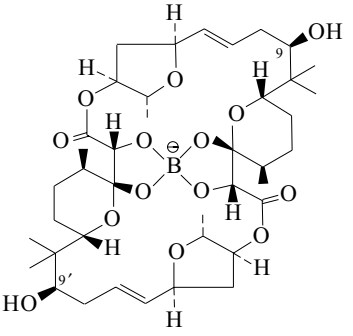
Aplasmomycin **A-571**

Aplasmomycin A
[61230-25-9]



$C_{40}H_{60}BO_{14}^{\ominus}$ 775.717
Isol. from *Streptomyces griseus* and *Plasmodium berghei*. Active against gram-positive bacteria and shows insecticidal and acaricidal props. Ionophore. Needles (MeOH) (as Na salt). Sol. MeOH, Et_2O; fairly sol. hexane; poorly sol. H_2O.
Mp 283-285° dec. (as Na salt). $[\alpha]_D^{22}$ +225 (c, 1.24 in $CHCl_3$) (Na salt). Belongs to small group of boron-containing antibiotics. Closely related to Boromycin.
▶ LD_{50} (mus, ipr) 125 mg/kg. CD8835000

9-Ac: ***Aplasmomycin B***
[68193-20-4]
$C_{42}H_{62}BO_{15}^{\ominus}$ 817.754
Isol. from *Streptomyces griseus* from a Japanese marine sediment. Active against gram-positive bacteria. Ionophore. Sol. MeOH, EtOAc; poorly sol. H_2O. $[\alpha]_D$ +188 (MeOH) (as Na salt).

9,9′-Di-Ac: ***Aplasmomycin C***
[68193-21-5]
$C_{44}H_{64}BO_{16}^{\ominus}$ 859.791
Prod. by *Streptomyces griseus* from a marine sediment. Weakly active against gram-positive bacteria. Ionophore. Sol. MeOH, EtOAc; poorly sol. H_2O. $[\alpha]_D$ +134 (MeOH) (as Na salt).

From *Aplidium* sp. Solid.
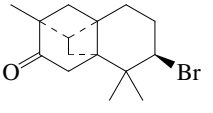
Mp 105-109°. $[\alpha]_D$ -8.6 (c, 0.245 in MeOH). λ_{max} 208 (ϵ 5286); 285 (ϵ 2830) (MeOH) (Berdy).

Geom. isomer, 12-acetoxy: ***Aplidite G***
[165689-37-2]
$C_{29}H_{34}N_2O_{10}$ 570.595
From *Aplidium* sp. Solid.
Mp 106-108°. $[\alpha]_D$ -26.9 (c, 0.60 in MeOH). λ_{max} 201 (ϵ 27400); 286 (ϵ 11000) (MeOH) (Berdy).

Murray, L. *et al., Aust. J. Chem.*, 1995, **48**, 1253-1266 (*isol, uv, ir, pmr, cmr, ms, struct*)

Aplydactone A-578

[325689-20-1]

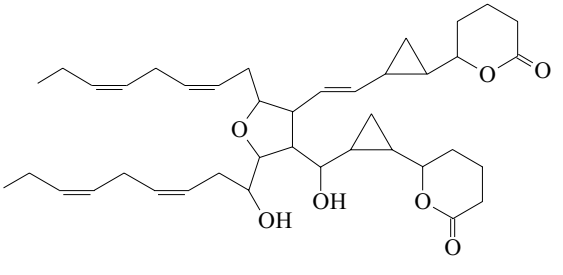


$C_{15}H_{21}BrO$
Constit. of *Aplysia dactylomela*.
Cryst. Mp 195-196°. $[\alpha]_D^{20}$ +33 (c, 0.2 in EtOH).

Fedorov, S.N. *et al., J.A.C.S.*, 2001, **123**, 504-505 (*isol, pmr, cmr, cryst struct*)

Aplydilactone A-579

[125295-94-5]

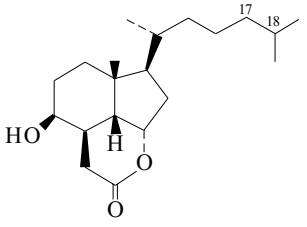


$C_{40}H_{58}O_7$ 650.894
Metab. of *Aplysia kurodai*. Shows phospholipase A2 activating activity. Oil. $[\alpha]_D^{27}$ -1.63 (c, 1.00 in $CHCl_3$). λ_{max} 204 (ϵ 20000) (MeCN) (Derep).

Ojika, M. *et al., Tet. Lett.*, 1990, **31**, 4907 (*isol, struct*)

Aplykurodin A A-580

[101691-10-5]



$C_{20}H_{34}O_3$ 322.487

Possibly a degraded steroid. Constit. of mollusc *Aplysia kurodai*. Needles. Sol. MeOH, $CHCl_3$; poorly sol. H_2O.
Mp 138°. $[\alpha]_D$ -44 (c, 0.96 in $CHCl_3$).

17,18-Didehydro: ***Aplykurodin B***
[101691-09-2]
$C_{20}H_{32}O_3$ 320.471
Constit. of *Aplysia kurodai*. Plates.
Mp 130-131°. $[\alpha]_D$ -36 (c, 0.90 in $CHCl_3$).

17,18-Didehydro, 4-Ac: ***4-Acetylaplykurodin B***
[142780-49-2]
$C_{22}H_{34}O_4$ 362.508
Constit. of *Aplysia fasciata*. Ichthyotoxic, antifeedant. $[\alpha]_D^{20}$ -26.1 (c, 0.74 in $CHCl_3$).

17,18-Didehydro, 4-ketone: ***Aplykurodinone B***
[142780-50-5]
$C_{20}H_{30}O_3$ 318.455
Constit. of *Aplysia fasciata*. Solid (hexane).
Mp 60°. $[\alpha]_D^{20}$ -198 (c, 0.73 in $CHCl_3$).

17,18-Didehydro, 4-ketone, 3-epimer: ***3-Epiaplykurodinone B***
[189818-73-3]
$C_{20}H_{30}O_3$ 318.455
Constit. of *Aplysia fasciata*. Amorph. powder. $[\alpha]_D^{25}$ -98 (c, 0.2 in $CHCl_3$).

Miyamoto, T. *et al., Tet. Lett.*, 1986, **27**, 1153 (*cryst struct*)
Spinella, A. *et al., J. Nat. Prod.*, 1992, **55**, 989-993 (*derivs*)

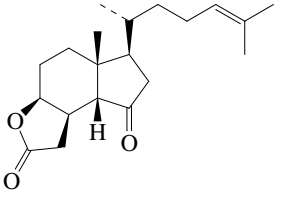
Aplykurodinone 1 A-581

[837424-47-2]



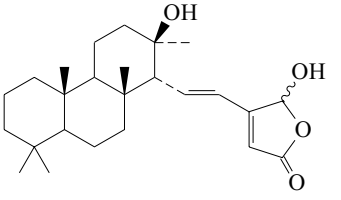
$C_{20}H_{30}O_3$ 318.455
Constit. of *Syphonota geographica*. Amorph. solid. $[\alpha]_D^{25}$ +51.2 (c, 0.3 in $CHCl_3$).

Parent hydroxyacid, Me ester: ***Aplykurodinone 2***
[837424-48-3]
$C_{21}H_{34}O_4$ 350.497
Constit. of *Syphonota geographica*. Amorph. solid. $[\alpha]_D^{25}$ +9.1 (c, 0.24 in $CHCl_3$).

Gavagnin, M. *et al., Tetrahedron*, 2005, **61**, 617-621 (*isol, pmr, cmr*)

Aplyolide A† A-582

[135288-73-2]

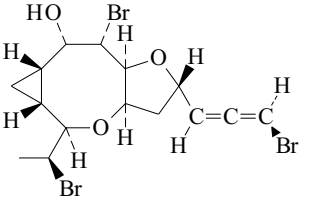


$C_{25}H_{38}O_4$ 402.573
Constit. of an *Aplysinopsis* sponge. Antiinflammatory agent. Oil. $[\alpha]_D$ -20 (c, 0.3 in MeOH). λ_{max} 269 (ϵ 51067) (MeOH) (Berdy).

Crews, P. *et al., Tetrahedron*, 1991, **47**, 3585-3600 (*isol, pmr, cmr*)

Aplyparvunin A-583

[167425-79-8]



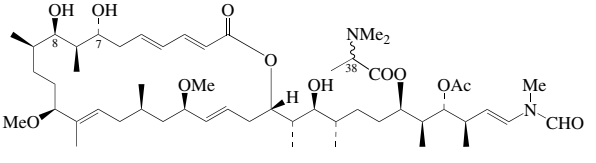
$C_{15}H_{19}Br_3O_3$ 487.025

Acetogenin. Isol. from the sea hare *Aplysia parvula*. Ichthyotoxic agent. Rods ($CHCl_3$).
Mp 138-139°. $[\alpha]_D^{22}$ -131.4 (c, 1.5 in $CHCl_3$).

Miyamoto, T. *et al., Tet. Lett.*, 1995, **36**, 6073-6074 (*isol, ir, pmr, cmr, ms*)

Aplyronine C A-584

[151923-86-3]



Absolute Configuration

$C_{53}H_{90}N_2O_{12}$ 947.3

Macrolide antibiotic. Obt. as a mixt. of C-38 epimers. Isol. from the sea hare *Aplysia kurodai*. Cytotoxic agent. Sol. MeOH, $CHCl_3$; poorly sol. H_2O. $[\alpha]_D^{27}$ +18 (c, 0.017 in MeOH). λ_{max} 259 (MeOH) (Berdy). λ_{max} 259 (ϵ 33000) (MeCN) (Berdy).

O^7*-(2-Dimethylamino-3-methoxypropanoyl):* ***Aplyronine A***
[151923-84-1]
$C_{59}H_{101}N_3O_{14}$ 1076.459
Isol. from *Aplysia kurodai*. Cytotoxic agent. Sol. MeOH, DMSO, THF, $CHCl_3$. $[\alpha]_D^{28}$ +32 (c, 0.26 in MeOH). λ_{max} 256 (ϵ 43500) (MeOH) (Berdy). λ_{max} 256 (ϵ 31000) (MeCN) (Berdy).

O^8*-(2-Dimethylamino-3-methoxypropanoyl):* ***Aplyronine B***
[151923-85-2]
$C_{59}H_{101}N_3O_{14}$ 1076.459
Isol. from *Aplysia kurodai*. Cytotoxic agent. Sol. MeOH, $CHCl_3$; poorly sol. H_2O. $[\alpha]_D^{27}$ +3.7 (c, 0.19 in MeOH). λ_{max} 258 (MeOH) (Berdy). λ_{max} 258 (ϵ 30200) (MeCN) (Berdy).

[125751-80-6]

Yamada, K. *et al., J.A.C.S.*, 1993, **115**, 11020-11021 (*isol, pmr, cmr*)

Takahashi, Y. *et al., Phytochemistry*, 1998, **48**, 987-990 (*Anhydroaplysiadial*)

Aplysianin A-587

[101550-77-0]

Aplysianin A [105521-56-0]
Glycoprotein consisting of 4 subunits. Isol. from the albumen gland of the sea hare *Aplysia kurodai*. Shows antitumour and antimicrobial activities.

Aplysianin E [112130-75-3]
Glycoprotein consisting of 3 subunits. Isol. from eggs of *Aplysia kurodai*. Shows antitumour activity.

Aplysianin P [102510-57-6]
Single polypeptide. Isol. from purple fluid of *Aplysia kurodai*. Cytolytic. Sol. H_2O.

Kamiya, H. *et al., Experientia*, 1986, **42**, 1065-1067 (*Aplysianin A*)
Kisugi, J. *et al., Cancer Res.*, 1987, **47**, 5649-5653 (*Aplysianin E*)

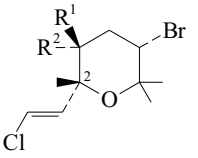
Aplysiapyranoid A A-588

[109927-30-2]



R^1 = Br, R^2 = H

$C_{10}H_{15}Br_2ClO$ 346.489
Constit. of *Aplysia kurodai*. Cytotoxic against various cell lines. Oil. Sol. MeOH, $CHCl_3$, C_6H_6; fairly sol. hexane; poorly sol. H_2O. $[\alpha]_D$ +4.4 (c, 1 in $CHCl_3$).

2-Epimer: ***Aplysiapyranoid B***
[108212-12-0]
$C_{10}H_{15}Br_2ClO$ 346.489
Constit. of *Aplysia kurodai*. Cytotoxic against various cell lines. Cryst. (EtOH). Sol. MeOH, C_6H_6, $CHCl_3$; fairly sol. hexane; poorly sol. H_2O.
Mp 46-49°. $[\alpha]_D$ -27 (c, 0.91 in $CHCl_3$).
Kusumi, T. *et al., J.O.C.*, 1987, **52**, 4597

Aplysiapyranoid C A-589

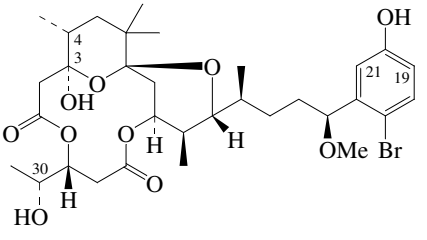
[109927-31-3]
As Aplysiapyranoid A, A-588 with
R^1 = H, R^2 = Cl
$C_{10}H_{15}BrCl_2O$ 302.037
Constit. of *Aplysia kurodai*. Cytotoxic to various cell lines. Oil. Sol. MeOH, $CHCl_3$, C_6H_6; fairly sol. hexane; poorly sol. H_2O. $[\alpha]_D$ +52 (c, 1 in $CHCl_3$).

2-Epimer: ***Aplysiapyranoid D***
[109927-32-4]
$C_{10}H_{15}BrCl_2O$ 302.037
From *Aplysia kurodai*. Cytotoxic to various cell lines. Oil. $[\alpha]_D$ +3.4 (c, 1.1 in $CHCl_3$).

Kusumi, T. *et al., J.O.C.*, 1987, **52**, 4597-4600 (*isol, Aplysia*)
Jung, M.E. *et al., J.O.C.*, 1991, **56**, 1347; 1998, **63**, 2982-2987 (*synth*)

Aplysiatoxin A-590

[52659-57-1]



$C_{32}H_{47}BrO_{10}$ 671.621
Related to Oscillatoxin A, O-133. Isol. from *Stylocheilus longicauda*, also from *Oscillatoria nigroviridis*, *Schizothrix calcicola*, *Lyngbya gracilis*, *Lyngbya majuscula* and *Gracillaria coronopifolia*. Oil. Sol. MeOH, C_6H_6, Et_2O; poorly sol. H_2O. λ_{max} 290 (ϵ 3000) (MeOH/NaOH) (Derep). λ_{max} 283 (ϵ 1950) (MeOH) (Derep).
▶ Carcinogenic, skin irritant. LD_{100} (mus, ipr) 0.3 mg/kg.
CD8870000

3-Deoxy, 3,4-didehydro: ***Anhydroaplysiatoxin***
[90359-03-8]
$C_{32}H_{45}BrO_9$ 653.606
Constit. of *Lyngbya majuscula*.

19-Bromo: ***19-Bromoaplysiatoxin***
$C_{32}H_{46}Br_2O_{10}$ 750.517

Minor component of *Schizothrix calcicola* and *Oscillatoria nitroviridis*. λ_{max} 283 (ϵ 1950) (MeOH) (Derep).

19-Bromo, 3-deoxy, 3,4-didehydro: ***Anhydro-19-bromoaplysiatoxin***
[90414-34-9]
$C_{32}H_{44}Br_2O_9$ 732.502
Constit. of *Lyngbya majuscula*.

19,21-Dibromo, 3-deoxy, 3,4-didehydro: ***Anhydro-19,21-dibromoaplysiatoxin***
[90414-35-0]
$C_{32}H_{43}Br_3O_9$ 811.398
Constit. of *Lyngbya majuscula*.

Debromo: ***Debromoaplysiatoxin***
[52423-28-6]
$C_{32}H_{48}O_{10}$ 592.725
Isol. from sea hare *Stylocheilus longicauda*, also from *Lyngbya gracilis*, *Schizothrix calcicola*, *Oscillatoria nigroviridis* and *Gracilaria coronopifolia*. Sol. MeOH, C_6H_6; poorly sol. H_2O. λ_{max} 290 (ϵ 3000) (MeOH/NaOH) (Derep). λ_{max} 283 (ϵ 1950) (MeOH) (Derep).
▶ Tumour promotor, toxin, LD_{50} (mus, ipr) 0.5 mg/kg. CD8880000

Debromo, 30-Ac: ***Manauealide C***
$C_{34}H_{50}O_{11}$ 634.762
Isol. from the red alga *Gracilaria coronopifolia*.
$[\alpha]_D$ +33.1 (c, 1 in MeOH). Config. not confirmed. λ_{max} 231 (ϵ 554); 276 (ϵ 582) (MeOH).

Debromo, 19-bromo: ***Manauealide B***
$C_{32}H_{47}BrO_{10}$ 671.621
Isol. from the red alga *Gracilaria coronopifolia*.
$[\alpha]_D$ +21.3 (c, 0.3 in MeOH). λ_{max} 232 (ϵ 740); 278 (ϵ 740); 704; 740 (MeOH).

Debromo, 3-deoxy, 3,4-didehydro: ***Anhydrodebromoaplysiatoxin***
[63543-22-6]
$C_{32}H_{46}O_9$ 574.71
Isol. from *Gracilaria coronopifolia*, *Schizothrix calcicola*, *Oscillatoria nigroviridis* and *Lyngbya majuscula*. Phycotoxin. Diarrhetic agent. Cryst. (Et_2O/pentane).
Mp 116-117.5°. $[\alpha]_D$ +25.6 (c, 0.02 in MeOH). Originally obt. as an artifact. λ_{max} 208 (ϵ 6800); 274 (ϵ 1790) (MeOH).

Debromo, 19-chloro: ***Manauealide A***
$C_{32}H_{47}ClO_{10}$ 627.17
Isol. from the red alga *Gracilaria coronopifolia*.
$[\alpha]_D$ +13.8 (c, 0.5 in MeOH). Config. not confirmed. λ_{max} 233 (ϵ 776); 279 (ϵ 738) (MeOH).

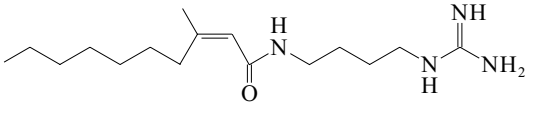
Aplysillamide A A-591

N-[4-[(Aminoiminomethyl)amino]butyl]-3-methyl-2-decenamide, 9CI. 3-Methyl-2-decenoic acid (4-guanidinobutyl)amide
[164301-82-0]



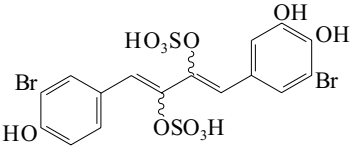
$C_{16}H_{32}N_4O$ 296.455
Alkaloid from the Okinawan marine sponge *Psammaplysilla purea*. Exhibits modest antimicrobial activity against some fungi and bacteria. Cytotoxic against murine lymphoma L1210 and human epidermoid carcinoma KB cells. Oil. Sol. MeOH. λ_{max} 225 (ϵ 10000) (MeOH) (Berdy).

*2,3*S*-Dihydro:* ***Aplysillamide B***
[164301-83-1]
$C_{16}H_{34}N_4O$ 298.471
Alkaloid from *Psammaplysilla purea*. Exhibits modest antimicrobial activity against some fungi and bacteria. Not cytotoxic. Oil. Sol. MeOH. $[\alpha]_D^{21}$ -2.4 (c, 0.1 in MeOH) (natural). $[\alpha]_D^{22}$ -5.1 (c, 1.6 in MeOH) (synthetic).

Honma, K. *et al., Tetrahedron*, 1995, **51**, 3745 (*isol, uv, ir, pmr, cmr, ms, synth, struct*)

Aplysillin A A-592

3-Bromo-5-[4-(3-bromo-4-hydroxyphenyl)-2,3-bis(sulfoxy)-1,3-butadienyl]-1,2-benzenediol, 9CI
[166833-91-6]

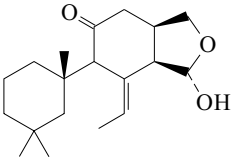


$C_{16}H_{12}Br_2O_{11}S_2$ 604.204
Isol. from the sponge *Aplysina fistularis fulva*. Thrombin receptor antagonist. Isol. as di-Na salt to which CAS no. refers.

Gulavita, N.K. *et al., J. Nat. Prod.*, 1995, **58**, 954-957 (*isol, pmr, cmr*)

Aplysillolide A A-593

[130221-22-6]

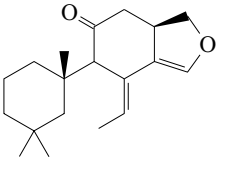


$C_{19}H_{30}O_3$ 306.444
Constit. of *Aplysilla glacialis*. Glass. $[\alpha]_D$ +30 (c, 2.4 in $CHCl_3$).

Tischler, M. *et al., J.O.C.*, 1991, **56**, 42 (*isol, pmr, cmr*)

Aplysillolide B A-594

[130221-23-7]

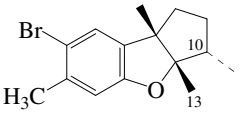


$C_{19}H_{28}O_2$ 288.429
Constit. of *Aplysilla glacialis*. Oil.

Tischler, M. *et al., J.O.C.*, 1991, **56**, 42 (*isol, pmr*)

Aplysin A-595

[6790-63-2]



$C_{15}H_{19}BrO$ 295.218
Constit. of *Aplysia kurodai* and *Aplysia californica*. Cryst. (MeOH).

Mp 85-86°. $[\alpha]_D^{27}$ -85.4 ($CHCl_3$). λ_{max} 234 (ϵ 8910); 294 (ϵ 4570) (EtOH) (Derep).

13-Oxo: ***Aplysinal***
[64052-99-9]

[72782-84-4]
[126252-17-3]
$C_{15}H_{20}O_2$ 232.322
Constit. of *Laurencia okamurai*. Cryst. (hexane).
Mp 85-87°. $[\alpha]_D^{21}$ -32 (c, 0.44 in $CHCl_3$).

Debromo, 13-bromo: ***Isoaplysin***
[68773-08-0]
[126252-18-4]
$C_{15}H_{19}BrO$ 295.218
Constit. of *Laurencia nipponica* and *Aplysia* sp. Oil. $[\alpha]_D$ -33 (c, 0.69 in $CHCl_3$). λ_{max} 240 (ϵ 30000) (EtOH) (Derep). λ_{max} 234 (ϵ 8910); 294 (ϵ 4570) (EtOH) (Derep).

10-Epimer, 10-hydroxy: ***10-Hydroxyepiaplysin***
[885328-73-4]
$C_{15}H_{19}BrO_2$ 311.218
Constit. of *Laurencia tristicha*. Oil. $[\alpha]_D^{20}$ -8.1 (c, 0.06 in MeOH).

10-Epimer, debromo, 10-hydroxy: ***10-Hydroxydebromoaplysin***
[154800-88-1]
$C_{15}H_{20}O_2$ 232.322
Constit. of *Laurencia tristicha*. Oil. $[\alpha]_D^{20}$ -19.7 (c, 0.1 in MeOH).

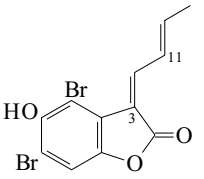
Aplysinadiene A-596

*4,6-Dibromo-3-(2-butenylidene)-5-hydroxy-2(3*H*)-benzofuranone, 9CI*



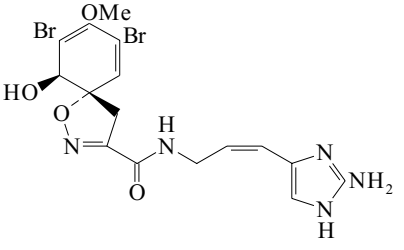
$C_{12}H_8Br_2O_3$ 360.001

(3Z,11E)-form [108940-55-2]
Constit. of *Aplysina aerophoba*.
Yellow amorph. powder. Sol. MeOH, $CHCl_3$; poorly sol. H_2O.
Mp 218-220°. λ_{max} 209 (ϵ 64000); 335 (ϵ 47222) (EtOH) (Berdy).
[108940-97-2]

Norte, M. *et al., Tetrahedron*, 1988, **44**, 4973 (*isol, pmr, cmr, synth*)

Aplysinamisine I A-597

[150417-67-7]

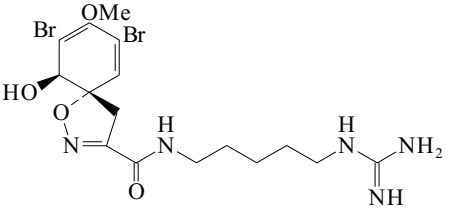


$C_{16}H_{17}Br_2N_5O_4$ 503.149
Alkaloid from the Caribbean sponge *Aplysina cauliformis.* Oil. $[\alpha]_D^{26}$ +121.9 (c, 5.7 in MeOH). λ_{max} 226 (ϵ 13700); 266 (ϵ 13100) (MeOH) (Berdy).

Rodríguez, A.D. *et al., J. Nat. Prod.*, 1993, **56**, 907 (*isol, uv, ir, pmr, cmr, ms, struct*)

Aplysinamisine II A-598

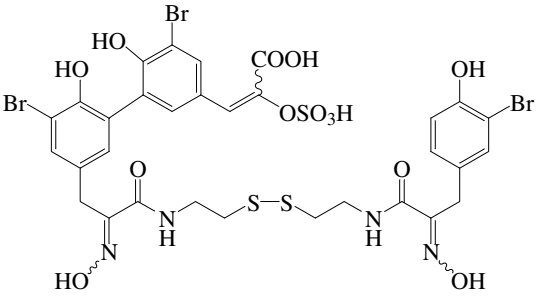
[150417-68-8]



$C_{16}H_{23}Br_2N_5O_4$ 509.197
Alkaloid from the Caribbean sponge *Aplysina cauliformis.*
Semisolid. $[\alpha]_D^{26}$ +47 (c, 7.9 in MeOH). λ_{max} 218 (ϵ 4600); 284 (ϵ 2500) (MeOH) (Berdy).

Rodríguez, A.D. *et al., J. Nat. Prod.*, 1993, **56**, 907 (*isol, uv, ir, pmr, cmr, ms, struct*)

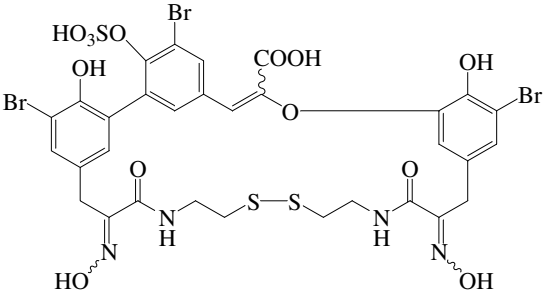
Aplysinellin A A-599



$C_{31}H_{29}Br_3N_4O_{13}S_3$ 1001.499
Isol. from the sponge *Aplysinella rhax*. Amorph. yellow solid (as di-Na salt).
Mp 191-194° dec. (di-Na salt). λ_{max} 204 (log ϵ 4.83); 291 (log ϵ 4.11) (MeOH) (di-Na salt).

Shin, J. *et al., Tetrahedron*, 2000, **56**, 9071-9077

Aplysinellin B A-600

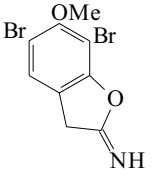


$C_{31}H_{27}Br_3N_4O_{13}S_3$ 999.483
Isol. from the sponge *Aplysinella rhax*. Amorph. yellow solid (as mono-Na salt).
Mp 236-239° dec. (Na salt). λ_{max} 205 (log ϵ 4.88); 280 (log ϵ 3.93) (MeOH) (Na salt).

Shin, J. *et al., Tetrahedron*, 2000, **56**, 9071-9077

Aplysinimine A-601

[129138-55-2]

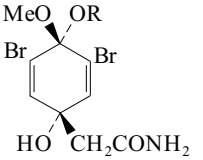


$C_9H_7Br_2NO_2$ 320.968
Constit. of *Aplysina thiona*. Amorph. solid.
Mp 146°.

Cruz, F. *et al., J. Nat. Prod.*, 1990, **53**, 543 (*isol, pmr*)

Aplysinketal A A-602

[129138-56-3]



R = $(CH_2)_3CH_3$

$C_{13}H_{19}Br_2NO_4$ 413.105
Related to 3,5-Dibromo-1-hydroxy-4,4-dimethoxy-2,5-cyclohexadiene-1-acetamide, D-259. Metab. of *Aplysina thiona*. Cryst. Mp 194-195°.

Cruz, F. *et al., J. Nat. Prod.*, 1990, **53**, 543-548 (*isol, pmr, ms*)
Toscano, R.A. *et al., Acta Cryst. C*, 1992, **48**, 2235-2237 (*cryst struct*)

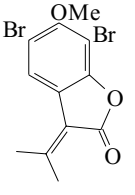
Aplysinketal B A-603

[129138-57-4]
As Aplysinketal A, A-602 with
R = $(CH_2)_4CH_3$
$C_{14}H_{21}Br_2NO_4$ 427.132
Metab. of *Aplysina thiona*. Cryst.
Mp 194-195°.

Cruz, F. *et al., J. Nat. Prod.*, 1990, **53**, 543-548 (*isol, pmr, ms*)

Aplysinolide A-604

[129138-54-1]

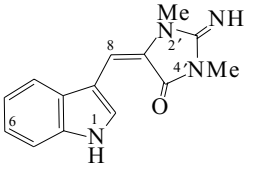


$C_{12}H_{10}Br_2O_3$ 362.017
Metab. of *Aplysina thiona*. Yellow cryst.
Mp 142-144°.

Cruz, F. *et al., J. Nat. Prod.*, 1990, **53**, 543 (*isol, pmr*)

Aplysinopsin A-605

*2-Imino-5-(1*H*-indol-3-ylmethylene)-1,3-dimethyl-4-imidazolidinone, 9CI*
[63153-56-0]
[138127-90-9]



$C_{14}H_{14}N_4O$ 254.291
Metab. of the marine sponges *Verongia spengelii* and *Thorecta* sp. and from the anthozoan *Astroides calycularis*. Antibiotic with antitumour props. Fine yellow needles + $1H_2O$ (MeOH aq. + Et_2NH).
Mp 235-237° dec. (232-233°). λ_{max} 217 (ϵ 27500); 280 (ϵ 10300); 406 (ϵ 24800) (EtOH aq./HCl) (Derep). λ_{max} 260 (ϵ 10000); 376 (ϵ 21200) (EtOH aq./NaOH) (Derep). λ_{max} 225 (ϵ 23000); 268 (ϵ 8800br); 383 (ϵ 21500) (50% EtOH) (Derep).

Di-Ac:
Fine yellow needles (EtOH). Mp 221-222° dec. (217-220°).

N^1-*Propanoyl:* **N^1-*Propionylaplysinopsin***
[100667-70-7]
$C_{17}H_{18}N_4O_2$ 310.355
Metab. from the anthozoan *Astroides calycularis*. Cryst. (MeOH). Mp 300°.

3′-N-*Me:* **N-*3′-Methylaplysinopsin***
[66492-97-5]
[66492-99-7]
$C_{15}H_{16}N_4O$ 268.318
Prod. by *Aplysinopsis reticulata*. Monoamine oxidase inhibitor, serotonergic neurotransmission potentiator. Sol. MeOH, $CHCl_3$; poorly sol. H_2O.

3′-N-*Et:* **N-*3′-Ethylaplysinopsin***
$C_{16}H_{18}N_4O$ 282.344
Isol. from the Jamaican sponge *Smenospongia aurea*. Yellowish gum. No CAS no. found to CA 136-139. λ_{max} 219 (log ϵ 4.13); 276 (log ϵ 3.74) (MeOH).

$N^{2'}$-*De-Me:* ***2′*-N-*Demethylaplysinopsin***
[72479-07-3]
$C_{13}H_{12}N_4O$ 240.264
Metab. of the marine sponge *Dercitus* sp., also isol. from the nudibranch *Phestilla melanobranchia* and the corals *Tubastrea coccinea* and *Dendrophyllia* sp.
Mp 235° (with charring from 180°). λ_{max} 217 (ϵ 27500); 280 (ϵ 10300); 406 (ϵ 24800) (EtOH aq./HCl) (Derep). λ_{max} 260 (ϵ 10000); 376 (ϵ 21200) (EtOH aq./NaOH) (Derep). λ_{max} 225 (ϵ 23000); 268 (ϵ 8800br); 383 (ϵ 21500) (50% EtOH) (Derep). λ_{max} 385 (ϵ 25000) (MeOH) (Berdy).

$N^{2'}$-*De-Me, 3′*-N-*Me:* ***2′*-N-*Demethyl*-N-*3′-methylaplysinopsin***
[126149-80-2]
$C_{14}H_{14}N_4O$ 254.291
Isol. from *Dendrophyllia* sp. Yellow solid.
Mp >250° dec. Obt. as an *E*/*Z*-mixt., Z-form predominates.

$N^{4'}$-*De-Me, 3′*-N-*Me:* ***Isoplysin A***
[158761-04-7]
$C_{14}H_{14}N_4O$ 254.291
Metab. from the Okinawan marine sponge *Aplysina* sp. Weakly cytotoxic. Yellow needles.
Mp 310° dec. λ_{max} 220 (ϵ 14000); 278 (ϵ 5400); 405 (ϵ 13000) (MeOH) (Berdy).

1′,8-Dihydro: ***1′,8-Dihydroaplysinopsin***
[85079-46-5]
$C_{14}H_{16}N_4O$ 256.307
Isol. from the coral *Tubastrea coccinea*.

3′-Deimino, 3′-oxo: [63153-57-1]
[117603-69-7, 117604-23-6]
$C_{14}H_{13}N_3O_2$ 255.276
Alkaloid from the coral *Tubastrea* sp. Obt. as an *E*/*Z*-mixt.

3′-Deimino, 3′-oxo, $N^{2'}$,$N^{4'}$*-di-de-Me:*
[117490-33-2, 117490-34-3]
$C_{12}H_9N_3O_2$ 227.222
Alkaloid from the coral *Leptopsammia pruvoti*. Obt. as an *E*/*Z*-mixt.

6-Bromo: ***6-Bromoaplysinopsin***
[85079-45-4]
$C_{14}H_{13}BrN_4O$ 333.187
Isol. from the marine sponge *Smenospongia aurea*, the anthozoan *Astroides calycularis* and the coral *Tubastrea coccinea*. Cryst. (MeOH). Sol. MeOH, C_6H_6; poorly sol. H_2O.
Mp 283-285°. λ_{max} 230 (ϵ 35000); 284 (ϵ 15000); 364 (ϵ 26000); 385 (ϵ 24000) (MeOH) (Berdy).

6-Bromo, N^1*-propanoyl:* ***6-Bromo*-N^1*-propionylaplysinopsin***
[100667-71-8]
$C_{17}H_{17}BrN_4O_2$ 389.251
Metab. from the anthozoan *Astroides calycularis*. Cryst. (MeOH). Mp 300°.

6-Bromo, $N^{2'}$*-de-Me:* ***6-Bromo-2′*-N-*demethylaplysinopsin***
[72479-08-4]
$C_{13}H_{11}BrN_4O$ 319.16
Metab. of the marine sponge *Dercitus* sp. Also isol. from the nudibranch *Phestilla melanobranchia* and the coral *Tubastrea coccinea*.
Mp 186-188° (with charring from 175°). λ_{max} 390 (ϵ 23000) (MeOH) (Derep).

6-Bromo, $N^{2'}$*-de-Me, 3′*-N-*Me:* ***6-Bromo-2′*-N-*demethyl*-N-*3′-methylaplysinopsin***
[126149-81-3 (*Z*-form), 126149-84-6 (*E*-form)]
$C_{14}H_{13}BrN_4O$ 333.187
Isol. from *Dendrophyllia* sp. Yellow solid.
Mp >280° dec. Obt. as an *E*/*Z*-mixt., *Z*-form predominates.
λ_{max} 238 (ϵ 8500); 286 (ϵ 5200); 385 (ϵ 10700) (MeOH).

6-Bromo, $N^{4'}$*-de-Me:* ***6-Bromo-4′*-N-*demethylaplysinopsin***
[97480-15-4]
$C_{13}H_{11}BrN_4O$ 319.16
Metab. of the marine sponge *Smenospongia aurea*. Sol. MeOH, C_6H_6; poorly sol. H_2O.
Mp 290° (as Ac). Characterised as the Ac deriv. λ_{max} 390 (ϵ 23000) (MeOH) (Derep). λ_{max} 230 (ϵ 35000); 284 (ϵ 15000); 364 (ϵ 26000) (MeOH) (Berdy).

6-Bromo, 1′,8-dihydro: ***6-Bromo-1′,8-dihydroaplysinopsin***
[85079-47-6]
$C_{14}H_{15}BrN_4O$ 335.203
Isol. from the coral *Tubastrea coccinea*.

6-Bromo, 1′,8-dihydro, 1′ξ-hydroxy: ***6-Bromo-1′,8-dihydro-1′-hydroxyaplysinopsin***
[868830-18-6]
$C_{14}H_{15}BrN_4O_2$ 351.202
Isol. from a *Thorectandra* sp. Red solid. $[\alpha]_D^{25}$ +1 (c, 0.5 in MeOH).

6-Bromo, 1′,8-dihydro, 1′ξ-methoxy: ***6-Bromo-1′,8-dihydro-1′-methoxyaplysinopsin***
[868830-19-7]
$C_{15}H_{17}BrN_4O_2$ 365.229
Isol. from a *Thorectandra* sp. Red solid. $[\alpha]_D^{25}$ +3 (c, 1.4 in MeOH).

6-Bromo, 1′,8-dihydro, 1′ξ-ethoxy: ***6-Bromo-1′-ethoxy-1′,8-dihydroaplysinopsin***
[868830-20-0]
$C_{16}H_{19}BrN_4O_2$ 379.256
Isol. from a *Smenospongia* sp. Red solid. $[\alpha]_D^{25}$ +19.3 (c, 0.05 in MeOH).

6-Bromo, 3′-deimino, 3′-oxo: ***6-Bromo-3′-deimino-3′-oxoaplysinopsin***
[117490-31-0, 117490-32-1]
$C_{14}H_{12}BrN_3O_2$ 334.172
Alkaloid from the coral *Tubastrea* sp. Obt. as an *E*-/*Z*-mixt.

6-Bromo, 3′-deimino, 3′-oxo, $N^{2'}$,$N^{4'}$*-di-de-Me:* ***6-Bromo-3′-deimino-2′,4′-bis(demethyl)-3′-oxoaplysinopsin***
[117490-29-6, 117490-30-9]
$C_{12}H_8BrN_3O_2$ 306.118
Alkaloid from the coral *Leptopsammia pruvoti*. Obt. as an *E*-/*Z*-mixt.

5,6-Dibromo, $N^{2'}$*-de-Me: 5,6-Dibromo-2′*-N-*demethylaplysinopsin*
[376598-41-3]
$C_{13}H_{10}Br_2N_4O$ 398.056
Isol. from the sponge *Hyrtios erecta*. Yellow powder. λ_{max} 246 (ϵ 8500); 293 (ϵ 2700); 385 (ϵ 8600) (MeOH).

Z-Isomer, 5,6-dibromo, $N^{2'}$*-de-Me:* [376598-39-9]
$C_{13}H_{10}Br_2N_4O$ 398.056
Isol. from *Hyrtios erecta*. Yellow powder. λ_{max} 247 (ϵ 17300); 294 (ϵ 4400); 383 (ϵ 20700) (MeOH).

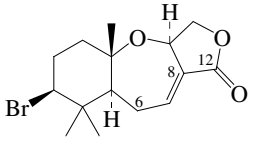
Aplysistatin A-607

[62003-89-8]



Absolute Configuration

$C_{15}H_{21}BrO_3$ 329.233
Constit. of *Aplysia angasi*. Shows weak antimycobacterial and cytotoxic activities. Cryst.
Mp 173-175°. $[\alpha]_D^{25}$ -375 (MeOH). λ_{max} 215 (ϵ 9000) (MeOH) (Derep).

12-Deoxo: 12-Deoxyaplysistatin. ***Palisadin A***
[77249-86-6]
$C_{15}H_{23}BrO_2$ 315.249
Constit. of *Laurencia* cf. *palisada*. Oil. $[\alpha]_D$ +19.5 (c, 1.5 in $CHCl_3$). Slowly oxid. to Aplysistatin in air.

6β-Hydroxy: ***6β-Hydroxyaplysistatin***
[79493-95-1]
$C_{15}H_{21}BrO_4$ 345.232
Constit. of *Laurencia filiformis*. Shows weak antimycobacterial and cytotoxic activities. Cryst. (MeOH).
Mp 153.5-155.5°. $[\alpha]_D^{25}$ +130 (c, 0.4 in MeOH). λ_{max} 237 (ϵ 2500) (EtOH) (Berdy).

12-Deoxo, 7ξ,8ξ-epoxide: ***3,4-Epoxypalisadin A***
[150998-89-3]
$C_{15}H_{23}BrO_3$ 331.249
Constit. of *Laurencia flexilis*. Cryst.
Mp 119-122°. $[\alpha]_D^{25}$ +10 (c, 0.1 in $CHCl_3$).

12-Deoxo, 6β-acetoxy: ***5β-Acetoxypalisadin A***
[150712-71-3]
$C_{17}H_{25}BrO_4$ 373.286
Constit. of *Laurencia flexilis*. Oil. $[\alpha]_D^{25}$ -45 (c, 0.1 in $CHCl_3$).

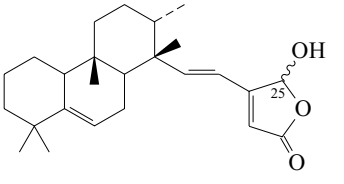
Aplysolide A A-608

[135261-91-5]

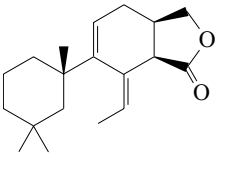


$C_{25}H_{36}O_3$ 384.558
Constit. of an *Aplysinopsis* sponge. Oil (as acetate). $[\alpha]_D$ -20 (c, 0.7 in $CHCl_3$) (acetate).

25-Epimer: ***Aplysolide B***
[135356-90-0]
$C_{25}H_{36}O_3$ 384.558
Constit. of an *Aplysinopsis* sponge. Oil (as acetate). $[\alpha]_D$ -9 (c, 0.4 in $CHCl_3$) (acetate).

Crews, P. *et al., Tetrahedron*, 1991, **47**, 3585 (*isol, pmr, cmr*)

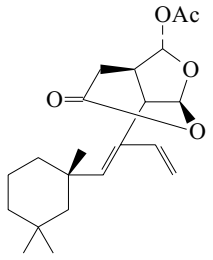
Aplytandiene 1 A-609



$C_{19}H_{28}O_2$ 288.429
Constit. of *Aplysilla tango*. Needles (Et_2O).
Mp 91-94°. $[\alpha]_D$ -134 (c, 1 in $CHCl_3$).

Poiner, A. *et al., Aust. J. Chem.*, 1990, **43**, 1713 (*isol, pmr, cmr*)

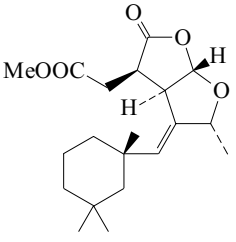
Aplytangene 1 A-610



$C_{21}H_{30}O_5$ 362.465
Constit. of *Aplysilla tango*. Gum. $[\alpha]_D$ +13.3 (c, 1 in $CHCl_3$).

Poiner, A. *et al., Aust. J. Chem.*, 1990, **43**, 1713 (*isol, pmr, cmr*)

Aplytangene 2 A-611

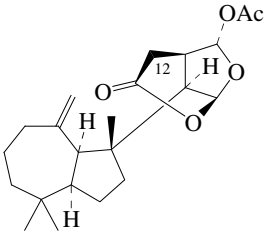


$C_{20}H_{30}O_5$ 350.454
Constit. of *Aplysilla tango*. Oil. $[\alpha]_D$ +32.3 (c, 1 in $CHCl_3$).

Poiner, A. *et al., Aust. J. Chem.*, 1990, **43**, 1713 (*isol, pmr, cmr*)

Aplyviolene A-612

[104371-86-0]



$C_{22}H_{32}O_5$ 376.492

This struct. was originally assigned to Dendrillolide A (see Dendrillolide A, D-68). Constit. of *Chelonaplysilla violacea* and *Aplysilla polyrhaphis*. Cryst. (EtOAc/petrol).
Mp 163-164°. $[\alpha]_D$ -29.5 (c, 1 in $CHCl_3$).

12β-Acetoxy: ***Aplyviolacene****. Macfarlandin E*
[104311-71-9]
$C_{24}H_{34}O_7$ 434.528
Constit. of *Chelonaplysilla violacea*, *Chromodoris macfarlandi* and *Dysidea* sp. Glass. Sol. MeOH, $CHCl_3$, Me_2CO; poorly sol. H_2O.
$[\alpha]_D$ -34 (c, 0.05 in $CHCl_3$).

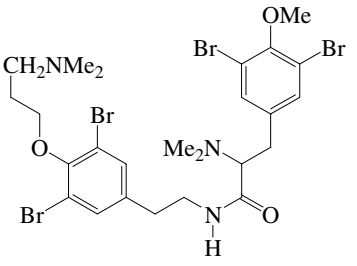
Aplyzanzine A A-613

[327165-67-3]

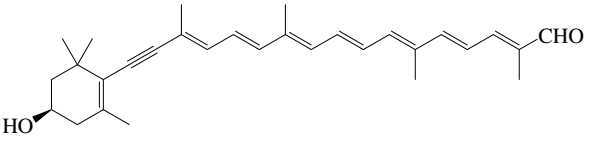


$C_{25}H_{33}Br_4N_3O_3$ 743.17
Isol. from an *Aplysina* sp. Pale orange oil.

Evan, T. *et al., J. Nat. Prod.*, 2001, **64**, 226-227

Apoalloxanthinal A-614

7,8-Didehydro-3-hydroxy-8′-apo-β-caroten-8′-al
[190849-79-7]

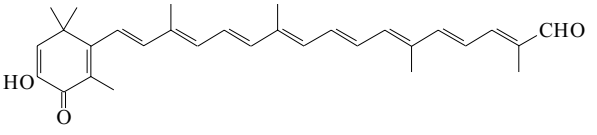


$C_{30}H_{38}O_2$ 430.629
Isol. from the mussel *Mytilus coruscus* and the oyster *Crassostrea gigas*.

Maoka, T. *et al., J. Nat. Prod.*, 1997, **60**, 616-617 (*isol, cd, pmr, ms*)

Apoastacenal A-615

2,3-Didehydro-3-hydroxy-4-oxo-8′-apo-β,ψ-carotenal, 9CI
[59076-74-3]

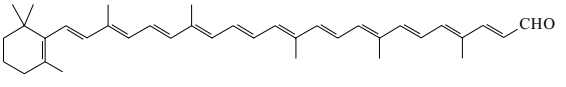


$C_{30}H_{36}O_3$ 444.613
Isol. from the egg masses of *Hexabranchus* sp. Cryst. ($CHCl_3$/hexane).
Mp 196-197° (synthetic).

Coman, R.E. *et al., J.C.S. Perkin 1*, 1975, 2529 (*synth*)
Tanaka, Y. *et al., CA*, 1993, **118**, 36149v (*isol*)

β-Apo-2′-carotenal A-616

3′,4′-Didehydro-2′-apo-β-caroten-2′-al

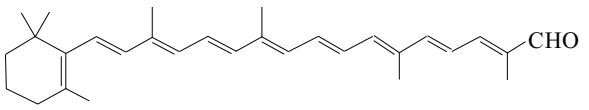


$C_{37}H_{48}O$ 508.786
Identified in *Aplysia* sp. Glistening metallic violet cryst. (petrol).
Mp 160-161°. λ_{max} 498 (petrol).

Rüegg, R. *et al., Helv. Chim. Acta*, 1959, **42**, 854 (*synth*)
Schwieter, U. *et al., Helv. Chim. Acta*, 1966, **49**, 369 (*synth*)
Czeczuga, B. *et al., Comp. Biochem. Physiol., B: Comp. Biochem.*, 1984, **78**, 259 (*occur*)

8′-Apo-β-caroten-8′-al A-617

β-Carotinal. *β-Apo-2-carotinal*. *C.I. Food Orange 6*
[1107-26-2]



$C_{30}H_{40}O$ 416.645
Constit. of orange peel, spinach, marigolds and egg yolks. Obt. by oxidn. of β-Carotene, C-129. Colour additive. Violet cryst. (MeOH).
Mp 139°.

8′-Alcohol: ***8′-Apo-β-caroten-8′-ol***
[6541-41-9]
$C_{30}H_{42}O$ 418.661
Constit. of *Aplysia kurodai*. Orange needles.
Mp 148-149°.

8′-Carboxylic acid: ***8′-Apo-β-caroten-8′-oic acid***. *β-Apo-8′-carotenoic acid*
[1962-15-8]
$C_{30}H_{40}O_2$ 432.645
Isol. from *Staphylococcus aureus*. Cryst. (C_6H_6).
Mp 189-190°. λ_{max} 448 (petrol).

8′-Carboxylic acid, Me ester: [4273-73-8]
$C_{31}H_{42}O_2$ 446.672
Isol. from *Staphylococcus aureus*. Red cryst. (petrol or Et_2O/petrol).
Mp 136-137°. λ_{max} 445; 471 (petrol).

8′-Carboxylic acid, Et ester: all-trans *Carophyll yellow. C.I. Food Orange 7*
[1109-11-1]
$C_{32}H_{44}O_2$ 460.698
Colour additive for foods, e.g. egg yolks. Dark red cryst. (CH_2Cl_2/EtOH). Mp 137-138°. λ_{max} 445; 470 (petrol).

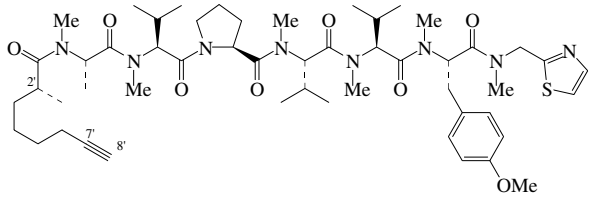
Apramide A A-618

[290298-29-2]



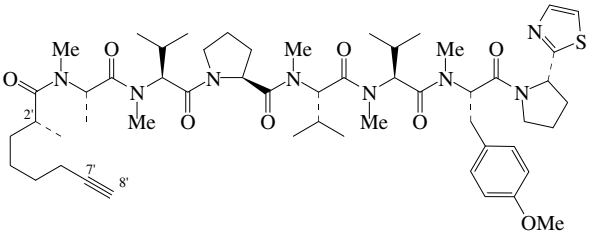
$C_{52}H_{80}N_8O_8S$ 977.319
Isol. from *Lyngbya majuscula*. Amorph. solid. $[\alpha]_D^{22}$ -206 (c, 2.7 in $CHCl_3$). λ_{max} 201 (log ϵ 4.74); 230 (sh) (log ϵ 4.29) (MeOH).

7′,8′-Dihydro: ***Apramide C***
[290298-31-6]
$C_{52}H_{82}N_8O_8S$ 979.335
Isol. from *Lyngbya majuscula*. Amorph. solid. $[\alpha]_D^{22}$ -206 (c, 0.56 in $CHCl_3$). λ_{max} 201 (log ϵ 4.74); 230 (sh) (log ϵ 4.3) (MeOH).

2′-Demethyl: ***Apramide B***
[290298-30-5]
$C_{51}H_{78}N_8O_8S$ 963.292
Isol. from *Lyngbya majuscula*. Amorph. solid. $[\alpha]_D$ -189 (c, 0.2 in $CHCl_3$). λ_{max} 201 (log ϵ 4.74); 230 (sh) (log ϵ 4.27) (MeOH).

Luesch, H. *et al., J. Nat. Prod.*, 2000, **63**, 1106-1112 (*Apramides A-C, isol, ir, uv, pmr, cmr, ms*)

Apramide D A-619



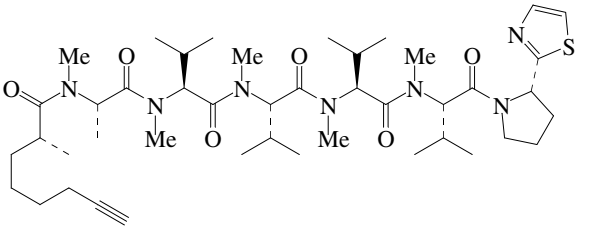
$C_{54}H_{82}N_8O_8S$ 1003.357
Isol. from *Lyngbya majuscula*. Amorph. solid. $[\alpha]_D^{22}$ -234 (c, 0.55 in $CHCl_3$). λ_{max} 201 (log ϵ 4.75); 230 (sh) (log ϵ 4.3) (MeOH).

7′,8′-Dihydro: ***Apramide F***
$C_{54}H_{84}N_8O_8S$ 1005.372
Isol. from *Lyngbya majuscula*. Amorph. solid. $[\alpha]_D^{22}$ -160 (c, 0.15 in $CHCl_3$). λ_{max} 201 (log ϵ 4.44); 240 (sh) (log ϵ 3.77) (MeOH).

2′-Demethyl: ***Apramide E***
$C_{53}H_{80}N_8O_8S$ 989.33
Isol. from *Lyngbya majuscula*. Amorph. solid. $[\alpha]_D^{22}$ -213 (c, 0.23 in $CHCl_3$). λ_{max} 201 (log ϵ 4.75); 230 (sh) (log ϵ 4.29) (MeOH).

Luesch, H. *et al., J. Nat. Prod.*, 2000, **63**, 1106-1112

Apramide G A-620

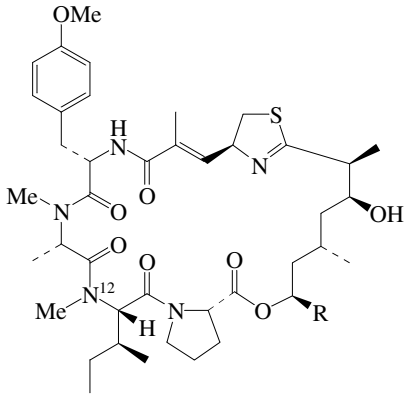


$C_{44}H_{73}N_7O_6S$ 828.17
Isol. from *Lyngbya majuscula*. Amorph. solid. $[\alpha]_D^{22}$ -160 (c, 0.15 in $CHCl_3$). λ_{max} 201 (log ϵ 4.44); 240 (sh) (log ϵ 3.77) (MeOH).

Luesch, H. *et al., J. Nat. Prod.*, 2000, **63**, 1106-1112

Apratoxin A A-621

[350791-64-9]



Absolute Configuration

R = -C(CH$_3$)$_3$

$C_{45}H_{69}N_5O_8S$ 840.135
Isol. from *Lyngbya majuscula*. Potent cytotoxin. Amorph. solid. $[\alpha]_D^{25}$ -161 (c, 1.3 in MeOH).

N^{12}*-De-Me:* ***Apratoxin B***
[444885-29-4]
$C_{44}H_{67}N_5O_8S$ 826.108
Isol. from *Lyngbya* sp. Amorph. solid. $[\alpha]_D^{25}$ -73 (c, 0.2 in MeOH). λ_{max} 200 (log ϵ 4.64); 230 (log ϵ 4.36) (MeOH).

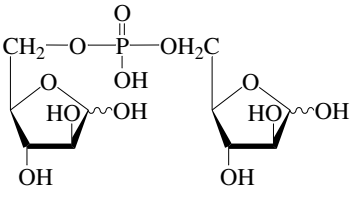
D-Arabinofuranose 5,5′-(hydrogen phosphate), 9CI A-625

[121808-61-5]

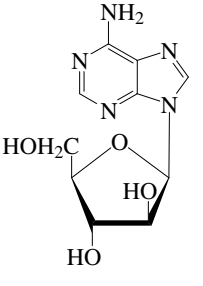


$C_{10}H_{19}O_{12}P$ 362.227
Constit. of an extracellular glycoprotein found in the alga *Volvox carteri* f. *nagariensis*.

Holst, O. *et al., Eur. J. Biochem.*, 1989, **181**, 345-350 (*isol, cmr, ms*)

9-Arabinofuranosyladenine, 8CI A-626

*9-Arabinofuranosyl-9*H*-purin-6-amine, 9CI*
[2006-02-2]



β-D-*form*

$C_{10}H_{13}N_5O_4$ 267.244

β-D-*form*

Vidarabine, BAN, INN, JAN, USAN. *Spongoadenosine. Adena-A. Ara-A. Arasena-A. Panavirin. Plosarabine forte. Vira-A. CI 673. NSC 404241. Araadenosine*

[5536-17-4]

Isol. from the marine gorgonian *Eunicella cavolini* and *Streptomyces* spp. Antiviral agent; shows significant activity against Herpes simplex and vaccinia viruses in cell cultures and in experimental animals. Nucleoside transporter substrate. Needles + ½ H_2O (H_2O).

Mp 257-257.5°. $[\alpha]_D^{40}$ +12 (c, 0.25 in H_2O). $[\alpha]_D^{27}$ -5 (c, 0.25 in H_2O).

Log P -2.88 (calc). λ_{max} 260 (ϵ 12000) (H_2O) (Derep).

▶ Human systemic effects when used therapeutically. Adverse ocular effects following topical administration. Exp. reprod. and teratogenic effects (large doses). LD_{50} (mus, orl) 7.8 mg/kg. Eye irritant. AU6200000

3′-Ac: [65286-65-9]

$C_{12}H_{15}N_5O_5$ 309.281

Isol. from *Eunicella cavolini*. Antiviral agent. Cryst. (MeOH). Sol. MeOH, butanol, H_2O; poorly sol. $CHCl_3$, hexane.

Mp 214-215°. λ_{max} 258 (ϵ 14000) (MeOH) (Berdy).

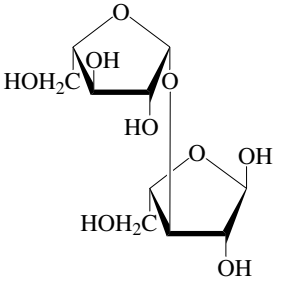
[24356-66-9, 71002-10-3]

Cimino, G. *et al., Experientia*, 1984, **40**, 339 (*β-D-Ac, isol*)

3-*O*-β-L-Arabinofuranosyl-L-arabinose, 9CI A-627

Arabinofuranobiose

[52287-00-0]



β-Furanose-*form*

$C_{10}H_{18}O_9$ 282.247

Formed on partial acid hydrolysis of sugar beet araban and certain plant gums, e.g. *Acacia pycnantha* gum and *Rhizophora mangle* gum.

$[\alpha]_D$ +94 (H_2O).

Phenylosazone: Mp 200°.

Isol. from the coral *Sinularia* sp. Enhances glucose transport in rat adipocytes. Oil. $[\alpha]_D$ -196 (c, 0.7 in $CHCl_3$).

Shindo, T. *et al., Experientia*, 1992, **48**, 688 (*isol, pmr, cmr, ms*)

Arachidonate lipoxygenases A-630

Fe-dependent oxidoreductase enzymes.

Arachidonate 5-lipoxygenase

E.C. 1.13.11.34. Arachidonate:oxygen 5-oxidoreductase. 5-Lipoxygenase. Leukotriene A_4 synthase

[80619-02-9]

Present in a number of mammalian cells and in plants. Catalyses the reaction of arachidonate with O_2 to give (5*S*,6*E*,8*Z*,11*Z*,14*Z*)-5-hydroperoxy-6,8,11,14-eicosatetraenoate.

Arachidonate 8-lipoxygenase

E.C. 1.13.11.40. Arachidonate:oxygen 8-oxidoreductase. 8-Lipoxygenase

[100900-72-9]

Isol. from the coral *Pseudoplexaura porosa*. Catalyses the reaction of arachidonate with O_2 to give (5*Z*,8*R*,9*E*,11*Z*,14*Z*)-8-hydroperoxy-5,9,11,14-eicosatetraenoate.

Arachidonate 12-lipoxygenase

E.C. 1.13.11.31. Arachidonate:oxygen 12-oxidoreductase. 12-Lipoxygenase

[82391-43-3]

Present in mammalian platelets, leucocytes and epidermis. Catalyses the reaction of arachidonate with O_2 to give (5*Z*,8*Z*,10*Z*,12*S*,14*Z*)-12-hydroperoxy-5,8,10,14-eicosatetraenoate (see 12-Hydroperoxy-5,8,10,14-eicosatetraenoic acid, H-430) which is rapidly reduced to the 12-hydroxy compd.

Arachidonate 15-lipoxygenase

E.C. 1.13.11.33. Arachidonate:oxygen 15-oxidoreductase. 15-Lipoxygenase. ω-6 Lipoxygenase

[82249-77-2]

Present in animal reticulocytes and leucocytes; also occurs in some plants. Catalyses the reaction of arachidonate with O_2 to give (5*Z*,8*Z*,11*Z*,13*E*,15*S*)-15-hydroperoxy-5,8,11,13-eicosatetraenoate which is rapidly reduced to the 15-hydroxy compd.

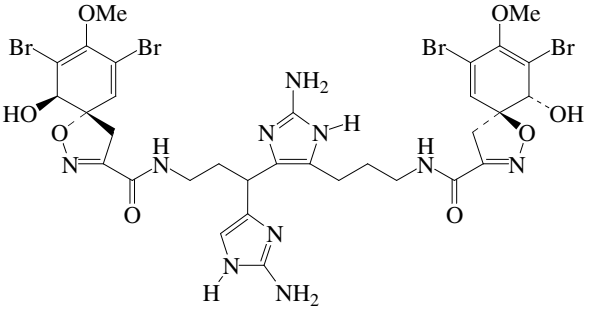
$C_5H_{10}N_2O_5S$ 210.21

(S)-form [56857-48-8]
Isol. from *Arca zebra*. Fish attractant. Syrup.

Sangster, A.W. *et al., Tetrahedron*, 1975, **31**, 1135

Archerine A-646

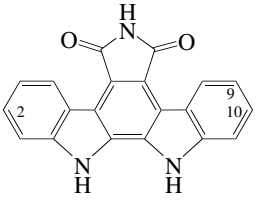


$C_{32}H_{36}Br_4N_{10}O_8$ 1008.315
Isol. from *Aplysina archeri*. Amorph. brown solid. $[\alpha]_D^{25}$ +111.4 (c, 0.07 in MeOH). λ_{max} 221 (ϵ 17600); 279 (ϵ 9500) (MeOH).

Ciminiello, P. *et al., Eur. J. Org. Chem.*, 2001, 55-60

Arcyriaflavin A A-647

12,13-Dihydro-5H-indolo[2,3-a]pyrrolo[3,4-c]carbazole-5,7(6H)-dione, 9CI
[118458-54-1]



$C_{20}H_{11}N_3O_2$ 325.326
Minor pigment from the fruiting bodies of the slime mould *Arcyria denudata*. Also isol. from the tunicate *Eudistoma* sp. and from *Nocardiopsis* sp. Orange solid.
Mp 360°. λ_{max} 235 (log ϵ 4.8); 257 (log ϵ 4.42); 272 (log ϵ 4.45); 281 (log ϵ 4.55); 300 (sh) (log ϵ 4.64); 314 (log ϵ 4.86); 402 (log ϵ 3.81) (MeOH).

N^{12}-*β*-D-*Glucopyranosyl:* ***Antibiotic BMY 41219***. *BMY 41219*. *Didechloro-4′*-O-*demethylrebeccamycin*
[158204-55-8]
$C_{26}H_{21}N_3O_7$ 487.468
Prod. by *Saccharothrix aerocolonigenes*. Orange-yellow powder. Sol. MeOH, DMSO, THF; poorly sol. H_2O. λ_{max} 236 (ϵ 29970); 284 (ϵ 17750); 316 (ϵ 37420); 404 (ϵ 3020) (MeOH).

Deoxo: See Antibiotic K 252c, A-551

2-Hydroxy: ***Arcyriaflavin B***
[73697-64-0]
$C_{20}H_{11}N_3O_3$ 341.325
Isol. from *Arcyria denudata* and *Metatrichia vesparium*. Pale yellow.
Mp 350°. λ_{max} 229 (log ϵ 4.07); 271 (log ϵ 3.7); 280 (log ϵ 3.75); 323 (log ϵ 4.11); 414 (log ϵ 3.19) (MeOH).

1,11-Dihydroxy: ***Antibiotic BE 13793C***. *BE 13793C*. *Antibiotic J 104303*. *J 104303*
[133805-03-5]
$C_{20}H_{11}N_3O_4$ 357.325
Prod. by *Streptomyces mobaraensis* sp. BA-13793. Antitumour agent. Topoisomerase inhibitor. Yellow-orange powder. Sol. THF, DMSO; fairly sol. MeOH; poorly sol. H_2O.
Mp 295°. λ_{max} 245 (ϵ 63500); 298 (ϵ 38100); 307 (ϵ 37400); 325 (sh) (ϵ 21900); 430 (ϵ 5600) (MeOH) (Derep).

▶ NM3457000

2,3-Dihydroxy: ***2,3-Dihydroxyarcyriaflavin A***
$C_{20}H_{11}N_3O_4$ 357.325
Isol. from *Lycogala epidendrum*. Cytotoxic. Amorph. yellow solid. λ_{max} 230 (log ϵ 10.5); 284 (log ϵ 9.8); 330 (log ϵ 10.5) (MeOH).

2,9-Dihydroxy: ***Arcyriaflavin D***
[179077-55-5]
$C_{20}H_{11}N_3O_4$ 357.325
Pigment from *Dictydiaethalium plumbeum*. Yellow cryst. powder. Mp >300°.

2,10-Dihydroxy: ***Arcyriaflavin C***
[73697-65-1]
$C_{20}H_{11}N_3O_4$ 357.325
Isol. from *Arcyria denudata*, *Metatrichia vesparium* and *Streptosporangium vulgare* K254. Enzyme inhibitor, calmodulin antagonist, shows insecticidal props. Pale yellow.
Mp 350°. λ_{max} 229 (ϵ 13800); 255 (sh) (ϵ 5890); 270 (ϵ 4570); 280 (ϵ 5010); 318 (sh) (ϵ 12300); 331 (ϵ 19500); 422 (ϵ 2190) (MeOH) (Derep).

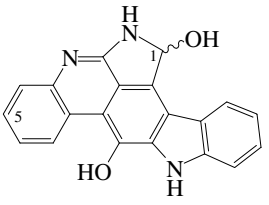
Arcyrin A A-648

*2,9-Dihydro-1*H-*indolo[3,2-*j*]pyrrolo[2,3,4-*gh*]phenanthridine-1,8-diol*



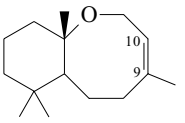
$C_{20}H_{13}N_3O_2$ 327.342
Systematic numbering shown. Isol. from *Arcyria* sp. No phys. props. reported. Not indexed by CAS.

1-Deoxy, 5-hydroxy: ***Arcyrin B***
$C_{20}H_{13}N_3O_2$ 327.342
Isol. from *Arcyria* sp. No phys. props. reported. Not indexed by CAS.

Steglich, W. *et al., Pure Appl. Chem.*, 1989, **61**, 281-288 (*occur*)

Arenaran A A-649

[162559-00-4]



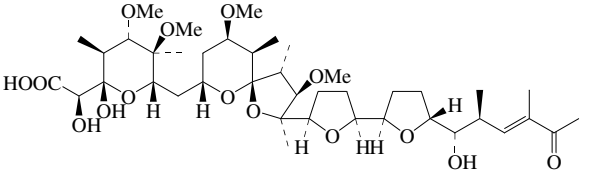
$C_{15}H_{26}O$ 222.37
Constit. of *Dysidea arenaria*. Amorph. solid. $[\alpha]_D$ +154 (c, 0.01 in $CHCl_3$).

9β,10β-Epoxide: ***Arenaran B***
[162559-01-5]
$C_{15}H_{26}O_2$ 238.369
Constit. of *Dysidea arenaria*. Amorph. solid. $[\alpha]_D$ -24.4 (c, 0.23 in $CHCl_3$).

Horton, P.A. *et al., J. Nat. Prod.*, 1995, **58**, 44 (*isol, pmr, cmr*)

Arenaric acid A-650

Antibiotic 27C6
[196202-51-4]
[223392-57-2]



$C_{41}H_{68}O_{15}$ 800.979
Polyether antibiotic. Related to Antibiotic K 41. Prod. by a marine *Streptomyces* sp. (isolate CNH-248). Cryst. (as Na salt). Mp 185-187° Mp 106-108° (Na salt). $[\alpha]_D^{25}$ -17.6 (c, 1.2 in MeOH) (Na salt). λ_{max} 230 (log ϵ 4.54) (MeOH) (Na salt).

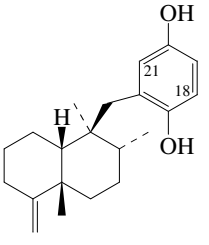
Cheng, X.C. *et al., J. Nat. Prod.*, 1999, **62**, 605-607 (*isol, uv, ir, pmr, cmr*)

Arenarol A-651

[87764-13-4]



$C_{21}H_{30}O_2$ 314.467
Constit. of *Dysidea arenaria*. Cryst. (MeOH aq.). Sol. MeOH, $CHCl_3$; poorly sol. H_2O.
Mp 128-130°. $[\alpha]_D$ +19 (c, 0.1 in $CHCl_3$). λ_{max} 298 (ϵ 3900) (solvent not reported) (Derep). λ_{max} 220 (ϵ 4085); 293 (ϵ 2713); 312 (ϵ 510) (MeOH) (Berdy).

Quinone: ***Arenarone***
[87764-16-7]
$C_{21}H_{28}O_2$ 312.451

Isol. from *Dysidea arenaria*. Yellow oil. Sol. MeOH, $CHCl_3$; poorly sol. H_2O. $[\alpha]_D$ +8.3 (c, 0.18 in $CDCl_3$). λ_{max} 246 (ϵ 12300); 315 (ϵ 750); 440 (ϵ 30) (solvent not reported) (Derep). λ_{max} 245 (ϵ 4753); 330 (ϵ 245) (MeOH) (Berdy).

Quinone, 19-methoxy, 21-hydroxy: ***21-Hydroxy-19-methoxyarenarone***
[267650-85-1]
$C_{22}H_{30}O_4$ 358.477
Constit. of *Hyrtios tubulatus*. Amorph. solid. λ_{max} 293 (ϵ 6520); 424 (ϵ 240) (MeOH).

Δ^3-Isomer: ***Isoarenarol***
[637774-35-7]
$C_{21}H_{30}O_2$ 314.467
Constit. of *Dysidea arenaria*.

Schmitz, F.J. *et al., J.O.C.*, 1984, **49**, 241-244 (*isol, pmr, cmr*)
Watson, A.T. *et al., J.O.C.*, 1995, **60**, 5102 (*synth*)

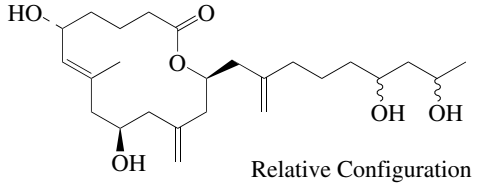
Arenolide A-654

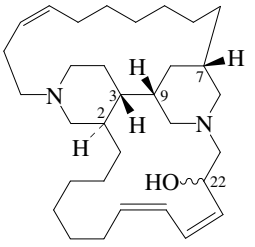


Relative Configuration

$C_{25}H_{42}O_6$ 438.603
Macrolide antibiotic. Isol. from a *Dysidea* sp. from Palau. Shows modest cytotoxic activity. Viscous oil. $[\alpha]_D$ +13 (c, 0.64 in $CHCl_3$). Unstable.

Lu, Q. *et al., J. Nat. Prod.*, 1998, **61**, 1096-1100 (*isol, ir, pmr, cmr, ms*)

Arenosclerin A A-655



$C_{32}H_{54}N_2O$ 482.791
Alkaloid from the sponge *Arenosclera brasiliensis*. Glassy solid. $[\alpha]_D^{25}$ -3 (c, 0.01 in MeOH). λ_{max} 235 (ϵ 15100) (MeOH).

Deoxy: ***Haliclonacyclamine E***
$C_{32}H_{54}N_2$ 466.792
Alkaloid from *Arenosclera brasiliensis*. Glassy solid. $[\alpha]_D^{25}$ +14 (c, 0.02 in MeOH). λ_{max} 236 (ϵ 14900) (MeOH).

Deoxy, 23,24-dihydro: ***Halichondramine***
$C_{32}H_{56}N_2$ 468.808
Alkaloid from *Halichondria* sp. Yellow oil. $[\alpha]_D^{25}$ +3.3 (c, 0.5 in MeOH).

2,3-Diepimer: ***Arenosclerin C***
$C_{32}H_{54}N_2O$ 482.791
Alkaloid from *Arenosclera brasiliensis*. Glassy solid. $[\alpha]_D^{25}$ -17 (c, 0.02 in MeOH). λ_{max} 235 (ϵ 15150) (MeOH).

2,3,7-Triepimer: ***Arenosclerin B***
$C_{32}H_{54}N_2O$ 482.791
Alkaloid from *Arenosclera brasiliensis*. Glassy solid. $[\alpha]_D^{25}$ +8.6 (c, 0.008 in MeOH). λ_{max} 235 (ϵ 15000) (MeOH).

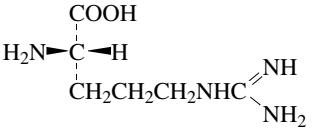
Arginine, INN, USAN A-656

2-Amino-5-[(aminoiminomethyl)amino]pentanoic acid. 2-Amino-5-guanidinovaleric acid. Arg
[7004-12-8]



(*S*)-*form*

$C_6H_{14}N_4O_2$ 174.202
Basic genetically coded amino acid. Essential amino acid for human development. Precursor of nitric oxide and is synth. by the body from 2,5-Diaminopentanoic acid, D-122. Diuretic agent. Growth hormone releaser. Immune stimulating agent and wound healing agent. Acidifying agent. Dietary supplement. Ammonia detoxicant (hepatic failure). Diagnostic aid for pituitary function. Log P -4.79 (calc).

(S)-form
L-form. L-Arginine. FEMA 3819
[74-79-3]
Found in seeds/shoots of pine, fir, acacia, arachis etc. and in many proteins. Reagent for the fluorimetric anal. of reducing sugars by hplc. Diagnostic aid (pituitary function determination); ammonia detoxicant; dietary supplement, nutrient. Plates or prisms + $2H_2O$ (H_2O), plates (EtOH). Sol. H_2O (15.0g/100g at 21°).
Mp 207° Mp 244° dec. (anhyd. 105°). $[\alpha]_D$ +21.8 (H_2O). $[\alpha]_D^{25}$ +48.1 (c, 1 in 5*M* HCl). pK_{a1} 2.17; pK_{a2} 9.04; pK_{a3} 12.48 (guanido). Isoelectric point 10.76. Bitter taste. *N*-Protected derivs. useful in peptide synth. have been listed alphabetically elsewhere.

▶ CF1934200

N^2*-(4-Hydroxybenzoyl):* ***N^2-(4-Hydroxybenzoyl)arginine***
[178495-39-1]
$C_{13}H_{18}N_4O_4$ 294.31

Isol. from the ascidian *Leptoclinides dubius*. Sol. MeOH, butanol. $[\alpha]_D^{20}$ +19.5 (c, 2 in MeOH). λ_{max} 210 (log ϵ 3.46); 256 (log ϵ 3.49) (MeOH). λ_{max} 216; 294 (MeOH/NaOH) (Berdy).

ARS 2 A-682

Glycoprotein containing 66.9% carbohydrate, mainly D-galactose; MW 63100. Isol. from *Chlorella vulgaris*. Shows antitumour activity. Immunostimulant. Powder. Sol. H_2O.

Noda, K. *et al., Planta Med.*, 1996, **62**, 423-426 (*isol, pmr, cmr*)

Arsenobetaine A-683

(Carboxymethyl)trimethylarsonium hydroxide inner salt, 9CI
[64436-13-1]
$Me_3As^{\oplus}CH_2COO^{\ominus}$
$C_5H_{11}AsO_2$ 178.062
Constit. of *Panulirus longipes cygnus*. Found in algae, lobsters, sharks and dogfish *Squalus acanthias*, etc. Metab of (2-Hydroxyethyl)trimethylarsonium(1+), H-620. Not produced in mammals. Deliquescent cryst. (Me_2CO/MeOH).
Mp 204-210° dec. Low mammalian toxicity, excreted unchanged e.g. from seafood sources.

▶ LD_{50} (mus, orl) 10000 mg/kg. CH9750000

Hydrobromide: [71642-15-4]
$C_5H_{12}AsBrO_2$ 258.974
Synth. from $AsMe_3$ + $BrCH_2COOH$ in toluene at 5° followed by stirring for 6 h then cooling (-20°; 30 min.). Non-hygroscopic white shiny cryst. (EtOH at 5°).

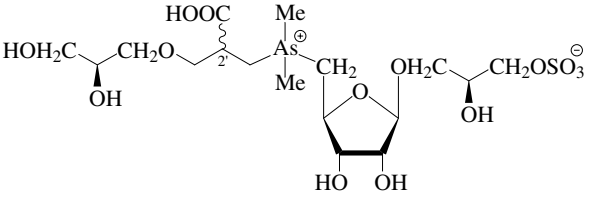
Sargassum lacerifolium Arsenomethionine A-684



$C_{17}H_{33}AsO_{14}S$ 568.427
Isol. from *Sargassum lacerifolium*. Isol. as a mixt. of C-2′ epimers.

Edmonds, J.S. *et al., Bioorg. Med. Chem. Lett.*, 2000, **10**, 1105-1108 (*isol*)

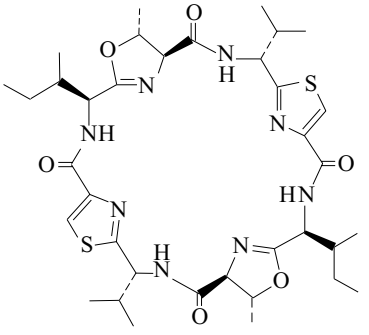
ARYFL amide A-685

[152247-51-3]
Ala-Arg-Tyr-Phe-Leu-NH_2
$C_{33}H_{49}N_9O_6$ 667.807
Isol. from the echiuroid worm *Urechis unicinctus*.

Ikeda, T. *et al., Pept. Chem.*, 1992, **30**, 583-585 (*isol*)

Ascidiacyclamide A-686

[86701-12-4]



$C_{36}H_{52}N_8O_6S_2$ 756.989
Cyclic peptide antibiotic. Prod. by an unidentified ascidian. Cytotoxic. Active against PV_4 cultured cells transformed with Polyoma virus. Prisms (C_6H_6). Sol. Me_2CO, $CHCl_3$; poorly sol. H_2O.
Mp 245-246° (139-139.5°). $[\alpha]_D^{25}$ +164 (c, 0.466 in $CHCl_3$). λ_{max} 232 (ϵ 21000) (MeOH) (Derep).

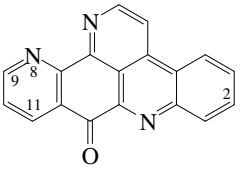
Ascididemin A-687

9H-Quino[4,3,2-de][1,10]phenanthrolin-9-one, 9CI. Leptoclinidinone
[114622-04-7]



$C_{18}H_9N_3O$ 283.289
CAS numbering shown. Other systems have been used. Alkaloid from the Okinawan tunicate *Didemnum* sp., *Cystodytes delle chiajei*, *Didemnum rubeum* and the Seychelles tunicate *Eudistoma* sp. Exhibits potent antineoplastic activity. Ca release agent. DNA intercalator and cleavage agent. Yellow solid. Sol. MeOH, EtOAc.
Mp 300°. λ_{max} 220 (ϵ 49500); 248 (ϵ 48000); 273 (sh) (ϵ 27500); 298 (ϵ 17000); 308 (ϵ 15700); 340 (sh) (ϵ 11300); 377 (ϵ 13600) (MeOH) (Derep). λ_{max} 220; 247; 270; 308; 340; 375 (EtOH) (Berdy).

10-Hydroxy: ***11-Hydroxyascididemin***. *Cystodamine*
[129741-41-9]
[158761-11-6]
$C_{18}H_9N_3O_2$ 299.288
Alkaloid from the ascidian *Leptoclinides* sp. and *Cystodytes delle chiajei*. Cytotoxic agent. Yellow amorph. solid.
Mp 250°. Struct. of Cystodamine revised in 2000. λ_{max} 203 (ϵ 25000); 227 (ϵ 38000); 275 (ϵ 18000); 285 (ϵ 17000); 370 (ϵ 11000) (MeOH) (Derep).

10-Hydroxy, 12,13-dihydro: ***8,9-Dihydro-11-hydroxyascididemin***
[151392-04-0]
$C_{18}H_{11}N_3O_2$ 301.304
Alkaloid from the Okinawan marine sponge *Biemna* sp. Cytotoxic agent. Yellow amorph. powder.
Mp 300°. λ_{max} 218 (ϵ 17000); 273 (ϵ 9300); 319 (ϵ 6700); 355 (ϵ 5300) (MeOH) (Berdy).

6-Bromo: ***2-Bromoleptoclinidinone***
[109802-17-7]
$C_{18}H_8BrN_3O$ 362.185

Alkaloid from an ascidian, prob. *Leptoclinides* sp. Toxic to lymphocytic leukaemia cells *in vitro*. Protein phosphatase inhibitor. Yellow powder ($CHCl_3$/MeOH). Sol. MeOH, $CHCl_3$; poorly sol. H_2O.

Mp 300°. Revised struct. λ_{max} 227 (ϵ 152000); 247 (ϵ 27800); 254 (sh) (ϵ 27300); 278 (ϵ 32000); 298 (ϵ 30600); 335 (ϵ 18500); 371 (ϵ 21000) (EtOH) (Derep).

5-Hydroxy: Neocalliactine

[143370-24-5]

Obt. from Calliactine, C-53 by treatment with dil. acid. Cryst. (CH_2Cl_2/Et_2O)(as Ac). Mp 280-290° (Ac).

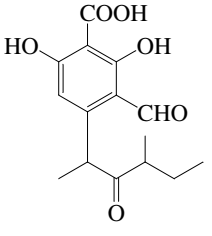
Ascochital A-688

4-(1,3-Dimethyl-2-oxopentyl)-3-formyl-2,6-dihydroxybenzoic acid



$C_{15}H_{18}O_6$ 294.304

Related to Ascochitin, A-689. Prod. by the marine fungi *Ascochyta salicorniae* and *Kirschsteiniothelia maritima*. Antibacterial agent.

Mp 122-124°. λ_{max} 235; 251; 281; 334 (MeOH).

Kusnick, C. *et al., Pharmazie*, 2002, **57**, 510-512 (*isol, uv, ir, pmr, cmr, ms*)

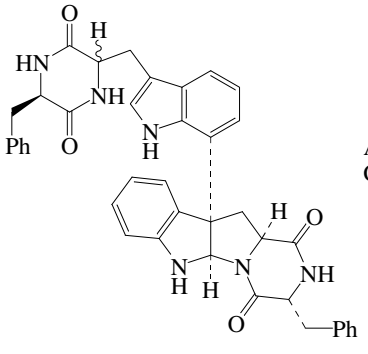
Asperazine A-699

[198953-76-3]



Absolute Configuration

$C_{40}H_{36}N_6O_4$ 664.762

Alkaloid from the sponge-derived culture of *Aspergillus niger*. Amorph. powder. $[\alpha]_D$ +53 (c, 0.2 in MeOH). λ_{max} 225; 285; 300 (MeOH).

Varoglu, M. *et al., J.O.C.*, 1997, **62**, 7078-7079 (*isol, uv, ir, pmr, ms*)

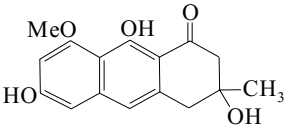
Asperflavin A-700

3,4-Dihydro-3,6,9-trihydroxy-8-methoxy-3-methylanthracen-1(2H)-one, 9CI

[38371-01-6]



$C_{16}H_{16}O_5$ 288.299

(+)-form

Constit. of *Aspergillus flavus*, *Aspergillus repens*, *Leucopaxillus tricolor* and *Microascus tardifaciens*. Mycotoxin. Immunosuppressant. Yellow needles (EtOAc). Sol. MeOH, bases; poorly sol. H_2O, hexane.

Mp 180° Mp 225-230°. $[\alpha]_D$ +4 (c, 0.3 in MeOH). $[\alpha]_D$ +89 (c, 0.2 in MeOH). Differences in phys. props. between the isolates suggest partial racemates. λ_{max} 232 (log ϵ 4.23); 270 (log ϵ 4.56); 318 (log ϵ 3.68); 332 (log ϵ 3.57); 389 (log ϵ 4.02) (MeOH). λ_{max} 230 (ϵ 13500); 269 (ϵ 32360); 317 (ϵ 43600); 335 (ϵ 28200); 392 (ϵ 8130) (MeOH) (Berdy).

6-O-α-D-Ribofuranoside:

$C_{21}H_{24}O_9$ 420.415

Prod. by the marine-derived *Microsporum* sp. Yellow oil. $[\alpha]_D^{20}$ +23.8 (c, 0.2 in MeOH). λ_{max} 225 (log ϵ 0.91); 269 (log ϵ 1.22); 312 (log ϵ 0.44); 388 (log ϵ 0.62) (MeOH).

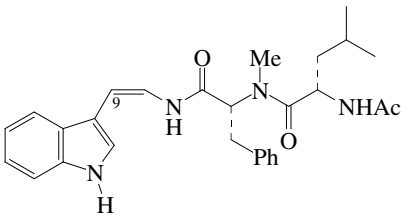
Aspergillamide A A-702

[217489-31-1]



$C_{28}H_{34}N_4O_3$ 474.602

Prod. by a marine *Aspergillus* sp. Cytotoxic agent. Amorph. powder. $[\alpha]_D$ -26.2 (c, 3.05 in MeOH). Exists as a 1:1 mixt. of *cis*- and *trans*-amide rotational conformers. λ_{max} 200 (log ϵ 4.68); 221 (log ϵ 4.59); 286 (log ϵ 4.44) (MeOH).

(E)-Isomer: ***Aspergillamide B***
[217489-32-2]
$C_{28}H_{34}N_4O_3$ 474.602
Prod. by a marine *Aspergillus* sp. Amorph. powder.

Toske, S.G. *et al., Tetrahedron*, 1998, **54**, 13459-13466 (*isol*)
Rivas, L. *et al., Tet. Lett.*, 2002, **43**, 7639-7641 (*Aspergillamide B, synth*)

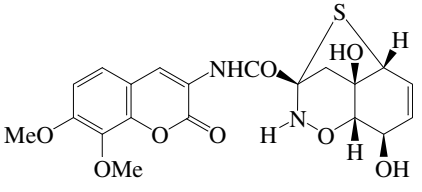
Aspergillazine A A-703

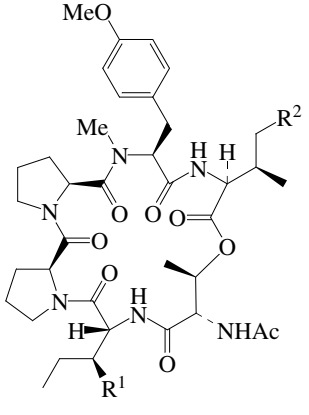


$C_{20}H_{20}N_2O_8S$ 448.453

Related to Trichodermamide A, T-492. Prod. by *Aspergillus unilateralis* (MST-F8675) and the marine-derived *Spicaria elegans*. Cytotoxic. Amorph. yellow solid. $[\alpha]_D$ -103 (c, 0.14 in MeOH). $[\alpha]_D$ -366.4 (c, 0.11 in MeOH). λ_{max} 205 (ϵ 19270); 245 (sh); 337 (ϵ 11100) (MeOH). λ_{max} 270 (log ϵ 3.95); 338 (log ϵ 4.29) (MeOH).

Liu, R. *et al., Arch. Pharmacal Res.*, 2005, **28**, 1042-1046 (*isol, pmr, cmr, ms*)
Capon, R.J. *et al., Org. Biomol. Chem.*, 2005, **3**, 123-129 (*isol, pmr, cmr*)

Aspergillicin A A-704



Absolute Configuration

$R^1 = CH_3$, $R^2 = H$

$C_{38}H_{56}N_6O_9$ 740.895

Prod. by a marine-derived *Aspergillus carneus*. Solid. $[\alpha]_D^{20}$ -51.9 (c, 0.03 in MeOH). λ_{max} 212 (ϵ 9870); 227 (ϵ 7530); 277 (ϵ 990); 283 (ϵ 870) (MeOH).

Demethoxy: ***Aspergillicin C***
$C_{37}H_{54}N_6O_8$ 710.869
Prod. by a marine-derived *Aspergillus carneus*. Isol. as a mixt. with Aspergillicin D.

Demethoxy, N*-de-Me:* ***Aspergillicin D***
$C_{36}H_{52}N_6O_8$ 696.842
Prod. by a marine-derived *Aspergillus carneus*. Isol. as a mixt. with Aspergillicin C.

Capon, R.J. *et al., Org. Biomol. Chem.*, 2003, **1**, 1856-1862 (*isol, pmr, cmr, ms*)

Aspergillicin B A-705

As Aspergillicin A, A-704 with
$R^1 = R^2 = H$

$C_{37}H_{54}N_6O_9$ 726.868
Prod. by a marine-derived *Aspergillus carneus*. Solid. $[\alpha]_D^{20}$ -46.6 (c, 0.02 in MeOH). λ_{max} 210 (ϵ 9800); 225 (ϵ 7500); 277 (ϵ 980); 283 (ϵ 880) (MeOH).

Capon, R.J. *et al., Org. Biomol. Chem.*, 2003, **1**, 1856-1862 (*isol, pmr, ms*)

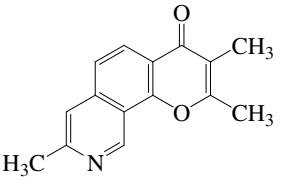
Aspergillicin E A-706

As Aspergillicin A, A-704 with
$R^1 = R^2 = CH_3$

$C_{39}H_{58}N_6O_9$ 754.922
Prod. by a marine-derived *Aspergillus carneus*. Solid.

Capon, R.J. *et al., Org. Biomol. Chem.*, 2003, **1**, 1856-1862 (*isol, pmr*)

Aspergillitine A-707

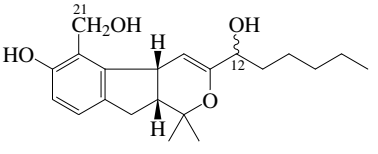


$C_{15}H_{13}NO_2$ 239.273

Prod. by the fungus *Aspergillus versicolor* isol. from the sponge *Xestospongia exigua*. Yellow powder (MeOH). λ_{max} 214; 245; 265; 295; 315; 370 (MeOH aq.).

Lin, W. *et al., J. Nat. Prod.*, 2003, **66**, 57-61 (*isol, pmr, cmr, ms*)

Aspergillodiol A-708



Relative Configuration

$C_{21}H_{30}O_4$ 346.466

Prod. by the marine *Aspergillus versicolor*.

21-Aldehyde: ***Aspergillol***
$C_{21}H_{28}O_4$ 344.45
Prod. by *Aspergillus versicolor*.

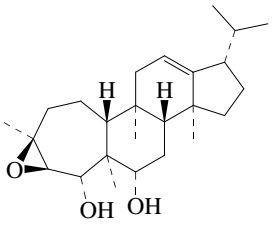
21-Aldehyde, 12-Ac: ***12-O-Acetylaspergillol***
$C_{23}H_{30}O_5$ 386.487
Prod. by *Aspergillus versicolor*.

12-Ketone, 21-aldehyde: ***Aspergillone***
$C_{21}H_{26}O_4$ 342.434
Prod. by *Aspergillus versicolor*. Amorph. solid. λ_{max} 220; 263; 350 (no solvent reported).

Lin, W.H. *et al., Chin. Chem. Lett.*, 2001, **12**, 435-438

Aspergilloxide A-709

[436144-24-0]

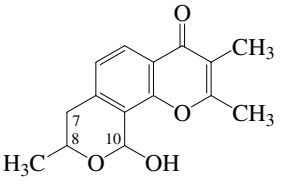


$C_{25}H_{40}O_3$ 388.589
Metab. of a marine derived *Aspergillus* sp. Amorph. powder. $[\alpha]_D$ -29 (c, 0.65 in CH_2Cl_2). λ_{max} 227 (log ϵ 5.4) ($CHCl_3$).

Cueto, M. *et al., Org. Lett.*, 2002, **4**, 1583-1585 (*isol, pmr, cmr*)

Aspergione B A-710

*7,8-Dihydro-10-hydroxy-2,3,8-trimethyl-4*H*-benzo[2,1-*b*:3,4-c′]dipyran-4-one*



$C_{15}H_{16}O_4$ 260.289
Struct. was incorrectly reported in a preliminary communication.
Prod. by *Aspergillus versicolor* isol. from *Xestospongia exigua*. Amorph. solid (MeOH). $[\alpha]_D^{20}$ +1.9 (c, 1.6 in MeOH). λ_{max} 231; 291; 352 (MeOH aq.).

Me ether: ***Aspergione A***
$C_{16}H_{18}O_4$ 274.316
Prod. by *Aspergillus versicolor* isol. from *Xestospongia exigua*. Amorph. solid (MeOH). $[\alpha]_D^{20}$ +8.8 (c, 0.28 in MeOH). λ_{max} 235; 291; 350 (MeOH aq.).

*7,8-Didehydro, Me ether: 10-Methoxy-2,3,8-trimethyl-4*H*,10*H*-benzo[2,1-*b*:3,4-c′]dipyran-4-one.* ***Aspergione C***
$C_{16}H_{16}O_4$ 272.3
Prod. by *Aspergillus versicolor* isol. from *Xestospongia exigua*. Amorph. yellow solid (MeOH). $[\alpha]_D^{20}$ +1.9 (c, 0.58 in MeOH).

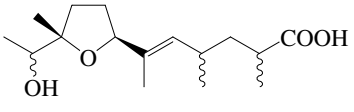
*7,8-Didehydro, ketone: 2,3,8-Trimethyl-4*H*,10*H*-benzo[2,1-*b*:3,4-c′]dipyran-4,10-dione.* ***Aspergione D***
$C_{15}H_{12}O_4$ 256.257
Prod. by *Aspergillus versicolor* isol. from *Xestospongia exigua*. Amorph. solid (MeOH). λ_{max} 211; 270; 325; 335; 390 (MeOH aq.).

10-Deoxy, 8-hydroxy: ***Aspergione F***
$C_{15}H_{16}O_4$ 260.289
Prod. by *Aspergillus versicolor* isol. from *Xestospongia exigua*. Amorph. solid (MeOH). $[\alpha]_D^{20}$ -1.7 (c, 1.5 in MeOH). λ_{max} 235; 291; 350 (MeOH aq.).

10-Deoxy, 8-methoxy: ***Aspergione E***
$C_{16}H_{18}O_4$ 274.316
Prod. by *Aspergillus versicolor* isol. from *Xestospongia exigua*. Amorph. solid (MeOH). $[\alpha]_D^{20}$ +2.5 (c, 0.6 in MeOH). λ_{max} 235; 291; 350 (MeOH aq.).

Lin, W. *et al., J. Nat. Prod.*, 2003, **66**, 57-61 (*isol, pmr, cmr, ms*)

Asperic acid A-711

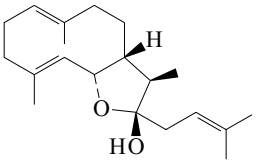


$C_{16}H_{28}O_4$ 284.395
Isol. from *Aspergillus niger* derived from the sponge *Hyrtios proteus*. Yellow wax. $[\alpha]_D$ +35 (c, 0.5 in CH_2Cl_2). λ_{max} 225; 280 (no solvent reported).

Varoglu, M. *et al., J. Nat. Prod.*, 2000, **63**, 41-43 (*isol, pmr, cmr*)

Asperketal A A-712

[114763-50-7]



$C_{20}H_{32}O_2$ 304.472
Constit. of *Eunicea asperula*. Cryst.
Mp 75-77°. $[\alpha]_D^{20}$ +75 (c, 0.97 in C_6H_6).

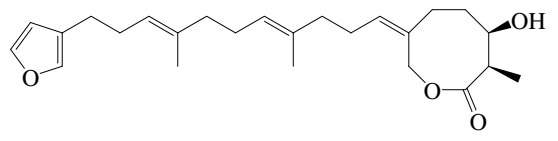
Namikoshi, M. *et al., J. Antibiot.*, 2003, **56**, 755-761 (*Chlorohydroxydeoxyaspyrone*)

Astakolactin A-720

[508226-57-1]

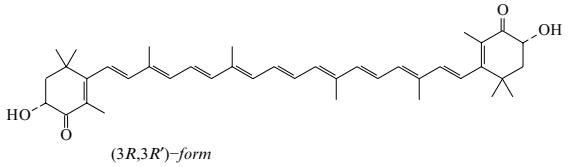


$C_{25}H_{36}O_4$ 400.557
Constit. of *Cacospongia scalaris*. Oil. $[\alpha]_D$ -36 (c, 0.05 in CH_2Cl_2).

Tsoukatou, M. *et al., J. Nat. Prod.*, 2003, **66**, 444-446 (*isol, pmr, cmr*)

Astaxanthin A-721

3,3′-Dihydroxy-β,β-carotene-4,4′-dione. 3,3′-Dihydroxycanthaxanthin. 3,3′-Dihydroxy-4,4′-diketo-β-carotene. Ovoester
[7542-45-2]



(3*R*,3*R*′)–*form*

$C_{40}H_{52}O_4$ 596.848

(3*R*,3′*R*)-*form* [60760-95-4]
Isol. from the yeast *Phaffia rhodozyma*.
Mp 222-223°. CD:$\Delta\epsilon_{385}$ -6.2, $\Delta\epsilon_{324}$ +24.0. λ_{max} 492 ($CHCl_3$).

(3*S*,3′*S*)-*form* [472-61-7]
Prosthetic group of carotenoprotein Alloporin ex *Allopora californica*.
Mp 223-225°. λ_{max} 472 (MeOH) (Berdy). λ_{max} 466 (hexane) (Berdy). λ_{max} 485 ($CHCl_3$) (Berdy). λ_{max} 492 ($CHCl_3$).

3-O-*β*-D-*Glucopyranoside:*
$C_{46}H_{62}O_9$ 758.99
Constit. of *Agrobacterium aurantiacum*. λ_{max} 487 (C_6H_6).

(3′*RS*,3′*SR*)-*form* [71772-51-5]
Isol. from lobster shells and lobster eggs along with both enantiomers. 85% of carotenoid content of alga *Pleurastrum tercinoideum*. Used in fish farming to induce trout flesh colouring.
Mp 216-219°. Meso-isomer.

[74601-68-6]

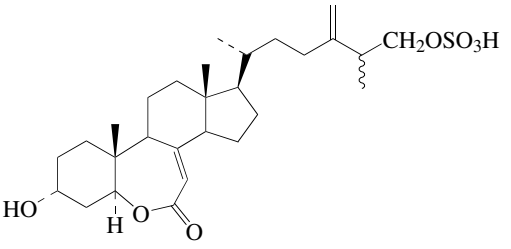
Asterasterol A A-722

[193008-25-2]

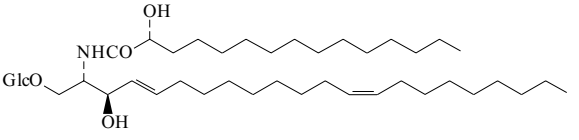


$C_{28}H_{44}O_7S$ 524.717
Constit. of an Antarctic starfish (Asteriidae).
$[\alpha]_D$ +4.5.

De Marino, S. *et al., Tetrahedron*, 1997, **53**, 8625-8628 (*isol, pmr, cmr*)

Asteriacerebroside A A-723

[134178-88-4]

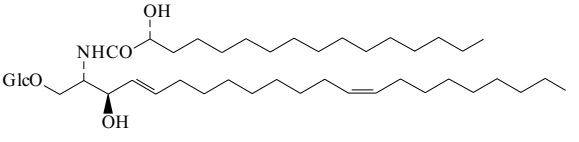


$C_{43}H_{81}NO_9$ 756.114
Glycosphingolipid. Isol. from the starfish *Asterias amurensis versicolor*. Needles + $4H_2O$ (MeOH).
Mp 182-184°. $[\alpha]_D^{25}$ +8.5 (c, 0.27 in 1-propanol).

Higuchi, R. *et al., Annalen*, 1991, 745-752 (*isol, pmr, cmr, struct*)

Asteriacerebroside B A-724

[134178-89-5]

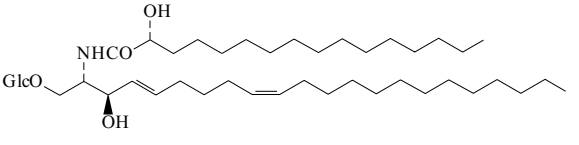


$C_{44}H_{83}NO_9$ 770.141
Glycosphingolipid. Isol. from the starfish *Asterias amurensis versicolor*. Needles + $3H_2O$ (MeOH).
Mp 178-180°. $[\alpha]_D^{25}$ +8.3 (c, 0.28 in 1-propanol).

Higuchi, R. *et al., Annalen*, 1991, 745-752 (*isol, pmr, cmr, struct*)

Asteriacerebroside C A-725

[134178-90-8]

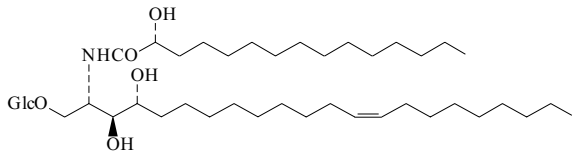


$C_{44}H_{83}NO_9$ 770.141
Glycosphingolipid. Isol. from the starfish *Asterias amurensis versicolor*. Needles + $3H_2O$ (MeOH).
Mp 183-186°. $[\alpha]_D^{25}$ +9.4 (c, 0.28 in 1-propanol).

Higuchi, R. *et al., Annalen*, 1991, 745-752 (*isol, pmr, cmr, struct*)

Asteriacerebroside D **A-726**

[134178-91-9]



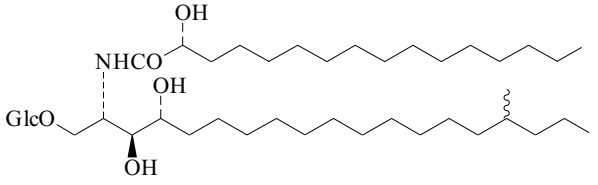
$C_{43}H_{83}NO_{10}$ 774.129

Glycosphingolipid. Isol. from the starfish *Asterias amurensis versicolor*. Needles + $2H_2O$ (MeOH).
Mp 174-176°. $[\alpha]_D^{25}$ +10.5 (c, 0.4 in 1-propanol).

Higuchi, R. *et al., Annalen*, 1991, 745-752 (*isol, pmr, cmr, struct*)

Asteriacerebroside E **A-727**

[134178-92-0]



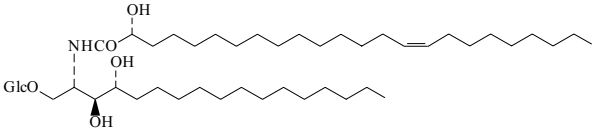
$C_{42}H_{83}NO_{10}$ 762.118

Glycosphingolipid. Isol. from the starfish *Asterias amurensis versicolor*. Needles + $1H_2O$ (MeOH).
Mp 216-218°. $[\alpha]_D^{25}$ +12.2 (c, 0.32 in 1-propanol).

Higuchi, R. *et al., Annalen*, 1991, 745-752 (*isol, pmr, cmr, struct*)

Asteriacerebroside F **A-728**

[134178-93-1]



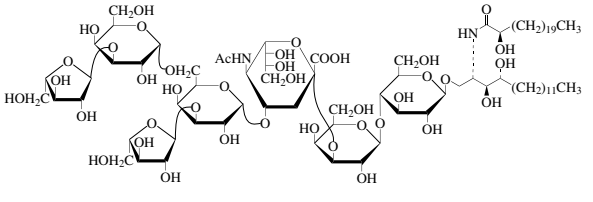
$C_{47}H_{91}NO_{10}$ 830.237

Glycosphingolipid. Isol. from the starfish *Asterias amurensis versicolor*. Needles + $4H_2O$ (MeOH).
Mp 167-169°. $[\alpha]_D^{25}$ +12.6 (c, 0.33 in 1-propanol).

Higuchi, R. *et al., Annalen*, 1991, 745-752 (*isol, pmr, cmr, struct*)

Asterinaganglioside A **A-729**

[131489-38-8]

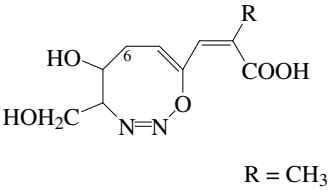


$C_{83}H_{150}N_2O_{41}$ 1832.087

Constit. of the starfish *Asterias pectinifera*. Amorph. powder.
Mp 163-165°. $[\alpha]_D^{24}$ +19.9 (c, 0.1 in H_2O).

Higuchi, R. *et al., Annalen*, 1991, 1 (*isol, ir, struct*)

Asterionellin A **A-730**



$R = CH_3$

$C_{10}H_{14}N_2O_5$ 242.231

Isol. from an *Asterionella* sp. Not indexed by CAS.

Shimizu, Y. *et al., Chem. Rev.*, 1993, **93**, 1685-1698

Asterionellin B **A-731**

As Asterionellin A, A-730 with
R = H

$C_9H_{12}N_2O_5$ 228.204

Isol. from the microalga *Asterionella* sp. Antibiotic.

6-Hydroxy: ***Asterionellin C***
$C_9H_{12}N_2O_6$ 244.204
Isol. from *Asterionella* sp.

Shimizu, Y. *et al., Chem. Rev.*, 1993, **93**, 1685-1698

Asterubin **A-732**

2-[[(Dimethylamino)iminomethyl]amino]ethanesulfonic acid, 9CI
[6249-86-1]

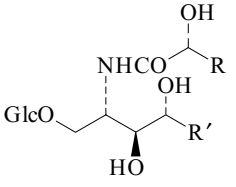
$HN{=}C(NMe_2)NHCH_2CH_2SO_3H$

$C_5H_{13}N_3O_3S$ 195.242

Isol. from starfish. Needles (MeOH aq.).
Mp 272-273° dec.

Ackermann, D. *et al., Hoppe-Seyler's Z. Physiol. Chem.*, 1935, **232**, 206; **235**, 233 (*isol, synth*)

Astrocerebrosides **A-733**



A, R = $(CH_2)_{12}CH_3$,
R′ = $(CH_2)_4CH{=}CH(CH_2)_{11}CH_3$ (*Z*–)
B, R = $(CH_2)_{13}CH_3$,
R′ = $(CH_2)_4CH{=}CH(CH_2)_{11}CH_3$ (*Z*–)
C, R = $(CH_2)_{21}CH_3$, R′ = $(CH_2)_{10}CH(CH_3)_2$

Isol. from $CHCl_3$/MeOH extract of the starfish *Astropecten latespinosus*.

Astrocerebroside A [126665-07-4]

$C_{43}H_{83}NO_{10}$ 774.129
Needles + $1H_2O$ (MeOH). Mp 188-192°. $[\alpha]_D^{25}$ +10.3 (c, 1 in 1-propanol).

Astrocerebroside B [122823-41-0]

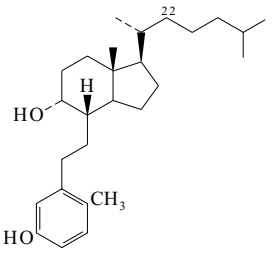
$C_{44}H_{85}NO_{10}$ 788.156
Needles + $3H_2O$ (MeOH). Mp 198-202°. $[\alpha]_D^{25}$ +10.8 (c, 1 in 1-propanol).

Astrocerebroside C [122823-47-6]

$C_{47}H_{93}NO_{10}$ 832.252
Needles + $2H_2O$ (MeOH). Mp 218-219°. $[\alpha]_D^{25}$ +10.7 (c, 1 in 1-propanol).

Higuchi, R. *et al., Annalen*, 1990, 659-663

Astrogorgiadiol A-734



$C_{27}H_{44}O_2$ 400.643
Metab. of gorgonian *Astrogorgia* sp. Inhibits cell division in fertilised starfish eggs. Solid. Sol. MeOH, $CHCl_3$, Et_2O; poorly sol. H_2O. $[\alpha]_D$ -16.4 (c, 0.058 in $CHCl_3$). λ_{max} 218 (ϵ 7080); 281 (ϵ 2291) (MeOH) (Berdy).

9-Ketone: ***Calicoferol E***
$C_{27}H_{42}O_2$ 398.628
Constit. of a gorgonian *Muricella* sp. Cryst. (Me_2CO/hexane). Mp 94-95°. $[\alpha]_D^{25}$ +21.4 (c, 0.6 in $CHCl_3$).

24,25-Didehydro: 9,10-Secocholesta-1,3,5(10),24-tetraene-3,9-diol. ***Calicoferol G***
[214962-74-0]
$C_{27}H_{42}O_2$ 398.628
Constit. of a *Muricella* sp. Oil. $[\alpha]_D^{25}$ -7.5 (c, 0.1 in $CHCl_3$). λ_{max} 218 (log ϵ 3.85); 281 (log ϵ 3.38) (MeOH).

*22,23-Didehydro(22*E*-), 9-ketone:* ***Calicoferol A***
$C_{27}H_{40}O_2$ 396.612
Constit. of *Calicogorgia* sp. Solid. $[\alpha]_D^{15}$ +4.2 (c, 0.24 in $CHCl_3$). λ_{max} 218 (ϵ 4980); 280 (ϵ 1730) (EtOH) (Berdy).

16β-Hydroxy, 9-ketone: 3,16-Dihydroxy-9,10-secocholesta-1,3,5(10)-trien-9-one. ***Calicoferol I***
[214962-76-2]
$C_{27}H_{42}O_3$ 414.627
Constit. of a *Muricella* sp. Oil. $[\alpha]_D^{25}$ +18.4 (c, 0.1 in $CHCl_3$). λ_{max} 218 (log ϵ 3.82); 283 (log ϵ 3.32) (MeOH).

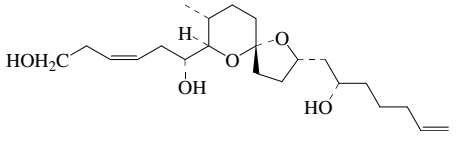
Attenol A A-740

[250729-79-4]



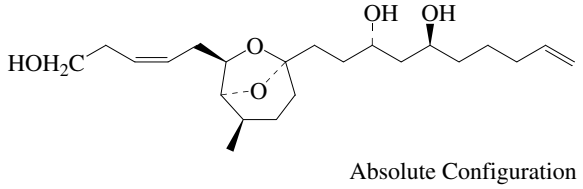
Absolute Configuration

$C_{22}H_{38}O_5$ 382.539
Isol. from the bivalve *Pinna attenuata*. Cytotoxic agent.

Takada, N. *et al., Chem. Lett.*, 1999, 1025-1026 (*isol*)
Araki, K. *et al., Tetrahedron*, 2002, **58**, 1983-1995 (*synth*)

Attenol B A-741

[250729-80-7]



Absolute Configuration

$C_{22}H_{38}O_5$ 382.539
Isol. from the bivalve *Pinna attenuata*. Cytotoxic agent.

Takada, N. *et al., Chem. Lett.*, 1999, 1025-1026 (*isol*)
Araki, K. *et al., Tetrahedron*, 2002, **58**, 1983-1995 (*synth*)

Attractin A-742

[210299-69-7]

Peptide containing 58 amino acid residues and 21 wt % carbohydrate as a result of *N*-linked glycosylation. Released by the marine mollusc *Aplysia* during egg laying. Water-borne pheromone.

Painter, S.D. *et al., Biol. Bull. (Woods Hole, Mass.)*, 1998, **194**, 120-131 (*isol, struct*)
Garimella, R. *et al., Biochemistry*, 2003, **42**, 9970-9979 (*soln struct*)
Cummins, S.F. *et al., Peptides (N.Y.)*, 2005, **26**, 121-129 (*rev*)

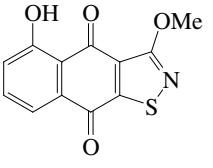
Augertoxins A-743

Three peptides containing 40-41 amino acid residues and 3 intramol. disulfide bridges. Isol. from venom of the toxoglossate gastropod *Terebra subulata*.

Imperial, J.S. *et al., Toxicon*, 2003, **42**, 391-398 (*isol*)

Aulosirazole A-744

*5-Hydroxy-3-methoxynaphth[2,3-*d*]isothiazole-4,9-dione, 9CI*
[159194-92-0]

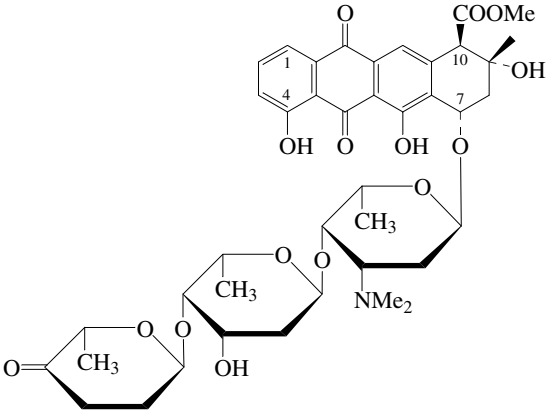


$C_{12}H_7NO_4S$ 261.258
Isol. from the blue-green alga *Aulosira fertilissima*. Cytotoxic agent. Deep yellow cryst. (MeOH aq.). λ_{max} 216 (ϵ 20500); 248 (ϵ 11200); 272 (ϵ 8500); 424 (ϵ 6300) (MeOH). λ_{max} 226; 280; 312; 536 (MeOH/NaOH) (Berdy).

Stratmann, K. *et al., J.O.C.*, 1994, **59**, 6279-6281

Auramycin A A-745

[78173-92-9]



$C_{41}H_{51}NO_{15}$ 797.852
Anthracycline antibiotic. Numbering systems vary. Isol. from *Streptomyces galilaeus* (OBB-111). Active against gram-positive bacteria, mycobacteria and tumours. Yellow powder. Sol. MeOH, $CHCl_3$; poorly sol. H_2O, hexane.
Mp 141°. $[\alpha]_D^{20}$ -8 (c, 0.1 in $CHCl_3$). λ_{max} 228 (E1%/1cm 620); 258 (E1%/1cm 375); 288 (E1%/1cm 135); 433 (E1%/1cm 200) (MeOH) (Berdy). λ_{max} 239 (E1%/1cm 575); 288 (E1%/1cm 165); 315 (E1%/1cm 90); 525 (E1%/1cm 180) (MeOH/NaOH) (Berdy).

▶ LD_{50} (mus, ipr) 100 mg/kg. QI9290700

Aglycone: Auramycinone
[78173-89-4]
Yellow powder. Sol. MeOH, $CHCl_3$; poorly sol. H_2O, hexane. Mp 153.5°. $[\alpha]_D^{20}$ +198 (c, 0.1 in $CHCl_3$).

1-Hydroxy: ***1-Hydroxyauramycin A****. 10-Hydroxyauramycin A*
[79217-17-7]
$C_{41}H_{51}NO_{16}$ 813.851
Prod. by *Streptomyces melanogenes* and *Streptomyces galilaeus*. Active against gram-positive bacteria and tumours. Sol. MeOH, $CHCl_3$; poorly sol. H_2O, hexane.
Mp 108.5°. $[\alpha]_D^{20}$ +93.1 (c, 0.1 in $CHCl_3$). λ_{max} 234 (E1%/1cm 500); 292 (E1%/1cm 103); 493 (E1%/1cm 150); 511 (E1%/1cm 130); 526 (E1%/1cm 140); 570 (E1%/1cm 80) (MeOH) (Berdy). λ_{max} 241 (E1%/1cm 535); 565 (E1%/1cm 210); 602 (E1%/1cm 170) (MeOH/NaOH) (Berdy).

1-Hydroxy, aglycone: 1-Hydroxyauramycinone. 10-Hydroxyauramycinone
[76023-81-9]
Red powder. Mp 180.5°. Shows same gross structure as ϵ_1-Pyrromycinone.

11-Hydroxy, aglycone: ***11-Hydroxyauramycinone***
[88458-06-4]
$C_{21}H_{18}O_9$ 414.368
Prod. by *Streptomyces* sp. (MST-77755). Red solid.
Mp 177°. $[\alpha]_D$ +60 (c, 0.1 in $CHCl_3$). λ_{max} 234 (E1%/1cm 950); 252 (E1%/1cm 605); 295 (E1%/1cm 193); 494 (E1%/1cm 300); 528 (E1%/1cm 276); 576 (E1%/1cm 136) (no solvent reported).

7-Deoxy, aglycone: ***7-Deoxyauramycinone****. 4-Deoxyauramycinone*
[78173-93-0]
$C_{21}H_{18}O_7$ 382.369
Prod. by *Streptomyces galilaeus* (OBB-111).
Mp 200°. $[\alpha]_D^{20}$ +81.2 (c, 0.1 in $CHCl_3$).

9-Epimer, 1-hydroxy, 4′-deglycosyl: ***1-Hydroxyauramycin T***
$C_{29}H_{33}NO_{11}$ 571.58
Prod. by marine-derived *Streptomyces* sp. (CANU Fox 21-2-6a). Cytotoxic. Deep red solid. λ_{max} 202; 234; 258; 290; 492 (MeOH).

10-Epimer, 7-deoxy, aglycone: ***Resomycin A***
$C_{21}H_{18}O_7$ 382.369
Prod. by *Streptomyces* sp. (GW71/2497). Orange solid. $[\alpha]_D^{20}$ -63 (c, 0.1 in $CHCl_3$). λ_{max} 261 (log ϵ 4.23); 292 (log ϵ 3.83); 435 (log ϵ 3.88) ($CHCl_3$).

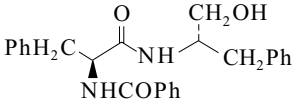
Aurantiamide A-746

N-*Benzoylphenylalanylphenylalaninol. Antibiotic TMC 58B. TMC 58B*
[58115-31-4]



Absolute configuration

$C_{25}H_{26}N_2O_3$ 402.492

Alkaloid from *Piper aurantiacum* and *Hybanthus enneasperma*. Prod. by *Aspergillus penicilloides*. Cryst. (C_6H_6).
Mp 194° (184°). $[\alpha]_D^{30}$ -51 ($CHCl_3$).

O-*Ac:* ***Asperglaucide****. Anomalamide. Lyciumamide. Aurantiamide acetate. Antibiotic TMC 58A. TMC 58A. Saropeptate*
[56121-42-7]
$C_{27}H_{28}N_2O_4$ 444.529
Alkaloid from *Aspergillus glaucus*, *Aspergillus penicilloides*, *Euphorbia fischeriana*, *Malachra fasciata* and *Cystoseira corniculata*, *Sargassum carpophylum*, *Euphorbia fischeriana*, *Malachra fasciata*, *Pteris multifida* and *Acanthophora spicifera*. Selective cathepsin inhibitor. Antiallergic agent. Shows specific antimicrobial activity.
Mp 185-186°. $[\alpha]_D^{30}$ -45 ($CHCl_3$).

O-*Benzoyl:* ***Aurantiamide benzoate****.* O-*Benzoylaurantiamide*
[150881-02-0]
[150881-03-1]
$C_{32}H_{30}N_2O_4$ 506.6
Alkaloid from *Piper aurantiacum* and *Zeyheria digitalis*. Needles (C_6H_6/cyclohexane).
Mp 211°. $[\alpha]_D^{30}$ -26.3 ($CHCl_3$).

L-D-Diastereomer, Ac: ***Diaaurantiamide acetate***
$C_{27}H_{28}N_2O_4$ 444.529
Isol. from the red alga *Acanthophora spicifera*.
Mp 167°. Genus name misspelt as Acantophora in the paper.

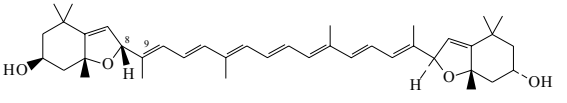
Auroxanthin A-764

5,8:5′,8′-Diepoxy-5,5′,8,8′-tetrahydro-β,β-carotene-3,3′-diol
[27785-15-5]



(8*R*,8′*R*)–*form*

$C_{40}H_{56}O_4$ 600.88
Isol. from *Viola tricolor, Lonicera japonica, Delonix regia* and other plants. Present in red algae. Yellow cryst. (EtOH).
Mp 203°. A *cis*-isomer was reported from *D. regia*.

3,3′-Dideoxy: 5,8:5′,8′-Diepoxy-5,5′,8,8′-tetrahydro-β,β-carotene. ***Aurochrome***
[6821-09-6]
$C_{40}H_{56}O_2$ 568.881
Widespread carotenoid. Present in red algae. Cryst.(C_6H_6/MeOH).
Mp 185°.

3′-Deoxy: 5,8:5′,8′-Diepoxy-5,5′,8,8′-tetrahydro-β,β-caroten-3-ol. ***Cryptochrome***
[73745-06-9]
$C_{40}H_{56}O_3$ 584.881
Isol. from *Prunus persica* (peach) and fruits of *Averrhoa carambola*. Isol. only in trace amounts. λ_{max} 424; 456 (CS_2). λ_{max} 399; 424 (EtOH).

(8R,8′R)-form [95034-12-1]
Isol. from *Rosa foetida* petals. λ_{max} 378; 398; 423 (no solvent reported).

(8R,8′S)-form [51921-06-3]
Isol. from *Rosa foetida* petals. λ_{max} 378; 398; 423 (no solvent reported).

(8S,8′S)-form [51921-05-2]
Isol. from *Rosa foetida* petals. λ_{max} 378; 398; 423 (no solvent reported).

(8R,8′R,9Z)-form [95119-78-1]
Isol. from *Rosa foetida* petals. λ_{max} 378; 398; 423 (no solvent reported).

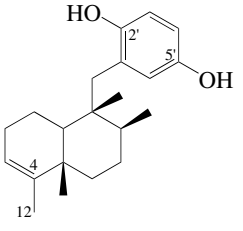
Avarol A-766

[55303-98-5]



Absolute Configuration

$C_{21}H_{30}O_2$ 314.467
Constit. of *Dysidea avara*. Immunostimulant. Shows antiinflammatory, analgesic, ichthyotoxic, antimutagenic and anti-HIV activity. Cryst. ($CHCl_3$). Sol. MeOH, $CHCl_3$; poorly sol. H_2O, hexane.
Mp 148-150°. $[\alpha]_D$ +6.1. Log P 6.98 (calc). λ_{max} 298 (ϵ 3900) (no solvent reported) (Derep).
▶ LD_{50} (mus, ipr) 269 mg/kg. Antimutagenic activity with inhibiting effect on benzo[*a*]pyrene monooxygenase. CZ9026700

5′-Ac: [122143-92-4]
$C_{23}H_{32}O_3$ 356.504
Constit. of *Dysidea avara*. Cryst. (Et_2O/hexane).
Mp 151-152°. $[\alpha]_D^{25}$ +11 (c, 3.1 in $CHCl_3$). λ_{max} 286 (no solvent reported) (Derep).

Di-Ac: [61187-44-8]
$C_{25}H_{34}O_4$ 398.541
Constit. of *Dysidea avara*. Cryst. (hexane).
Mp 92-94°. $[\alpha]_D$ +12.5 (c, 1.0 in $CHCl_3$).

6′-Hydroxy: ***6′-Hydroxyavarol***
[130203-72-4]
$C_{21}H_{30}O_3$ 330.466
Metab. of *Dysidea cinerea*. HIV reverse transcriptase and DNA polymerase inhibitor. Oil. $[\alpha]_D^{25}$ +60 (c, 0.02 in MeOH). λ_{max} 242 (ϵ 2750); 294 (ϵ 2200); 385 (ϵ 500) (MeOH) (Berdy).

6′-Acetoxy: ***6′-Acetoxyavarol***
[130203-69-9]
$C_{23}H_{32}O_4$ 372.503
Metab. of *Dysidea cinerea*. DNA polymerase inhibitor. Oil. $[\alpha]_D^{25}$ +18.9 (c, 0.44 in $CHCl_3$). λ_{max} 298 (ϵ 4000) (MeOH) (Berdy).

6′-Hydroxy, 5′-Ac: ***5′-O-Acetyl-6′-hydroxyavarol***
[132194-46-8]
$C_{23}H_{32}O_4$ 372.503
Isol. from *Dysidea avara*. Cryst. (Et_2O/hexane).
Mp 113-115°. $[\alpha]_D$ +16 (c, 0.8 in $CHCl_3$).

2′,5′-Quinone: ***Avarone***
[55303-99-6]
$C_{21}H_{28}O_2$ 312.451
From *Dysidea avara*. Immunostimulant. Antiiflammatory, antimutagenic and antileukaemic activity. Oil. Sol. MeOH, $CHCl_3$; poorly sol. H_2O. λ_{max} 246 (ϵ 12300); 315 (ϵ 750); 440 (ϵ 30) (no solvent reported) (Derep). λ_{max} 247 (ϵ 14700) (EtOH) (Berdy).
▶ LD_{50} (mus, ipr) 181 mg/kg. GU5405000

2′,5′-Quinone, 3′-hydroxy: ***3′-Hydroxyavarone****. Avarone A*
[130203-67-7]
$C_{21}H_{28}O_3$ 328.45
Metab. of *Dysidea cinerea*. Oil. $[\alpha]_D^{25}$ +45 (c, 0.06 in $CHCl_3$). λ_{max} 256 (ϵ 10200); 284 (ϵ 3300) (MeOH) (Berdy).

2′,5′-Quinone, 3′,6′-dihydroxy: ***3′,6′-Dihydroxyavarone****. Avarone B*
[114019-20-4]
$C_{21}H_{28}O_4$ 344.45
Metab. of *Dysidea cinerea*. Oil. $[\alpha]_D^{25}$ +65.6 (c, 0.32 in $CHCl_3$). λ_{max} 256 (ϵ 11400); 282 (ϵ 8140) (MeOH) (Berdy).

2′,5′-Quinone, 6′-acetoxy: ***6′-Acetoxyavarone***
[130203-70-2]
$C_{23}H_{30}O_4$ 370.488
Metab. of *Dysidea cinerea*. Oil. $[\alpha]_D^{25}$ -4.2 (c, 0.018 in $CHCl_3$). λ_{max} 250 (ϵ 10300); 330 (ϵ 550) (MeOH) (Berdy).

2′,5′-Quinone, 6′-hydroxy, 4′-methoxy: ***6′-Hydroxy-4′-methoxyavarone***
[130203-71-3]
$C_{22}H_{30}O_4$ 358.477
Metab. of *Dysidea cinerea*. Oil. $[\alpha]_D^{25}$ +75 (c, 0.040 in $CHCl_3$). λ_{max} 256 (ϵ 12700); 294 (ϵ 5400) (MeOH) (Berdy).

2′,5′-Quinone, 3′-methoxy: ***18-Methoxyavarone***
[117686-16-5]
$C_{22}H_{30}O_3$ 342.477
Constit. of *Dysidea avara*. Yellow solid.
Mp 120-125°. $[\alpha]_D^{20}$ -14.5 (c, 0.02 in CH_2Cl_2). λ_{max} 270 (ϵ 7980) (EtOH) (Derep).

2′,5′-Quinone, 4′-methoxy: ***19-Methoxyavarone****. 4′-Methoxyavarone*
[129357-96-6]
$C_{22}H_{30}O_3$ 342.477
Constit. of *Dysidea avara*. Yellow solid.
Mp 149-151°. $[\alpha]_D$ +16.4 (c, 0.15 in $CHCl_3$). λ_{max} 270 (ϵ 7980) (EtOH) (Derep).

$\Delta^{4(12)}$-Isomer: ***Isoavarol****. Neoavarol*
[129443-87-4]
$C_{21}H_{30}O_2$ 314.467
Isol. from a sponge *Dysidea* sp. Ichthyotoxic agent. Needles.
Mp 151-153°. $[\alpha]_D$ -38.6 (c, 0.1 in $CHCl_3$). λ_{max} 298 (ϵ 3700) (EtOH).

$\Delta^{4(12)}$-Isomer, 5′-Ac: ***20-O-Acetylneoavarol***
[852629-62-0]
$C_{23}H_{32}O_3$ 356.504
Constit. of a *Dysidea* sp. Yellow oil. $[\alpha]_D^{25}$ -31.9 (c, 0.1 in $CHCl_3$).

$\Delta^{4(12)}$-Isomer, 2′,5′-quinone: ***Neoavarone***
[129445-46-1]
$C_{21}H_{28}O_2$ 312.451
Isol. from a sponge *Dysidea* sp. Ichthyotoxic agent. Yellow cryst.
Mp 78-79°. $[\alpha]_D$ -55.2 (c, 0.07 in $CHCl_3$). λ_{max} 247 (ϵ 14900) (EtOH).

$\Delta^{4(12)}$-Isomer, 2′,5′-quinone, 4′-methoxy: ***4′-Methoxyneoavarone***
$C_{22}H_{30}O_3$ 342.477
Constit. of the sponges *Chelonaplysilla violacea* and *Dysidea* sp.

Yellow cryst.
Mp 161-163°. $[\alpha]_D$ -8.1 (c, 0.22 in $CHCl_3$). λ_{max} 270 (ϵ 7900) (EtOH).

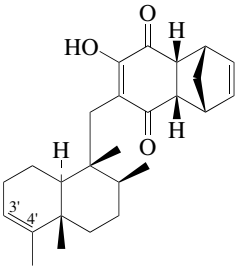
Avarone adduct A A-767

[193157-86-7]



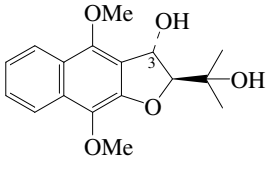
$C_{26}H_{34}O_3$ 394.553
Not named in paper. Constit. of a *Dysidea* sp. Oil. λ_{max} 205; 220; 290 (MeOH).

3′,4′,7′,8′-Tetraepimer: ***Avarone adduct B***
[193157-87-8]
$C_{26}H_{34}O_3$ 394.553
Oil.

3′,4′-Dihydro: ***Avarone adduct C***
[193284-78-5]
$C_{26}H_{36}O_3$ 396.569
Constit. of a *Dysidea* sp. Orange oil. λ_{max} 208; 285 (MeOH).

Stewart, M. *et al., Aust. J. Chem.*, 1997, **50**, 341-347 (*isol, pmr, cmr*)

Avicenol A A-768



Absolute Configuration

$C_{17}H_{20}O_5$ 304.342
Constit. of the stem bark of *Avicennia alba*. Oil. $[\alpha]_D$ +5.1 (c, 0.39 in $CHCl_3$). λ_{max} 210; 239; 290; 300; 321; 335 (MeOH).

Di-O-*de*-*Me:* ***Dide*-O-*methylavicenol A***
$C_{15}H_{16}O_5$ 276.288
Constit. of *Tabebuia heptaphylla*. Resin.

3-Deoxy: ***Avicenol C***
$C_{17}H_{20}O_4$ 288.343
Constit. of *Avicennia alba* and *Avicennia officinalis*. Oil. $[\alpha]_D$ +22 (c, 1.03 in $CHCl_3$). λ_{max} 210; 239; 286; 297; 326; 338 (MeOH).

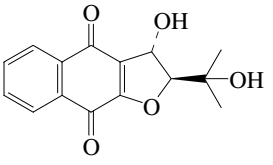
Avicequinone A A-769

2,3-Dihydro-3-hydroxy-2-(1-hydroxy-1-methylethyl)naphtho[2,3-b]furan-4,9-dione



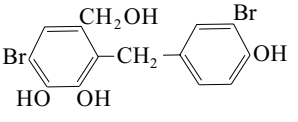
Relative Configuration

$C_{15}H_{14}O_5$ 274.273
Constit. of the stem bark of *Avicennia alba*. Phytoalexin. Yellow oil. $[\alpha]_D$ +35 (c, 0.11 in $CHCl_3$). λ_{max} 206; 245; 251; 286; 334 (MeOH).

Ito, C. *et al., Chem. Pharm. Bull.*, 2000, **48**, 339-343

Avrainvilleol A-770

6-Bromo-3-[(3-bromo-4-hydroxyphenyl)methyl]-4-(hydroxymethyl)-1,2-benzenediol, 9CI
[87402-66-2]



$C_{14}H_{12}Br_2O_4$ 404.054
Feeding deterrent from *Avrainvillea longicaulis*. Ichthyotoxic agent. IMP dehydrogenase inhibitor. Viscous oil. Sol. MeOH, Et_2O; poorly sol. H_2O. λ_{max} 288 (ϵ 4400) (MeOH) (Derep).

Sun, H.H. *et al., Phytochemistry*, 1983, **22**, 743

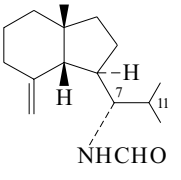
AX II A-771

Peptide containing 51 amino acid residues. Isol. from the sea anemone *Anthopleura xanthogrammica*. Toxin. Na Channel Inhibitor. Ichthyotoxic agent. For Neurotoxin AX I see Anthopleurins, A-523. λ_{max} 280 (H_2O) (Berdy).
▶ LD_{50} (mus, ipr) 0.008 mg/kg.

Schweitz, H. *et al., Biochemistry*, 1981, **20**, 5245-5252 (*isol, struct*)

Axamide 1 A-772

[56012-88-5]



$C_{16}H_{27}NO$ 249.395
Constit. of *Axinella cannabina*. Oil. $[\alpha]_D$ +10 (c, 1.2 in $CHCl_3$).

7,11-Didehydro: ***Axamide 4***
[62078-09-5]

$C_{16}H_{25}NO$ 247.38
Constit. of *Axinella cannabina*. Cryst.
Mp 81-84°. $[\alpha]_D$ +63.3.

Isothiocyanate: ***Axisothiocyanate 1***
[53822-97-2]
$C_{16}H_{25}NS$ 263.446
Isol. from *Axinella cannabina*. Oil. $[\alpha]_D$ +5.9 (c, 2.5 in $CHCl_3$). Has -NCS replacing -NHCHO.

Isocyanide: ***Axisonitrile 1***
[53822-96-1]
$C_{16}H_{25}N$ 231.38
From *Axinella cannabina* and *Phyllidia pulitzeri*. Ichthyotoxic agent. Cryst.
Mp 43-45°. $[\alpha]_D$ +22.6 (c, 1 in $CHCl_3$). Has -NC replacing -NHCHO.

7,11-Didehydro, isocyanide: ***Axisonitrile 4***
[62078-10-8]
$C_{16}H_{23}N$ 229.364
Isol. from *Axinella cannabina*. Cryst.
Mp 56-58°. $[\alpha]_D$ +51.4 (c, 1 in $CHCl_3$).

7,11-Didehydro, isothiocyanate: ***Axisothiocyanate 4***
[62078-11-9]
$C_{16}H_{23}NS$ 261.43
Isol. from *Axinella cannabina*. Oil. $[\alpha]_D$ -35.9 (c, 1.2 in $CHCl_3$).

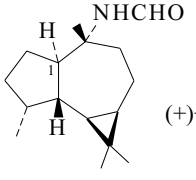
Axamide 2 A-773



(+)–*form*

$C_{16}H_{27}NO$ 249.395

(+)-form [56012-89-6]
Constit. of *Axinella cannabina*.
Oil. $[\alpha]_D$ +37.5 (c, 0.9 in $CHCl_3$).

Isocyanide: ***Axisonitrile 2***
[55907-33-0]
$C_{16}H_{25}N$ 231.38
From *Axinella cannabina*, *Phyllidia pustulosa* and *Cadlina luteomarginata*. Oil. $[\alpha]_D$ +29 (c, 0.5 in $CHCl_3$). Has -NC replacing -NHCHO.

Isothiocyanate: ***Axisothiocyanate 2***
[56012-90-9]
$C_{16}H_{25}NS$ 263.446
Isol. from *Axinella cannabina*. Oil. $[\alpha]_D$ +12.8 (c, 1.5 in $CHCl_3$). Has -NCS replacing -NHCHO.

1-Epimer: ***10α-Formamidoalloaromadendrane***
[108739-41-9]
$C_{16}H_{27}NO$ 249.395
Constit. of *Axinella cannabina*. Oil.

1-Epimer, isocyanide: ***10α-Isocyanoalloaromadendrane***
[108739-39-5]
$C_{16}H_{25}N$ 231.38
Isol. from *Axinella cannabina*. Oil. $[\alpha]_D$ -17.21 (c, 0.7 in $CHCl_3$).

1-Epimer, isothiocyanate: ***10α-Isothiocyanatoalloaromadendrane***
[108739-40-8]
$C_{16}H_{25}NS$ 263.446
From *Axinella cannabina*. Oil. $[\alpha]_D$ -6.95 (c, 0.9 in $CHCl_3$).

(-)-form

1-Epimer, isothiocyanate:
$C_{16}H_{25}NS$ 263.446
Constit. of *Acanthella cavernosa*. Oil. $[\alpha]_D$ +8 (c, 0.1 in $CHCl_3$). Not indexed by CAS.

Fattorusso, E. *et al., Tetrahedron*, 1974, **30**, 3911-3913; 1975, **31**, 269-270 (*Axisonitrile 2, Axisothiocyanate 2, Axamide 2*)

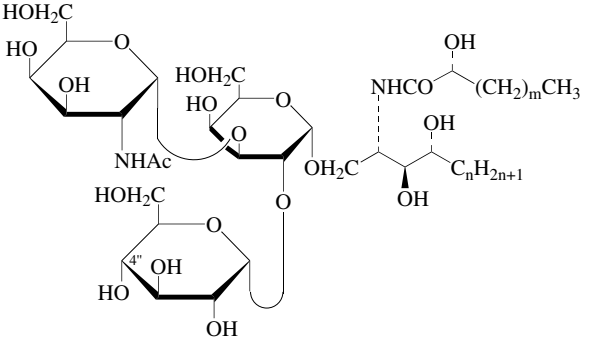
Axiceramide A A-774

[160338-33-0]



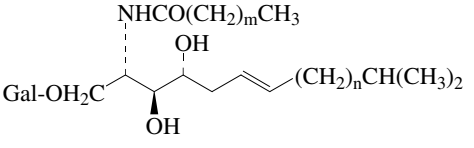
m = 21,22 or 23
n = 12,13,14,15 or 17

Glycosphingolipid complex. Isol. from the sponge *Axinella* sp. Oil (as per-Ac). $[\alpha]_D^{25}$ +88 (c, 0.01 in $CHCl_3$) (per-Ac).

4″-Epimer: ***Axiceramide B***
[160338-32-9]
Isol. from *Axinella* sp.
Oil (as per-Ac). $[\alpha]_D^{25}$ +82 (c, 0.01 in $CHCl_3$) (per-Ac).

Costantino, V. *et al., Annalen*, 1994, 1181-1186 (*isol, pmr, cmr, ms*)

Axidjiferosides A-775



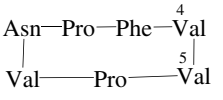
m = 19-23
n = 4-12

Glycosphingolipid complex. Isol. from the mangrove sponge *Axinyssa djiferi*.

Genin, E. *et al., Boll. Mus. Ist. Biol. Univ. Genova*, 2004, **68**, 327-334

Axinastatin 1 A-776

Malaysiatin. Pseudoaxinellin
[145038-60-4]



$C_{38}H_{56}N_8O_8$ 752.909
Cyclic peptide antibiotic. Isol. from the marine sponges *Pseudaxinyssa* sp., *Axinella* sp. and *Pseudaxinella* sp. Cytotoxic agent. Cryst. (CH_2Cl_2).
Mp 283-287° dec. $[\alpha]_D$ -162 (c, 0.1 in MeOH). Similar to Pseudoaxinellin. Struct. of Malaysiatin revised in 1995.

5-L-Leucine analogue: ***Axinastatin 2***
[153723-34-3]
$C_{39}H_{58}N_8O_8$ 766.936
From *Axinella* sp. Cytotoxic agent. Cryst. (MeOH aq.).
Mp 280-282°. $[\alpha]_D$ -153 (c, 0.2 in MeOH).

4-L-Isoleucine, 5-L-leucine analogue: ***Axinastatin 3***
[153723-35-4]
$C_{40}H_{60}N_8O_8$ 780.963
From *Axinella* sp. Cytotoxic agent. Cryst. (MeOH aq.).
Mp 291-294°. $[\alpha]_D$ -185 (c, 0.2 in MeOH).

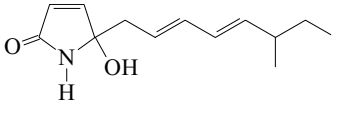
Axinellamide A-778

*1,5-Dihydro-5-hydroxy-5-(6-methyl-2,4-octadienyl)-2*H*-pyrrol-2-one, 9CI. 5-Hydroxy-5-(6-methyl-2,4-octadienyl)-3-pyrrolin-2-one*
[167425-78-7]

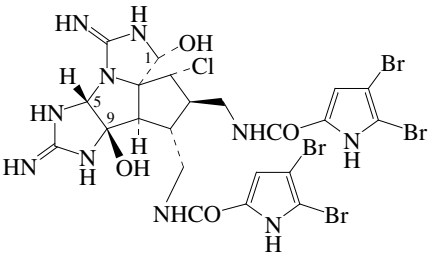


$C_{13}H_{19}NO_2$ 221.299
Alkaloid from the marine sponge *Axinella* sp. Pale yellow gum. $[\alpha]_D$ -26.2 (c, 0.08 in $CHCl_3$). λ_{max} 277 (ϵ 8700) (MeOH) (Berdy).

Miller, S.L. *et al., Tet. Lett.*, 1995, **36**, 5851 (*isol, uv, ir, pmr, cmr, struct*)

Axinellamine A† A-779

[221225-27-0]



$C_{22}H_{23}Br_4ClN_{10}O_4$ 846.557
CAS nos. refer to bis(trifluoroacetates). Alkaloid from the Australian sponge *Axinella* sp. Powder (as bistrifluoroacetate salt). $[\alpha]_D^{20}$ -18 (c, 0.16 in MeOH). λ_{max} 277 (ϵ 11400) (MeOH).

1-Me ether: ***Axinellamine C***
[221226-05-7]
$C_{23}H_{25}Br_4ClN_{10}O_4$ 860.584
Alkaloid from an *Axinella* sp. Pale yellow oil. $[\alpha]_D^{20}$ -9 (c, 1.1 in MeOH). λ_{max} 277 (ϵ 6500) (MeOH).

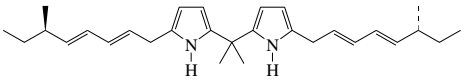
5,9-Diepimer: ***Axinellamine B***†
[221226-09-1]
$C_{22}H_{23}Br_4ClN_{10}O_4$ 846.557
Alkaloid from an *Axinella* sp. Pale yellow oil. $[\alpha]_D^{20}$ -7 (c, 0.21 in MeOH). λ_{max} 277 (ϵ 8000) (MeOH).

5,9-Diepimer, 1-Me ether: ***Axinellamine D***
[221226-07-9]
$C_{23}H_{25}Br_4ClN_{10}O_4$ 860.584
Alkaloid from an *Axinella* sp. Pale yellow oil. $[\alpha]_D^{20}$ -6 (c, 0.5 in MeOH). λ_{max} 276 (ϵ 8000) (MeOH).

Urban, S. *et al., J.O.C.*, 1999, **64**, 731-735 (*isol, uv, ir, pmr, cmr, ms*)
Dransfield, P.J. *et al., Tetrahedron*, 2006, **62**, 5223-5247 (*synth*)

Axinellamine B† A-780

[213269-07-9]



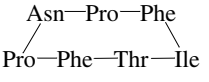
Probable Configuration

$C_{29}H_{42}N_2$ 418.664
Alkaloid from the marine sponge *Axinella* sp. Pale yellow gum. $[\alpha]_D$ -8.9 (c, 0.2 in $CHCl_3$). λ_{max} 228 (ϵ 6500) (MeOH).

Bascombe, K.C. *et al., Heterocycles*, 1998, **48**, 1461-1464 (*isol, uv, ir, pmr, cmr, ms*)
Seki, M. *et al., Eur. J. Org. Chem.*, 2001, 503-506 (*config*)

Axinellin A A-781

[215586-19-9]

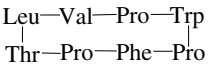


$C_{42}H_{56}N_8O_9$ 816.953
Cyclic peptide antibiotic. Isol. from the marine sponge *Axinella carteri*. Moderate antitumour agent. Amorph. solid. $[\alpha]_D$ -98.2 (c, 0.003 in MeOH).

Randazzo, A. *et al., Eur. J. Org. Chem.*, 1998, 2659-2665 (*isol ir, pmr, cmr, ms*)

Axinellin B A-782

[215586-20-2]

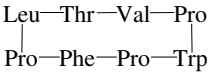


$C_{50}H_{67}N_9O_9$ 938.134

Cyclic peptide antibiotic. Isol. from the marine sponge *Axinella carteri*. Moderate antitumour agent. Amorph. solid. $[\alpha]_D$ +50 (c, 0.001 in MeOH).

Randazzo, A. *et al., Eur. J. Org. Chem.*, 1998, 2659-2665 (*isol, ir, pmr, cmr, ms*)

Axinellin C A-783



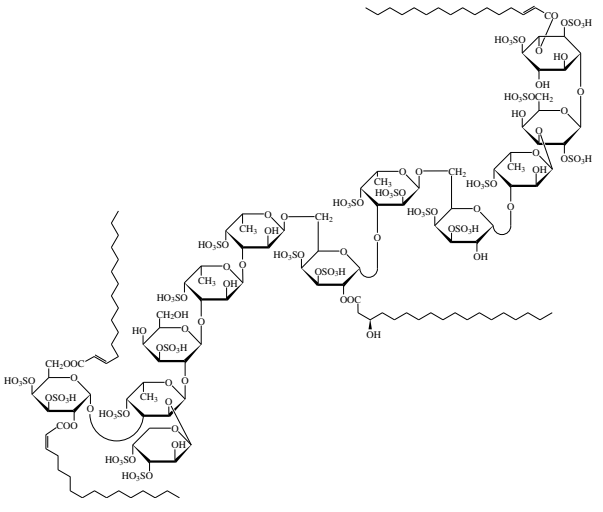
$C_{50}H_{67}N_9O_9$ 938.134

Cyclic peptide antibiotic. Isol. from the marine sponge *Stylotella aurantium*. Oil. $[\alpha]_D^{25}$ -53.1 (c, 0.001 in MeOH). λ_{max} 290 (ϵ 3320) (MeOH).

Tabudravu, J.N. *et al., Tetrahedron*, 2002, **58**, 7863-7868 (*isol, pmr, cmr, ms, cryst struct*)

Axinelloside A A-784

[868081-48-5]



$C_{137}H_{238}O_{117}S_{19}$ 4366.571

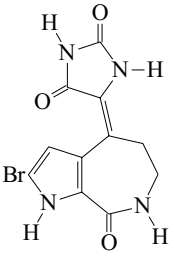
Highly sulfated lipopolysaccharide. Isol. from *Axinella infundibula*. Human telomerase inhibitor. Amorph. solid. $[\alpha]_D^{26}$ -10 (c, 0.1 in MeOH). λ_{max} 210 (MeOH).

Warabi, K. *et al., J.A.C.S.*, 2005, **127**, 13262-13270 (*isol, pmr, cmr, ms*)

Axinohydantoin A-785

5-(2-Bromo-5,6,7,8-tetrahydro-8-oxopyrrolo[2,3-c]azepin-4(1H)-ylidene)-2,4-imidazolidinedione, 9CI

[132160-42-0]



$C_{11}H_9BrN_4O_3$ 325.121

Alkaloid from the sponges *Axinella* sp. and *Monanchora* sp. Yellow prisms (MeOH).

Mp 350°. λ_{max} 264; 345 (ϵ 14400) (MeOH) (Berdy).

Debromo: ***Debromoaxinohydantoin***

$C_{11}H_{10}N_4O_3$ 246.225

Isol. from the Papua New Guinea sponge *Monanchora* sp.

Mp 300° dec. λ_{max} 208 (ϵ 16000); 225 (ϵ 11200); 255 (ϵ 15500); 339 (ϵ 27500) (MeOH) (Berdy).

(Z)-Isomer: ***Spongiacidin D****. (Z)-Axinohydantoin. Fuscin*†

$C_{11}H_9BrN_4O_3$ 325.121

Isol. from the sponges *Phakellia fusca*, *Stylotella aurantium* and *Hymeniacidon* sp. Inhibitor of protein kinase C. Amorph. solid.

Mp 221-227° (dec.). There is confusion in CAS w.r.t. the config. of the *Phakellia* isolate. λ_{max} 272 (ϵ 10000); 310 (ϵ 4000) (MeOH).

Debromo, (Z)-isomer: ***Spongiacidin C****. (Z)-Debromoaxinohydantoin*

$C_{11}H_{10}N_4O_3$ 246.225

Isol. from the sponge *Stylotella aurantia* and *Hymeniacidon* sp. Inhibitor of protein kinase C. Amorph. solid.

Mp 213-218° (dec.). λ_{max} 273 (ϵ 9700); 312 (ϵ 3800) (MeOH).

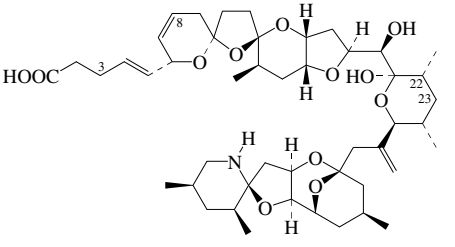
Iwagawa, T. *et al., Tetrahedron*, 1996, **52**, 13121-13128

Azaspiracid 1 A-792

Killarytoxin 3
[214899-21-5]



Absolute Configuration

$C_{47}H_{71}NO_{12}$ 842.077

Struct. finally confirmed in 2004. Alkaloid from *Mytilus edulis* (blue mussel). Shellfish toxin. Amorph. solid. $[\alpha]_D^{20}$ -21 (c, 0.1 in MeOH).

*3*R-*Hydroxy:* ***Azaspiracid 7***
[629656-50-4]
$C_{47}H_{71}NO_{13}$ 858.077
Alkaloid from *Mytilus edulis* (blue mussel).

*23*R-*Hydroxy:* ***Azaspiracid 8***
[629656-53-7]
$C_{47}H_{71}NO_{13}$ 858.077
Alkaloid from *Mytilus edulis* (blue mussel).

22-Demethyl: ***Azaspiracid 3***
[265996-93-8]
$C_{46}H_{69}NO_{12}$ 828.051
Alkaloid from *Mytilus edulis* (blue mussel).

*22-Demethyl, 3*R-*hydroxy:* ***Azaspiracid 4***
[344422-49-7]
$C_{46}H_{69}NO_{13}$ 844.05
Alkaloid from *Mytilus edulis* (blue mussel).

*22-Demethyl, 23*S-*hydroxy:* ***Azaspiracid 5***
[344422-51-1]
$C_{46}H_{69}NO_{13}$ 844.05
Alkaloid from *Mytilus edulis* (blue mussel).

8-Methyl: ***Azaspiracid 2***
[265996-92-7]
$C_{48}H_{73}NO_{12}$ 856.104
Alkaloid from *Mytilus edulis* (blue mussel).

*8-Methyl, 3*R*-hydroxy:* ***Azaspiracid 11***
[629656-62-8]
$C_{48}H_{73}NO_{13}$ 872.104
Alkaloid from *Mytilus edulis* (blue mussel).

*8-Methyl, 23*R*-hydroxy: Azaspiracid 12*
[629656-65-1]
$C_{48}H_{73}NO_{13}$ 872.104
Existence as a natural prod. has been predicted but not proven.

8-Methyl, 22-demethyl: ***Azaspiracid 6***
[629656-47-9]
$C_{47}H_{71}NO_{12}$ 842.077
Alkaloid from *Mytilus edulis* (blue mussel).

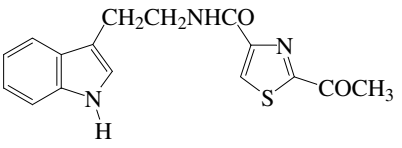
Bacillamide B-1

[637344-98-0]



$C_{16}H_{15}N_3O_2S$ 313.379

Prod. by the marine *Bacillus* sp. SY-1. Algicide active against *Cochlodinium polykrikoides*. Amorph. powder. λ_{max} 279 (log ϵ 3.72) (no solvent reported).

Jeong, S.-Y. *et al., Tet. Lett.*, 2003, **44**, 8005-8007 (*isol, pmr, cmr*)

Bacillariolide I B-2

*Hexahydro-4-hydroxy-3-(1,4,7,10-tridecatetraenyl)-1*H*-cyclopenta[c]furan-1-one, 9CI*

[126857-23-6]

$C_{20}H_{28}O_3$ 316.439

Cyclopentane eicosanoid. Isol. from the diatom *Nitzschia pungens*. $[\alpha]_D^{24}$ -25.9 (c, 0.21 in MeOH).

3-Epimer: ***Bacillariolide II***

[126923-96-4]

$C_{20}H_{28}O_3$ 316.439

Isol. from *Nitzschia pungens*.

$[\alpha]_D^{23}$ -59.2 (c, 0.33 in MeOH).

Wang, R. *et al., Chem. Comm.*, 1990, 413; 1993, 379 (*isol, pmr, struct, abs config*)

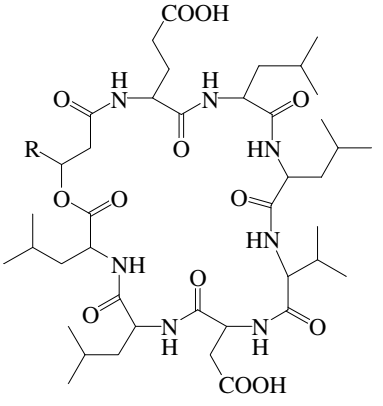
Bacircines B-5

Batsirtsines, 9CI. Bacirtcines. Bacirtsins



Bacircine 1 R = $-(CH_2)_6CH(CH_3)CH_2CH_3$
2 R = $-(CH_2)_8CH(CH_3)_2$
3 R = $-(CH_2)_{10}CH_3$
4 R = $-(CH_2)_8CH(CH_3)CH_2CH_3$
5 R = $-(CH_2)_9CH(CH_3)_2$

Depsipeptide antibiotic complex. Several alternative spellings in the lit., including CAS. Prod. by *Bacillus pumilis* KMM150 isol. from an Australian sponge *Ircinia* sp.

Bacircine 1 [169276-09-9]

$C_{51}H_{89}N_7O_{13}$ 1008.303

Sol. MeOH, EtOAc. $[\alpha]_D$ -36.5 (c, 0.5 in MeOH).

Bacircine 2 [169276-10-2]

$C_{52}H_{91}N_7O_{13}$ 1022.33

Sol. MeOH, EtOAc. $[\alpha]_D$ -31.5 (c, 0.5 in MeOH).

Bacircine 3 [169276-11-3]

$C_{52}H_{91}N_7O_{13}$ 1022.33

Sol. MeOH, EtOAc. $[\alpha]_D$ -32.4 (c, 0.5 in MeOH).

Bacircine 4 [169276-12-4]

$C_{53}H_{93}N_7O_{13}$ 1036.357

Cryst. Sol. MeOH, EtOAc. Mp 143.5-144.5°. $[\alpha]_D$ -28.6 (c, 0.5 in MeOH).

Bacircine 5 [169276-13-5]

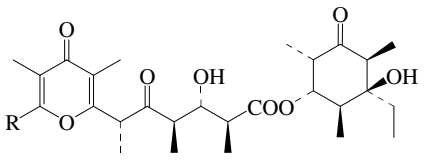
$C_{53}H_{93}N_7O_{13}$ 1036.357

Cryst. Sol. MeOH, EtOAc. Mp 142.5-143.5°. $[\alpha]_D$ -33.6 (c, 0.5 in MeOH).

Kalinovskaya, N.I. *et al., Russ. Chem. Bull. (Engl. Transl.)*, 1995, **44**, 951-955 (*Bacirines 1-5, isol, struct*)
Prokof'eva, N.G. *et al., Toxicon*, 1999, **37**, 801-813 (*activity*)

Baconipyrone A B-6

[123003-45-2]



Absolute Configuration

R = CH_2CH_3

$C_{29}H_{44}O_8$ 520.662

Constit. of the pulmonate mollusc *Siphonaria baconi*. Oil. $[\alpha]_D$ -82 (c, 0.47 in $CHCl_3$). λ_{max} 220 (ϵ 10300); 260 (ϵ 12700) (MeOH) (Derep).

Manker, D.C. *et al., J.O.C.*, 1989, **54**, 5371-5374 (*isol, pmr, cmr*)
Turks, M. *et al., Org. Lett.*, 2004, **6**, 3031-3034 (*synth, abs config*)

Baconipyrone B B-7

[123003-46-3]

As Baconipyrone A, B-6 with

R = -CH_3

$C_{28}H_{42}O_8$ 506.635

Constit. of the pulmonate mollusc *Siphonaria baconi*. Oil. $[\alpha]_D$ -65.9 (c, 0.66 in $CHCl_3$). λ_{max} (solvent not reported) (Derep). λ_{max} 220 (ϵ 10300); 260 (ϵ 12700) (MeOH) (Derep).

Aplysia californica ϵ-Bag cell peptide B-12

[109024-45-5]

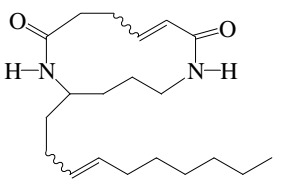
H-Ser-Val-Leu-Thr-Pro-Ser-Leu-Ser-Ser-Leu-Gly-Glu-Ser-Leu-Glu-Ser-Gly-Ile-Ser-OH

Isol. from bag cells of the marine mollusc *Aplysia californica*. Released during egg-laying.

Newcomb, R. *et al., J. Neurosci.*, 1987, **7**, 857 (*isol, struct*)
Nagle, G.T. *et al., Biol. Bull. (Woods Hole, Mass.)*, 1989, **177**, 210 (*isol, struct*)

Bahamamide B-13

2-(3-Decenyl)-1,6-diazacyclododec-8-ene-7,12-dione, 9CI
[190782-45-7]

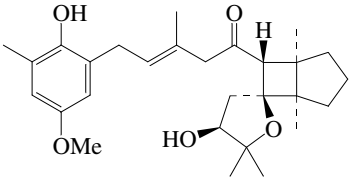


$C_{20}H_{34}N_2O_2$ 334.501
Prod. by an unidentified marine bacterium. Oil. $[\alpha]_D$ +27.8 (c, 0.5 in $CHCl_3$). λ_{max} 227 (ϵ 1700) (THF).

Boehler, M. *et al., Nat. Prod. Lett.*, 1997, **10**, 75-78 (*isol, uv, ir, pmr, cmr*)

Balearone B-14

[92675-09-7]



Absolute configuration

$C_{28}H_{40}O_5$ 456.621
Metabolite of brown alga *Cystoseira balearica*. Cryst. (hexane). Mp 94-96°. $[\alpha]_D^{20}$ +52.

Z-*Isomer:* ***Isobalearone***
[110351-75-2]
$C_{28}H_{40}O_5$ 456.621
Constit. of *Cystoseira stricta*. Oil. $[\alpha]_D^{20}$ +38.3 (c, 1.2 in EtOH).

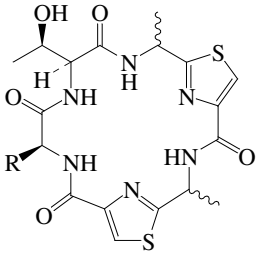
Banyascyclamide B B-15

[501904-00-3]



R = $-CH_2CH(CH_3)_2$

$C_{22}H_{30}N_6O_5S_2$ 522.648
Isol. from *Nostoc* sp. TAU strain IL-235.

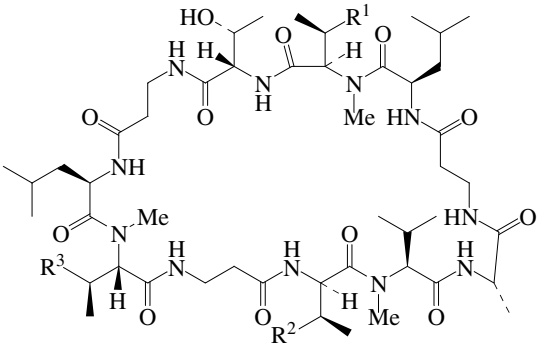
Ploutno, A. *et al., Tetrahedron*, 2002, **58**, 9949-9957 (*isol, pmr, cmr, ms*)

Banyascyclamide C B-16

[501904-01-4]
As Banyascyclamide B, B-15 with
R = $-CH_2Ph$
$C_{25}H_{28}N_6O_5S_2$ 556.665
Isol. from *Nostoc* sp. TAU strain IL-235.
$[\alpha]_D^{25}$ +50.1 (c, 0.1 in MeOH). This is an isomer of Didmolamide B, D-409. λ_{max} 222 (ϵ 15100); 238 (ϵ 16300) (MeOH).

Ploutno, A. *et al., Tetrahedron*, 2002, **58**, 9949-9957 (*isol, pmr, cmr, ms*)

Barangamides B-17



Barangamide A	$R^1 = R^2 = R^3 = -CH_2CH_3$
Barangamide B	$R^1 = R^2 = -CH_2CH_3$, $R^3 = CH_3$
Barangamide C	$R^1 = R^3 = -CH_2CH_3$, $R^2 = CH_3$
Barangamide D	$R^1 = CH_3$, $R^2 = R^3 = -CH_2CH_3$

Cyclic peptide. Isol. from the sponge *Theonella swinhoei*.

Barangamide A

$C_{54}H_{97}N_{11}O_{12}$ 1092.427
Glassy solid. $[\alpha]_D^{25}$ -38.4 (c, 0.3 in MeOH).

Barangamide B

$C_{53}H_{95}N_{11}O_{12}$ 1078.4
Glassy solid. $[\alpha]_D^{29}$ +76.5 (c, 0.04 in $CHCl_3$).

Barangamide C

$C_{53}H_{95}N_{11}O_{12}$ 1078.4
Glassy solid. $[\alpha]_D^{26}$ +57.8 (c, 0.07 in $CHCl_3$).

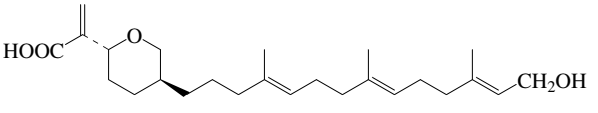
Barangamide D

$C_{53}H_{95}N_{11}O_{12}$ 1078.4
Glassy solid. $[\alpha]_D^{29}$ +84.6 (c, 0.1 in $CHCl_3$).

Roy, M.C. *et al., Tetrahedron*, 2000, **56**, 9079-9092 (*isol, ir, pmr, cmr*)

Barangcadoic acid A B-18

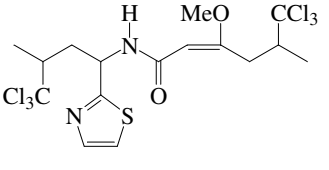
[457938-80-6]



$C_{25}H_{40}O_4$ 404.589
Isol. from the sponge *Hippospongia* sp. RCE-protease inhibitor. $[\alpha]_D^{28}$ +34.9 (c, 3.8 in CH_2Cl_2).

Craig, K.S. *et al., Tet. Lett.*, 2002, **43**, 4801-4804 (*isol, pmr, cmr*)

Barbaleucamide A B-19



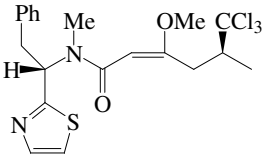
$C_{16}H_{20}Cl_6N_2O_2S$ 517.128
Isol. from a *Dysidea* sp. Pale yellow oil.

N-*Me:* ***Barbaleucamide B***
$C_{17}H_{22}Cl_6N_2O_2S$ 531.155
Isol. from a *Dysidea* sp. Pale yellow oil.

Harrigan, G.G. *et al., J. Nat. Prod.*, 2001, **64**, 1133-1138

Barbamide B-20

[174630-03-6]



Absolute Configuration

$C_{20}H_{23}Cl_3N_2O_2S$ 461.838

Metab. from the Caribbean cyanobacterium *Lyngbya majuscula*. Possesses molluscicidal activity. Pale yellow oil. Sol. MeOH, $CHCl_3$, EtOAc; poorly sol. hexane, H_2O. $[\alpha]_D^{26}$ -89 (c, 1.9 in MeOH). The first marine nat. prod. for which the biosynthetic gene cluster has been sequenced. λ_{max} 240 (ϵ 16000) (MeOH) (Berdy).

Dechloro: ***Dechlorobarbamide***
[327613-98-9]
$C_{20}H_{24}Cl_2N_2O_2S$ 427.393
Metab. of *Lyngbya majuscula*. Pale yellow oil. $[\alpha]_D^{25}$ -67 (c, 0.05 in MeOH). λ_{max} 238 (ϵ 16000) (MeOH).

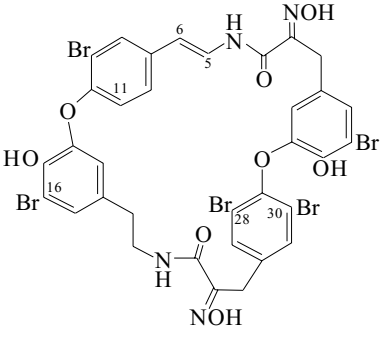
Bastadin 4 B-28

Cyclobastadin 1
[79067-76-8]



$C_{34}H_{25}Br_5N_4O_8$ 1017.113

Some Bastadins were renumbered in 1993. Isol. from the sponge *Ianthella basta*. Antiinflammatory agent. Active against gram-positive bacteria. Yellow needles (DMF aq.). Poorly sol. hexane. Mp 250° dec. λ_{max} 209 (ϵ 126000); 289 (ϵ 20000); 300 (sh) (ϵ 15800); 310 (ϵ 15800) (MeOH) (Derep). λ_{max} 210 (ϵ 68400); 228 (ϵ 10000); 315 (ϵ 10000) (MeOH) (Berdy).

5,6-Dihydro: ***Bastadin 5***. *Cyclobastadin 2*
[79067-75-7]
$C_{34}H_{27}Br_5N_4O_8$ 1019.129
From *Ianthella basta*. Cryst. (MeCN) (as tetra-Me ether). Poorly sol. hexane.
Mp 262-264° (tetra-Me ether). λ_{max} 208 (ϵ 126000); 280 (ϵ 7940) (MeOH) (Derep).

*5,6-Dihydro, 6*S*-hydroxy:* ***Bastadin 8***
[127709-45-9]
$C_{34}H_{27}Br_5N_4O_9$ 1035.129
From *Ianthella basta*. Film. Fortuitously given the same trivial name by 2 independent groups. λ_{max} 208 (ϵ 126000); 280 (ϵ 7940) (MeOH) (Derep).

11-Bromo, 5,6-dihydro: ***Bastadin 6***. *Cyclobastadin 3*
[79067-74-6]
$C_{34}H_{26}Br_6N_4O_8$ 1098.025
From *Ianthella basta* and *Psammaplysilla purpurea*. Antiangiogenic agent. Powder. Poorly sol. hexane. λ_{max} 220 (sh) (ϵ 50000); 281 (ϵ 5500) (MeOH) (Derep).

16-Debromo: ***Bastadin 11***
[127687-09-6]
$C_{34}H_{26}Br_4N_4O_8$ 938.217
From *Ianthella basta*. Antiinflammatory agent. Film. λ_{max} 208 (ϵ 20000); 285 (ϵ 2510); 331 (ϵ 3160) (MeOH) (Derep).

16-Debromo, 5,6-dihydro: ***Bastadin 9***†
[127687-07-4]
$C_{34}H_{28}Br_4N_4O_8$ 940.233
From *Ianthella basta*. Antiinflammatory agent. Powder (MeOH aq.). λ_{max} 208 (ϵ 126000); 279 (ϵ 10000) (MeOH) (Derep).

*16-Debromo, 5,6-dihydro, 34-*O*-sulfate:* ***34-O-Sulfobastadin 9***
$C_{34}H_{28}Br_4N_4O_{11}S$ 1020.297
Isol. from *Ianthella basta*. Amorph. solid (as Na salt).

28-Debromo: ***Bastadin 7***. *Cyclobastadin 4*
[79067-73-5]
$C_{34}H_{26}Br_4N_4O_8$ 938.217

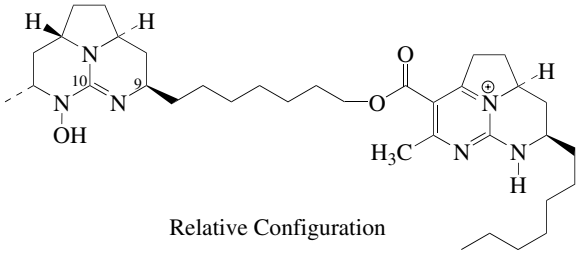
Batzelladine G B-38

[188112-84-7]
As Batzelladine F, B-37 with
R = OH, n = 7
$C_{39}H_{68}N_6O_3$ 669.005
Alkaloid from the sponge *Batzella* sp. Immunosuppressant. Powder. Sol. H_2O; fairly sol. MeOH; poorly sol. Me_2CO, hexane. $[\alpha]_D$ +14.7 (c, 0.79 in MeOH). λ_{max} 233; 258; 295 (MeOH).

Patil, A.D. *et al., J.O.C.*, 1997, **62**, 1814-1819 (*isol, uv, ir, pmr, cmr, struct*)

Batzelladine H B-39

[188112-85-8]



Relative Configuration

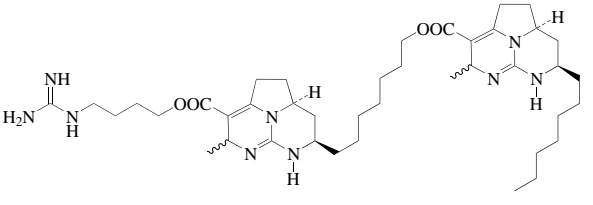
$C_{35}H_{57}N_6O_3^{\oplus}$ 609.874

Isol. as a 43:57 inseparable mixt. with Batzelladine I. Alkaloid from the sponge *Batzella* sp. Oil (as formate). Sol. H_2O; fairly sol. MeOH; poorly sol. Me_2CO, hexane. $[\alpha]_D$ +33.7 (c, 0.56 in MeOH) (formate). λ_{max} 217; 258 (MeOH).

Isomer: ***Batzelladine I***
[188112-86-9]
$C_{35}H_{57}N_6O_3^{\oplus}$ 609.874
From *Batzella* sp. Isomer of Batzelladine H in which the N-hydroxy group is located on the N between C-9 and C-10.

Patil, A.D. *et al., J.O.C.*, 1997, **62**, 1814-1819 (*isol, uv, ir, pmr, cmr, struct*)

Batzelladine J B-40

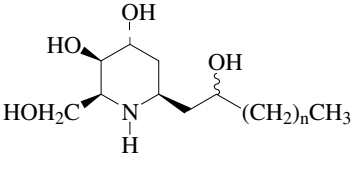


$C_{41}H_{67}N_9O_4$ 750.038
Alkaloid from the sponge *Monanchora unguifera*.
$[\alpha]_D^{25}$ -11.8 (c, 0.13 in MeOH). λ_{max} 228 (ϵ 8800); 295 (ϵ 7200) (MeOH).

Gallimore, W.A. *et al., J. Nat. Prod.*, 2005, **68**, 1420-1423 (*isol, pmr, cmr, ms*)

Batzellaside A B-41

6-(2-Hydroxydodecyl)-2-(hydroxymethyl)-3,4-piperidinediol



Relative Configuration

n = 9

$C_{18}H_{37}NO_4$ 331.495

Alkaloid from the sponge *Batzella* sp. Oil. $[\alpha]_D^{25}$ +8.1 (c, 0.44 in MeOH).

Segraves, N.L. *et al., J. Nat. Prod.*, 2005, **68**, 118-121 (*isol, pmr, cmr*)

Batzellaside B **B-42**

2-(Hydroxymethyl)-6-(2-hydroxyundecyl)-3,4-piperidinediol
As Batzellaside A, B-41 with
n = 8

$C_{17}H_{35}NO_4$ 317.468
Alkaloid from the sponge *Batzella* sp. Oil. $[\alpha]_D^{25}$ +10 (c, 0.5 in MeOH).

Segraves, N.L. *et al., J. Nat. Prod.*, 2005, **68**, 118-121 (*isol, pmr, cmr*)

Batzellaside C **B-43**

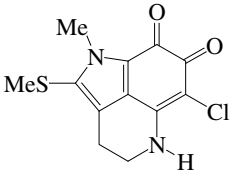
2-(Hydroxymethyl)-6-(2-hydroxytridecyl)-3,4-piperidinediol
As Batzellaside A, B-41 with
n = 10

$C_{19}H_{39}NO_4$ 345.521
Alkaloid from the sponge *Batzella* sp. Oil. $[\alpha]_D^{25}$ +12 (c, 0.4 in MeOH).

Segraves, N.L. *et al., J. Nat. Prod.*, 2005, **68**, 118-121 (*isol, pmr, cmr*)

Batzelline A **B-44**

6-Chloro-1,3,4,5-tetrahydro-1-methyl-2-(methylthio)pyrrolo[4,3,2-de]quinoline-7,8-dione, 9CI
[123064-89-1]



$C_{12}H_{11}ClN_2O_2S$ 282.75
Alkaloid from the deep water Bahamas sponge *Batzella* sp. Black prisms ($CHCl_3$/MeOH).
Mp 205°. λ_{max} 214 (ϵ 8900); 269 (ϵ 22100); 356 (ϵ 7900); 376 (ϵ 8000); 548 (ϵ 600) (MeOH) (Derep).

N-*Me:* Mp 202°.

N-*De-Me:* ***Batzelline B***
[123064-90-4]
$C_{11}H_9ClN_2O_2S$ 268.723
Isol. from *Batzella* sp. Herbicide. Dark brown solid. No definite Mp (dec.). λ_{max} 211 (ϵ 58300); 266 (ϵ 120800); 330 (sh); 387 (ϵ 51800); 550 (ϵ 4000) (MeOH) (Derep).

De(methylthio): ***Batzelline C***
[123064-91-5]
$C_{11}H_9ClN_2O_2$ 236.657
Isol. from *Batzella* sp. and *Zyzzya massalis*. Herbicide. Dark brown solid. No definite Mp (dec.). λ_{max} 211 (ϵ 7900); 250 (ϵ 17300); 331 (ϵ 9100); 380 (sh); 540 (ϵ 900) (MeOH) (Derep).

De(methylthio), N-*de-Me:* ***Batzelline D***
[437980-22-8]
$C_{10}H_7ClN_2O_2$ 222.63
Isol. from *Zyzzya fuliginosa* and *Zyzzya massalis*. Purple solid. λ_{max} 248 (log ϵ 4); 328 (log ϵ 3.73) (MeOH).

Sakemi, S. *et al., Tet. Lett.*, 1989, **30**, 2517 (*isol, uv, ir, pmr, cmr, ms, struct*)

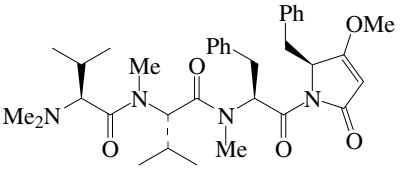
Belamide A **B-46**

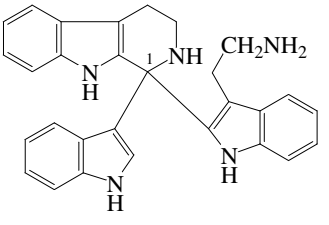


$C_{35}H_{48}N_4O_5$ 604.788
Isol. from a marine *Symploca* sp. Antimitotic. Yellow oil. $[\alpha]_D^{25}$ +16 (c, 0.002 in $CHCl_3$). λ_{max} 240 ($CHCl_3$).

Simmons, T.L. *et al., Tet. Lett.*, 2006, **47**, 3387-3390 (*isol, pmr, cmr*)

Bengacarboline **B-47**

[192947-81-2]

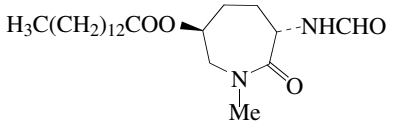


$C_{29}H_{27}N_5$ 445.566
Isol. from the ascidian *Didemnum* sp. Cytotoxic agent. Brown solid. λ_{max} 226 (ϵ 6719); 284 (ϵ 1877) (MeOH).

Foderaro, T.A. *et al., J.O.C.*, 1997, **62**, 6064-6065 (*isol, uv, ir, cd, pmr, cmr*)

Bengamide K **B-48**

[193894-98-3]



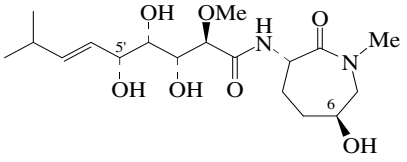
$C_{22}H_{40}N_2O_4$ 396.569
Isol. from the sponge *Jaspis carteri*.

$[\alpha]_D^{25}$ +78.7 (c, 0.08 in MeOH).

D'Auria, M.V. *et al., J. Nat. Prod.*, 1997, **60**, 814-816 (*isol, pmr, cmr, ms*)

Bengamide Z B-49

[118477-10-4]



Absolute Configuration

$C_{18}H_{32}N_2O_7$ 388.46
Isol. from the sponge *Jaspis* cf. *coriacea* and from *Pachastrissa* sp. Cytotoxic agent; anthelmintic; nematocide; shows antiproliferative action. $[\alpha]_D^{20}$ +45 (c, 0.11 in MeOH).

6-O-*(3*R*,4*S*,5*R*-Trihydroxy-2*R*-methoxy-8-methyl-6-nonenoyl):* ***Bengamide D***
[118477-02-4]
$C_{29}H_{50}N_2O_{12}$ 618.72
From a Choristid sponge (Jaspidae). Anthelmintic, nematocide. Sol. MeOH, $CHCl_3$; poorly sol. H_2O. $[\alpha]_D^{20}$ +19.8 (c, 0.086 in MeOH). Unstable in $CDCl_3$ soln.

6-O-*Tridecanoyl:* ***Bengamide H***
[193894-95-0]
$C_{31}H_{56}N_2O_8$ 584.792
Isol. from *Jaspis carteri* and *Jaspis* cf. *coriacea*.
$[\alpha]_D^{25}$ +9.2 (c, 0.1 in MeOH).

6-O-*(12-Methyltridecanoyl):* ***Bengamide O***
$C_{32}H_{58}N_2O_8$ 598.819
Isol. from *Jaspis* cf. *coriacea*. Oil. $[\alpha]_D$ +35.8 (c, 23.9 in MeOH).

6-O-*Tetradecanoyl:* ***Bengamide B****. NSC 646846*
[104947-69-5]
$C_{32}H_{58}N_2O_8$ 598.819
Isol. from *Jaspis* cf. *coriacea* and *Pachastrissa* sp. Anthelminthic and cytotoxic agent. Exhibits antiparasitic and antimicrobial activity. Shows antiproliferative action. Viscous oil. $[\alpha]_D^{20}$ +34.6 (c, 0.075 in MeOH).

6-O-*(13-Methyltetradecanoyl):* ***Bengamide M***
$C_{33}H_{60}N_2O_8$ 612.846
Isol. from *Jaspis* cf. *coriacea*. Oil. $[\alpha]_D$ +2.1 (c, 61.9 in MeOH).

6-O-*Pentadecanoyl:* ***Bengamide J***
[193894-97-2]
$C_{33}H_{60}N_2O_8$ 612.846
Isol. from *Jaspis carteri*.
$[\alpha]_D^{25}$ +33 (c, 0.1 in MeOH).

N-*De-Me:* ***Bengamide Y***
[118477-09-1]

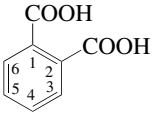
Phthalic acid, 8CI. Alizarinic acid. Naphthalinic acid†*. Phthalinic acid*
[88-99-3]



$C_8H_6O_4$ 166.133
Obt. industrially by oxidn. of 1,2-Dimethylbenzene and Naphthalene. Found in *Gibberella fujikuroi*. Esters are important plasticisers. Used for gravimetric detn. of Pb. Used as aq. soln. in buffer solns.; alkalimetric standard (as K salt). Plates (H_2O). Sol. hot H_2O, alkalis; mod. sol. H_2O, EtOH; spar. sol. Et_2O.
Mp 210° dec Mp 234°. pK_{a1} 2.95; pK_{a2} 5.41 (25°,H_2O). Forms anhydride at Mp. Frequent reports of the isol. of phthalate esters as nat. prods. are in prob. all cases erroneous because of their ubiquitous presence in solvs., laboratory plastics, etc. as plasticisers.

▶ Fl. p. 168°. Violent reaction on heating with $NaNO_2$. Skin and mucous membrane irritant. Low acute mammalian toxicity. TH9625000

Dioctyl ester: Dioctyl phthalate. Vinicizer 85
[117-84-0]
$C_{24}H_{38}O_4$ 390.562
Reported as a nat. prod. from the brown alga *Sargassum wightii* and various plant spp. Plasticiser. Oil. d_{20}^{20} 0.98.
Mp -25°. Bp_1 185° $Bp_{0.1}$ 165°. n_D^{25} 1.4848. Almost certainly a contaminant.

Bis(2-ethylnonyl) ester: Bis(2-ethylnonyl) phthalate
$C_{30}H_{50}O_4$ 474.723
Reported as a nat. prod. from the red alga *Acanthophora spicifera*. Nat. occurrence doubtful in view of the widespread presence of phthalate esters in the environment.

Benzyl butyl ester: Benzyl butyl phthalate. Santicizer 160. Spatozoate. Unimoll BB. BBP
[85-68-7]
$C_{19}H_{20}O_4$ 312.365
Reported isol. from the alga *Spatoglossum variabile*. Plasticiser. Liq. Insol. H_2O. d^{25} 1.12. Bp 370° Bp_{10} 235-255°. n_D^{25} 1.5380. Struct. of Spatozoate revised in 2003.

$C_7H_5NS_2$ 167.255

NH-form predominates. Isol. from a *Micrococcus* sp. in *Tedania ignis*. Also present in cranberries. Vulcanisation accelerator. Used as 1% $CHCl_3$ soln. for separation pptn. of Au, $I^{\ominus}$; photometric detn. of Pd, Os, Rh, Se, Ni (λ_{max} 750 nm). Needles (MeOH aq.). Spar. sol. EtOH, Et_2O, AcOH; insol. H_2O; sol. alkalis.
Mp 177-179°. Readily oxidised to the disulfide.
▶ LD_{50} (rat, orl) 100 mg/kg. Exp. carcinogen. Exp. reprod. and teratogenic effects. DL6475000

NH-form

Mp 80-81°. $[\alpha]_D^{25}$ +187 (c, 0.756 in $CHCl_3$).

Ac: [83474-73-1]
$C_{17}H_{21}BrCl_2O_3$ 424.161
Constit. of *Laurencia intricata*. Oil.

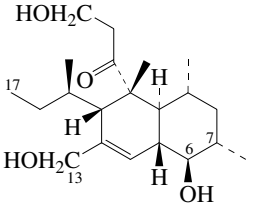
Cordellina, J.H. *et al., Can. J. Chem.*, 1982, **60**, 2675

Berovin B-70

Protein. Isol. from the ctenophore *Beroe ovata*. $Ca^{2\oplus}$-photo-activated protein.

Ward, W.W. *et al., Biochemistry*, 1974, **13**, 1500-1510 (*isol*)

Betaenone G B-71



$C_{21}H_{36}O_4$ 352.513
Prod. by the marine-derived *Microsphaeropsis* sp. Stamm 6288. Amorph. solid. $[\alpha]_D^{20}$ -18 (c, 0.1 in MeOH). λ_{max} 226 (sh) (log ϵ 3.46); 273 (log ϵ 2.51) (MeOH).

6-Deoxy: ***Betaenone H***
$C_{21}H_{36}O_3$ 336.514
Prod. by *Microsphaeropsis* sp. Stamm 6288. Amorph. solid. $[\alpha]_D^{20}$ -18 (c, 0.1 in MeOH). λ_{max} 267 (log ϵ 2.39) (MeOH).

6-Deoxy, 7β-hydroxy: ***Betaenone I***
$C_{21}H_{36}O_4$ 352.513
Prod. by *Microsphaeropsis* sp. Stamm 6288. Amorph. solid. $[\alpha]_D^{20}$ -3 (c, 0.1 in MeOH). λ_{max} 217 (sh) (log ϵ 3.15) (MeOH).

6-Deoxy, 17-hydroxy: ***Betaenone J***
$C_{21}H_{36}O_4$ 352.513
Prod. by *Microsphaeropsis* sp. Stamm 6288. Amorph. solid. $[\alpha]_D^{20}$ -4 (c, 0.1 in MeOH).

Schlörke, O. *et al., Dissertation*, Univ. of Göttingen, 2005, (*isol, cd, pmr, cmr, ms*)

Betaine B-72

Carboxy-N,N,N-*trimethylmethanaminium hydroxide inner salt, 9CI. (Carboxymethyl)trimethylammonium. Glycine betaine. Glycocoll betaine. Lycine. Abromine. Oxyneurine*
[107-43-7]
$Me_3N^{\oplus}CH_2COO^{\ominus}$
$C_5H_{11}NO_2$ 117.147
Prod. by *Aspergillus oryzae, Patella vulgata, Claviceps purpurea* and other fungi. Occurs widely in plants and animals. Alkaloid from *Abroma augusta* (Sterculiaceae). May play a part in cytoplasmic osmoregulation. Causes myoatrophy in combination with Guanidinoacetic acid, G-192. Deliquescent scales or cryst.; cryst. + $1H_2O$ (H_2O). pK_a 3.84 (free acid). Dec. at *ca*. 310° (293-4°) with isom. to Me_2NCH_2COOMe.

▶ LD_{50} (mus, scu) 10800 mg/kg. DS5900000

Monohydrate: Trimethylglycine hydroxide
[17146-86-0] Lipotropic. Cryst. Loses water at 100° to form inner salt.

Hydrochloride: Betaine hydrochloride, USAN. Lycine hydrochloride. Achylin. Acidin. Acidol. Acinorm. Acipepsol. Aciventral forte. Euacid. Muriat. Pepsacid. Pluchine
[590-46-5] Used in solders, fluxes and in org. synth. Lipotropic. Electrolyte replenisher, gastric acidifier. Needles. Mp 243-244° dec. $[\alpha]_D^{20}$ -29.51 (H_2O).

▶ BP3136000

Aspartate (1:1): Hepastyl. Somabet. Somatyl
[52921-08-1] Used in treatment of liver and stomach disorders.

Picrate:
Yellow prisms (H_2O). Mp 181-182°.

Chloride: See 2-Chloro-*N,N,N*-trimethyl-2-oxoethanaminium(1+) in *The Combined Chemical Dictionary.*

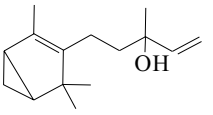
$C_{19}H_{28}O_2$ 288.429
Constit. of *Euryops* spp. Oil.

Bohlmann, F. *et al., Chem. Ber.*, 1974, **107**, 3928
Bohlmann, K. *et al., Phytochemistry*, 1978, **17**, 1135 (*isol, pmr*)
Asakawa, Y. *et al., Phytochemistry*, 1980, **19**, 2141 (*Ac*)
Bowden, B.F. *et al., Tet. Lett.*, 1980, **21**, 3105-3108 (*isol, Ac, Parerythropodium, pmr, cmr*)

Bicyclolaurencenol B-78

[79373-33-4]

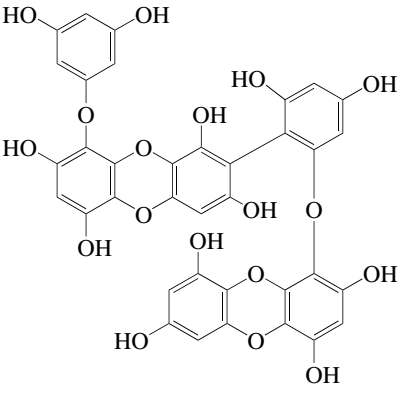


$C_{15}H_{24}O$ 220.354
Constit. of *Laurencia intricata*. Oil. $[\alpha]_D^{25}$ -16.1 (c, 0.67 in $CHCl_3$).

Horsley, S.B. *et al., J.O.C.*, 1981, **46**, 5033

2‴,8-Bieckol B-79

[96820-21-2]

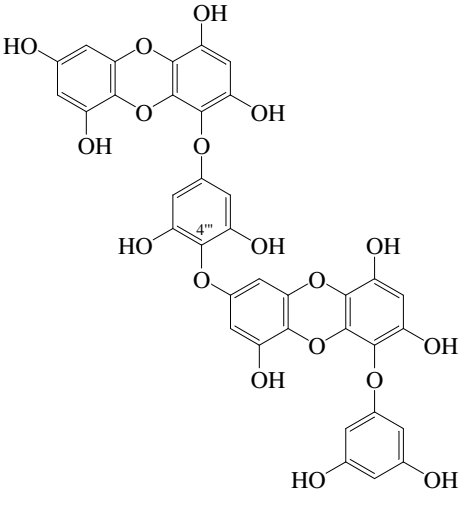


$C_{36}H_{22}O_{18}$ 742.559
Numbering systems vary. Constit. of the brown alga *Eisenia arborea*. Isol. as dodeca-Ac.

Glombitza, K.-W. *et al., Phytochemistry*, 1985, **24**, 543-551 (*isol, pmr, cmr*)

4‴,7-Bieckol B-80

[88095-79-8]

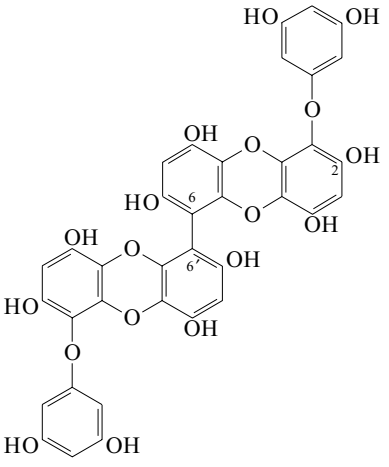


$C_{36}H_{22}O_{18}$ 742.559
Numbering systems vary. Constit. of the brown algae *Ecklonia maxima*, *Eisenia arborea* and *Eisenia bicyclis*. Isol. as undeca-Ac to which CAS no. refers. λ_{max} 233; 278; 290 (sh) (MeCN) (as undeca-Ac).

Glombitza, K.-W. *et al., Phytochemistry*, 1985, **24**, 308-312; 543-551 (*isol, pmr, cmr*)

6,6′-Bieckol B-81

[88095-81-2]



$C_{36}H_{22}O_{18}$ 742.559

Numbering systems vary. Constit. of the brown algae *Ecklonia kurome* and *Eisenia arborea*. Antiplasmin inhibitor. α_2-Macroglobulin inhibitor. Prisms (H_2O).
Mp 300°. λ_{max} 295 (ϵ 11000) (MeOH) (Berdy).

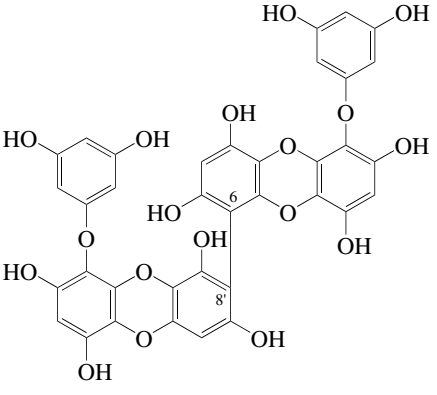
*2-*O*-(2,4,6-Trihydroxyphenyl): 2-*O*-(2,4,6-Trihydroxyphenyl)-6,6′-bieckol.* ***2-Phloro-6,6′-bieckol***
[89079-38-9]
$C_{42}H_{26}O_{21}$ 866.655
Constit. of *Ecklonia kurome*. Antiplasmin inhibitor. α_2-Macroglobulin inhibitor. Amorph. solid. λ_{max} 295 (ϵ 11000) (MeOH) (Berdy).

8,8′-Dihydroxy: ***8,8′-Dihydroxy-6,6′-bieckol***
[96820-22-3]
$C_{36}H_{22}O_{20}$ 774.558
Constit. of the brown alga *Eisenia arborea*. Isol. as tetradeca-Ac.

Glombitza, K.-W. *et al., Phytochemistry*, 1985, **24**, 543-551 (*isol, pmr, cmr, 8,8′-dihydroxy*)
Fukuyama, Y. *et al., Chem. Pharm. Bull.*, 1989, **37**, 2438-2440 (*isol, uv, ir, pmr, cmr, ms*)

6,8′-Bieckol B-82

[99469-09-7]



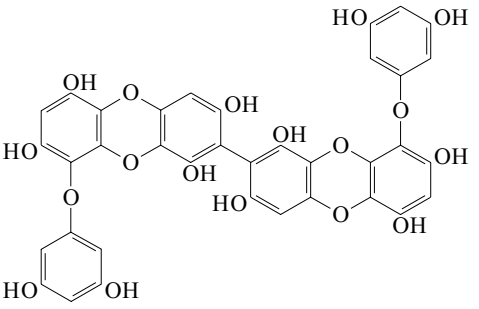
$C_{36}H_{22}O_{18}$ 742.559

Numbering systems vary. Constit. of the brown algae *Eisenia arborea* and *Ecklonia maxima*. Isol. as dodeca-Ac, to which CAS no. refers.

Glombitza, K.-W. *et al., Phytochemistry*, 1985, **24**, 543-551 (*isol, pmr, cmr*)
Glombitza, K.W. *et al., Planta Med.*, 1985, 308-312 (*isol, pmr, cmr*)

8,8′-Bieckol B-83

[89445-12-5]



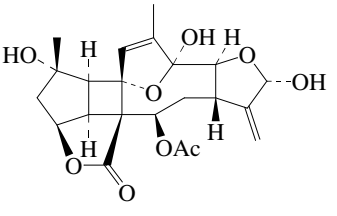
$C_{36}H_{22}O_{18}$ 742.559

Related to Dieckol, D-410. Numbering systems vary. Constit. of the brown algae *Ecklonia kurome* and *Eisenia arborea*. Antiplasmin inhibitor. α_2-Macroglobulin inhibitor. Light brown prisms (H_2O).
Mp 300°. λ_{max} 231 (ϵ 3800); 295 (ϵ 8800) (MeOH) (Berdy).

Glombitza, K.-W. *et al., Phytochemistry*, 1985, **24**, 534-551 (*isol, pmr, cmr*)
Fukuyama, Y. *et al., Chem. Pharm. Bull.*, 1989, **37**, 2438-2440 (*isol, uv, ir, pmr, cmr, ms*)

Bielschowskysin B-84

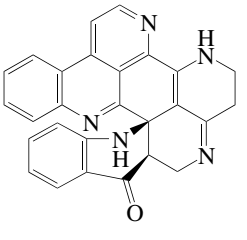
[697298-90-1]



$C_{22}H_{26}O_9$ 434.442
Constit. of *Pseudopterogorgia kallos*. Cryst.
Mp 139-141° dec. $[\alpha]_D^{20}$ -17.3 (c, 1.1 in MeOH).

Marrero, J. *et al., Org. Lett.*, 2004, **6**, 1661-1664 (*isol, pmr, cmr, cryst struct*)

Biemnadin B-85



$C_{27}H_{19}N_5O$ 429.48

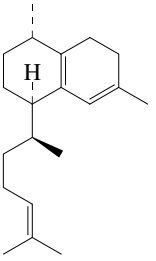
(±)-form [152053-10-6]
Alkaloid from the Okinawan marine sponge *Biemna* sp. and *Biemna fortis*. Cytotoxic. Neuronal differentiation inducer. Yellow cryst. (as hydrochloride).
Mp 300° (hydrochloride). Closely related to Eudistone A, E-888. λ_{max} 229 (ϵ 29000); 256 (ϵ 17000); 370 (ϵ 5000) (MeOH).

Zeng, C.-M. *et al., Tetrahedron*, 1993, **49**, 8337-8342 (*isol, uv, ir, pmr, cmr, cryst struct*)
Aoki, S. *et al., Bioorg. Med. Chem.*, 2003, **11**, 1969-1973 (*isol, pmr, cmr*)

1(6),4,15-Bifloratriene B-86

Isoelisabethatriene

[334022-60-5]



$C_{20}H_{32}$ 272.473

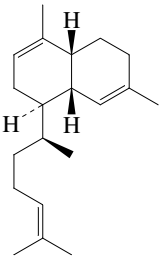
Constit. of *Pseudopterogorgia elisabethae*. λ_{max} 245 (MeOH).

Kohl, A.C. *et al., Mar. Drugs*, 2003, **1**, 54-65 (*isol, pmr*)

4,9,15-Bifloratriene B-87

[251114-02-0]

[173692-41-6 incorrect epimer]



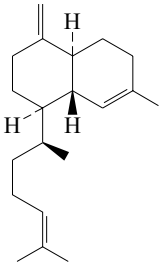
$C_{20}H_{32}$ 272.473

Constit. of a *Cribrochalina* sp. and of *Acanthella cavernosa*. Larval settlement inhibitor, antifouling agent. Oil. $[\alpha]_D^{20}$ +51.4 (c, 0.5 in $CHCl_3$). $[\alpha]_D$ +64 (c, 0.05 in $CHCl_3$). Struct. of *C.* isolate revised in 2005; formerly assigned as a stereoisomer.

Hirota, H. *et al., Tetrahedron*, 1996, **52**, 2359 (*1-epimer*)
Ciavatta, M.L. *et al., Tetrahedron*, 1999, **55**, 12629-12636; 2005, **61**, 8049-8053 (*isol, pmr, cmr, struct*)

4,10(19),15-Bifloratriene B-88

[69636-81-3]



$C_{20}H_{32}$ 272.473

Constit. of defensive secretion of *Cubitermes umbratus* and other *Cubitermes* spp. Also found in the soft coral, *Xenia obscuronata*. Oil. $[\alpha]_D$ -92 (c, 0.13 in MeOH).

Wiemer, D.F. *et al., J.O.C.*, 1980, **45**, 191 (*isol, cryst struct*)
Vig, O.P. *et al., J. Indian Chem. Soc.*, 1983, **60**, 757 (*synth*)
Groweiss, A. *et al., Tetrahedron*, 1983, **39**, 3385 (*isol*)
Mori, K. *et al., Tetrahedron*, 1984, **40**, 305 (*synth, abs config*)
Kodama, M. *et al., Tet. Lett.*, 1984, **25**, 5781 (*synth*)

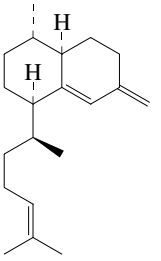
Paknikar, S.K. *et al., J. Nat. Prod.*, 1988, **51**, 326 (*synth*)

4(20),5,15-Bifloratriene B-89

Elisabethatriene

[334499-19-3]

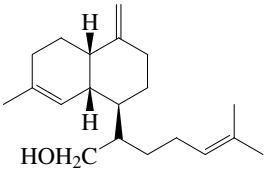


$C_{20}H_{32}$ 272.473

Constit. of *Pseudopterogorgia elisabethae*. Biosynthetic precursor of the pseudopterosins and secopseudopterosins. Oil. λ_{max} 245 (MeOH).

Coleman, A.C. *et al., Tetrahedron*, 2000, **56**, 9569-9574 (*isol, pmr, cmr*)
Kohl, A.C. *et al., Mar. Drugs*, 2003, **1**, 54-65 (*biosynth*)

4,10(19),15-Bifloratrien-12-ol B-90



$C_{20}H_{32}O$ 288.472

12-O-*β*-D-*Xylopyranoside:* ***Lemnaflavoside***
[473299-25-1]
$C_{25}H_{40}O_5$ 420.588
Constit. of *Lemnalia flava*. Amorph. solid. $[\alpha]_D$ +12 (c, 0.9 in MeOH).

12-(2-O-*Acetyl-β-D-xylopyranoside):* [471890-91-2]
$C_{27}H_{42}O_6$ 462.625
Constit. of *Lemnalia flava*. Oil.

12-(3-O-*Acetyl-β-D-xylopyranoside):* [471890-93-4]
$C_{27}H_{42}O_6$ 462.625
Constit. of *Lemnalia flava*. Oil.

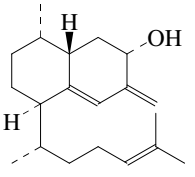
12-(4-O-*Acetyl-β-D-xylopyranoside):* [471890-95-6]
$C_{27}H_{42}O_6$ 462.625
Constit. of *Lemnalia flava*. Oil.

Rudi, A. *et al., J. Nat. Prod.*, 2002, **65**, 1672-1674 (*isol, pmr, cmr*)

4(20),5,15-Bifloratrien-3-ol B-91

Elisabethatrienol

[890153-96-5]

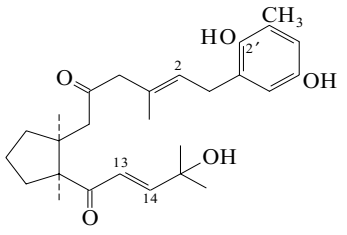


$C_{20}H_{32}O$ 288.472

Constit. of *Pseudopterogorgia elisabethae*. Amorph. solid. $[\alpha]_D^{25}$ -44.8 (c, 0.14 in MeOH). λ_{max} 236 (ϵ 16800) (MeOH).

Duque, C. *et al., Tetrahedron*, 2006, **62**, 4205-4213 (*Elisabethatrienol*)

Bifurcarenone B-92



(2*E*)–*form*

$C_{27}H_{38}O_5$ 442.594

Struct. revised in 1989. λ_{max} 215 (ϵ 15600); 225 (ϵ 16200); 292 (ϵ 3400) (MeOH) (Derep).

(2*E*)-*form* [75872-68-3]
[110351-79-6]
Constit. of the brown alga *Cystoseira stricta* and *Bifurcaria galapagensis*. Antibacterial. Oil. $[\alpha]_D^{20}$ +5.7 (c, 0.24 in $CHCl_3$) $[\alpha]_D^{20}$ +5.5 (c, 8 in EtOH).

2′-Me ether: [110309-19-8]
$C_{28}H_{40}O_5$ 456.621
Constit. of *Cystoseira stricta*. Oil. $[\alpha]_D^{20}$ +5.3 (c, 1.15 in EtOH).

5′-Me ether: [194550-95-3]
$C_{28}H_{40}O_5$ 456.621
Constit. of *Cystoseira amentacea* var. *stricta* and *Cystoseira tamariscifolia*. Oil. $[\alpha]_D^{25}$ +10.7 (c, 1.5 in EtOH). λ_{max} 214 (log ϵ 4.02); 224 (log ϵ 4.07); 289 (log ϵ 3.34) (EtOH).

13,14-Dihydro, 2′,5′-di-Me ether: [93236-29-4]
$C_{29}H_{44}O_5$ 472.664
Constit. of the brown alga *Cystoseira algeriensis* and *Cystoseira jabukae*. Oil. $[\alpha]_D^{20}$ +25 (c, 1.1 in EtOH).

(2*Z*)-*form* [104529-85-3]
Sol. MeOH, C_6H_6; poorly sol. H_2O. λ_{max} 215 (ϵ 15600); 225 (ϵ 16200); 292 (ϵ 3400) (MeOH) (Berdy).

13,14-Dihydro, 2′,5′-di-Me ether: [93380-11-1]
$C_{29}H_{44}O_5$ 472.664
Constit. of *Cystoseira algeriensis*. Oil. $[\alpha]_D^{20}$ +12 (c, 1.3 in EtOH).

Sun, H.H. *et al., Tet. Lett.*, 1980, 3123-3126 (*isol, struct, spectra*)

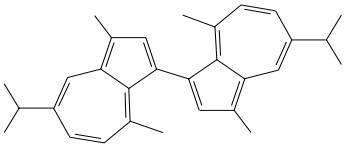
Limulus Big defensin B-93

Horseshoe crab big defensin
Peptide containing 79 amino acid residues. Isol. from haemocytes of the horseshoe crab *Limulus*. Shows antibacterial activity.

Saito, T. *et al., J. Biochem. (Tokyo)*, 1995, **117**, 1131-1137 (*isol, struct*)
Kiwabata, S. *et al., Methods Mol. Biol.*, 1997, **78**, 51-61 (*isol*)

2,2′-Biguaiazulenyl B-94

3,3′,8,8′-Tetramethyl-5,5′-bis(1-methylethyl)-1,1′-biazulene
[17509-79-4]

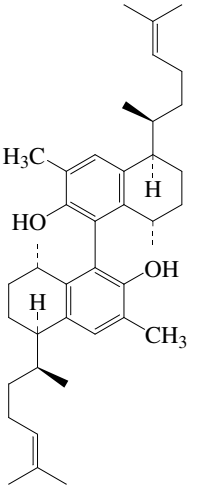


$C_{30}H_{34}$ 394.599
Constit. of *Calicogorgia granulosa*. Blue-green solid.
Mp 88-90°. λ_{max} 250 (ϵ 45770); 283 (ϵ 63100); 309 (ϵ 42280); 354 (ϵ 16220); 374 (ϵ 19520); 626 (ϵ 2795) (MeOH) (Berdy).

Seo, Y. *et al., J. Nat. Prod.*, 1996, **59**, 985-986 (*isol, pmr, cmr*)

8,8′-Bi[7-hydroxyerogorgiaene] B-95

Bis-7-hydroxyerogorgiaene
[318513-15-4]



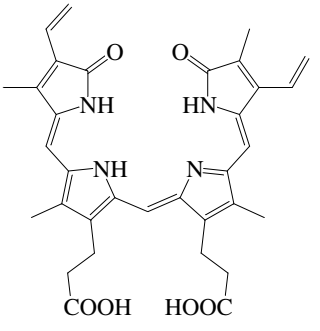
$C_{40}H_{58}O_2$ 570.897

Incorrectly drawn as *meso*-compound in ref. Constit. of *Pseudopterogorgia elisabethae*. Oil. $[\alpha]_D^{25}$ +61.5 (c, 0.7 in $CHCl_3$). λ_{max} 210 (ϵ 41600); 286 (ϵ 5800) (MeOH).

Rodríguez, A.D. *et al., J. Nat. Prod.*, 2001, **64**, 100-102 (*isol, pmr, cmr*)

Biliverdin B-96

Biliverdin IXα
[114-25-0]



$C_{33}H_{34}N_4O_6$ 582.655

Blue-green pigment of bile, eggshells of birds, dog placenta. Major pigment from the blue coral *Heliopora coerulea*. Primary prod. derived from Haem by oxidative ring fission *in vivo*, also formed by oxidn. of Bilirubin. Dark-blue green cryst. with violet sheen ($CHCl_3$).
Mp 300°. Gives Gmelin reaction with conc. $HNO_3/CHCl_3$.
Reduced to Bilirubin in mammals.

Di-Me ester: [10035-62-8]
$C_{35}H_{38}N_4O_6$ 610.708
Blue-green cryst. ($CHCl_3$/petrol). Mp 220-221°. λ_{max} 379; 656 (no solvent reported).

[55482-27-4]

Lemberg, R. *et al., Haematin Compounds and Bile Pigments*, Interscience, N.Y., 1949,

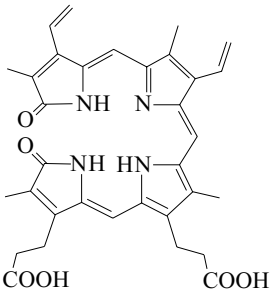
Biliverdin IXδ B-97

[29575-16-4]



$C_{33}H_{34}N_4O_6$ 582.655

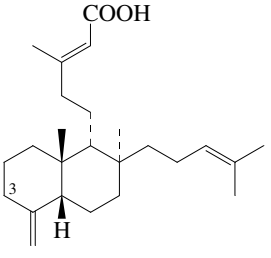
Prod., together with isomers, by oxidative cleavage of Haem. Isol. from ovaries of marine snail *Turbo cornutus*.

Di-Me ester: [26195-58-4]
$C_{35}H_{38}N_4O_6$ 610.708
Blue cryst. Mp 172-174°. λ_{max} 379, 651-7 nm.

Bonnett, R. *et al., J.C.S. Perkin 1*, 1973, 881 (*synth*)
Benedikt, E. *et al., Eur. J. Biochem.*, 1988, **175**, 643 (*isol*)

Bilosespene A B-98

[243971-15-5]



$C_{25}H_{40}O_2$ 372.59

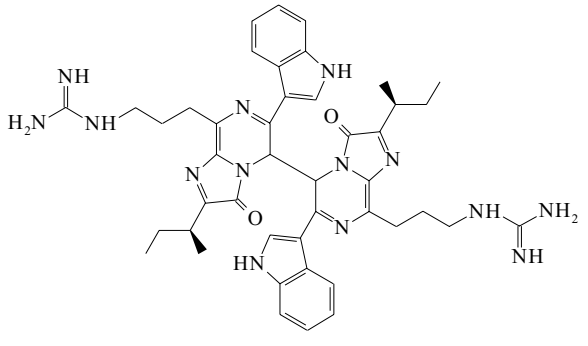
Constit. of *Dysidea cinerea*.

Δ^3-Isomer: ***Bilosespene B***
[243971-16-6]
$C_{25}H_{40}O_2$ 372.59
Constit. of *Dysidea cinerea*.

Rudi, A. *et al., Org. Lett.*, 1999, **1**, 471-472 (*isol, pmr, cmr*)
Hsu, D.-S. *et al., Org. Lett.*, 2003, **5**, 4741-4743 (*synth*)

Cypridina Biluciferyl B-99

Cypridina *Biluciferol*
[96700-80-0]



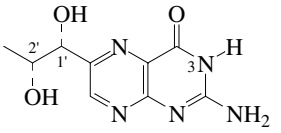
$C_{44}H_{52}N_{14}O_2$ 808.987

Dimer of *Cypridina* Luciferin, L-239. Isol. from *Cypridina* sp. Bioluminescent compd.

Toya, Y. *et al., Tet. Lett.*, 1985, **26**, 239 (*uv, pmr, struct*)

Biopterin B-100

*2-Amino-6-(1,2-dihydroxypropyl)-4(1*H*)-pteridinone, 9CI. 2-Amino-4-hydroxy-6-(1,2-dihydroxypropyl)pterin. Ranachrome 1*



(1'*R*,2'*R*)-*form*

$C_9H_{11}N_5O_3$ 237.218

(1′R,2′R)-form
D-threo-*form*. ***Dictyopterin***
[13019-52-8]
Isol. from *Dictyostelium discoideum*.
Mp 300°. pK_{a1} 2.2; pK_{a2} 7.92.

(1′R,2′S)-form
L-erythro-*form*
[22150-76-1]
Widely distributed in microorganisms, insects, algae, amphibia and mammals. Found in urine. Growth factor. Pale yellow cryst. (AcOH aq.).
Mp 250-280° dec. $[\alpha]_D^{20}$ -66 (c, 0.2 in 0.1*M* HCl). pK_{a1} 2.23; pK_{a2} 7.89.

► UO3506000

1′-O-D-Glucopyranoside: ***Biopterin glucose***
[32838-67-8]
$C_{15}H_{21}N_5O_8$ 399.36
Constit. of a marine plankton.

2′-O-α-D-Glucopyranoside: [235416-12-3]
$C_{15}H_{21}N_5O_8$ 399.36
Isol. from *Spirulina* (*Arthrospira*) *platensis*.

2′-O-(2-Acetamido-2-deoxy-β-D-glucopyranoside): ***Limipterin***
[164803-20-7]
$C_{17}H_{24}N_6O_8$ 440.412
Prod. by *Chlorobium limicola f. thiosulfatophilum*.

3-Me: ***2-Amino-6-(1,2-dihydroxypropyl)-3-methylpterin-4-one***
[111317-37-4]
$C_{10}H_{13}N_5O_3$ 251.244
Isol. from the marine anthozoan *Astroides calycularis*. Pale yellow cryst. powder (MeOH). Sol. MeOH, H_2O.
Mp 229-231°. $[\alpha]_D$ -60 (c, 0.3 in 0.1*M* HCl). λ_{max} 230 (ϵ 28200); 319 (ϵ 11700) (pH 1 H_2O) (Derep). λ_{max} 242 (ϵ 28200); 276 (ϵ 24000); 356 (ϵ 9550) (H_2O pH 7) (Derep).

7,8-Dihydro: 7,8-Dihydrobiopterin
[6779-87-9]
[7644-44-2]
$C_9H_{13}N_5O_3$ 239.233
Hygroscopic needles (H_2O or MeOH aq.). $[\alpha]_D^{22}$ +35 (c, 0.4 in 0.1*M* NaOH).

5,6,7,8-Tetrahydro: See 5,6,7,8-Tetrahydrobiopterin in *The Combined Chemical Dictionary*.

(1′S,2′R)-form
D-erythro-*form*
[13039-62-8]
Mp 300°. pK_{a1} 2.23; pK_{a2} 7.9.

(1′S,2′S)-form
L-threo-*form*. ***Orinapterin***. *Ciliapterin*
[13039-82-2]
Isol. from human urine. Prod. by *Aphanizomenon flos-aquae*.
Pale yellow cryst. (AcOH aq.).
Mp 300°. $[\alpha]_D$ +72 (0.1*M* HCl). pK_{a1} 2.24; pK_{a2} 7.87.

2′-O-(2-Acetamido-2-deoxy-β-D-glucopyranoside): ***Tepidopterin***
[188778-28-1]
$C_{17}H_{24}N_6O_8$ 440.412
Prod. by *Chlorobium tepidum*.

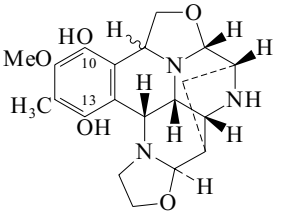
Bioxalomycin α1 B-101

Antibiotic 31F508α1. 31F508α1
[157207-82-4]



$C_{20}H_{25}N_3O_5$ 387.435
Isol. from the marine-derived *Streptomyces viridostaticus* ssp. *littoralis* (LL-31F508). Exhibits potent antimicrobial and antitumour activity. Powder. Sol. MeOH, H_2O, DMSO, Me_2CO; poorly sol. CH_2Cl_2, Me_2CO, MeCN, $CHCl_3$. λ_{max} 290; 294 (MeOH) (Berdy).

N-*Me:* ***Bioxalomycin α2***. *Antibiotic 31F508α2. 31F508α2*
[157207-83-5]
$C_{21}H_{27}N_3O_5$ 401.461
From *Streptomyces viridostaticus* ssp. *littoralis*. Exhibits potent antimicrobial and antitumour activity. Powder. Sol. MeOH, Me_2CO, DMSO, H_2O; poorly sol. CH_2Cl_2, $CHCl_3$, MeCN, Me_2CO. $[\alpha]_D^{25}$ +31 (MeOH). Unstable in soln. λ_{max} 292 (ε 2729) (MeOH) (Berdy).

10,13-Quinone: ***Bioxalomycin β1***. *Antibiotic 31F508β1. 31F508β1*
[157207-84-6]
$C_{20}H_{23}N_3O_5$ 385.419
Isol. from *Streptomyces viridostaticus* ssp. *littoralis*. Potent antitumour and antimicrobial agent. Sol. CH_2Cl_2, DMSO, MeOH, $CHCl_3$; poorly sol. H_2O, hexane.

10,13-Quinone, N-*Me:* ***Bioxalomycin β2***. *Antibiotic 31F508β2. 31F508β2*
$C_{21}H_{25}N_3O_5$ 399.446
From *Streptomyces viridostaticus* ssp. *littoralis*. Exhibits potent antitumour and antimicrobial activity. Sol. CH_2Cl_2, $CHCl_3$, DMSO, MeOH; poorly sol. H_2O, hexane. It is proposed that this is the naturally occurring form of Naphthyridinomycin (see Naphthyridinomycin A). λ_{max} 270 (ε 10508); 370 (MeOH) (Berdy). λ_{max} 264; 370 (MeOH-HCl) (Berdy).

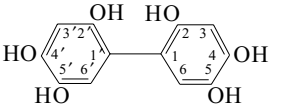
2,2′,4,4′,5,5′-Biphenylhexol B-102

2,2′,4,4′,5,5′-Hexahydroxybiphenyl
[76625-61-1]



$C_{12}H_{10}O_6$ 250.207
Constit. of the sponge *Axinella polycapella*. Antimicrobial agent. Light-blue-grey solid.
Mp 277-280°.

Hexa-Ac:
$C_{24}H_{22}O_{12}$ 502.431
Cryst. (EtOH). Mp 172-174°.

Hexa-Me ether: 2,2′,4,4′,5,5′-Hexamethoxybiphenyl
[1702-67-6]
$C_{18}H_{22}O_6$ 334.368
Needles (AcOH). Mp 180°.

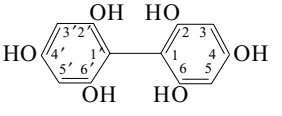
2,2′,4,4′,6,6′-Biphenylhexol B-103

2,2′,4,4′,6,6′-Hexahydroxybiphenyl. ***Difucol***
[4371-20-4]



$C_{12}H_{10}O_6$ 250.207
Occurs in several brown algae, e.g. *Fucus vesiculosus*, *Cystophora retroflexa*, *Carpophyllum angustifolium*.

2-O-*Sulfate:* [123203-15-6]
$C_{12}H_{10}O_9S$ 330.272
Constit. of an alga.

4,4′-Di-O-*sulfate:* [123203-16-7]
$C_{12}H_{10}O_{12}S_2$ 410.336
Isol. from alga *Pleurocarpus gardneri*. Isol. as di-K salt.

Hexa-Me ether: 2,2′,4,4′,6,6′-Hexamethoxybiphenyl
[14262-07-8]
$C_{18}H_{22}O_6$ 334.368
Cryst. (EtOH). Mp 156°.

3-Chloro: 3-Chloro-2,2′,4,4′,6,6′-biphenylhexol. ***3-Chlorodifucol***
$C_{12}H_9ClO_6$ 284.652
Isol. from *Carpophyllum angustifolium*. Called 3[A_4]-chloro in the lit. by analogy with phlorotannins having a greater no. of rings.

[57103-39-6, 115834-42-9, 115868-52-5]

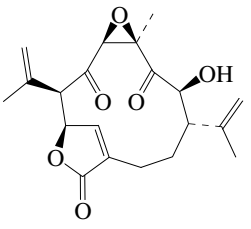
Bipinnapterolide A B-104

[245681-43-0]

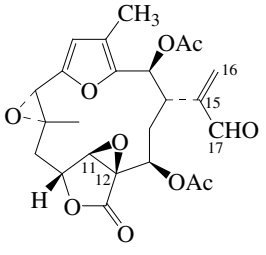


$C_{20}H_{24}O_6$ 360.406
Constit. of *Pseudopterogorgia bipinnata*. Cryst.
Mp 153-154°. $[\alpha]_D^{24}$ -7.8 (c, 2.1 in $CHCl_3$). λ_{max} 216 (ϵ 9800) (MeOH).

Rodriguez, A.D. *et al., J. Nat. Prod.*, 1999, **62**, 1228-1237 (*isol, pmr, cmr, cryst struct*)

Bipinnatin B B-105

Lophotoxin-analog I
[99552-24-6]



Absolute Configuration

$C_{24}H_{26}O_{10}$ 474.463
Metab. of *Pseudopterogorgia bipinnata*. Cytotoxic. Irreversibly inhibits the binding of α-toxin to nicotinic acetylcholine receptor. $[\alpha]_D^{20}$ -68.9 (c, 1.2 in CH_2Cl_2). λ_{max} 242 (ϵ 948) ($CHCl_3$) (Derep). λ_{max} 242 (ϵ 948) ($CHCl_3$) (Berdy).

17-Carboxylic acid, Me ester: ***Bipinnatin A***. *Lophotoxin-analog V*
[99552-28-0]
$C_{25}H_{28}O_{11}$ 504.49
Metab. of *Pseudopterogorgia bipinnata*. Cytotoxic. $[\alpha]_D^{20}$ -76.6 (c, 3.5 in $CHCl_3$). λ_{max} 286 (ϵ 10500) ($CHCl_3$) (Derep). λ_{max} 286 (ϵ 10500) ($CHCl_3$) (Berdy).

11,12-Deepoxy(Z-): ***Bipinnatin D***
[123374-33-4]
$C_{24}H_{26}O_9$ 458.464
Metab. of *Pseudopterogorgia bipinnata*. Cytotoxic. $[\alpha]_D^{20}$ +34.2 (c, 0.17 in $CHCl_3$). λ_{max} 242 (ϵ 948) ($CHCl_3$) (Derep). λ_{max} 241 (ϵ 641) ($CHCl_3$) (Berdy).

15S,16-Epoxide, 17-deoxo: ***Bipinnatin C***
[123483-20-5]

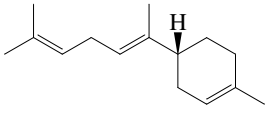
[17627-44-0]



(*R,E*)-*form*

$C_{15}H_{24}$ 204.355
Not the same as 2,6,10-Bisabolatriene, B-121 which has been renamed (formerly α-Bisabolene). The FEMA number refers to mixed bisabolenes including 2,7(14),10-Bisabolatriene, B-124 and 2,6,10-Bisabolatriene B-121. Constit. of numerous essential oils, e.g. chamomile, lemon, bergamot, calamus, etc. Flavouring ingredient used singly or as mixed isomers.

(*R,E*)-*form* [70286-31-6]
Isol. from *Halichondria* sp.
Oil. $[\alpha]_D^{20}$ +54.3 (c, 1 in EtOH).

(*R,Z*)-*form* [70286-33-8]
Oil. $[\alpha]_D^{20}$ -12 (c, 1 in EtOH).

(*S,E*)-*form* [70286-32-7]
Oil. $[\alpha]_D^{20}$ -38.9 (c, 1 in EtOH).

(*S,Z*)-*form* [58845-44-6]
Constit. of oil of Opopanax and defence secretion of termite *Amitermes wheeleri*.
Oil. Bp_{12} 155-157°. $[\alpha]_D^{20}$ +8 (c, 1 in EtOH).

(ξ,*E*)-*form* [25532-79-0]
Constit. of *Athanasia crithmifolia*.
Oil. Abs. config. not detd., no opt. rotn. given.

[29837-07-8, 70286-16-7, 70332-15-9, 73465-96-0]

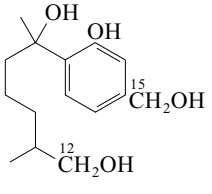
[150624-45-6]



$C_{15}H_{24}O_4$ 268.352

Prod. by *Penicillium* sp. FH-A6260. Antibacterial and antifungal agent. Sol. MeOH, Me_2CO, EtOAc, $CHCl_3$, Py; poorly sol. H_2O. $[\alpha]_D^{20}$ +6.7 (c, 1.5 in MeOH). λ_{max} 205 (ϵ 12850); 219; 278 (ϵ 2850) (MeOH) (Berdy). λ_{max} 216 (ϵ 9250); 244 (ϵ 5800); 294 (ϵ 3650) (MeOH/NaOH) (Berdy).

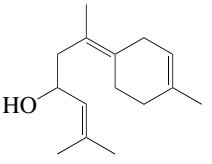
12-Ac: ***12-O-Acetylwaraterpol***
[150370-77-7]
$C_{17}H_{26}O_5$ 310.389
Prod. by *Penicillium* sp. FH-A6260.
$[\alpha]_D^{20}$ +1.9 (c, 1.3 in $CHCl_3$).

15-Ac: ***15-O-Acetylwaraterpol***
[150370-78-8]
$C_{17}H_{26}O_5$ 310.389
Prod. by *Penicillium* sp. FH-A6260.
$[\alpha]_D^{20}$ +14.5 (c, 0.31 in $CHCl_3$).

12-Carboxylic acid: 1,7,15-Trihydroxy-1,3,5-bisabolatrien-12-oic acid
$C_{15}H_{22}O_5$ 282.336

12-Carboxylic acid, amide: ***Curcutriolamide***
[848645-03-4]
$C_{15}H_{23}NO_4$ 281.351
Constit. of fungus CNC-979 isol. from a marine sediment. Oil. $[\alpha]_D^{20}$ -3.8 (c, 0.3 in MeOH). λ_{max} 203 (ϵ 138523); 282 (ϵ 18014) (MeOH).
Henne, P. *et al., Annalen*, 1993, 565
Mülhaupt, T. *et al., Eur. J. Org. Chem.*, 2005, 334-341 (*Curcutriolamide*)

2,6,10-Bisabolatrien-9-ol B-129

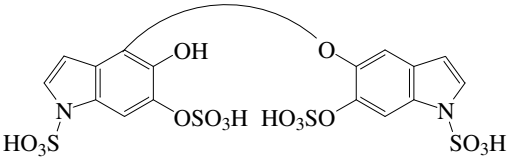


$C_{15}H_{24}O$ 220.354

(E)-form
Ac: 9-Acetoxy-γ-bisabolene
[195823-86-0]
$C_{17}H_{26}O_2$ 262.391
Constit. of *Laurencia rigida*. Oil. $[\alpha]_D^{25}$ +1 (c, 0.56 in $CHCl_3$).
König, G.M. *et al., J. Nat. Prod.*, 1997, **60**, 967-970 (*isol, pmr, cmr*)

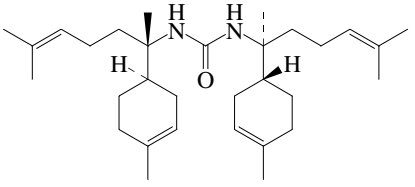
Bisancorinolate B B-130

[471913-82-3]



$C_{16}H_{12}N_2O_{16}S_4$ 616.539
Alkaloid from the sponge *Ancorina* sp. Powder (as tetra-Na salt). CAS no. refers to tetra Na salt. λ_{max} 221 (log ϵ 4.53); 268 (log ϵ 4.07); 301 (log ϵ 3.82) (MeOH) (tetra-Na salt).
Meragelman, K.M. *et al., J.O.C.*, 2002, **67**, 6671-6677 (*isol, pmr, cmr, ms*)

N,N′-Bis(2,10-bisaboladien-7-yl)urea B-131



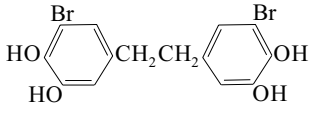
Absolute Configuration

$C_{31}H_{52}N_2O$ 468.765

(6*R*,6′*R*,7*S*,7′*S*)-*form* [105281-45-6]
Isol. from a *Halichondria* sp.
Mp 139-141°. $[\alpha]_D^{20}$ +44 (c, 1.1 in $CHCl_3$).
Sullivan, B.W. *et al., J.O.C.*, 1986, **51**, 5134-5136 (*isol, pmr, cmr*)

1,2-Bis(3-bromo-4,5-dihydroxyphenyl)ethane B-132

4,4′-(1,2-Ethanediylbis[6-bromo-1,2-benzenediol]), 9CI. 3,3′-Dibromo-4,4′,5,5′-tetrahydroxybibenzyl
[60484-69-7]

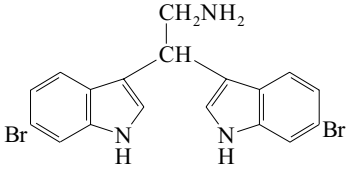


$C_{14}H_{12}Br_2O_4$ 404.054
Isol. from *Polysiphonia urceolata*. Cryst. (C_6H_6/MeOH).
Mp 205-206°.

Kurata, K. *et al., Chem. Lett.*, 1976, 821 (*isol*)

2,2-Bis(6-bromo-3-indolyl)ethylamine B-133

*6-Bromo-β-(6-bromo-1*H*-indol-3-yl)-1*H*-indole-3-ethanamine, 9CI*
[135077-20-2]

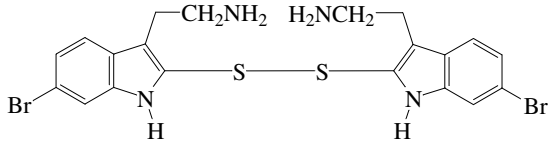


$C_{18}H_{15}Br_2N_3$ 433.145
Alkaloid from the marine tunicate *Didemnum candidum*. Also isol. from the deep-water New Caledonian sponge *Orina* sp. Pale yellow oil.

Fahy, E. *et al., J. Nat. Prod.*, 1991, **54**, 564-569 (*isol, uv, ir, pmr, cmr, ms, struct*)
Bifulco, G. *et al., J. Nat. Prod.*, 1995, **58**, 1254-1260 (*isol*)

Bis(6-bromo-2-tryptaminyl) disulfide B-134

*Bis[3-(2-aminoethyl)-6-bromo-1*H*-indol-2-yl] disulfide*

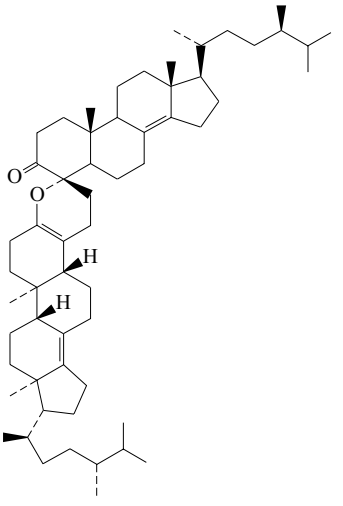


$C_{20}H_{20}Br_2N_4S_2$ 540.345
Alkaloid from the marine snail *Calliostoma canaliculatum*. Potassium channel agonist. Neurotoxin.

Kelley, W.P. *et al., J. Biol. Chem.*, 2003, **278**, 34934-34942 (*isol, pmr, cmr, ms, activity*)
Wolters, A.M. *et al., J. Nat. Prod.*, 2005, **68**, 162-167 (*pmr, anal*)

Bisconicasterone B-135

[154277-93-7]

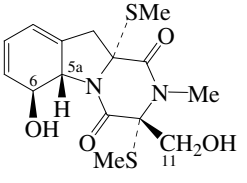


$C_{58}H_{92}O_2$ 821.364
Constit. of *Theonella swinhoei*. Cryst.
Mp 213-216°.

Inouye, Y. *et al., Chem. Lett.*, 1994, 419-420 (*isol, pmr, cmr*)

Bisdethiobis(methylthio)gliotoxin B-136

*2,3,5*a*,6,10,10*a*-Hexahydro-6-hydroxy-3-(hydroxymethyl)-2-methyl-3,10*a*-bis(methylthio)pyrazino[1,2-*a*]indole-1,4-dione, 9CI. FR 49175. Antibiotic FR 49175*
[74149-38-5]



$C_{15}H_{20}N_2O_4S_2$ 356.466
Related to Gliotoxin, G-94. Prod. by *Gliocladium deliquescens* and marine-derived *Aspergillus fumigatus* and *Pseudallescheria* sp. (MFB165). Inhibits PAF induced platelet aggregation. Antibacterial agent. Powder. $[\alpha]_D^{20}$ -51 (c, 1 in MeOH).
▶ LD_{50} (mus, ipr) 500-1500 mg/kg.

*5*a*,6-Didehydro:* ***5*a*,6-Dehydrobisdethiobis(methylthio)gliotoxin***. *Bisdethiobis(methylthio)dehydrogliotoxin*
[74149-39-6]
$C_{15}H_{18}N_2O_4S_2$ 354.45
Prod. by *Gliocladium deliquescens*. Yellow gum.

11-Deoxy: ***Deoxybisdethiobis(methylthio)gliotoxin***
$C_{15}H_{20}N_2O_3S_2$ 340.467
Prod. by a marine-derived *Pseudallescheria* sp. (MFB165). Antibacterial agent. Oil. $[\alpha]_D$ -48 (c, 0.3 in MeOH). λ_{max} 271 (log ϵ 4.25) (MeOH).

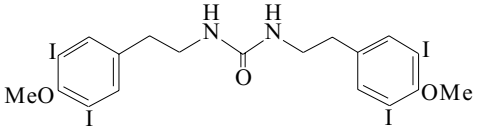
[89631-87-8]



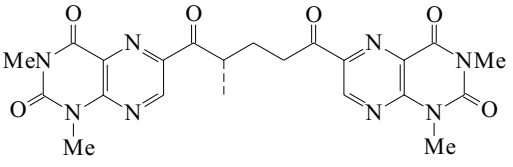
$C_{19}H_{20}I_4N_2O_3$ 831.997

Minor metab. from an unidentified didemnid tunicate *Didemnum* sp.

Mp 224-225°.

Sesin, D.F. *et al., Tet. Lett.*, 1984, **25**, 403-404 (*pmr, cmr, struct*)

1,5-Bis(1,3-dimethyl-6-lumazinyl)-2-methyl-1,5-pentanedione **B-140**



$C_{22}H_{22}N_8O_6$ 494.466

(*S*)-*form* [173324-68-0]

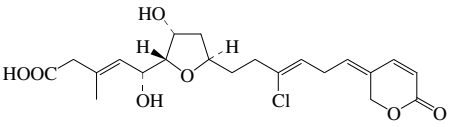
Metab. from the marine polychaete *Odontosyllis undecimdonta*.

Solid (MeOH).

Mp 114-115°. $[\alpha]_D^{25}$ -61.9 (c, 0.21 in $CHCl_3$).

Tanino, H. *et al., Heterocycles*, 1996, **42**, 125-128 (*isol, uv, ir, pmr, ms, synth, struct*)

Biselide E **B-142**



Absolute Configuration

$C_{21}H_{27}ClO_7$ 426.893

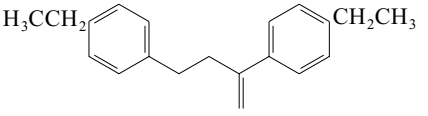
Constit. of a *Didemnum* sp. Oil.

Teruya, T. *et al., Tetrahedron*, 2005, **61**, 6561-6567 (*isol, pmr, cmr*)

2,4-Bis(4-ethylphenyl)-1-butene **B-143**

1,1′-(1-Methylene-1,3-propanediyl)bis[4-ethylbenzene], 9CI

[156251-84-2]



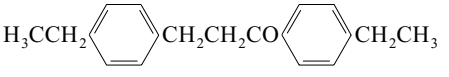
$C_{20}H_{24}$ 264.41

Constit. of the starfish *Pteraster militaris.*

Yayli, N. *et al., Indian J. Chem., Sect. B*, 1994, **33**, 556 (*isol, pmr, cmr*)

1,3-Bis(4-ethylphenyl)-1-propanone **B-144**

[156251-85-3]



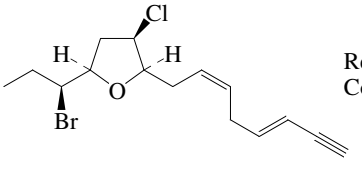
$C_{19}H_{22}O$ 266.382

Constit. of the starfish *Pteraster militaris.*

Yayli, N. *et al., Indian J. Chem., Sect. B*, 1994, **33**, 556 (*isol*)

Bisezakyne A **B-145**

13-Bromo-10-chloro-9,12-epoxy-3,6-pentadecadien-1-yne



Relative Configuration

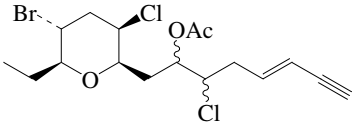
$C_{15}H_{20}BrClO$ 331.679

Constit. of a *Laurencia* sp. Oil. $[\alpha]_D^{22}$ -71.3 (c, 0.33 in $CHCl_3$). λ_{max} 228 (ϵ 14400) (EtOH).

Suzuki, M. *et al., Phytochemistry*, 1999, **51**, 657-662 (*isol, uv, ir, pmr, cmr, ms*)

Bisezakyne B **B-146**

7-Acetoxy-12-bromo-6,10-dichloro-9,13-epoxy-3-pentadecen-1-yne



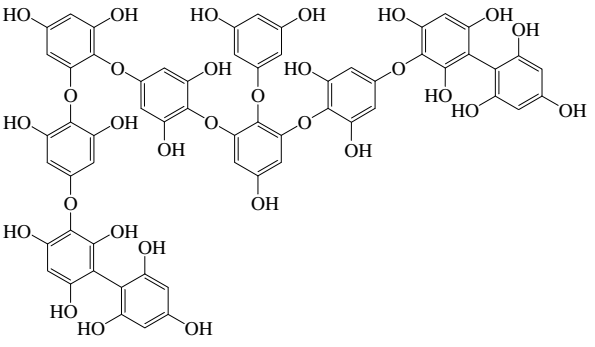
$C_{17}H_{23}BrCl_2O_3$ 426.176

Constit. of a *Laurencia* sp.

Mp 69-70°. $[\alpha]_D^{22}$ -45.1 (c, 0.27 in $CHCl_3$). λ_{max} 223 (ϵ 14440) (EtOH).

Suzuki, M. *et al., Phytochemistry*, 1999, **51**, 657-662 (*isol, uv, ir, pmr, cmr, ms*)

Bisfucoheptaphlorethol A B-147

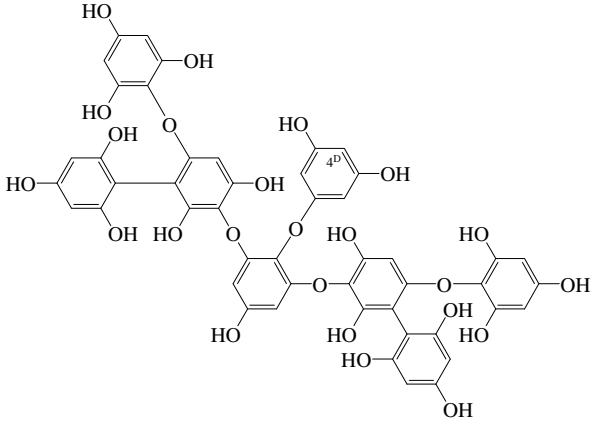


$C_{60}H_{42}O_{30}$ 1242.974
Isol. from brown alga *Cystophora retroflexa*.

Sailler, B. *et al., Phytochemistry*, 1999, **50**, 869-881 (*isol, pmr, cmr, ms*)

Bisfucopentaphlorethol A B-148

[88524-53-2]



$C_{48}H_{34}O_{24}$ 994.782
Constit. of *Himanthalia elongata*, *Cystophora torulosa* and *Cystophora retroflexa*. Isol. as per-Ac, to which CAS no. refers.

4^D-Chloro: ***Chlorobisfucopentaphlorethol A***
[202211-26-5]
$C_{48}H_{33}ClO_{24}$ 1029.227
Isol. from *Sargassum spinuligerum*. Isol. as per-Ac, to which CAS no. refers.

4^D-Hydroxy: ***Hydroxybisfucopentaphlorethol A***
[199857-67-5]
$C_{48}H_{34}O_{25}$ 1010.782
Isol. from *Cystophora torulosa*. Isol. as per-Ac, to which CAS no. refers.

Grosse-Damhues, J. *et al., Phytochemistry*, 1983, **22**, 2043 (*Bisfucopentaphlorethol A, isol, struct*)
Glombitza, K.W. *et al., Planta Med.*, 1985, **50**, 42-46 (*isol, struct*)

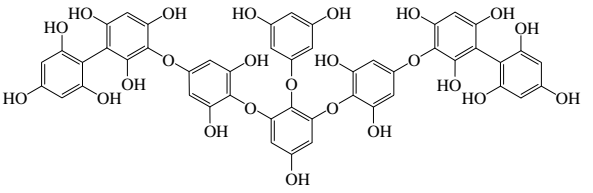
Sailler, B. *et al., Phytochemistry*, 1999, **50**, 869-881 (*isol*)

Bisfucopentaphlorethol B B-149

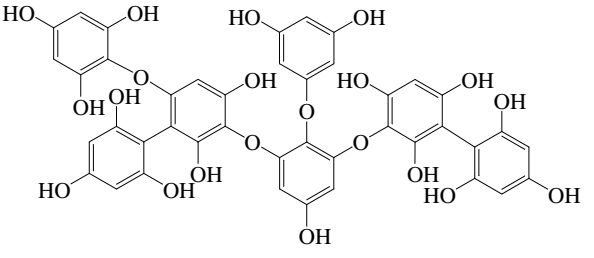


$C_{48}H_{34}O_{24}$ 994.782
Isol. from *Cystophora retroflexa* and *Cystophora torulosa*.

Glombitza, K.W. *et al., Phytochemistry*, 1997, **46**, 1417-1422 (*isol, pmr, ms*)
Sailler, B. *et al., Phytochemistry*, 1999, **50**, 869-881 (*isol*)

Bisfucotetraphlorethol A B-150

[96738-80-6]

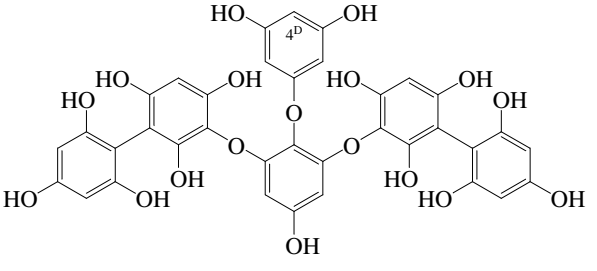


$C_{42}H_{30}O_{21}$ 870.686
Isol. from *Cystophora retroflexa*, *Cystophora torulosa* and *Himanthalia elongata*. Identified as per-Ac, to which CAS no. refers.

Glombitza, K.W. *et al., Planta Med.*, 1985, **50**, 42-46 (*isol, struct*)
Glombitza, K.W. *et al., Phytochemistry*, 1997, **46**, 735-740; 1999, **50**, 869-881 (*isol*)

Bisfucotriphlorethol A B-151

[79003-53-5]

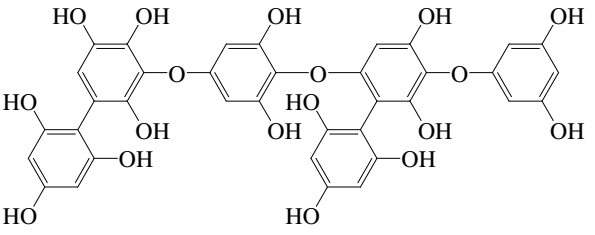


$C_{36}H_{26}O_{18}$ 746.591
Isol. from *Cystophora retroflexa*, *Cystoseira baccata*, *Carpophyllum maschalocarpum*, *Carpophyllum angustifolium*, *Sargassum spinuligerum* and *Himanthalia elongata*. Isol. as per-Ac, to which CAS no. refers.

4^D-Hydroxy: ***Hydroxybisfucotriphlorethol A***
$C_{36}H_{26}O_{19}$ 762.59
Isol. from *Sargassum spinuligerum*.

Glombitza, K.W. *et al., Arch. Pharm. (Weinheim, Ger.)*, 1981, **314**, 602-608 (*isol, struct*)
Glombitza, K.W. *et al., Phytochemistry*, 1991, **30**, 3423-3427; 1997, **46**, 735-740; 1999, **50**, 869-881 (*isol, pmr, ms*)
Glombitza, K.W. *et al., J. Nat. Prod.*, 1999, **62**, 1238-1240 (*isol*)

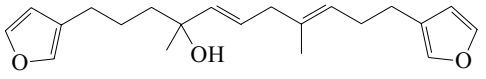
Bisfucotriphlorethol B B-152



$C_{36}H_{26}O_{18}$ 746.591
Isol. from brown alga *Cystophora torulosa*.

Glombitza, K.W. *et al., Phytochemistry*, 1997, **46**, 735-740

1,11-Bis(3-furanyl)-4,8-dimethyl-5,8-undecadien-4-ol B-153



$C_{21}H_{28}O_3$ 328.45

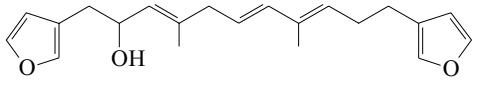
Me ether: 1,11-Bis(3-furanyl)-8-methoxy-4,8-dimethyl-3,6-undecadiene
$C_{22}H_{30}O_3$ 342.477
Constit. of *Fasciospongia cavernosa*. Oil. $[\alpha]_D^{28}$ +12 (c, 0.3 in $CHCl_3$).

[141631-72-3, 141631-89-2]

Kobayashi, M. *et al., Chem. Pharm. Bull.*, 1992, **40**, 599 (*isol, pmr, cmr*)

1,11-Bis(3-furanyl)-4,8-dimethyl-3,6,8-undecatrien-2-ol B-154

α-[9-(3-Furanyl)-2,6-dimethyl-1,4,6-nonatrienyl]-3-furanethanol, 9CI



$C_{21}H_{26}O_3$ 326.435

Ac: 2-Acetoxy-1,11-bis(3-furanyl)-4,8-dimethyl-3,6,8-undecatriene
[97530-63-7]
$C_{23}H_{28}O_4$ 368.472
Constit. of nudibranch *Dendrodoris grandiflora*.
$[\alpha]_D$ +12.8 (c, 0.24 in $CHCl_3$).

Cimino, G. *et al., Tetrahedron*, 1985, **41**, 1093

N,N′-Bis[1(10),4-germacradien-11-yl]urea B-155

Roussis, V. *et al., Phytochemistry*, 1993, **34**, 107-111 (*Encyothalia cliftonii constits*)

Bis(3-oxoundecyl) disulfide **B-164**
1,1′-Dithiodi-3-undecanone, 8CI
[33796-37-1]
$H_3C(CH_2)_7COCH_2CH_2SSCH_2CH_2CO(CH_2)_7CH_3$
$C_{22}H_{42}O_2S_2$ 402.705
Constit. of *Dictyopteris plagiogramma*. Cryst.
Mp 67-67.5°.
Roller, P. *et al., Chem. Comm.*, 1971, 503

Bis(3-oxoundecyl) tetrasulfide **B-165**
1,1′-Tetrathiobis-3-undecanone, 9CI
[34852-29-4]
$H_3C(CH_2)_7COCH_2CH_2SSSSCH_2CH_2CO(CH_2)_7CH_3$
$C_{22}H_{42}O_2S_4$ 466.837
Constit. of *Dictyopteris plagiogramma* and *Dictyopteris australis*.
Mp 32-33°.
Moore, R.E. *et al., Chem. Comm.*, 1971, 1168

Bis(3-oxoundecyl) trisulfide **B-166**
1,1′-Trithiobis-3-undecanone, 9CI
[34852-28-3]
$H_3C(CH_2)_7COCH_2CH_2SSSCH_2CH_2CO(CH_2)_7CH_3$
$C_{22}H_{42}O_2S_3$ 434.771
Constit. of *Dictyopteris plagiogramma* and *Dictyopteris australis*.
Needles (MeOH).
Mp 60.5-61°.
Moore, R.E. *et al., Chem. Comm.*, 1971, 1168

***N*,*N*′-Bis(2-phenylethyl)urea, 9CI** **B-167**
N,N′-Diphenethylurea. AM 2498. Metabolite AM 2498
[5467-84-5]
$PhCH_2CH_2NHCONHCH_2CH_2Ph$
$C_{17}H_{20}N_2O$ 268.358

Metab. from the marine ascidian *Didemnum ternatanum*. Also isol. from a *Streptomyces* sp. strain No. AM-2498. Weak depressant lacking acute toxicity. Needles (MeOH). Sol. MeOH, C_6H_6; poorly sol. H_2O.
Mp 138-141° (135°). λ_{max} 248 (ϵ 308); 251 (ϵ 411); 253 (ϵ 446); 256 (ϵ 535); 259 (ϵ 549); 262 (ϵ 543); 265 (ϵ 419); 269 (ϵ 351) (MeOH) (Derep).

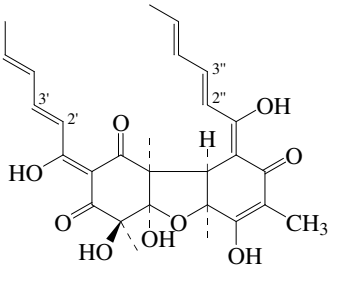
Bisvertinolone B-187

[133683-27-9]



Absolute Configuration

$C_{28}H_{32}O_9$ 512.555
Struct. revised in 1991 and again in 1994. Contains β-enetrione system; other tautomers possible. Prod. by *Verticillium intertextum*, *Acremonium strictum*, *Trichoderma longibrachiatum* and a marine-derived *Penicillium chrysogenum*. β-1,6-Glucan biosynth. inhibitor. Shows DPPH radical scavenging activity. Induces hyphal malformation in fungi. Yellow rosettes (diisopropyl ether).
Mp 156-158.3° dec. $[\alpha]_D^{20}$ -1046 (c, 0.91 in $CHCl_3$). $[\alpha]_D^{25}$ -495 (c, 0.1 in MeOH). λ_{max} 272 (ϵ 23000); 366 (ϵ 24000) (MeOH) (Berdy). λ_{max} 276 (ϵ 32000); 394 (ϵ 17000) (MeOH/NaOH) (Berdy).

2′,3′-Dihydro: ***2′,3′-Dihydrobisvertinolone***
$C_{28}H_{34}O_9$ 514.571
Prod. by a marine-derived *Penicillium terrestre*. Amorph. yellowish powder.
Mp 115-119°. $[\alpha]_D^{20}$ -668 (c, 0.24 in MeOH). λ_{max} 225 (log ϵ 4.57); 271 (log ϵ 4.61); 385 (log ϵ 4.57) (MeOH).

2′,2″,3′,3″-Tetrahydro: ***2′,2″,3′,3″-Tetrahydrobisvertinolone***
$C_{28}H_{36}O_9$ 516.587
Prod. by a marine-derived *Penicillium terrestre*. Amorph. yellowish powder.
Mp 82-87°. $[\alpha]_D^{20}$ -371 (c, 0.36 in MeOH). λ_{max} 228 (log ϵ 4.05); 267 (log ϵ 4.06); 336 (log ϵ 4.01) (no solvent reported).

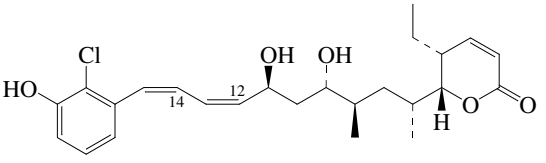
Bitungolide A B-188



$C_{25}H_{33}ClO_5$ 448.985
Isol. from the Indonesian sponge *Theonella* cf. *swinhoei*. Needles (MeOH aq.).
Mp 179-182°. $[\alpha]_D^{27}$ +30 (c, 0.38 in MeOH). λ_{max} 270 (log ϵ 4.1) (MeOH).

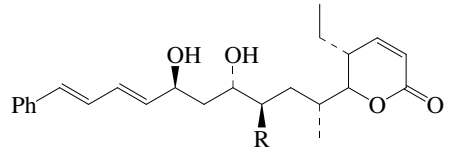
*12*E-*Isomer:* ***Bitungolide D***
$C_{25}H_{33}ClO_5$ 448.985
Isol. from *Theonella* cf. *swinhoei*. Amorph. solid. $[\alpha]_D^{27}$ +66 (c, 0.58 in $CHCl_3$). λ_{max} 270 (log ϵ 4.1) (MeOH).

*14*E-*Isomer:* ***Bitungolide C***
$C_{25}H_{33}ClO_5$ 448.985
Isol. from *Theonella* cf. *swinhoei*. Amorph. solid. $[\alpha]_D^{27}$ +89 (c, 0.11 in $CHCl_3$). λ_{max} 286 (log ϵ 4) (MeOH).

*12*E,*14*E-*Isomer:* ***Bitungolide B***
$C_{25}H_{33}ClO_5$ 448.985
Isol. from *Theonella* cf. *swinhoei*. Amorph. solid. $[\alpha]_D^{27}$ +42 (c, 4.2 in $CHCl_3$). λ_{max} 291 (log ϵ 4) (MeOH).

Sirirath, S. *et al., J. Nat. Prod.*, 2002, **65**, 1820-1823 (*isol, pmr, cmr, ms*)

Bitungolide E B-189



R = CH_3

$C_{25}H_{34}O_4$ 398.541
Isol. from the Indonesian sponge *Theonella* cf. *swinhoei*. Pale yellow glass. $[\alpha]_D^{27}$ +107 (c, 1.3 in $CHCl_3$).

Sirirath, S. *et al., J. Nat. Prod.*, 2002, **65**, 1820-1823 (*isol, pmr, cmr, ms*)

Bitungolide F B-190

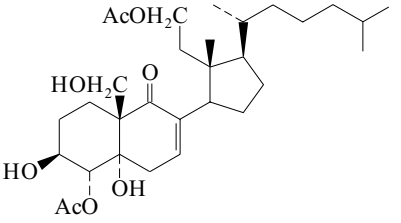
As Bitungolide E, B-189 with
R = H

$C_{24}H_{32}O_4$ 384.514
Isol. from the Indonesian sponge *Theonella* cf. *swinhoei*. Pale yellow glass. $[\alpha]_D^{27}$ +43 (c, 0.85 in $CHCl_3$).

Sirirath, S. *et al., J. Nat. Prod.*, 2002, **65**, 1820-1823 (*isol, pmr, cmr, ms*)

Blancasterol B-191

[152135-67-6]

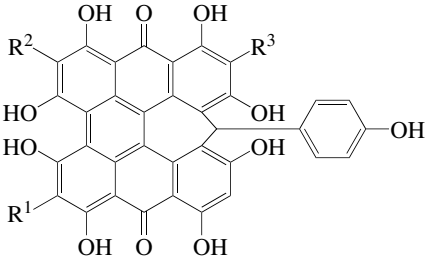


$C_{31}H_{50}O_8$ 550.731
Constit. of a *Pleraplysilla* sp. Amorph. solid. λ_{max} 240 (ϵ 5100); 288 (ϵ 1050) (MeOH) (Berdy).

Pika, J. *et al., Tetrahedron*, 1993, **49**, 8757-8760 (*isol, pmr, cmr*)

Blepharismins B-192

[129898-49-3]



Blepharismin 1 $R^1 = R^2 = CH_2CH_3$, $R^3 = H$
2 $R^1 = CH_2CH_3$, $R^2 = CH(CH_3)_2$, $R^3 = H$
3 $R^1 = R^2 = CH(CH_3)_2$, $R^3 = H$
4 $R^1 = CH_2CH_3$, $R^2 = CH(CH_3)_2$, $R^3 = CH_3$
$R^1 = CH(CH_3)_2$, $R^2 = CH_2CH_3$, $R^3 = CH_3$
5 $R^1 = R^2 = CH(CH_3)_2$, $R^3 = CH_3$

Pigment complex isol. from the ciliate *Blepharisma japonicum*. Photoreceptor molecules. Active against gram-positive bacteria. Red powder.

Blepharismin 1
$C_{39}H_{26}O_{11}$ 670.628

Blepharismin 2
$C_{40}H_{28}O_{11}$ 684.655

Blepharismin 3
$C_{41}H_{30}O_{11}$ 698.681

Blepharismin 4
$C_{41}H_{30}O_{11}$ 698.681
Struct. not fully elucidated.

Blepharismin 5
$C_{42}H_{32}O_{11}$ 712.708

Pant, B. *et al., FEMS Microbiol. Lett.*, 1997, **155**, 67-71 (*activity*)
Checcucci, G. *et al., J.A.C.S.*, 1997, **119**, 5762-5763; 9588 (*isol, uv, pmr, cmr*)

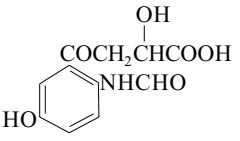
Blepharismone B-193

2-(Formylamino)-α,5-dihydroxy-γ-oxobenzenebutanoic acid, 9CI
[40136-11-6]



$C_{11}H_{11}NO_6$ 253.211
Ciliation-inducing hormone of the ciliate *Blepharisma japonicum*.

(±)-*form*
Yellowish cryst. Mp 250°.

Tokoroyama, T. *et al., Heterocycles*, 1978, **10**, 159 (*synth, bibl*)
Entzeroth, M. *et al., Z. Naturforsch., C*, 1981, **36**, 180 (*synth, pmr, ir, uv, bibl*)
Entzeroth, M. *et al., Annalen*, 1983, 226 (*synth*)

Blood depressing substances B-194

BDS
Isol. from sea anemone *Anemonia sulcata*. Antihypertensive.

BDS I Peptide containing 43 amino acid residues with 3 intramol. disulfide bonds.

BDS II Peptide; differs in 2 positions from BDS I.

Diochot, S. *et al., J. Biol. Chem.*, 1998, **273**, 6744-6749 (*isol, struct*)

Blue copper proteins B-195

Type 1 Copper proteins
$[CuN_2S_2]$

A group of metalloproteins which have a single Cu atom at the active site and three characteristic props.: intense blue colour at *ca*. 600 nm, unusually narrow hyperfine coupling in the epr spectrum of the $Cu^{2\oplus}$ protein, and high reduction potentials (range 184-680 mV).

Amicyanin
Contains 106 amino acids. Isol. from the methylotropic bacteria *Pseudomonas* AMI and *Thiobacillus versutus*. Mediates electron transfer between cytochrome c and methylamine dehydrogenase.

Azurin
Contains 128 or 129 amino acids. Isol. from denitrifying bacteria such as *Alcaligenes denitrificans* and *Pseudomonas aeruginosa*. Functions as electron transport between cytochrome c_{551} and cytochrome oxidase.

Cucumber basic protein
Plantacyanin. CBP
Contains 96 amino acids. Isol. from cucumber.

Plastocyanin
There are a number of Plastocyanins, each containing between 97 and 104 amino acids. Isol. from various higher plants, green algae and blue-green algae. Plastocyanin from *Anabaena variabilis* (blue-green alga) has some different props. Involved in electron transport between photosystems II and I in higher plants and algae.

Pseudoazurin
Contains 123 amino acids. Isol. from *Anabaena faecalis* S-6, *Achromobacter cycloclastes*, *Pseudomonas* sp. and other bacteria. Believed to transfer electrons to a Cu-containing nitrite reductase.

Rusticyanin
Contains 144 amino acids. Isol. from *Thiobacillus ferroxidans*. Respiratory chain component.

Stellacyanin
Contains 107 amino acids. Isol. from *Rhus vernicifera* (lacquer tree). Biochemical function not v. well studied.

Umecyanin
Contains 125 amino acids. Isol. from roots of *Armoracia laphatifolia* (horseradish). Biochemical function not v. well studied.

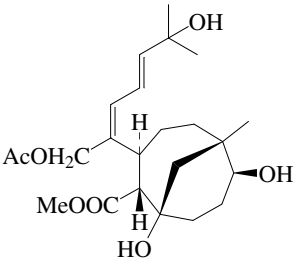
Blumicin A B-196

[866403-79-4]

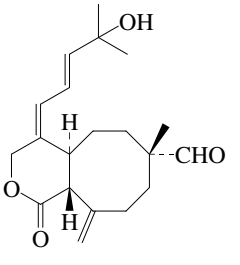


$C_{23}H_{36}O_7$ 424.533
Constit. of *Xenia blumi*. Oil. $[\alpha]_D^{25}$ -23 (c, 0.1 in $CHCl_3$). λ_{max} 235 (log ϵ 4.23) (MeOH).

El-Gamal, A.A.H. *et al., J. Nat. Prod.*, 2005, **68**, 1336-1340 (*Blumicin A*)

Blumiolide A B-197

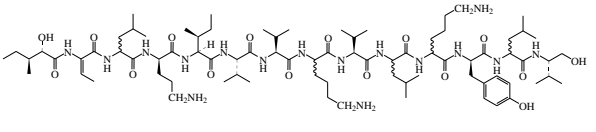
[866403-76-1]



$C_{20}H_{28}O_4$ 332.439
Constit. of *Xenia blumi*. Oil. $[\alpha]_D^{25}$ +18 (c, 0.4 in $CHCl_3$). λ_{max} 226 (log ϵ 3.6) (MeOH).

El-Gamal, A.A.H. *et al., J. Nat. Prod.*, 2005, **68**, 1336-1340 (*Blumiolide A*)

Bogorol A B-198

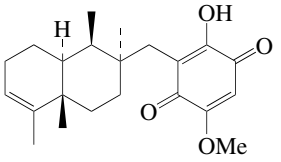


$C_{80}H_{142}N_{16}O_{16}$ 1584.099
Polypeptide antibiotic. Prod. by the marine-derived *Brevibacillus laterosporus* (PNG-276). Active against MRSA and vancomycin-resistant enterococcal strains. Amorph. solid. $[\alpha]_D^{25}$ -38.2 (MeOH).

Barsby, T. *et al., Org. Lett.*, 2001, **3**, 437-440 (*isol, struct*)
Barsby, T. *et al., J.O.C.*, 2006, **71**, 6031-6037 (*struct*)

Bolinaquinone B-199

[216498-95-2]



$C_{22}H_{30}O_4$ 358.477
Constit. of a *Dysidea* sp. Cytotoxic agent. Yellow glass. $[\alpha]_D$ -106 (c, 0.4 in $CHCl_3$). λ_{max} 288 (log ϵ 3.7); 424 (log ϵ 2.16) (no solvent reported). λ_{max} 288 (ϵ 5010); 424 (ϵ 144) (MeOH) (Berdy). λ_{max} 290 (ϵ 4677); 518 (ϵ 500) (MeOH/NaOH) (Berdy).

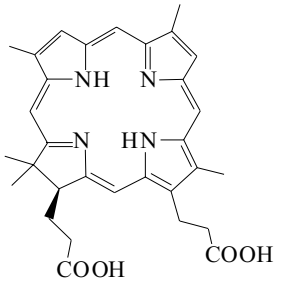
Bonellin B-200

[62888-19-1]



$C_{31}H_{34}N_4O_4$ 526.634
λ_{max} 402; 523; 548 (sh); 587 (sh); 631 (6% HCl) (Derep). λ_{max} 394; 488; 494; 521; 539; 590; 620 (sh); 641 ($CHCl_3$) (Derep).

(S)-form

Green pigment which occurs in the female gephyrean worm *Bonellia viridis*. Also isol. as amino acid conjugates. Sexual differentiation factor. Larvicide. Green needles. Bonellin exists in nature as a peptide deriv. For prod. of acidic treatment see Anhydrobonellin. λ_{max} 396; 488; 494; 521; 539; 590; 641 ($CHCl_3$) (Berdy). λ_{max} 402; 523; 631 (HCl) (Berdy).

Di-Me ester: [62888-20-4]
$C_{33}H_{38}N_4O_4$ 554.688
Dark green cryst. Mp 164-165° (55°).

(±)-form

Mp 155-157° (as di-Me ester).

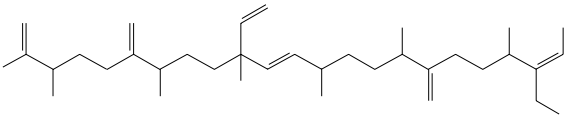
C_{36} Botryococcene B-215

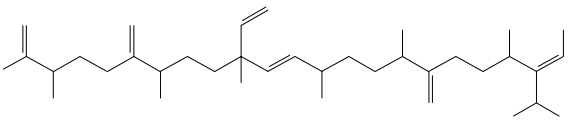
Darwinene
[87946-73-4]



$C_{36}H_{62}$ 494.886
Metab. of green alga *Botryococcus braunii*. Oil.

Galbraith, M.N. *et al., Phytochemistry*, 1983, **22**, 1441 (*struct*)
Metzger, P. *et al., Phytochemistry*, 1985, **24**, 2995 (*isol*)

C_{37} Botryococcene B-216

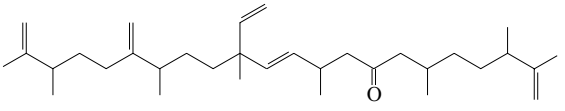


$C_{37}H_{64}$ 508.913
Metab. of alga *Botryococcus braunii*.

Metzger, P. *et al., Phytochemistry*, 1985, **24**, 2995 (*struct*)

Botryococcenone B-217

[133514-81-5]

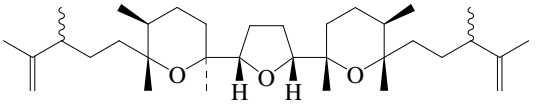


$C_{33}H_{56}O$ 468.805
Constit. of *Botryococcus braunii*. Oil. $[\alpha]_D$ -12 (c, 1.8 in $CHCl_3$).

Summons, R.E. *et al., Aust. J. Chem.*, 1991, **44**, 313 (*isol, pmr, cmr, ms*)

Botryolin A B-218

[443782-82-9]



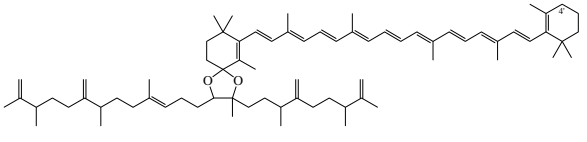
$C_{34}H_{60}O_3$ 516.846
Constit. of *Botryococcus braunii*. Oil. $[\alpha]_D^{25}$ -6 (c, 2.6 in $CHCl_3$).

Diastereoisomer: ***Botryolin B***
[443782-83-0]
$C_{34}H_{60}O_3$ 516.846
Constit. of *Botryococcus braunii*. Oil. $[\alpha]_D^{25}$ -0.6 (c, 3 in $CHCl_3$).

Metzger, P. *et al., Phytochemistry*, 2002, **59**, 839-843 (*isol, pmr, cmr*)

Botryoxanthin A B-219

[173792-78-4]



$C_{74}H_{112}O_2$ 1033.698
Constit. of *Botryococcus braunii*. λ_{max} 274 (ϵ 19000); 426 (sh); 450 (ϵ 104000); 479 (ϵ 92000) (no solent reported).

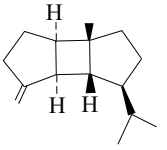
4′-Oxo: ***Botryoxanthin B***
[207594-88-5]
$C_{74}H_{110}O_3$ 1047.681
Constit. of *Botryococcus braunii*. λ_{max} 294 (ϵ 25000); 454 (ϵ 162000) (hexane).

$\Delta^{4'}$-Isomer: ***α-Botryoxanthin A***
[207594-90-9]
$C_{74}H_{112}O_2$ 1033.698
Constit. of *Botryococcus braunii*. λ_{max} 421 (sh) (ϵ 21000); 445 (ϵ 112000); 473 (ϵ 102000) (hexane).

Okada, S. *et al., Tet. Lett.*, 1996, **37**, 1065-1068 (*isol, pmr, cmr*)
Okada, S. *et al., Phytochemistry*, 1998, **47**, 1111-1115 (*Botryoxanthin B, α-Botryoxanthin A*)

4(15)-Bourbonene B-220

β-Bourbonene
[5208-59-3]



$C_{15}H_{24}$ 204.355
Constit. of the essential oil of *Geranium bourbon* and other essential oils. Oil. $[\alpha]_D^{20}$ -92.12.

ent-form
(+)-*β*-*Bourbonene*
[68036-15-7]
Constit. of secretion of the scale insect *Ceroplastes ceriferus*.

7-Epimer: **(+)-*β*-*Epibourbonene***
[92998-16-8]
$C_{15}H_{24}$ 204.355
Constit. of *Eunicea succinea*. Oil. $[\alpha]_D$ +94 (c, 1.02 in $CHCl_3$).

Křepinský, J. *et al., Tet. Lett.*, 1966, **7**, 359-367 (*struct*)

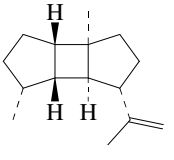
Bülow, N. *et al., Phytochemistry*, 2000, **55**, 141-168 (*biosynth, pmr, cmr*)

11-Bourbonene B-221

Prespatane
[190663-66-2]



Absolute Configuration

$C_{15}H_{24}$ 204.355
Constit. of *Cymbastela hooperi*. Oil. $[\alpha]_D$ -38 (c, 0.55 in $CHCl_3$).

König, G.M. *et al., J.O.C.*, 1997, **62**, 3837-3840 (*isol, pmr, cmr*)
Nabeta, K. *et al., Biosci., Biotechnol., Biochem.*, 1999, **63**, 1772-1776 (*abs config*)
Nabeta, K. *et al., J.C.S. Perkin 1*, 2000, 2703-2708 (*biosynth*)

Boxin B-222

Isol. from the defensive skin secretion of the Red Sea trunkfish *Ostracion cubicus*. Ichthyotoxin.

Kalmanzon, E. *et al., Mar. Biol. (Berlin)*, 2000, **136**, 471-476
Kalmanzon, E. *et al., Cell. Mol. Biol. Lett.*, 2001, **6**, 971-984

Brachyurin B-223

Proteolytic enzymes related to a subfamily of chymotrypsin. Isol. from various crustaceans incl. crabs. Serine collagenolytic agents.

Rudenskaya, G.N. *et al., Russ. J. Bioorg. Chem. (Engl. Transl.)*, 2003, **29**, 101-111 (*rev*)

Bradykinin B-224

Kallidin I. BRS 640
[58-82-2]
H-Arg-Pro-Pro-Gly-Phe-Ser-Pro-Phe-Arg-OH
$C_{50}H_{73}N_{15}O_{11}$ 1060.221

Isol. from plasma of humans and other mammals. Tissue hormone which produces all four cardinal symptoms of inflammatory response; vasodilation, pain, increased capillary permeability and leucocyte accumulation. Rapidly inactivated by peptidases. Amorph.
Mp 170° dec. $[\alpha]_D^{23}$ -84.1 (c, 1.1 in H_2O). $[\alpha]_D^{25}$ -78.4 (c, 1.4 in 1M AcOH).

N^2-*L-Lysyl:* ***Kallidin II***. N-*Lysylbradykinin*
[342-10-9]
$C_{56}H_{85}N_{17}O_{12}$ 1188.394
Peptide producing the signs of inflammatory response. Amorph.

6-L-Threonine analogue: [6120-63-4]
$C_{51}H_{75}N_{15}O_{11}$ 1074.247
Isol. from plasma of *Alligator mississippiensis* and the turtle *Pseudemys scripta*.

6-L-Threonine, 8-L-leucine analogue: See Ornithokinin in *The Combined Chemical Dictionary.*

1-L-Alanine, 6-L-threonine analogue: [155964-90-2]
$C_{48}H_{68}N_{12}O_{11}$ 989.139
Isol. from plasma of *Python reticulatus.*

5-L-Tryphophan analogue: [77669-54-6]
Isol. from plasma of the bowfin *Amia calva*.

5-L-Tryptophan, 8-L-leucine analogue: [188947-67-3]
$C_{49}H_{76}N_{16}O_{11}$ 1065.24
Isol. from plasma of the trout *Oncorhynchus mykiss* and the cod *Gadus morhua*.

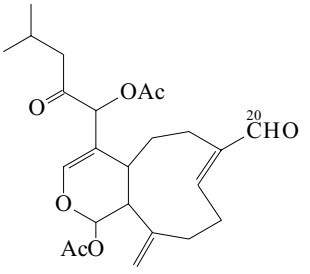
Branacenal B-226

[131623-11-5]



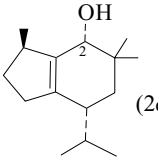
$C_{24}H_{32}O_7$ 432.513
Constit. of *Xenia membranacea*. Amorph.

20-Carboxylic acid: ***Branacenoic acid***
[131643-63-5]
$C_{24}H_{32}O_8$ 448.512
Constit. of *Xenia membranacea*. Amorph. $[\alpha]_D$ +5 (c, 0.67 in $CHCl_3$).

20-Carboxylic acid, Me ester: ***Methyl branacenoate***
$C_{25}H_{34}O_8$ 462.539
Constit. of *Xenia membranacea*. Amorph.

Almourabit, A. *et al., J. Nat. Prod.*, 1990, **53**, 894 (*isol, pmr, cmr*)

1(6)-Brasilen-2-ol B-227



(2α,9β)–*form*

$C_{15}H_{26}O$ 222.37

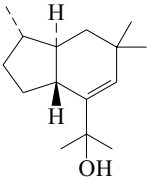
(2α,9β)-*form*
2-Epibrasilenol. *2*-epi-*Brasilenol*
[70000-41-8]
From *Aplysia brasiliana*.
Oil. $[\alpha]_D^{21}$ +96 (c, 1.05 in $CHCl_3$).

(2β,9β)-*form*
Brasilenol
[70000-39-4]
Constit. of *Aplysia brasiliana*.
Cryst.
Mp 55-56°. $[\alpha]_D^{21}$ +33.4 (c, 1.6 in $CHCl_3$).

Ac: Brasilenol acetate
[70000-40-7]
$C_{17}H_{28}O_2$ 264.407
Constit. of *Aplysia brasiliana*. Oil.

Stallard, M.O. *et al., Tetrahedron*, 1978, **34**, 2077-2081 (*isol, struct*)
Greene, A.E. *et al., J.O.C.*, 1986, **51**, 4250; 1987, **52**, 1169 (*synth, abs config*)

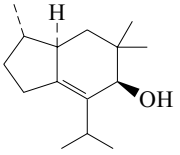
4-Brasilen-10-ol B-228



$C_{15}H_{26}O$ 222.37

(1α,6β,9α)-*form* [136978-51-3]
Constit. of *Laurencia implicata*.
Oil. $[\alpha]_D^{22}$ -3 (c, 0.17 in $CHCl_3$). Struct. revised in 1994.
Wright, A.D. *et al., J. Nat. Prod.*, 1991, **54**, 1025 (*isol, pmr, cmr*)
Tori, M. *et al., Tet. Lett.*, 1994, **35**, 3105 (*synth, struct, abs config*)

5-Brasilen-4-ol B-229



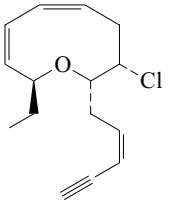
$C_{15}H_{26}O$ 222.37

(1α,4β,9α)-*form* [135448-11-2]
Metab. of *Laurencia obtusa*.
Pale yellow oil. $[\alpha]_D^{25}$ -36.1 (c, 1.6 in EtOH).

(1β,4α,9β)-*form* [136978-49-9]
Constit. of *Laurencia implicata*.
Oil. $[\alpha]_D^{22}$ -45 (c, 0.03 in $CHCl_3$).
[136978-49-9]
Wright, A.D. *et al., J. Nat. Prod.*, 1991, **54**, 1025 (*isol, pmr, cmr*)
Amico, V. *et al., Phytochemistry*, 1991, **30**, 1921 (*isol, pmr, cmr*)

Brasilenyne B-230

3-Chloro-9-ethyl-2,3,4,9-tetrahydro-2-(2-penten-4-ynyl)oxonin, 9CI
[71778-84-2]

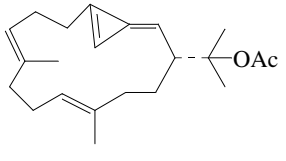


Absolute configuration

$C_{15}H_{19}ClO$ 250.767
Isol. from the sea hare *Aplysia brasiliana*. Cryst. (pentane). Sol. MeOH, C_6H_6; poorly sol. H_2O.
Mp 37-38°. $[\alpha]_D^{21}$ +216 (c, 0.017 in $CHCl_3$). λ_{max} 224 (ϵ 14000) (MeOH) (Berdy).
Kinnel, R.B. *et al., Proc. Natl. Acad. Sci. U.S.A.*, 1979, **76**, 3576-3579 (*isol, pmr, cmr, cryst struct*)
Denmark, S.E. *et al., J.A.C.S.*, 2004, **126**, 12432-12440 (*synth*)

Brassicolene B-231

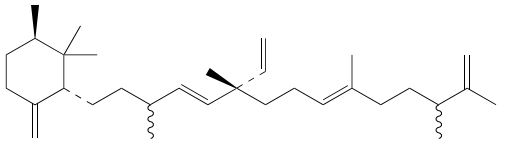
[268558-54-9]



$C_{22}H_{32}O_2$ 328.494
Constit. of *Nephthea brassica*. Oil. $[\alpha]_D^{25}$ +16.2 (c, 0.06 in $CHCl_3$). λ_{max} 226 (log ϵ 4.16) (no solvent reported).
Duh, C.-Y. *et al., Tet. Lett.*, 2000, **41**, 1401-1403 (*isol, pmr, cmr*)

Braunicene B-232

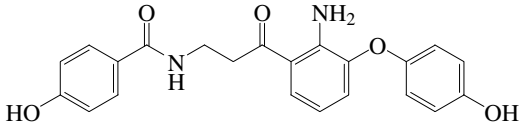
10-Ethenyl-2,3,6,10,13-pentamethyl-15-(2,2,3-trimethyl-6-methylenecyclohexan-1-yl)-1,6,11-pentadecatriene. Meijicoccene
[114066-81-8]



$C_{32}H_{54}$ 438.779
Isol. from the green alga *Botryococcus braunii*. Oil. $[\alpha]_D^{25}$ -29 (c, 3.15 in $CHCl_3$).
Huang, Z. *et al., J.A.C.S.*, 1988, **110**, 3959 (*isol, pmr, cmr, struct*)
Huang, Z. *et al., J.O.C.*, 1988, **53**, 4089 (*abs config*)
Murakami, M. *et al., Phytochemistry*, 1988, **27**, 455

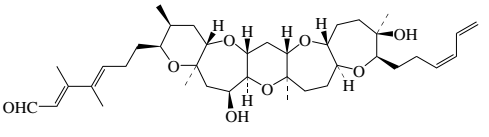
Brefelamide B-234

N-*[3-[2-Amino-3-(4-hydroxyphenoxy)phenyl]-3-oxopropyl]-4-hydroxybenzamide, 9CI*
[868529-07-1]



$C_{22}H_{20}N_2O_5$ 392.41
Isol. from *Dictyostelium brefeldianum* and *Dictyostelium giganteum*. Inhibitor of astrocytoma. Yellow oil.
Kikuchi, H. *et al., J.O.C.*, 2005, **70**, 8854-8858 (*isol, synth, pmr, cmr*)

Brevenal B-235

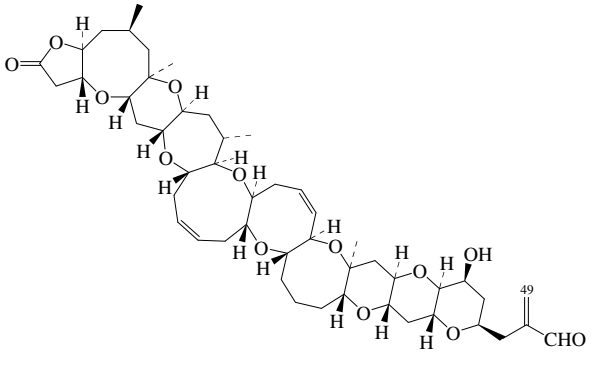


Relative Configuration

$C_{39}H_{60}O_8$ 656.898
Proposed struct. shown to be in need of revision (2006). Isol. from the dinoflagellate *Karenia brevis*. Amorph. solid. λ_{max} 227; 290 (no solvent reported).
Bourdelais, A.J. *et al., J. Nat. Prod.*, 2005, **68**, 2-6 (*isol, pmr, cmr*)
Fuwa, H. *et al., J.A.C.S.*, 2006, **128**, 9648-9650 (*synth*)

Brevetoxin A B-236

Brevetoxin 1. Brevetoxin PbTx1. ***PbTx1****. Toxin GB1. GB1 Toxin†. T46 Toxin*
[85087-27-0]



$C_{49}H_{70}O_{13}$ 867.084

Prod. by *Gymnodinium breve* and *Ptychodiscus brevis*. Potent neuro- and ichthyotoxin. Fine prisms (MeCN). Sol. $CHCl_3$, hexane; poorly sol. H_2O.
Mp 197-199° Mp 218-220° (double Mp). λ_{max} 208 (ϵ 16000) (MeOH) (Derep). λ_{max} 208 (ϵ 11000); 215 (MeOH) (Berdy).

Di-Me acetal: Mp 233-235°.

44-Alcohol: Brevetoxin PbTx7. ***PbTx7***. *Toxin GB7*. *GB7 Toxin*
[99798-30-8]
$C_{49}H_{72}O_{13}$ 869.1
Prod. by *Gymnodinium breve* and *Ptychodiscus brevis*. Neuro- and ichthyotoxin. Sol. Et_2O.

43,49-Dihydro, 44-alcohol: Brevetoxin PbTx10. ***PbTx10***
[148132-90-5]
$C_{49}H_{74}O_{13}$ 871.116
Isol. from *Gymnodinium breve*.

[98112-41-5]

Bromine, 11CI B-245

Dibromine
[7726-95-6]
Br_2
Br 79.904

Atomic No. 35. Ground state electron config. $[Ar]3d^{10}4s^24p^5$. Isol. in 1826 by A.J. Balard and C. Löwig. There are 19 isotopes of which ^{79}Br and ^{81}Br are natural and are of importance in nmr spectroscopy. Abundance: 2.5 ppm (earth's crust) and 65 ppm (sea water). Br–Br: 228 pm, 227 pm (solid). Obt. as bromide from natural brines from wells in USA. Oxidation by air gives the element. Synth. from metallic bromides by reaction with oxidants (e.g. $K_2Cr_2O_7/H_2SO_4$). Liberated from brines on chlorination. Occurs naturally in several marine spp. Used in making lead scavenging agents, fumigants, flameproofing agents, water purifn. prods., and many fine chemicals with wide applications. Strong oxidant. Dark brownish-red liq., with a strong disagreeable pungent odour, forming rhombic cryst. Sol. H_2O (3% at r.t.) increased in presence of bromide salts. Misc. most org. solvs. (although it may react). d^{20} 3.12.
Mp -7.3°. Bp 59.5°. Forms adducts with many org. compds. (e.g. ethers such as dioxan, and aromatic hydrocarbons) and also hydrates. Dissociates > 600°. Bond energy 193 kJ mol^{-1}.
►Causes painful burns on skin contact; irritates eyes and throat.
EF9100000

Octahydrate:
Light red cryst. Cubic. May be stored at r.t.

Bromine 75 [14809-47-3]
Radioactive, $t_{½}$ 1.62 h. Prod. from ^{74}Se (d,n), ^{74}Se (p,γ), or ^{65}Cu (^{12}C,2n). Also obt. by proton bombardment of Br or Y. I = -3/2; μ = 0.75(11) μ_N. Decays by orbital electron capture or $\beta^{\oplus}$ emission to ^{75}Se.

Bromine 76 [15765-38-5]
Radioactive, $t_{½}$ 16.0 h. Prod. from ^{75}As (α,3n). Used in diagnostic nuclear medicine.
I = -1; μ = 0.54821 μ_N. Decays by $\beta^{\oplus}$ emission, or orbital electron capture to ^{76}Se.

Bromine 77 [15765-39-6]
Radioactive, $t_{½}$ 2.376 d. Prod. from ^{75}As (α,2n). Used in diagnostic nuclear medicine.
I = -3/2. Decays by orbital electron capture (99%), or $\beta^{\oplus}$ emission (1%) to ^{77}Se.

Bromine 79 [14336-94-8]
Stable. Representative abundance 50.69 atom %. I = -3/2; μ = +2.106399 μ_N. Nmr relative sensitivity (^1H=1.00) 0.0786; receptivity (^{13}C=1.00) 226.

Bromine 80 [14391-61-8]
Radioactive, $t_{½}$ 17.68 min. Prod. from ^{79}Br (n,γ), ^{81}Br (γ,n), or ^{79}Br (d,p). Daughter of ^{80m}Br (4.42 h). I = +1; μ = 0.5140 μ_N. Decays by $\beta^{\ominus}$ emission (91.7%) to ^{80}Kr, or by $\beta^{\oplus}$ emission (8.3%) to ^{80}Se.

Bromine 80m
Radioactive, $t_{½}$ 4.42 h. Prod. from ^{79}Br (n,γ). I = -5; μ = +1.3177 μ_N. Decays by isomeric transition to ^{80}Br.

Bromine 81 [14380-59-7]
Stable. Representative abundance 49.31 atom %. Preferred isotope for nmr spectroscopy.
I = -3/2; μ = +2.270560 μ_N. Nmr relative sensitivity (^{1}H=1.00) 0.0985; receptivity (^{13}C=1.00) 277.

Bromine 82 [14686-69-2]
Radioactive, $t_{1/2}$ 1.471 d. Prod. from ^{81}Br (n,γ). Used in diagnostic nuclear medicine.
I = -5; μ = +1.6270 μ_N. Decays by $\beta^\ominus$ emission to ^{82}Kr.

Bromine 83 [14687-62-8]
Radioactive, $t_{1/2}$ 2.39 h. Daughter of ^{83}Se. I = -3/2. Decays by $\beta^\ominus$ emission to ^{83m}Kr.

Bromine 84 [14331-90-9]
Radioactive, $t_{1/2}$ 31.8 min. Prod. from ^{87}Rb (n,α), or by thermal neutron-induced nuclear fission. I = -2. Decays by $\beta^\ominus$ emission to ^{84}Kr.

Bromine 87 [13982-62-2]
Radioactive, $t_{1/2}$ 55.69 s. Prod. by thermal neutron-induced nuclear fission. I = -3/2. Decays by $\beta^\ominus$ emission to ^{87}Kr, or by neutron emission.

Bromine 88 [14280-22-9]
Radioactive, $t_{1/2}$ 16.7 s. Prod. by thermal neutron-induced nuclear fission. I = -1. Decays by $\beta^\ominus$ emission to ^{88}Kr, or by neutron emission.

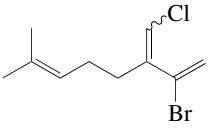
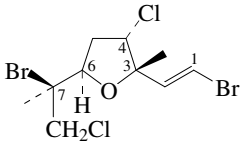
[55498-43-6]



$C_{10}H_{14}BrCl$ 249.577
Tentative struct. Constit. of *Chondrococcus hornemanni* (*Portieria hornemannii*).

Ichikawa, N. *et al., Chem. Lett.*, 1974, 1333-1336 (*isol, ms*)

5-(1-Bromo-2-chloro-1-methylethyl)-2-(2-bromoethenyl)-3-chlorotetrahydro-2-methylfuran B-319
1,7-Dibromo-4,8-dichloro-3,6-epoxy-3,7-dimethyl-1-octene

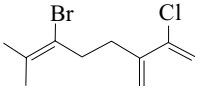


$C_{10}H_{14}Br_2Cl_2O$ 380.933
Terpenoid numbering shown.

(1E,3R*,4R*,6R*,7R*)-form [479072-74-7]
Constit. of *Plocamium cartilagineum*.
Oil. $[\alpha]_D^{25}$ -153 (c, 0.02 in $CHCl_3$).

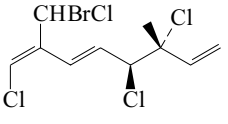
4-Dechloro, 4α-bromo: ***3-Bromo-5-(1-bromo-2-chloro-1-methylethyl)-2-(2-bromoethenyl)tetrahydro-2-methylfuran***. *1,4,7-Tribromo-8-chloro-3,6-epoxy-3,7-dimethyl-1-octene*
[479072-75-8]
$C_{10}H_{14}Br_3ClO$ 425.385
Constit. of *Plocamium cartilagineum*. Oil. $[\alpha]_D^{25}$ -120 (c, 0.01 in $CHCl_3$).
Díaz-Marrero, A.R. *et al., Tetrahedron*, 2002, **58**, 8539-8542 (*isol, pmr, cmr*)

6-Bromo-2-chloro-7-methyl-3-methylene-1,6-octadiene B-320
6-Bromo-2-chloromyrcene
[55498-42-5]



$C_{10}H_{14}BrCl$ 249.577
Constit. of *Chondrococcus hornemanni*. Oil.
Ichikawa, N. *et al., Chem. Lett.*, 1974, 1333-1336 (*isol, ms*)
Burreson, B.J. *et al., Chem. Lett.*, 1975, 1111-1114 (*cmr*)

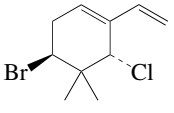
2-(Bromochloromethyl)-1,5,6-trichloro-6-methyl-1,3,7-octatriene, 9CI B-321
[89197-88-6]



$C_{10}H_{11}BrCl_4$ 352.912
Sol. MeOH, C_6H_6; fairly sol. hexane; poorly sol. H_2O.

(3R*,4S*,5E,7E)-form
Constit. of *Plocamium cartilagineum*.
Oil.
Crews, P. *et al., J.O.C.*, 1984, **49**, 1371 (*isol, struct, cmr*)

6-Bromo-8-chloro-1,3-ochtodadiene B-322
[159125-50-5]
[67237-07-4]



$C_{10}H_{14}BrCl$ 249.577
Constit. of *Portieria hornemannii*. λ_{max} 233 (ε 15400) (MeOH).
McConnell, O.J. *et al., J.O.C.*, 1978, **43**, 4238-4241 (*synth, pmr*)
Fuller, R.W. *et al., J. Med. Chem.*, 1994, **34**, 4407-4411 (*isol*)

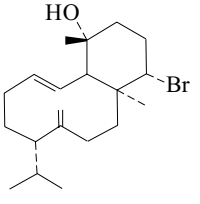
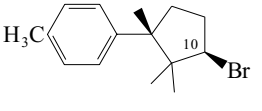
Bromocontryphan B-325
[186821-81-8]
Gly-Cys-Hyp-D-Trp-Glu-Pro-Trp*-Cys-NH_2
$C_{45}H_{54}BrN_{11}O_{11}S_2$ 1069.025
Peptide containing 6-bromotryptophan (Trp*) and 4-hydroxyproline (Hyp) residues. Isol. from venom of *Conus radiatus*.
Jimenez, E.C. *et al., Biochemistry*, 1997, **36**, 989-994 (*isol*)

Bromocorodienol B-326
[92675-10-0]



$C_{20}H_{33}BrO$ 369.384
Constit. of red alga *Sphaerococcus coronopifolius*. Cryst. (MeCN). Mp 89-91°. $[\alpha]_D$ +34.3 (c, 1.5 in $CHCl_3$).
Cafieri, F. *et al., Tet. Lett.*, 1984, **25**, 3141

α-Bromocuparene B-327
1-(3-Bromo-1,2,2-trimethylcyclopentyl)-4-methylbenzene, 9CI. Bromocuparene
[57794-64-6]

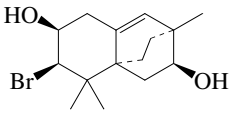


$C_{15}H_{21}Br$ 281.235

Constit. of *Laurencia* spp. Oil. $[\alpha]_D$ +23 (c, 0.95 in $CHCl_3$).

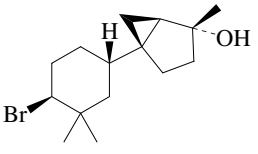
10-Epimer: ***α-Isobromocuparene***
[57766-60-6]
$C_{15}H_{21}Br$ 281.235
Constit. of *Laurencia* spp. Oil. $[\alpha]_D$ +91 (c, 0.87 in $CHCl_3$).
Suzuki, T. *et al., Tet. Lett.*, 1975, 3057

10-Bromo-3,14-cyclo-7(14)-chamigrene-2,9-diol B-328
[488834-25-9]



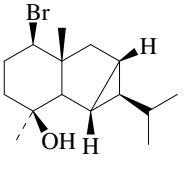
$C_{15}H_{23}BrO_2$ 315.25
Constit. of *Caloglossa leprieurii*. Cryst.
Mp 104-105°.
Xu, X.H. *et al., Chin. Chem. Lett.*, 2002, **13**, 953-954 (*isol, pmr, cmr*)

Bromocyclococanol B-329
[439612-81-4]



$C_{15}H_{25}BrO$ 301.266
Constit. of *Laurencia obtusa*. Oil. $[\alpha]_D^{25}$ +7.3 (c, 0.2 in $CHCl_3$).
Brito, I. *et al., Tet. Lett.*, 2002, **43**, 2551-2553 (*isol, pmr, cmr*)

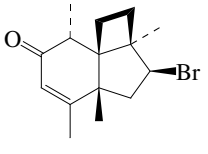
1-Bromo-6,8-cyclo-4-eudesmanol B-330



$C_{15}H_{25}BrO$ 301.266

(1β,4β,6β*H*,8β*H*)-*form* [479633-71-1]
Constit. of *Laurencia microcladia*.
Oil. $[\alpha]_D^{20}$ +10 (c, 0.13 in MeOH).
Guella, G. *et al., Z. Naturforsch., B*, 2002, **57**, 1147-1151 (*isol, pmr, cmr*)

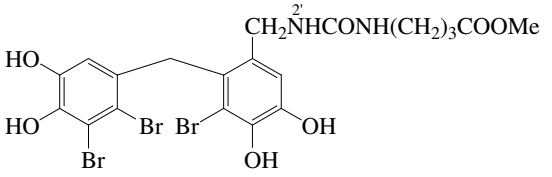
7-Bromo-8,11-cyclo-3-perforen-2-one B-331



$C_{15}H_{21}BrO$ 297.234

(1α,7β,8*R*,11*S*)-*form* [874193-59-6]
Constit. of *Laurencia obtusa*.
Oil. $[\alpha]_D^{20}$ -40.4 (c, 0.14 in CH_2Cl_2). λ_{max} 228 (log ϵ 4.1) (hexane).
Kladi, M. *et al., Tetrahedron*, 2006, **62**, 182-189 (*Laurencia obtusa constit*)

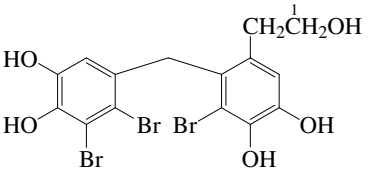
***N*-[3-Bromo-2-(2,3-dibromo-4,5-dihydroxybenzyl)-4,5-dihydroxybenzyl]-*N′*-(3-methoxycarbonylpropyl)urea** B-332
Methyl N′*-[3-bromo-(2,3-dibromo-4,5-dihydroxybenzyl)-4,5-dihydroxybenzyl] γ-ureidobutyrate*



$C_{20}H_{21}Br_3N_2O_7$ 641.107
Constit. of *Rhodomela confervoides*. Brown powder.
Mp 176-178°.

$N^{2'}$*-(2,3-Dibromo-4,5-dihydroxybenzyl):*
$C_{27}H_{25}Br_5N_2O_9$ 921.023
Constit. of *Rhodomela confervoides*. Brown gum.
Ma, M. *et al., J. Nat. Prod.*, 2006, **69**, 206-210 (*isol, pmr, cmr, ms*)

2-(3-Bromo-2-(2,3-dibromo-4,5-dihydroxybenzyl)-4,5-dihydroxyphenyl)ethanol B-333



$C_{15}H_{13}Br_3O_5$ 512.977

1-Sulfate:
$C_{15}H_{13}Br_3O_8S$ 593.041
Constit. of *Rhodomela confervoides*. Brown gum. λ_{max} 209 (log ϵ 4.75); 290 (log ϵ 3.68) (MeOH).
Ma, M. *et al., J. Nat. Prod.*, 2006, **69**, 206-210 (*isol, pmr, cmr, ms*)

Bromomethane, 9CI B-466

Methyl bromide, BSI, ISO, JMAF. R 40B1. Dow Fume MC2. Halon 1001. Terabol. Curafume
[74-83-9]
H_3CBr
CH_3Br 94.939
Isol. from various marine sources incl. giant kelp and ice algae.

Used as a solvent for extraction of plant oils and as a refrigerant. Stratospheric ozone depleting agent. Principally used as an insecticidal and nemacidal fumigant, esp. for soil and agricultural produce. Gas with faint chloroform-like odour. Spar. sol. H_2O. Mp -93.7°. Bp 4.5° (3.6°). Forms a hydrate at 0-5°. The signatory countries to the 1995 Montreal Treaty have agreed to phase out the industrial use of methyl bromide by 2010, in the USA its use will be banned after 1st January 2005.

▶ Autoignition temp. 535/537°. Vapour can ignite or explode if strongly heated. Eye irritant and vesicant which can penetrate rubber protection equipment. One of the most toxic organic halides, whose effects are cumulative and may be delayed after exposure. Organs affected after inhalation or percutaneous absorption include nervous system, kidneys and lung. Acute or chronic exposure can be fatal. Exp. carcinogen. OES: long-term 5 ppm; short-term 15 ppm (Sk). PA4900000

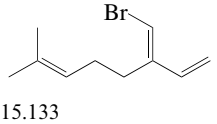
3-(Bromomethylene)-7-methyl-1,6-octadiene B-477

10-Bromo-β-myrcene



(*E*)-*form*

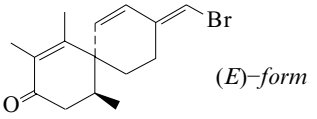
$C_{10}H_{15}Br$ 215.133

(*E*)-*form*
10-Bromomyrcene
[55498-37-8]
Constit. of *Chondrococcus hornemanni* (*Portieria hornemannii*).
Called (*Z*)- in ref.

(*Z*)-*form* [55498-36-7]
Constit. of *Chondrococcus hornemanni* (*Portieria hornemannii*).
Called (*E*)- in ref.
Ichikawa, N. *et al., Chem. Lett.*, 1974, 1333-1336 (*isol, ms*)
Burreson, B.J. *et al., Chem. Lett.*, 1975, 1111-1114 (*biosynth*)
Burreson, B.J. *et al., Tet. Lett.*, 1975, 2155-2158 (*isol*)

9-(Bromomethylene)-1,2,5-trimethylspiro[5.5]undeca-1,7-dien-3-one B-478

[101686-86-6]



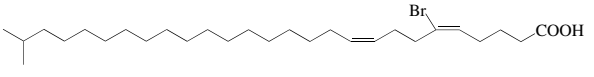
(*E*)–*form*

$C_{15}H_{19}BrO$ 295.218

(*E*)-*form*
Constit. of *Aplysia dactylomela.*
Oil.

(*Z*)-*form*
From *Aplysia dactylomela.*
Cryst.
Mp 97-99.5°. $[\alpha]_D^{20}$ +33.5 (c, 0.074 in $CHCl_3$).
Sakai, R. *et al., Helv. Chim. Acta*, 1986, **69**, 91
Iwata, C. *et al., Chem. Ind. (London)*, 1987, 294 (*synth, struct*)

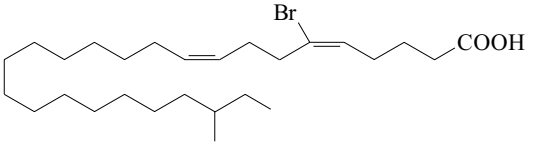
6-Bromo-26-methyl-5,9-heptacosadienoic acid B-479



$C_{28}H_{51}BrO_2$ 499.614

(5*E*,9*Z*)-*form*
cis,cis-*form*
[162259-51-0]
Isol. from the sponge *Xestospongia* sp.
Li, Y. *et al., J. Chem. Res., Synop.*, 1995, 126-127 (*isol*)

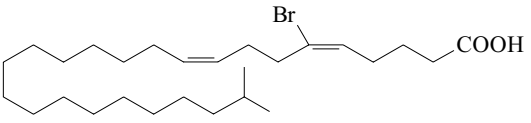
6-Bromo-24-methyl-5,9-hexacosadienoic acid B-480



$C_{27}H_{49}BrO_2$ 485.587

(5*E*,9*Z*)-*form*
cis,cis-*form*
[92313-34-3]
Constit. of the phospholipids of the sponges *Petrosia ficiformis* and *Petrosia hebe.* Incorr. descr. as (*Z,Z*)-.
Wijekoon, W.M.D. *et al., Tet. Lett.*, 1984, **25**, 3285 (*isol*)

6-Bromo-25-methyl-5,9-hexacosadienoic acid B-481



$C_{27}H_{49}BrO_2$ 485.587

(5*E*,9*Z*)-*form*
cis,cis-*form*
[162259-50-9]
[92340-05-1]
Constit. of the phospholipids of the sponges *Petrosia ficiformis*, *Petrosia hebes* and *Xestospongia* sp. Incorr. descr. as (*Z,Z*)-.
Wijekoon, W.M.D. *et al., Tet. Lett.*, 1984, **25**, 3285-3288 (*isol*)

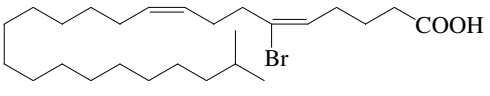
$C_{29}H_{53}BrO_2$ 513.641

(5*E*,9*Z*)-*form*
cis,cis-*form*
[162259-52-1]
Isol. from the sponge *Xestospongia* sp.
Li, Y. *et al., J. Chem. Res., Synop.*, 1995, 126-127 (*isol*)

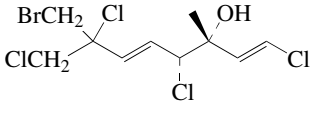
6-Bromo-24-methyl-5,9-pentacosadienoic acid B-484



$C_{26}H_{47}BrO_2$ 471.56

(5*E*,9*Z*)-*form* [150994-72-2]
Constit. of an *Agelas* sp.
Carballeira, N.M. *et al., Lipids*, 1993, **28**, 763-766 (*isol*)

7-Bromomethyl-1,4,7,8-tetrachloro-3-methyl-1,5-octadien-3-ol B-485

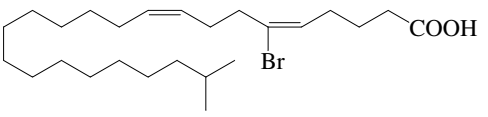


$C_{10}H_{13}BrCl_4O$ 370.927

(1*E*,3*R*,4*R*,5*E*,7ξ)-*form* [130770-03-5]
Constit. of *Pantoneura plocamioides*. Earlier isol. from *Plocamium cartilagineum*, prob. as a mixt. of stereoisomers.
Oil. $[\alpha]_D^{25}$ -28 (c, 0.30 in $CHCl_3$).

(1*E*,3*S*,4*R*,5*E*,7ξ)-*form* [207130-31-2]
Constit. of *Pantoneura plocamioides*.
Oil. $[\alpha]_D^{25}$ -50.8 (c, 0.42 in $CHCl_3$).
Rovirosa, J. *et al., Bol. Soc. Chil. Quim.*, 1990, **35**, 131-135 (*isol*)
Cueto, M. *et al., Tetrahedron*, 1998, **54**, 3575-3580 (*isol, pmr, cmr*)

6-Bromo-23-methyl-5,9-tetracosadienoic acid B-486

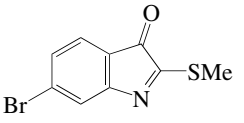


$C_{25}H_{45}BrO_2$ 457.533

(5*E*,9*Z*)-*form* [150994-70-0]
Constit. of an *Agelas* sp.
Carballeira, N.M. *et al., Lipids*, 1993, **28**, 763-766 (*isol*)

6-Bromo-2-(methylthio)-3*H*-indol-3-one, 9CI B-487

Tyrindoleninone
[50630-70-1]



C_9H_6BrNOS 256.123
Alkaloid from the mollusc *Dicathais orbita*. Red needles.
Mp 109.5°. λ_{max} 217 (ε 8700); 242 (ε 25000); 247 (ε 25000); 278 (ε 11000); 318 (ε 5200); 333 (ε 5000); 355 (ε 2700); 426 (ε 1700); 447 (ε 1700) (hexane).

Metab. of *Aplysia dactylomela*. Cytotoxic agent. Oil. Sol. MeOH, $CHCl_3$; poorly sol. H_2O, hexane. $[\alpha]_D$ -40 (c, 0.03 in $CHCl_3$).

2,7-Di-Ac: Parguerol 7-acetate
$C_{24}H_{35}BrO_6$ 499.441
Constit. of *Laurencia saitoi*. Oil. $[\alpha]_D^{26}$ -5.41 (c, 0.64 in $CHCl_3$).

2,16-Di-Ac: Parguerol 16-acetate
[83115-43-9]
$C_{24}H_{35}BrO_6$ 499.441
Constit. of *Laurencia saitoi* and *Aplysia dactyomela*. Cytotoxic agent.

2,19-Di-Ac: Parguerol 19-acetate
$C_{24}H_{35}BrO_6$ 499.441
Constit. of *Laurencia saitoi*. Oil. $[\alpha]_D^{20}$ -17.1 (c, 0.81 in $CHCl_3$).

2,7,16-Tri-Ac:
$C_{26}H_{37}BrO_7$ 541.478
Constit. of *Laurencia filiformis*. Waxy solid. $[\alpha]_D$ -13.2 (c, 0.15 in $CHCl_3$).

2,16,19-Tri-Ac:
$C_{26}H_{37}BrO_7$ 541.478
Metab. of *Laurencia obtusa*. Viscous oil. $[\alpha]_D$ -37.8 (c, 1.54 in $CHCl_3$).

Tetra-Ac:
$C_{28}H_{39}BrO_8$ 583.515
Constit. of *Laurencia filiformis*. Oil.

2-Ketone: ***15-Bromo-7,16,19-trihydroxy-9(11)-pargueren-2-one***
$C_{20}H_{29}BrO_4$ 413.351
Metab. of *Laurencia obtusa*. Glassy solid. $[\alpha]_D$ -41 (c, 0.89 in MeOH).

Schmitz, F.J. *et al., J.A.C.S.*, 1982, **104**, 6415-6423 (*Parguerol*)

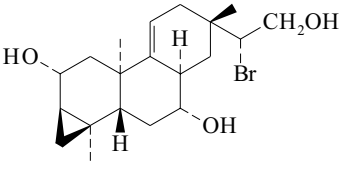
15-Bromo-9(11)-parguerene-2,7,16-triol B-510



Absolute configuration

$C_{20}H_{31}BrO_3$ 399.367

(*ent*-2β,7β,15*S*)-*form* [124974-50-1]
Metab. of *Laurencia obtusa*.
Cryst.
Mp 173-174°. $[\alpha]_D$ -36.4 (c, 1.85 in $CHCl_3$).

2-Ac: ***Deoxyparguerene****. Deoxyparguerol*
[83115-44-0]
$C_{22}H_{33}BrO_4$ 441.404
Found in *Aplysia dactylomela* and *Laurencia obtusa*. Cytotoxic. Oil. Sol. MeOH, $CHCl_3$; poorly sol. H_2O, hexane. $[\alpha]_D$ -35.8 (c, 0.62 in $CHCl_3$).

2,16-Di-Ac: [82668-11-9]
$C_{24}H_{35}BrO_5$ 483.441
Metab. of *Laurencia obtusa*. Cryst.
Mp 121-123°. $[\alpha]_D$ -48 (c, 0.1 in MeOH).

2,7-Di-Ac:
$C_{24}H_{35}BrO_5$ 483.441
Constit. of *Laurencia filiformis*. Oil. $[\alpha]_D$ -10 (c, 0.2 in $CHCl_3$).

Tri-Ac:
$C_{26}H_{37}BrO_6$ 525.479
Constit. of *Laurencia filiformis*. Oil.

Schmitz, F.J. *et al., J.A.C.S.*, 1982, **104**, 6415-6423 (*isol, pmr*)

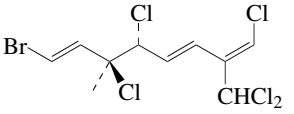
$C_{20}H_{33}BrO_2$ 385.383
Constit. of red alga *Sphaerococcus coronopifolius*. Oil. $[\alpha]_D$ -5.9 (c, 0.5 in $CHCl_3$).

12β-Hydroxy, 1-Me ether:
$C_{21}H_{35}BrO_3$ 415.41
Constit. of *Sphaerococcus coronopifolius*. Oil. $[\alpha]_D$ +0.5 ($CHCl_3$).
Cafieri, F. *et al., Tetrahedron*, 1986, **42**, 4273-4276 (*isol, pmr, cmr, ms, struct, biosynth*)
Cafieri, F. *et al., Gazz. Chim. Ital.*, 1990, **120**, 139 (*deriv*)

8-Bromo-1,5,6-trichloro-2-(dichloromethyl)-6-methyl-1,3,7-octatriene B-546

1-Bromo-7-dichloromethyl-3,4,8-trichloroocta-1,5,7-triene



(1*E*,3*E*,5*R**,6*S**,7*E*)-*form*

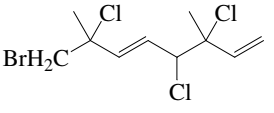
$C_{10}H_{10}BrCl_5$ 387.357

(1*E*,3*E*,5*R,6*S**,7*E*)-*form*** [57766-79-7]
Constit. of *Plocamium cartilagineum*. Metab. of *Aplysia dactylomela*. Shows antibacterial and algicide activity. $[\alpha]_D^{25}$ -22.9 (c, 0.9 in $CHCl_3$).

(1*Z*,3*E*,5*R,6*R**,7*E*)-*form*** [57766-77-5]
Constit. of the red alga *Plocamium cartilagineum*.
$[\alpha]_D^{25}$ +4.7 (c, 1.1 in $CHCl_3$). λ_{max} 244 (pentane).

(1*Z*,3*E*,5*R,6*S**,7*E*)-*form*** [57766-78-6]
Constit. of *Plocamium cartilagineum*.
$[\alpha]_D^{25}$ -4.4 (c, 1.1 in $CHCl_3$). λ_{max} 242 (pentane).
Mynderse, J.S. *et al., Tetrahedron*, 1975, **31**, 1963-1967 (*isol, uv, pmr, ms*)
Wessels, M. *et al., J. Nat. Prod.*, 2000, **63**, 920-928 (*cmr, activity*)

8-Bromo-3,4,7-trichloro-3,7-dimethyl-1,5-octadiene B-547

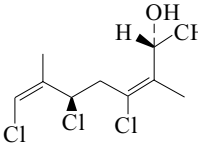


$C_{10}H_{14}BrCl_3$ 320.483

(5*E*)-*form*
Isol. from *Aplysia californica*. Not fully characterised.
Ireland, C. *et al., J.O.C.*, 1976, **41**, 2461-2465 (*isol, pmr*)

1-Bromo-4,6,8-trichloro-3,7-dimethyl-3,7-octadien-2-ol B-548

Costatol
[63023-57-4]

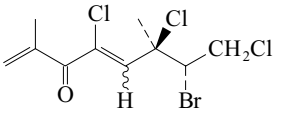


Absolute configuration

$C_{10}H_{14}BrCl_3O$ 336.482
Constit. of *Plocamium costatum*. Cryst. (hexane). Sol. MeOH, Et_2O; poorly sol. H_2O.
Mp 88-89°. $[\alpha]_D$ -103 (c, 1 in $CHCl_3$).
Kazlauskas, R. *et al., Tet. Lett.*, 1976, 4451

7-Bromo-4,6,8-trichloro-2,6-dimethyl-1,4-octadien-3-one B-549

Plocamenone
[89353-92-4]



$C_{10}H_{12}BrCl_3O$ 334.466

Constit. of the red alga *Plocamium* sp. Oil. Sol. MeOH, C_6H_6; poorly sol. H_2O. $[\alpha]_D$ -17.3 ($CHCl_3$). λ_{max} 232 (ϵ 6310) (MeOH) (Derep). λ_{max} 232 (ϵ 6450) (MeOH) (Berdy).

▶ Shows mutagenic props.

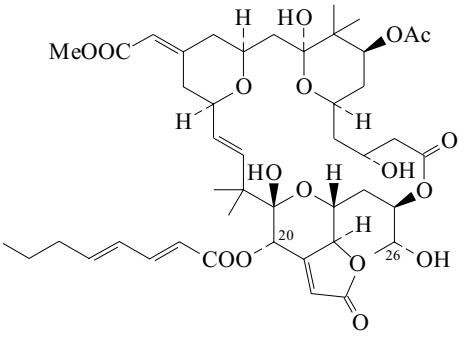
Bryostatin 3 B-571

[87370-86-3]



$C_{46}H_{64}O_{17}$ 889.001

Macrolide antibiotic. The original isolate called Bryostatin 3 was assigned the incorrect C-20 config. Later the 20-epimer was isolated and called Bryostatin 3- the original compd. was renamed 20-Epibryostatin 3. Isol. from the marine Bryozoan, *Bugula neritina*. Antineoplastic agent. Sol. MeOH, $CHCl_3$; poorly sol. H_2O, hexane. Log P 0.09 (uncertain value) (calc). λ_{max} 230 (ϵ 36000); 263 (ϵ 35000) (MeOH) (Derep). λ_{max} 230 (ϵ 36000); 261 (ϵ 35000) (MeOH) (Berdy). λ_{max} 229 (ϵ 31700); 264 (ϵ 30600) (EtOH) (Berdy).

20-Epimer: ***20-Epibryostatin 3***
$C_{46}H_{64}O_{17}$ 889.001
Isol. from *Bugula neritina*. Antineoplastic agent. Amorph. solid. $[\alpha]_D^{25}$ +61 (c, 0.26 in MeOH). Formerly known as Bryostatin 3. λ_{max} 228; 266 (MeOH) (Berdy).

26-Ketone: ***Bryostatin 3 26-ketone***
[132564-78-4]
$C_{46}H_{62}O_{17}$ 886.986
Isol. from *Bugula neritina*. The C-20 config. should presumably be reversed (i.e. to correspond with that of Bryostatin 3). λ_{max} 228; 266 (MeCN) (Berdy).

n-*Butyl alcohol, 8CI. FEMA 2178*
[71-36-3]
[35296-72-1]

$H_3CCH_2CH_2CH_2OH$
$C_4H_{10}O$ 74.122

Mainly produced by hydroformylation of 1-Propene with Carbon monoxide and hydrogen in the oxo process, also from Acetaldehyde by aldol condensation. Occurs in essential oils and other plant sources e.g. *Thea sinensis* (tea), *Ribes nigrum* (blackcurrant). Important industrial chemical, 49th in order of volume for USA in 1994 (production 0.72 million tons/year). Industrial solvent, particularly for lacquer coatings. Used in brake fluids and in plasticiser manuf. Anal. derivatisation reagent for carboxylic and amino acids. Liq. Mod. sol. H_2O. d^{15} 0.81.
Fp -90. Bp 117.4°. n_D^{20} 1.3971. Forms constant-boiling mixt. with H_2O, Bp 92°, contg. 37% H_2O.

▶ Flammable, fl. p. 29/35°, autoignition temp. 359°. Eye, skin and respiratory tract irritant. Mild CNS effects by skin absorption and inhalation (headache, dizziness). Can cause dermatitis. LD_{50} (rat, orl) 790 mg/kg. Exp. reprod. effects. OES: short-term 50 ppm. EO1400000

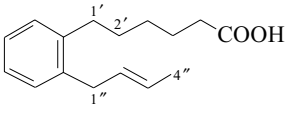
2-(2-Butenyl)benzenehexanoic acid, 9CI B-596

Rubrenoic acid A
[95230-66-3]



$C_{16}H_{22}O_2$ 246.349
Metab. of the marine bacterium *Alteromonas rubra*.

1′,2′-Didehydro: 6-[2-(2-Butenyl)phenyl]-5-hexenoic acid, 9CI. ***Rubrenoic acid B***
[95230-67-4]
$C_{16}H_{20}O_2$ 244.333
From *Alteromonas rubra*.

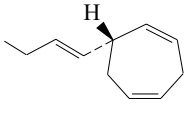
1″,4″-Didehydro: 2-(1,3-Butadienyl)benzenehexanoic acid, 9CI. ***Rubrenoic acid C***
[95230-68-5]
$C_{16}H_{20}O_2$ 244.333
From *Alteromonas rubra*.

$\Delta^{1''}$-Isomer(Z-): 2-(1-Butenyl)benzenehexanoic acid. ***Pseudorubrenoic acid A***
$C_{16}H_{22}O_2$ 246.349
Prod. by the soil bacterium *Pseudomonas fluorescens*.

Holland, G.S. *et al., Chem. Ind. (London)*, 1984, 850-851 (*isol, struct*)
Rickard, R.W. *et al., Tetrahedron*, 2002, **58**, 3793-3800 (*Pseudorubrenoic acid A*)

6-(1-Butenyl)-1,4-cycloheptadiene, 9CI B-597

1-(2,5-Cycloheptadienyl)-1-butene
[38011-59-5]



(R)–(E)–form

$C_{11}H_{16}$ 148.247

(R)-(E)-form
Isol. from *Dictyopteris acrostichoides*.

(S)-(Z)-form
Ectocarpene. *Dictyopterene D′*. *Sirenin*†
[33156-92-2]
Constit. of the essential oil of the seaweed *Dictyopteris* spp., e.g. *Dictyopteris acrostichioides*; sex attractant of androgametes of the brown alga *Ectocarpus siliculosus*.
$[\alpha]_D^{25}$ +75 (c, 0.15 in CH_2Cl_2). CAS describes Ectocarpene as the (*R*)-enantiomer, but this appears to be erroneous.

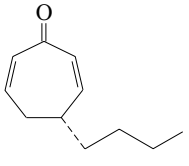
4-Butyl-2,6-cycloheptadienone, 9CI B-603



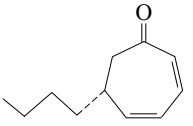
$C_{11}H_{16}O$ 164.247

(*R*)-*form* [52084-28-3]

Present in odoriferous oil from *Dictyopteris* spp.
$[\alpha]_D$ +96 (MeOH/2,3,3-trimethylpentane).

Moore, R.E. *et al., Chem. Comm.*, 1973, 937 (*isol*)

6-Butyl-2,4-cycloheptadienone, 9CI B-604



Probable absolute configuration

$C_{11}H_{16}O$ 164.247

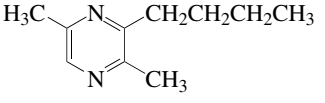
(*R*)-*form* [52084-29-4]

Present in odoriferous oil from *Dictyopteris* spp.
$[\alpha]_D$ +1120 (pentane).

Moore, R.E. *et al., Chem. Comm.*, 1973, 937 (*isol, uv, cmr*)

3-Butyl-2,5-dimethylpyrazine B-605

[40790-29-2]



$C_{10}H_{16}N_2$ 164.25

Isol. from the ant *Iridomyrmex purpureus* and the fly *Anastrepha fraterculus*. Prod. by various marine bacteria. Bp_{12} 101°.

Zavylov, S.I. *et al., Izv. Akad. Nauk SSSR, Ser. Khim.*, 1973, 707 (*synth*)

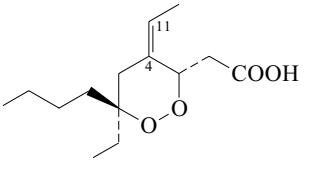
6-Butyl-6-ethyl-4-ethylidene-1,2-dioxan-3-acetic acid B-606

[153566-06-4]



Relative configuration

$C_{14}H_{24}O_4$ 256.341

Constit. of the sponge *Callyspongia* sp. Cytotoxic agent. Faint yellow gum. $[\alpha]_D$ +50 (c, 0.7 in $CHCl_3$). Related to Plakortic acid, P-472.

4α,11-Dihydro: 6-Butyl-4,6-diethyl-1,2-dioxan-3-acetic acid

[153566-07-5]

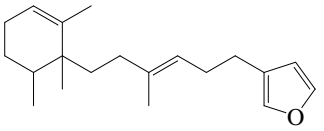
$C_{14}H_{26}O_4$ 258.357

Constit. of *Callyspongia* sp. Cytotoxic agent. Gum. $[\alpha]_D$ +48 (c, 0.5 in $CHCl_3$). C-6 config. not detn.

Toth, S.I. *et al., J. Nat. Prod.*, 1994, **57**, 123

Cacospongin A C-1

[325691-42-7]



$C_{20}H_{30}O$ 286.456
Constit. of a *Cacospongia* sp. Oil. $[\alpha]_D$ -14 (c, 0.16 in $CHCl_3$). λ_{max} 209 (log ϵ 3.9) (MeOH).

Tasdemir, D. *et al., Tetrahedron*, 2000, **56**, 9025-9030 (*isol, pmr, cmr*)

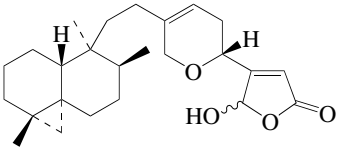
Cacospongionolide C-4

[116079-49-3]

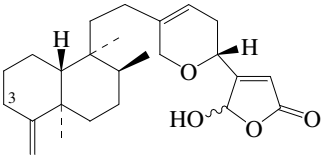


$C_{25}H_{36}O_4$ 400.557
Constit. of *Fasciospongia cavernosa*. Ichthyotoxic and anti-inflammatory agent. Pla_2 enzyme inhibitor. Toxic to brine shrimp. Cryst. Sol. MeOH, Et_2O; fairly sol. hexane; poorly sol. H_2O. Mp 163-165°. $[\alpha]_D$ +27 (c, 1.4 in $CHCl_3$). Source originally identified erroneously as *Cacospongia mollior*. λ_{max} 222 (ϵ 4000) (MeOH) (Derep).

De Rosa, S. *et al., J.O.C.*, 1988, **53**, 5020 (*isol, pmr, cmr*)
Puliti, R. *et al., Acta Cryst. C*, 1990, **46**, 1533 (*cryst struct*)
De Rosa, S. *et al., J. Nat. Prod.*, 1998, **61**, 931-935 (*abs config*)

Cacospongionolide B C-5

[172854-76-1]



$C_{25}H_{36}O_4$ 400.557
Constit. of *Fasciospongia cavernosa*. Pla_2 inhibitor. Antiinflammatory agent. Toxic to brine shrimp. Cryst. (MeOH).
Mp 116-118°. $[\alpha]_D$ +28.2 (c, 2.8 in $CHCl_3$). λ_{max} 223 (ϵ 4500) (MeOH) (Berdy).

Deoxy: ***25-Deoxycacospongionolide B***
$C_{25}H_{36}O_3$ 384.558
Constit. of *Fasciospongia cavernosa*. Toxic to brine shrimp. Cryst. (MeOH).
Mp 159-161°. $[\alpha]_D$ +10.5 (c, 1.4 in $CHCl_3$).

Δ^3-Isomer: ***Cacospongionolide E***
[211304-16-4]
$C_{25}H_{36}O_4$ 400.557
Constit. of *Fasciospongia cavernosa*. Inhibitor of human secretory phospholipase A_2. $[\alpha]_D$ -85.4 (c, 0.2 in $CHCl_3$). λ_{max} 223 (log ϵ 3.64) (MeOH).

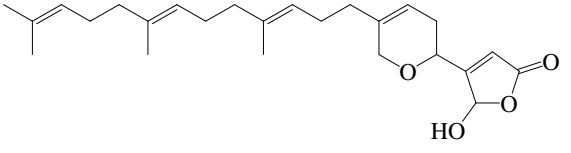
Cacospongionolide D C-6

[198208-70-7]

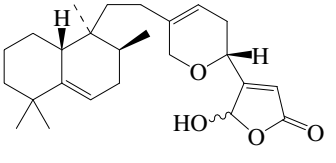


$C_{25}H_{36}O_4$ 400.557
Constit. of *Fasciospongia cavernosa*. Toxic to brine shrimp. Ichthyotoxin. Waxy solid. $[\alpha]_D$ +17.7 (c, 0.2 in $CHCl_3$). λ_{max} 223 (ϵ 4800) (MeOH).

De Rosa, S. *et al., Nat. Prod. Lett.*, 1997, **10**, 267-274 (*isol, pmr, cmr*)

Cacospongionolide F C-7

[247151-66-2]

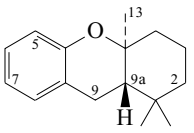


$C_{25}H_{36}O_4$ 400.557
Constit. of *Fasciospongia cavernosa*. Amorph. solid. $[\alpha]_D$ -123 (c, 0.21 in $CHCl_3$). λ_{max} 225 (ϵ 4600) (MeOH).

De Rosa, S. *et al., J. Nat. Prod.*, 1999, **62**, 1316-1318 (*isol, pmr, cmr*)
Demeke, D. *et al., Org. Lett.*, 2003, **5**, 991-994 (*synth*)

Cacoxanthene C-8

2,3,4,4a,9,9a-Hexahydro-1,1,4a-trimethyl-1H-xanthene, 9CI



$C_{16}H_{22}O$ 230.349

Parent compd. unknown. CAS numbering (as used by Garson *et al*) shown.

6-Bromo, 7-hydroxy: ***Debromoisocymobarbatol***
$C_{16}H_{21}BrO_2$ 325.245
Metab. of *Cymopolia barbata*. Feeding deterrent. Viscous oil. λ_{max} 258 (ϵ 4760); 325 (ϵ 6650) (MeOH) (Berdy).

2α,7,13-Tribromo: ***Tribromocacoxanthene***
[122535-68-6]
$C_{16}H_{19}Br_3O$ 467.037
Isol. from a *Cacospongia* sp. Also found in fish and mussels prob. as a pollutant. Cryst. (CH_2Cl_2/Et_2O).
Mp 172-173.5°. $[\alpha]_D$ +8.95 (c, 0.13 in $CHCl_3$).

2α,6-Dibromo, 7-hydroxy: ***Isocymobarbatol***
$C_{16}H_{20}Br_2O_2$ 404.141
Metab. of *Cymopolia barbata*. Antimutagenic agent. Cryst.
Mp 147°. $[\alpha]_D^{23}$ -51.4. Called 4-Isocymobarbatol in the ref. (different numbering scheme). λ_{max} 225; 305 (ϵ 5750) (MeOH) (Berdy). λ_{max} 326 (ϵ 6000) (MeOH/NaOH) (Berdy).

2α,5,7,13-Tetrabromo: Tetrabromocacoxanthene
[122535-69-7]
$C_{16}H_{18}Br_4O$ 545.934
Isol. from a *Cacospongia* sp. Also found in fish and mussels prob. as a pollutant. Cubes (CH_2Cl_2/Et_2O).
Mp 167-168°. $[\alpha]_D$ -169.8 (c, 0.33 in $CHCl_3$).

2α,7,13-Tribromo, 9α-hydroxy: ***Tribromo-9α-hydroxycacoxanthene***
[132244-37-2]
$C_{16}H_{19}Br_3O_2$ 483.037
Constit. of a *Cacospongia* sp.
$[\alpha]_D$ -0.83 (c, 0.12 in $CHCl_3$).

2α,7,13-Tribromo, 9β-hydroxy: ***Tribromo-9β-hydroxycacoxanthene***
[132244-36-1]
$C_{16}H_{19}Br_3O_2$ 483.037
Constit. of a *Cacospongia* sp. Needles (CH_2Cl_2/hexane).
Mp 187-189°. $[\alpha]_D$ -11.8 (c, 0.321 in Me_2CO).

2α,6-Dibromo, 7-hydroxy, 9a-epimer: ***Cymobarbatol***
[124962-11-4]
$C_{16}H_{20}Br_2O_2$ 404.141
Metab. of *Cymopolia barbata*. Antimutagenic agent. Cryst.
Mp 166°. $[\alpha]_D^{23}$ -15.4. λ_{max} 225; 306 (ϵ 5260) (MeOH) (Berdy). λ_{max} 327 (ϵ 7000) (MeOH/NaOH) (Berdy).

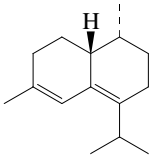
4,6-Cadinadiene C-9



(1β,10α)-*form*

$C_{15}H_{24}$ 204.355

(1β,10α)-*form*
Zonarene
Constit. of *Dictyopteris zonarioides*.
Oil. $[\alpha]_D$ -217.8 (c, 0.46 in cyclohexane).

(1β,10β)-*form*
10-Epizonarene
Constit. of *Cupressus bakeri*.
$[\alpha]_D^{22}$ -229 (c, 2.1 in $CHCl_3$).

Fenical, W. *et al., Phytochemistry*, 1972, **11**, 1161-1163 (*Zonarene*)

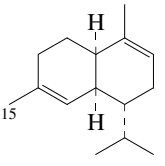
4,9-Cadinadiene C-10

[31983-22-9]



(1α,6α,7α)-*form*

$C_{15}H_{24}$ 204.355
Shows antibacterial activity.

(1α,6α,7α)-*form*
4,9-Muuroladiene. ***(+)-α-Muurolene***
[17627-24-6]
Isol. from various plant oils incl. *Brachylaena hutchinsii*, *Carphephorus odoratissimus*, *Pinus mugo* (dwarf mountain pine) and from the marine sponge *Acanthella cavernosa*. Also from the soft coral *Heteroxenia fuscescens* and gorgonians.
$[\alpha]_D$ +67 ($CHCl_3$) (+58).

9α,10α-Epoxide: ***9,10-Epoxy-4-cadinene****. 9,10-Epoxy-4-muurolene*
$C_{15}H_{24}O$ 220.354
Constit. of *Xenia* spp. Cryst. (Et_2O/petrol).
Mp 47-50°. $[\alpha]_D$ +146 (c, 0.1 in $CHCl_3$).

(1α,6α,7β)-*form*
4,9-Amorphadiene. ***α-Amorphene***
[23515-88-0]
Constit. of *Amorpha fruticosa*.

(1α,6β,7α)-*form*
4,9-Bulgaradiene. ***β$_1$-Bulgarene***
[68000-45-3]
[30021-74-0]
Constit. of berries of *Juniperus oxycedrus*.
Oil. $[\alpha]_D$ -98.5 (c, 0.76 in $CHCl_3$).

(1α,6β,7β)-*form*
α-Cadinene
[24406-05-1]
[29350-73-0]
Constit. of *Humulus lupulus* (hops).
Oil. $[\alpha]_D^{24}$ -62.4 (c, 0.808 in $CHCl_3$).

(1β,6β,7β)-*form*
(-)-α-Muurolene
[10208-80-7]
Widespread, e.g. in conifer oils such as turpentine, and other plant oils. Isol. from the gorgonian *Heteroxenia fuscescens*. Bp_{13} 118°.
$[\alpha]_D^{20}$ -52.5. n_D^{22} 1.5051.

[51260-25-4]

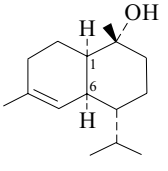
4-Cadinen-10-ol C-31



(1α,6α,7α,10α)–*form*

$C_{15}H_{26}O$ 222.37

(1α,6α,7α,10α)-*form*
4-Muurolen-10-ol. **ent-T-*Muurolol***
Constit. of *Scapania undulata*.
$[\alpha]_D$ +83.4 (c, 2.42 in $CHCl_3$).

(1α,6α,7α,10β)-*form*
Cedrelanol. *Brown-algae cadinol. Pilgerol*
[5937-11-1]
Constit. of *Pinus albicaulis, Pinus armandii, Juniperus communis* (juniper) and *Pilgerodendron uniferum*. Also from *Cedrela odorata,*

Chamaecyparis lawsoniana, Athrotaxis selaginoides, Cryptomeria japonica, Dictyopteris divaricata and others (some earlier identifications prob. erroneous in view of uncertainty over struct.).
Mp 139-140°. $[\alpha]_D^{20}$ -102 (c, 3.2 in EtOH).

(1α,6β,7β,10α)-*form*
α-Cadinol
[481-34-5]
Constit. of *Chamaecyparis lawsoniana* and *Juniperus communis* (juniper). Also from *Chamaecyparis obtusa, Chamaecyparis pisifera, Juniperus horizontalis, Juniperus scopulorum, Athrotaxis* spp. and *Neocallitropsis araucaroides*. Shows cytotoxic activity.
Cryst.
Mp 74.5-75°. $[\alpha]_D$ -47 (-38.5).

Me ether: ***α-Cadinol methyl ether***
$C_{16}H_{28}O$ 236.397
Constit. of *Senecio adenophyllus*. Oil. $[\alpha]_D^{24}$ -49 (c, 3.42 in $CHCl_3$).

(1α,6β,7β,10β)-*form*
T-*Cadinol*
Isol. from the sponge *Acanthella cavernosa*. Constit. of *Taiwania cryptomeroides*, *Commiphora guidottii*, *Teucrium yemense*, *Athrotaxis selaginoides* and *Satureja gilliesii*. Leukotriene biosynthesis inhibitor.
Mp 64-64.5°. $[\alpha]_D$ +3.4 (c, 1.2 in $CHCl_3$).

(1β,6β,7β,10α)-*form*
***Torreyol*. δ-Cadinol. Sesquigoyol. Cedreanol**
[36564-42-8]
Constit. of *Pinus parviflora*, *Pinus formosana*, *Juniperus communis* and *Xylopia* sp.
Cryst.
Mp 139-140°. $[\alpha]_D^{20}$ +102 (c, 3.2 in EtOH). First thought to be a cadinene and therefore appropriately named but since shown to be a muurolane.

(1β,6β,7β,10β)-*form*
T-*Muurolol*
[19912-62-0]
Constit. of *Taiwania cryptomeroides*, *Athrotaxis selaginoides*, *Chamaecyparis obtusa* and *Cedrela toona*.
Cryst.
Mp 80.5-81.5°. $[\alpha]_D^{23}$ -114 (c, 1 in $CHCl_3$).

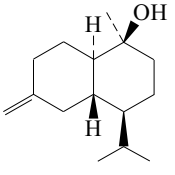
4(15)-Cadinen-10-ol C-32



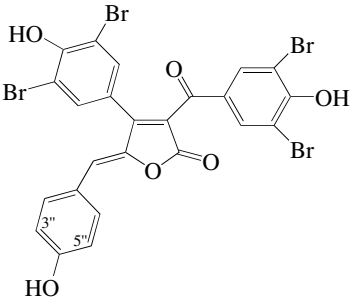
$C_{15}H_{26}O$ 222.37

(1α,6β,7β,10β)-*form*
Millecrol B
[154524-44-4]
Constit. of *Leminda millecra*.
Oil.

Pika, J. *et al., Tetrahedron*, 1994, **50**, 3065-3070 (*isol, pmr, cmr*)

Cadiolide A C-33

[206763-40-8]



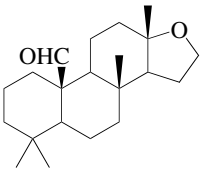
$C_{24}H_{12}Br_4O_6$ 715.971
Isol. from the ascidian *Botryllus* sp. Orange amorph. solid.
λ_{max} 254 (ϵ 10100); 406 (ϵ 16100) (MeOH).

3'',5''-Dibromo: ***Cadiolide B***
[206763-42-0]
$C_{24}H_{10}Br_6O_6$ 873.763
Isol. from a *Botryllus* sp. Orange amorph. solid. λ_{max} 270 (ϵ 16400); 388 (ϵ 24900) (MeOH).

Smith, C.J. *et al., J.O.C.*, 1998, **63**, 4147-4150 (*isol, uv, pmr, cmr, ms*)

Cadlinaldehyde C-34

[194020-35-4]



$C_{21}H_{34}O_2$ 318.498
Constit. of *Cadlina luteomarginata*. Needles (MeOH).
Mp 65°. $[\alpha]_D^{25}$ +25 ($CHCl_3$).

Dumdei, E.J. *et al., Can. J. Chem.*, 1997, **75**, 773-789 (*isol, pmr, cmr, cryst struct*)

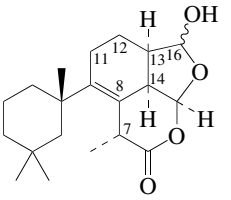
Cadlinolide B C-35

[130221-21-5]



$C_{20}H_{30}O_4$ 334.455
Constit. of *Aplysilla glacialis*. Oil.

Ac (16α-): ***Aplysulphuride***. *Tetrahydroaplysulphurin 1*
[91236-89-4]
$C_{22}H_{32}O_5$ 376.492
Constit. of *Cadlina luteomarginata* and *Darwinella oxeata*. Cryst. (CH_2Cl_2/hexane).

Mp 109°. $[\alpha]_D$ +169 (c, 1 in $CHCl_3$).

16-Me ether: ***Cadlinolide D***
[676154-32-8]
$C_{21}H_{32}O_4$ 348.481
Constit. of *Chelonaplysilla violacea*. Solid.

16-Ketone: ***Cadlinolide A***
[130246-91-2]
$C_{20}H_{28}O_4$ 332.439
Constit. of *Aplysilla glacialis* and *Cadlina luteomarginata*. Cryst. (hexane).
Mp 126-127°. $[\alpha]_D$ +19 (c, 8 in $CHCl_3$).

11,12,13,14-Tetradehydro, Ac (16α-): ***Aplysulphurin***
[91236-90-7]
$C_{22}H_{28}O_5$ 372.46
Constit. of *Aplysilla sulphurea*. Cryst. (hexane).
Mp 195°. $[\alpha]_D^{25}$ +110 (c, 1 in $CHCl_3$).

16-Deoxy: ***Cadlinolide C***
[676154-31-7]
$C_{20}H_{30}O_3$ 318.455
Constit. of *Chelonaplysilla violacea*. Yellow solid. $[\alpha]_D^{20}$ +27.3 (c, 0.68 in CH_2Cl_2).

12-Acetoxy, 16-Ac(16α-): ***12-Acetoxytetrahydrosulphurin I***
$C_{24}H_{34}O_7$ 434.528
Isol. from an *Aplysilla* sp. Phospholipase A2 inhibitor.

$\Delta^{7,8}$-Isomer, Ac (16α-): ***Tetrahydroaplysulphurin 3***
[106009-85-2]
$C_{22}H_{32}O_5$ 376.492
Constit. of *Darwinella oxeata*. Oil. $[\alpha]_D^{20}$ +11.6 (c, 0.5 in $CHCl_3$).

$\Delta^{8,14}$-Isomer, Ac (16α-): ***Tetrahydroaplysulphurin 2***
[106009-84-1]
$C_{22}H_{32}O_5$ 376.492
Constit. of *Darwinella oxeata*. Cryst. (petrol).
Mp 181-183°.

Karuso, P. *et al., Aust. J. Chem.*, 1984, **37**, 1081; 1986, **39**, 1643-1653 (*Aplysulphurin, Aplysulphuride, Tetrahydroaplysulphurins*)

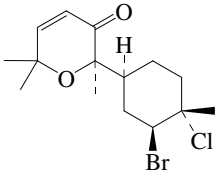
Caespitenone† C-36

[124193-10-8]

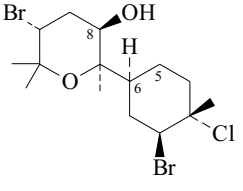


$C_{15}H_{22}BrClO_2$ 349.694
Constit. of *Aplysia dactylomela*.
$[\alpha]_D$ +36.3 (c, 0.47 in $CHCl_3$).

Wessels, M. *et al., J. Nat. Prod.*, 2000, **63**, 920-928 (*isol, pmr, cmr*)

Caespitol C-37

[50656-64-9]



$C_{15}H_{25}Br_2ClO_2$ 432.622
Constit. of *Laurencia caespitosa*. Metab. of *Aplysia dactylomela*. Toxic to brine shrimp. Shows algicidal props. Cryst. (hexane). Poorly sol. hexane.
Mp 109-111°. $[\alpha]_D$ +4.3 (c, 0.44 in $CHCl_3$).

Ac: ***Caespitol acetate****. 8-Acetylcaespitol*
[73410-30-7]
$C_{17}H_{27}Br_2ClO_3$ 474.659
Constit. of *Aplysia dactylomela*.
$[\alpha]_D$ 0 (c, 0.34 in $CHCl_3$).

6-Hydroxy: ***6-Hydroxycaespitol***
$C_{15}H_{25}Br_2ClO_3$ 448.621
Constit. of *Laurencia caespitosa*. Cryst.
Mp 152-153°. $[\alpha]_D$ +11.7 (c, 0.29 in $CHCl_3$).

5β,6-Dihydroxy, 8-Ac: ***Dihydroxydeodactol monoacetate***
[72926-49-9]
$C_{17}H_{27}Br_2ClO_5$ 506.658
Constit. of *Aplysia dactylomela*. Cryst. (hexane/C_6H_6).
Mp 168-169°. $[\alpha]_D$ +40.5 ($CHCl_3$).

8-Deoxy: ***Caespitane***
[124264-63-7]
$C_{15}H_{25}Br_2ClO$ 416.623
Constit. of *Laurencia caespitosa*. Metab. of *Aplysia dactylomela*. Toxic to brine shrimp. Shows algicidal props. Cryst.
Mp 82-84°. $[\alpha]_D$ +39.8 (c, 0.89 in $CHCl_3$).

8-Deoxy, 5β-hydroxy: ***Deodactol***
[71679-25-9]
$C_{15}H_{25}Br_2ClO_2$ 432.622
Constit. of *Aplysia dactylomela*. Shows antineoplastic props. Cryst. (hexane). Sol. H_2O; poorly sol. MeOH, hexane.
Mp 134-135°. $[\alpha]_D$ +40 (c, 0.2 in EtOH).

8-Deoxy, 6-hydroxy: ***Isodeodactol***
[79373-31-2]
$C_{15}H_{25}Br_2ClO_2$ 432.622
Isol. from *Aplysia dactylomela*. Cryst. (hexane).
Mp 158-160°. $[\alpha]_D$ +18.9 (c, 0.37 in $CHCl_3$).

Gonzales, A.G. *et al., Tet. Lett.*, 1974, 1249-1250; 1976, 3051; 1979, 2719-2722 (*struct, biosynth, cmr*)

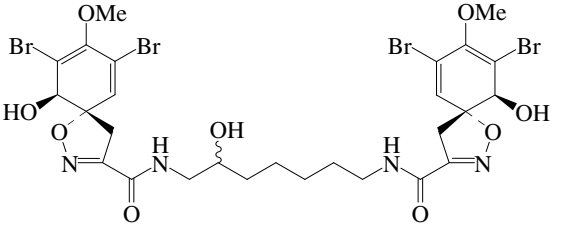
Caissarine B C-38



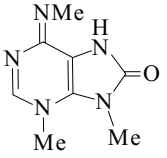
Relative Configuration

$C_{27}H_{32}Br_4N_4O_9$ 876.187
Isol. from the Brazilian sponge *Aplysina caissara*. Glassy solid.
λ_{max} 234 (ϵ 9000); 283 (ϵ 4300) (MeOH).

Saeki, B.M. *et al., J. Nat. Prod.*, 2002, **65**, 796-799; 2003, **66**, 1039 (*isol, pmr, cmr, ms*)

Caissarone C-39

[106145-23-7]



$C_8H_{11}N_5O$ 193.208

Alkaloid from the sea anemone *Bunodosoma caissarum*. Inducer of anomalous growth in sea urchin eggs, increases muscle contraction. λ_{max} 228 (ϵ 21600); 302 (ϵ 17700) (MeOH) (Derep).

▶ Teratogen.

Hydrochloride:

Needles (MeOH aq.). Mp 285-290°.

Picrate:

Cryst. (EtOH). Mp 245-250°.

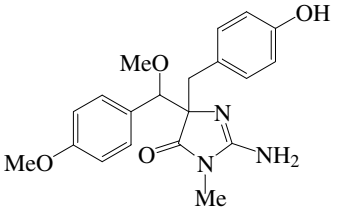
Bardhan, S. *et al., Org. Lett.*, 2006, **8**, 927-930 (*synth, abs config*)

Calcaridine A C-41

[568561-14-8]



$C_{20}H_{23}N_3O_4$ 369.419

Isol. from a calcareous sponge *Leucetta* sp.

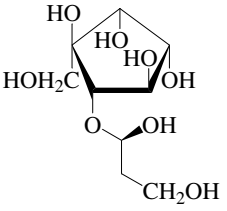
Yellow oil. $[\alpha]_D$ +1.6 (c, 0.12 in MeOH).

Edrada, R.A. *et al., J. Nat. Prod.*, 2003, **66**, 939-942 (*isol, pmr, cmr*)

Calditol C-42

5-(2,3-Dihydroxypropoxy)-1-(hydroxymethyl)-1,2,3,4-cyclohexanetetrol, 9CI

[164300-76-9]



$C_9H_{18}O_8$ 254.236

Originally assigned a branched chain nonitol struct. Correct struct established by synthesis in 1999. Degradation prod. of a complex of macrocyclic tetraether lipids isol. from membranes of thermoacidophilic archaebacteria of the *Caldariella* group and *Methanospirillum* species, e.g. *Sulfolobus solfataricus*. Also found in methanobacteria.

$[\alpha]_D$ -8.72 (c, 1.3 in H_2O).

MaGee, D.I. *et al., Tet. Lett.*, 1997, **38**, 1289-1292 (*synth*)

Califin C-51

Consists of three peptides, designated Califins A, B and C. Structs. comprise a 36-residue subunit bound by a single disulfide bond to an 18 residue subunit. The large subunits of Califins A-C differ from each other by 1 or 2 residues whereas the small subunits are identical. Isol. from the atrial gland of the marine mollusc *Aplysia californica*. Inducer of egg-laying.

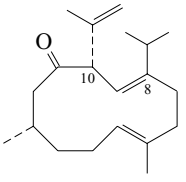
Calyculone D C-73

[130575-02-9]



$C_{20}H_{32}O$ 288.472
Constit. of *Eunicea calyculata*. Oil. $[\alpha]_D$ +198 (c, 1 in $CHCl_3$).

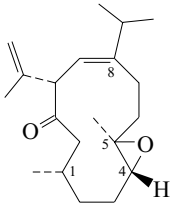
10-Epimer: ***Calyculone E***
[130694-34-7]
$C_{20}H_{32}O$ 288.472
Constit. of *Eunicea calyculata*. Oil. $[\alpha]_D$ -359 (c, 0.5 in $CHCl_3$).

*8*E*-Isomer:* ***Calyculone F***
[130694-35-8]
$C_{20}H_{32}O$ 288.472
Constit. of *Eunicea calyculata*. Oil. $[\alpha]_D$ +143 (c, 0.4 in $CHCl_3$).

*8*E*-Isomer, 10-epimer:* ***Calyculone G***
[130694-36-9]
$C_{20}H_{32}O$ 288.472
Constit. of *Eunicea calyculata*. Oil. $[\alpha]_D$ -107 (c, 0.5 in $CHCl_3$).

Shin, J. *et al., J.O.C.*, 1991, **56**, 1227 (*isol, pmr, cmr*)

Calyculones C-74



(4α,5β,8*E*)*–form*
Relative configuration

$C_{20}H_{32}O_2$ 304.472

(4α,5β,8*E*)-*form*
Calyculone A
[89088-38-0]
Constit. of *Eunicea calyculata*.
Cryst. (Et_2O).
Mp 101-102°. $[\alpha]_D^{20}$ +76 (c, 0.61 in $CHCl_3$).

7α-Acetoxy: ***7-Acetoxycalyculone A***
[656251-65-9]
$C_{22}H_{34}O_4$ 362.508
Constit. of *Eunicea laciniata*. Cryst.
Mp 78-80°. $[\alpha]_D$ +140.3 (c, 0.06 in $CHCl_3$). λ_{max} 212 (log ϵ 3.42) (MeOH).

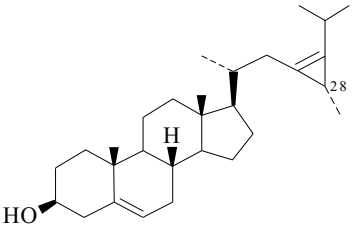
(4α,5α,8*E*)-*form*
Calyculone B
[89163-38-2]
From *Eunicea calyculata*.
Oil. $[\alpha]_D^{20}$ -28 (c, 1.1 in $CHCl_3$).

(4β,5α,8*Z*)-*form*
Calyculone C
[89163-39-3]
From *Eunicea calyculata*.
Oil. $[\alpha]_D^{20}$ +95 (c, 0.99 in $CHCl_3$).

Look, S.A. *et al., J.O.C.*, 1984, **49**, 1417
Marville, K.I. *et al., Heterocycles*, 2004, **63**, 107-113 (*7-Acetoxycalyculone A*)

Calysterol C-75

[57331-04-1]



Absolute configuration

$C_{29}H_{46}O$ 410.682
Constit. of *Calyx nicaeensis* and *Petrosia ficiformis*. Cryst.
Mp 114-116°. $[\alpha]_D$ -29.3 (c, 1 in $CHCl_3$).

5α,6-Dihydro: ***5α-Calystanol***
[117064-35-4]
$C_{29}H_{48}O$ 412.698
Isol. from the sponge *Calyx podatypa*.

5β,6-Dihydro: ***Calystanol***
[123238-26-6]
$C_{29}H_{48}O$ 412.698
Minor sterol from sponge *Calyx nicaeensis*, prob. as an endobacterial metab.

3-Epimer, 5β,6-dihydro: ***5β-Calystan-3α-ol***
[123238-74-4]
$C_{29}H_{48}O$ 412.698
Minor sterol from *Calyx nicaeensis*, prob. as endobacterial metab.

[85798-18-1]

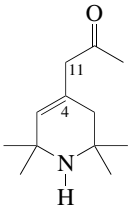
Calyxamine A C-76

[199105-62-9]



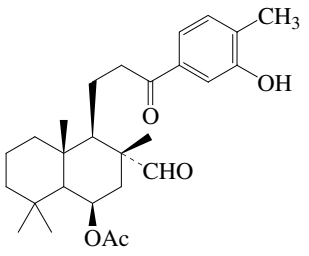
$C_{12}H_{21}NO$ 195.304
Alkaloid from the sponge *Calyx podatypa*. Needles ($CHCl_3$/hexane) (as trifluoroacetate salt). λ_{max} 205 (ϵ 1000) (MeOH) (TFA salt).

$\Delta^{4,11}$-Isomer: ***Calyxamine B***
[150710-72-8]
$C_{12}H_{21}NO$ 195.304
Alkaloid from *Calyx podatypa*. Cryst. (as trifluoroacetate salt). Possible artifact. λ_{max} 231 (ϵ 10400) (MeOH) (TFA salt).

Rodriguez, A.D. *et al., J. Nat. Prod.*, 1997, **60**, 1331-1333 (*isol, uv, ir, pmr, cmr, ms, cryst struct*)

Caminatal C-77

[588725-02-4]



Relative Configuration

$C_{27}H_{38}O_5$ 442.594
Isol. from the sponge *Suberites caminatus*. Oil. $[\alpha]_D^{20}$ +167 (c, 0.12 in $CHCl_3$).

Diaz-Marrero, A.R. *et al., Tet. Lett.*, 2003, **44**, 5939-5942 (*isol, pmr, cmr, ms*)

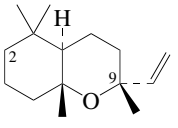
Cangitoxin C-78

Peptide containing 48 amino acid residues incl. 6 cysteines. Isol. from the sea anemone *Bunodosoma cangicum*. Epileptogenic.

Cunha, R.B. *et al., Toxicon*, 2005, **45**, 207-217 (*struct*)

Caparrapioxide C-79

[20303-73-5]
[57345-37-6]



$C_{15}H_{26}O$ 222.37
Isol. from the frontal gland of *Amitermes evuncifer*. Also isol. from the sponge *Dysidea fragilis*. Oil.

9-Epimer: ***9-Epicaparrapioxide***
[57345-36-5]
[62107-46-4 (*+-form*)]
$C_{15}H_{26}O$ 222.37
Isol. from *Amitermes evuncifer*. Called 8-epi in the lit.

9-Epimer, 2β-bromo: ***3β-Bromo-8-epicaparrapioxide***
[62078-13-1]
$C_{15}H_{25}BrO$ 301.266
Metab. of *Laurencia obtusa*. Oil solidifying at -20°. Sol. MeOH, hexane. $[\alpha]_D^{21}$ +30.4 (c, 1.46 in EtOH). Relative stereochem. known only.

Wadhams, L.J. *et al., Tet. Lett.*, 1974, **15**, 1697-1700 (*9-Epicaparrapioxide*)

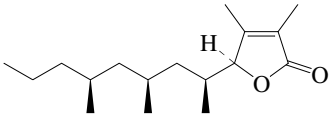
Capensifuranone C-80

*3,4-Dimethyl-5-(1,3,5-trimethyloctyl)-2(5*H*)-furanone*



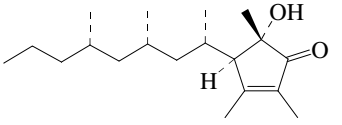
Absolute Configuration

$C_{17}H_{30}O_2$ 266.423
Isol. from the marine mollusc *Siphonaria capensis*. Oil. $[\alpha]_D^{21}$ -15.1 (c, 0.29 in $CHCl_3$).

Beukes, D.R. *et al., Tetrahedron*, 1999, **55**, 4051-4056 (*isol, ir, pmr, cmr, ms*)
Williams, D.R. *et al., J.O.C.*, 2004, **69**, 5374-5382 (*synth, abs config*)

Capensinone C-81

5-Hydroxy-2,3,5-trimethyl-4-(1,3,5-trimethyloctyl)-2-cyclopenten-1-one

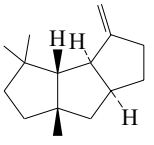


$C_{19}H_{34}O_2$ 294.476
Isol. from the marine mollusc *Siphonaria capensis*. Yellow oil. $[\alpha]_D^{21}$ -65 (c, 0.42 in $CHCl_3$).

Beukes, D.R. *et al., Tetrahedron*, 1999, **55**, 4051-4056 (*isol, ir, pmr, cmr, ms*)

9(12)-Capnellene C-82

[68349-51-9]



$C_{15}H_{24}$ 204.355
Constit. of *Capnella imbricata*. Oil. $[\alpha]_D^{20}$ -145 (c, 0.4 in $CHCl_3$).

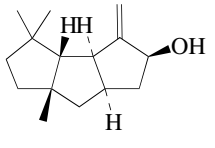
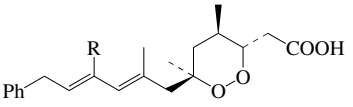
9(12)-Capnellen-8-ol C-89



$C_{15}H_{24}O$ 220.354

8β-*form* [215650-33-2]
Constit. of *Capnella imbricata*.
Amorph. powder. $[\alpha]_D$ +19.5 (c, 0.2 in $CHCl_3$).
Morris, L.A. *et al., Tetrahedron*, 1998, **54**, 12953-12958 (*isol, pmr, cmr*)

Capucinoic acid A C-90



Relative Configuration

R = H

$C_{21}H_{28}O_4$ 344.45
Isol. from *Plakinastrella onkodes*. Cytotoxic. Oil (as Me ester). $[\alpha]_D^{25}$ -44.8 (c, 0.67 in CH_2Cl_2) (Me ester). λ_{max} 227 (ϵ 5330) (CH_2Cl_2).

Williams, D.E. *et al., J. Nat. Prod.*, 2001, **64**, 281-285

Capucinoic acid B C-91

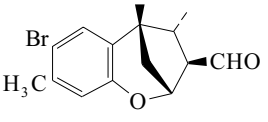
As Capucinoic acid A, C-90 with
R = CH_3

$C_{22}H_{30}O_4$ 358.477
Isol. from *Plakinastrella onkodes* and a *Plakortis* sp. Cytotoxic. Oil (as Me ester). $[\alpha]_D^{25}$ -48.7 (c, 0.37 in CH_2Cl_2) (Me ester). λ_{max} 229 (ϵ 3830) (CH_2Cl_2) (Me ester).

Williams, D.E. *et al., J. Nat. Prod.*, 2001, **64**, 281-285

Caraibical C-92

[79383-37-2]

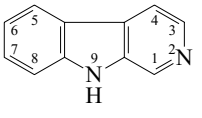


$C_{15}H_{17}BrO_2$ 309.202
Constit. of *Laurencia caraibica*. Cryst.
Mp 106-108°. $[\alpha]_D$ +42 (c, 1.01 in $CHCl_3$). λ_{max} 209 (ϵ 3550); 289 (ϵ 1120); 297 (ϵ 1120) (EtOH) (Derep).

Izac, R.R. *et al., Tet. Lett.*, 1981, 1799

β-Carboline C-93

*9H-Pyrido[3,4-*b*]indole, 9CI. 2,9-Diazafluorene. Norharman. 2-Carboline. Carbazoline*†
[244-63-3]



$C_{11}H_8N_2$ 168.198
Alkaloid from *Chrysophyllum lacourtianum*, *Nocardia* sp., *Catharanthus roseus* leaves, *Lolium perenne*, *Strychnos johnsonii*, *Strychnos potatorum*, and *Festuca arundinacea*. Prod. by *Streptomyces* sp., a metab. from the New Zealand ascidian *Ritterella sigillinoides*. Also a trace constit. of the fluorescent dinoflagellate *Noctiluca miliaris*. Plant growth and enzyme inhibitor. Potentiator of benzo[*a*]pyrene induced mutagenicity, antiparasitic, antirypanosomal agent. A comutagen with aromatic amines active towards bacteria. Needles (EtOH). Sol. hot H_2O; spar. sol. C_6H_6, petrol. Mp 198.5°. Blue fluor. in dil. acid soln. λ_{max} 235 (ϵ 31000); 290; 350 (ϵ 4600) (MeOH) (Berdy).
▶ Exp. nephrotoxic at high doses. A comutagen. UU9350000

N^2-*Oxide:* [24223-07-2]
$C_{11}H_8N_2O$ 184.197
Mp 256°.

N^2-*Me: 2-Methyl-9*H*-pyrido[3,4-*b*]indolium. **Normelinonine F***
[17994-14-8]
[5667-11-8, 21951-87-1]
$C_{12}H_{11}N_2^{\oplus}$ 183.232
Quaternary alkaloid from *Strychnos usambarensis* (Strychnaceae). Antimitotic agent. Poorly sol. hexane.

*3,4-Dihydro, 9-Ac: 9-Acetyl-4,9-dihydro-3*H*-pyrido[3,4-*b*]indole, 9CI. 9-Acetyl-3,4-dihydro-β-carboline*
[76528-83-1]
$C_{13}H_{12}N_2O$ 212.251
Alkaloid from the roots of *Adhatoda vasica* (Acanthaceae). Mp 165-166° Mp 187-188° (as hydrochloride).

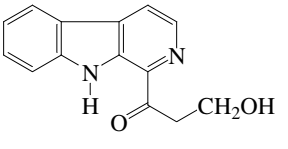
1-(β-Carbolin-1-yl)-3-hydroxy-1-propanone C-95

*3-Hydroxy-1-(9*H*-pyrido[3,4-*b*]indol-1-yl)-1-propanone. 1-(3-Hydroxypropanoyl)-β-carboline*



$C_{14}H_{12}N_2O_2$ 240.261
Prod. by the marine bacterium strain Bio215. Yellowish-green solid.

Shaaban, M. *et al., Dissertation*, Univ. of Göttingen, 2004, (*isol, pmr, ms*)

Carbon tetrabromide C-96

Tetrabromomethane, 9CI. Carbon bromide†

[558-13-4]

CBr_4

CBr_4 331.627

Isol. from various marine algae. Monoclinic cryst. (below 46.8°). Sol. EtOH, Et_2O, $CHCl_3$; insol. H_2O. $d_4^{99.5}$ 2.96.

Mp 94.3° (90-91°). Bp_{50} 102°. $n_D^{99.5}$ 1.5942. Dimorphic; crystals transformed at 46.8° to cubic form.

▶ High vapour conc. narcotic. Eye and skin irritant. LD_{50} (mus, scu) 298 mg/kg. Hepatotoxic. OES: long-term 0.1 ppm; short-term 0.3 ppm. FG4725000

Carbon tetrachloride C-97

Tetrachloromethane, 9CI. Carbon chloride (CCl_4). Carbon chloride†*. Perchloromethane. Tetra. F10. Halon 1040. R10*

[56-23-5]

CCl_4

CCl_4 153.822

Produced by chlorination of hydrocarbons or of Carbon disulfide. Isol from several plants and marine algae. Solv. for org. compds., formerly used in fire extinguishers, as a dry-cleaning solv. and as a grain fumigant. Used in manuf. of chlorofluoromethanes. Chlorinating agent, source of $:CCl_2$. Reference material used in elemental microanalysis. Anthelmintic. Liq. Sol. EtOH, Et_2O; prac. insol. H_2O. d_4^0 1.63.

Mp 21.2° Mp 23.8° Mp 28.6° (trimorph.). Bp 76.74°. n_D^{15} 1.4631.

▶ Toxic by inhalation and skin contact. Dec. to highly toxic Carbonyl chloride if strongly heated in the presence of air. Production controlled by environmental legislation, illegal in EU from 1996. Eye and skin irritant. Repeated skin exposure can cause dermatitis. Acute and chronic exposure cause gastrointestinal and CNS disturbances. High vapour conc. narcotic. Hepatotoxic and nephrotoxic. Poss. human carcinogen. LD_{50} (rat, orl) 2350 mg/kg. LC_{50} (rat, ihl) 8000 ppm (4h exposure). Exp. carcinogen. Exp. reprod. and teratogenic effects. Non-flammable, autoignition temp. >1000°. OES: long-term 2 ppm (Sk). FG4900000

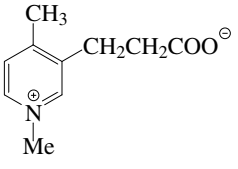
$C_{22}H_{38}O_6$ 398.539

*Di-Ac: 3-(14,15-Diacetoxy-13-carboxyhexadecyl)-5-methyl-2(5*H*)-furanone*
[27261-77-4]
$C_{26}H_{42}O_8$ 482.613
Isol. from the gorgonian *Pterogorgia guadalupensis*. Cryst. (2-propanol aq.).
Mp 81.1-82.9°. $[\alpha]_D$ -8.3 (c, 0.47 in $CHCl_3$). λ_{max} 204 (ϵ 17440) (EtOH aq.).
Schmitz, F.J. *et al., J.O.C.*, 1971, **36**, 719-721 (*isol, uv, ir, pmr*)

3-(2-Carboxyethyl)-1,4-dimethylpyridinium, 9CI C-102
Sulcatine
[264870-65-7]



$C_{10}H_{13}NO_2$ 179.218
Zwitterionic. Isol. from the ascidian *Microcosmus vulgaris*. Shows antiproliferative activity. Amorph. solid.
Aiello, A. *et al., J. Nat. Prod.*, 2000, **63**, 517-519 (*isol, pmr, cmr*)

(2-Carboxyethyl)dimethylsulfonium(1+) C-103
Dimethyl-β-propiothetin
[6708-36-7]
[4337-33-1]

$Me_2S^{\oplus}CH_2CH_2COOH$
$C_5H_{11}O_2S^{\oplus}$ 135.207
Isol. from green and red algae, e.g. *Enteromorpha intestinalis, Ulva lactuca*. Also from *Spartina anglica*. Biol. precursor of Dimethyl sulfide, D-894. Fish feeding stimulant. Needles (EtOH) (as chloride).
Mp 134° dec. (129°). pK_a 3.35.

Betaine: 3-Dimethylsulfonio propanoate. Dimethylpropiothetin. DMSP. (2-Carboxyethyl)dimethylsulfonium betaine
[7314-30-9]
[20986-22-5, 44743-29-5]
$C_5H_{10}O_2S$ 134.199
Isol. from numerous marine sources. Biochemical source of dimethyl sulfide. Growth stimulant for fish. Cryst. (EtOH).
Mp 112-114°. Zwitterion.

Carcinoscorpius rotunda *Lectin*

Protein, MW *ca*. 420000. Isol. from the Indian horseshoe crab *Carcinoscorpius rotunda cauda*. Sialic acid-binding lectin.

Bishayee, S. *et al., Biochim. Biophys. Acta*, 1980, **623**, 89-97 (*isol*)
Dorai, D.T. *et al., Arch. Biochem. Biophys.*, 1981, **209**, 325-333 (*composition*)

Carcinustatins C-112

H-Tyr-Ala-Phe-Gly-Leu-NH_2

A family of 20 peptides of the allatostatin superfamily with the common C-terminal pentapeptide sequence -YXFGL-NH_2; struct. of Carcinustatin 1 shown. Isol. from the cerebral and thoracic ganglia of the shore crab *Carcinus maenas*. Neuropeptides.

Carcinustatin 1
Penaeustatin 13
[172846-10-5]
$C_{29}H_{40}N_6O_6$ 568.672
Also isol. from the tiger prawn *Penaeus monodon*.

Carcinustatin 2 [204909-50-2]
$C_{37}H_{52}N_8O_{10}$ 768.865

Carcinustatin 3 [204909-51-3]
$C_{39}H_{54}N_8O_{10}$ 794.903

Carcinustatin 4 [204909-52-4]
$C_{38}H_{52}N_8O_{10}$ 780.876

Carcinustatin 5 [204909-53-5]
$C_{38}H_{53}N_9O_9$ 779.892

Carcinustatin 6 [204909-54-6]
$C_{37}H_{52}N_8O_9$ 752.866

Carcinustatin 7 [204909-55-7]
$C_{40}H_{57}N_9O_{10}$ 823.945

Carcinustatin 8
Penaeustatin 6
[204909-56-8]
$C_{39}H_{55}N_9O_9$ 793.918
Also isol. from the crayfish *Orconectes limosus* and the tiger prawn *Penaeus monodon*.

Carcinustatin 9 [204909-57-9]
$C_{38}H_{53}N_9O_9$ 779.892

Carcinustatin 10 [204909-58-0]
$C_{47}H_{67}N_{11}O_{11}$ 962.113

Carcinustatin 11 [204909-59-1]
$C_{43}H_{63}N_{11}O_{12}$ 926.037

Carcinustatin 12 [204909-60-4]
$C_{43}H_{61}N_9O_{11}S$ 912.075

Carcinustatin 13 [204909-61-5]
$C_{102}H_{150}N_{24}O_{30}S$ 2224.516

Carcinustatin 14
Penaeustatin 35
[172846-11-6]
$C_{29}H_{40}N_6O_7$ 584.671
Also isol. from the tiger prawn *Penaeus monodon*.

Carcinustatin 15 [204909-62-6]
$C_{39}H_{55}N_9O_{10}$ 809.918

Carcinustatin 16 [204909-63-7]
$C_{38}H_{53}N_9O_{11}$ 811.89

Carcinustatin 17 [204909-64-8]
$C_{39}H_{56}N_{10}O_{12}$ 856.931

Carcinustatin 18 [204909-65-9]
$C_{41}H_{59}N_9O_{13}S$ 918.036

Carcinustatin 19 [204909-66-0]
$C_{50}H_{73}N_{11}O_{15}S$ 1100.257

Carcinustatin 20 [204909-67-1]
$C_{142}H_{208}N_{38}O_{44}$ 3151.433

Lombarska-Sliwinska, D. *et al., Bull. Pol. Acad. Sci., Chem.*, 1995, **43**, 33-40 (*Carcinustatin 1, Carcinustatin 14, synth*)

Octopus Cardioactive peptides C-113

H-Gly-D-Phe-Gly-Asp-OH
Struct. of peptide 1 shown. Isol. from the brain of *Octopus minor*.

***Octopus* Cardioactive peptide 1**
GFGD
[134562-90-6]
$C_{17}H_{22}N_4O_7$ 394.383
Cardioactive. *Octopus* Cardioactive peptide 2 in which L-Phe replaces D-Phe shows very low cardioactive activity.

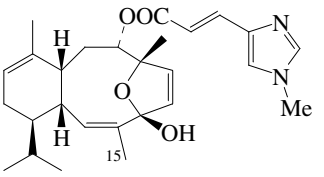
***Octopus* Cardioactive peptide 3**
GSWD
[277317-24-5]
$C_{20}H_{25}N_5O_8$ 463.446
Cardioactive. *Octopus* Cardioactive peptide 4, in which D-Ser replaces L-Ser shows very low cardioactive activity.

[277317-21-2, 277317-28-9]

Iwakoshi, E. *et al., Peptides (N.Y.)*, 2000, **21**, 623-630 (*isol*)

Caribaeorane C-114

[346406-75-5]



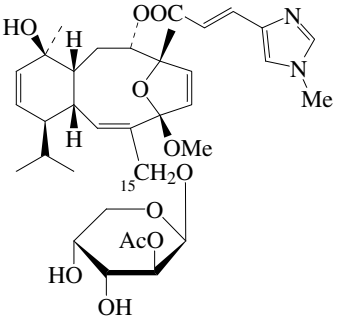
$C_{27}H_{36}N_2O_4$ 452.592
Constit. of *Erythropodium caribaeorum*.

15-Hydroxy: ***15-Hydroxycaribaeorane***
[216317-92-9]
$C_{27}H_{36}N_2O_5$ 468.592
Constit. of *Erythropodium caribaeorum*.

Britton, R. *et al., Tet. Lett.*, 2001, **42**, 2953-2956 (*isol, pmr, cmr*)

Caribaeoside C-115

[259728-79-5]



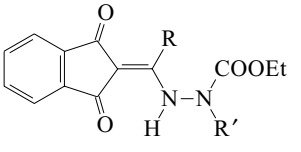
$C_{35}H_{48}N_2O_{11}$ 672.771
Constit. of *Erythropodium caribaeorum*. Related to Eleutherobin, in E-68.

Aglycone, 15-Ac: ***Caribaeolin***
[259728-87-5]
$C_{30}H_{40}N_2O_7$ 540.655
Constit. of *Erythropodium caribaeorum*.

Cinel, B. *et al., Org. Lett.*, 2000, **2**, 257-260 (*isol, pmr, cmr*)

Caribbazoin A C-116

[130518-25-1]



R = CH_3, R′ = Ac

$C_{16}H_{16}N_2O_5$ 316.313
Constit. of *Cliona caribboea*. Cryst. (C_6H_6).
Mp 165-167° Mp 172-173° (synthetic).

Lemke, T.L. *et al., J. Pharm. Sci.*, 1990, **79**, 840 (*isol, pmr, cmr*)

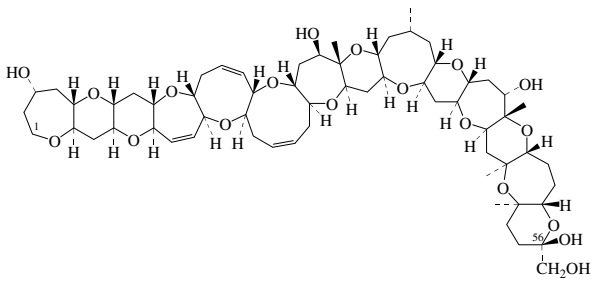
Caribbazoin B C-117

[130518-26-2]
As Caribbazoin A, C-116 with
R = H, R′ = Me
$C_{14}H_{14}N_2O_4$ 274.276
Constit. of *Cliona caribboea*. Shows hypotensive props.

Lemke, T.L. *et al., J. Pharm. Sci.*, 1990, **79**, 840; 1126 (*isol, pmr, cmr*)

Caribbean ciguatoxin 1 C-118

Ciguatoxin (Caribbean). C-CTX 1
[193363-37-0]

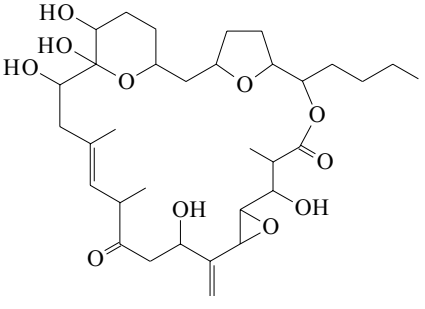


$C_{62}H_{92}O_{19}$ 1141.397
Isol. from *Caranx latus*. Causes ciguatera food poisoning.
Amorph. solid.

56-Epimer: C-CTX 2
[193363-38-1]
$C_{62}H_{92}O_{19}$ 1141.397
Isol. from *Caranx latus*.
Lewis, R.J. *et al., J.A.C.S.*, 1998, **120**, 5914-5920

Caribenolide I C-119

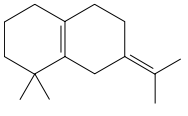
[161505-24-4]



$C_{33}H_{52}O_{11}$ 624.767
Macrolide antibiotic. Isol. from the dinoflagellate *Amphidinium* sp. S1-36-5. Cytotoxic agent. Microcryst. powder (isooctane/2-propanol). $[\alpha]_D^{25}$ +91 (c, 0.1 in CH_2Cl_2).
Bauer, I. *et al., J.O.C.*, 1995, **60**, 1084 (*isol, pmr, cmr, ms*)

Caridiene C-120

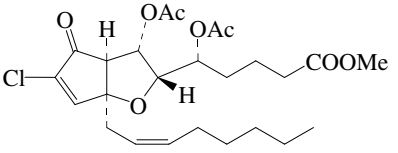
1,2,3,4,5,6,7,8-Octahydro-1,1-dimethyl-7-(1-methylethenyl)-naphthalene. 1,2,3,4,5,6,7,8-Octahydro-7-isopropylidene-1,1-dimethylnaphthalene
[132055-18-6]



$C_{15}H_{24}$ 204.355
Rearranged eremophilane. Constit. of *Pseudopterogorgia americana*. Oil.
Rivero, R.B. *et al., Z. Naturforsch., B*, 1990, **45**, 1571 (*isol, pmr, cmr*)

Carijenone C-121

[719296-43-2]



$C_{25}H_{35}ClO_8$ 498.999
Isol. from the octocoral *Carijoa multiflora*. Oil. $[\alpha]_D^{25}$ +22.2 (c, 0.1 in $CHCl_3$).
Dorta, E. *et al., Org. Lett.*, 2004, **6**, 2229-2232 (*isol, pmr, cmr, ms*)

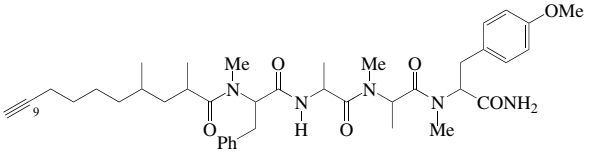
Caritoxins C-122

Actinia cari *Toxins. CTX*

Three basic proteins (Caritoxins I-III) lacking cysteine. Isol. from the sea anemone *Actinia cari*. Show high haemolytic activity.
Macek, P. *et al., Toxicon*, 1982, **20**, 181-185 (*isol*)
Sencic, L. *et al., Comp. Biochem. Physiol., B: Comp. Biochem.*, 1990, **97**, 687-693 (*isol*)

Carmabin A C-123

[205492-50-8]



$C_{40}H_{57}N_5O_6$ 703.92
Isol. from *Lyngbya majuscula*. Amorph. solid. $[\alpha]_D^{27}$ -109 (c, 0.4 in MeOH). λ_{max} 222 (ϵ 6900); 278 (ϵ 1400) (MeOH). λ_{max} 222 (ϵ 6900); 278 (ϵ 1400) (MeOH) (Berdy).

9,9,10,10-Tetrahydro, 9-oxo: ***Carmabin B***
[205492-52-0]
$C_{40}H_{59}N_5O_7$ 721.935
Isol. from *Lyngbya majuscula*. Amorph. solid. $[\alpha]_D^{27}$ -102 (c, 0.2 in MeOH). λ_{max} 222 (ϵ 7000); 278 (ϵ 1200) (MeOH). λ_{max} 222 (ϵ 7000); 278 (ϵ 1200) (MeOH) (Berdy).
Hooper, G.J. *et al., J. Nat. Prod.*, 1998, **61**, 529-533 (*isol, uv, ir, pmr, cmr, ms*)

Carnocins C-124

Polypeptide bacteriocins.

Carnocin CP 5 [149983-81-3]
Prod. by *Carnobacterium piscicola* CP5.

Carnocin UI 49 [142540-01-0]
Prod. by *Carnobacterium piscicola* UI49 isol. from fish.

Carnocin H
Peptide containing approx. 75 amino acid residues. Prod. by *Carnobacterium* sp. 377.

Carnocin KZ213
Prod. by *Carnobacterium piscicola* 213.
Stoffels, G. *et al., J. Appl. Bacteriol.*, 1992, **73**, 309-316 (*Carnocin UI 49*)
Mathieu, F. *et al., Biotechnol. Lett.*, 1993, **15**, 587-590 (*Carnocin CP 5*)

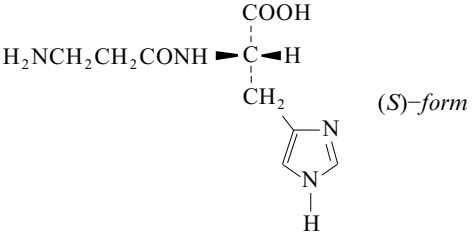
Carnosine C-126

N-*β-Alanylhistidine, 9CI*



(S)–form

$C_9H_{14}N_4O_3$ 226.235
Log P -4.13 (calc).

(*R*)-*form*

D-form
[5853-00-9]
No depressor activity on blood pressure. Mp 260°.
$[\alpha]_D^{28}$ -20.4 (c, 1.5 in H_2O).

Hydrochloride: Mp 245°.

N-*Benzyloxycarbonyl:*
$C_{17}H_{20}N_4O_5$ 360.369
Mp 161°. $[\alpha]_D^{24}$ -11 (H_2O).

(*S*)-*form*

L-form
[305-84-0]
Occurs in the skeletal muscles of many animals and man. Isol. from the green alga *Spongomorpha saxatilis*. Also present in high concns. in olfactory bulb tissue. No biochemical role has yet been assigned although it exerts a depressor effect on blood pressure. Appears to be involved in regulation of anaerobic glycolysis, olfactory transmission and other physiol. functions. Has strong pH-buffering, antioxidant and membrane-stabilising props. Needles. Sol. EtOH; fairly sol. MeOH; poorly sol. butanol, hexane.
Mp 246-250° dec. $[\alpha]_D^{20}$ +24.1 (c, 1.5 in H_2O). pK_{a1} 2.62; pK_{a2} 6.66; pK_{a3} 9.24 (25°). Log P -4.13 (calc).
▶ LD_{50} (mus, ipr) 9087 mg/kg. Exp. reprod. and teratogenic effects. MS3080000

Hydrochloride: [5852-99-3]
Mp 245°.

Nitrate: [5852-98-2]
Needles. Mp 219° (222° dec.).

*Sulfate:*Dec. at 238-40°.

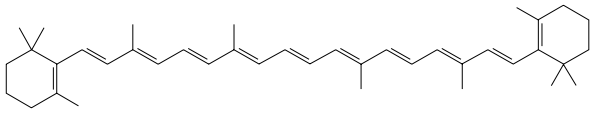
β-Carotene C-129

Betacarotene, INN, USAN. *Carotaben. Phenoro. Solatene. β,β-Carotene. Provatene. E160a*
[7235-40-7]
[116-32-5]



$C_{40}H_{56}$ 536.882
Widespread in plant and animal kingdoms. In plants it is almost always associated with chlorophyll. Occurs in marine organisms, e.g. sponges, esp. of the Poecilosclerida and Axinellida. Prod. commercially biosynthetically by *Dunaliella salina* growing in highly saline medium. Used in ultraviolet sunscreen preparations. Yellow food colour. Exhibits strong vitamin A activity; dietary supplement, nutrient, vitamin A precursor, antihistamine. Deep purple prisms (C_6H_6/MeOH); red rhombs. (petrol). Sol. CS_2, hexane, C_6H_6; fairly sol. MeOH, Et_2O, $CHCl_3$; poorly sol. H_2O. Mp 183° (sealed tube). Log P 15.23 (uncertain value) (calc). Air-sensitive. λ_{max} 452; 484; 520 (CS_2). λ_{max} 425; 450; 477 (hexane). λ_{max} 429; 452; 478 (Me_2CO). λ_{max} 450; 478 (EtOH).
▶ Produces yellow skin discolouration when used therapeutically.
FI0329500

7,8-Dihydro: ***7,8-Dihydro-β,β-carotene***
[58218-99-8]
$C_{40}H_{58}$ 538.898
Isol. from *Parasilurus asotus*, *Cercospora cruenta* and other catfish. λ_{max} 405 (ε 73600); 427 (ε 111000); 453 (ε 101000) (hexane).

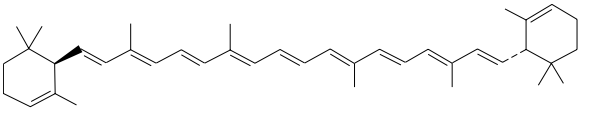
ε-Carotene C-130

ϵ_1-Carotene. ε,ε-Carotene
[38894-81-4]



(*R,R*)–*form*

$C_{40}H_{56}$ 536.882

(*R,R*)-*form* [472-89-9]
Constit. of *Navicula torquatum*, *Bryopsis corticulans*, *Codium fragile* and *Cryptomonas ovata*.
Red cryst.
Mp 199-201° Mp 196° (sealed tube). $[\alpha]_D^{27}$ +806 (C_6H_6). λ_{max} 415; 440; 470 (petrol).

(*S,S*)-*form*
Constit. of *Pelagococcus subviridis* and *Ulva lactuca*.
Mp 197-198° (sealed tube). $[\alpha]_D^{27}$ -786 (C_6H_6). λ_{max} (Me_2CO).

(*RS,RS*)-*form*
Orange platelets (C_6H_6/MeOH). Mp 190° (sealed tube).

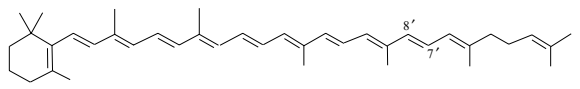
γ-Carotene C-131

β,ψ-Carotene. Sphaerobolin
[472-93-5]



$C_{40}H_{56}$ 536.882
Widespread carotenoid found esp. in *Gonocaryum pyriforme* and from marine strain of the cyanobacterium *Synechococcus* spp. Exhibits vitamin A activity. Violet prisms (C_6H_6/petrol). Mp 178° (154°). Log P 15.04 (uncertain value) (calc). λ_{max} 437; 462; 494 (hexane). λ_{max} 439; 461; 491 (Me_2CO). λ_{max} 439; 461; 491 ($CHCl_3$).

1′,2′-Dihydro: 1′,2′-Dihydro-β,ψ-carotene. ***1′,2′-Dihydro-γ-carotene***
[198413-30-8]
$C_{40}H_{58}$ 538.898
Constit. of *Chlorobium tepidum*. λ_{max} 439 (sh); 461; 490 (Me_2CO/MeOH/THF).

1′,2′-Dihydro, 1′-hydroxy, O-*β*-D-*glucopyranoside: 1′-Glucosyloxy-1′,2′-dihydro-β,ψ-carotene*
[36473-46-8]
$C_{46}H_{68}O_6$ 717.04
Isol. from a gliding filamentous organism. λ_{max} 462; 490 (Me_2CO) (as per-Ac).

7′,8′-Dihydro: ***β-Zeacarotene****. Carotene X. 7′,8′-Dihydro-β,ψ-carotene*
[514-90-9]
$C_{40}H_{58}$ 538.898
Isol. from sweet corn (*Zea mays*) grains, *Citrus* spp., cultures of *Phycomyces blakesleeanus* etc. Orange-yellow platelets (Me_2CO). Mp 96-97°. λ_{max} 403; 427; 451 (petrol). λ_{max} 406; 428; 454 (EtOH).

3′,4′-Didehydro: 3′,4′-Didehydro-β,ψ-carotene. 3′,4′-Didehydro-γ-carotene. ***Torulin***†*. Torulene*
[547-23-9]
$C_{40}H_{54}$ 534.867
Constit. of yeasts *Rhodotorula rubra*, *Rhodotorula minuta* and the ladybird beetle *Coccinella septempunctata*. Fine red needles (EtOAc) or violet cryst.(C_6H_6/EtOH). Mp 183-184°. λ_{max} 460 (sh); 484; 518 (petrol). λ_{max} 467; 501; 537 ($CHCl_3$).

3′,4′-Didehydro, 1′,2′-dihydro, 2′-hydroxy: 3′,4′-Didehydro-1′,2′-dihydro-β,ψ-caroten-2′-ol. 2′-Hydroxy-1′,2′-dihydrotorulene. 1,2′-Dihydro-2′-hydroxytorulene
$C_{40}H_{56}O$ 552.882
Minor carotenoid from the asporogenous yeast *Cryptococcus laurentii*. Tentative struct.

3′,4′-Didehydro, 1′,2′-dihydro, 1′-hydroxy, O-*β*-D-*glucopyranoside:*
[36210-85-2]
$C_{46}H_{66}O_6$ 715.024
Isol. from a gliding filamentous organism and from the myxobacterium *Sorangium compositum*. λ_{max} 448; 473; 503 (Me_2CO) (as per-Ac).

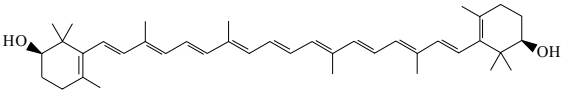
β,β-Carotene-2,2′-diol C-132



(2*R*,2′*R*)*-form*

$C_{40}H_{56}O_2$ 568.881

2′-Deoxy, 5β,6β-epoxide: ***5,6-Epoxy-5,6-dihydro-β,β-caroten-2-ol***
[53120-11-9]
$C_{40}H_{56}O_2$ 568.881
Isol. from *Trentepohlia iolithus*. λ_{max} 423; 443; 472 (Et_2O).

3,3′,4,4′-Tetradehydro, mono-Me ether: ***3,3′,4,4′-Tetradehydro-2′-methoxy-β,β-caroten-2-ol***
[83332-06-3]
$C_{41}H_{54}O_2$ 578.876
Isol. from *Rhaphidophlus typicus.*

3,3′,4,4′-Tetradehydro, di-Me ether: ***3,3′,4,4′-Tetradehydro-2,2′-dimethoxy-β,β-carotene***
[83332-05-2]
$C_{42}H_{56}O_2$ 592.903
Isol. from *Rhaphidophlus typicus.*

(2R,2′R)-form [39668-26-3]
Constit. of *Trentepohlia iolithus* and *Ectatosoma tiaratum.* Purple cryst. ($CHCl_3$/MeOH). Mp 167°. Kayser repts. *ca*. 54% ee 2*S* ex *Ectatosoma tiaratum*.

Monoketone: ***2′-Hydroxy-β,β-caroten-2-one***
$C_{40}H_{54}O_2$ 566.865
Isol. from adult specimens of *Ectatosoma tiaratum* as partial racemate: also isol. from other stick insects as material of undetd. abs. config. CD: λ_{max} 222 nm, Δε + 1.1. λ_{max} 450; 477 (Me_2CO).

Monodeoxy: ***β,β-Caroten-2-ol***
[58501-76-1]
$C_{40}H_{56}O$ 552.882
Constit. of *Trentepohlia iolithus* and *Cerura vinula*. Isol. from *Idotea* spp. and *Ligia exotica*. Blue cryst. ($CHCl_3$/MeOH). Mp 177-178°. Kayser repts. *ca*. 48% ee 2*S* ex *Cerura vinula*.

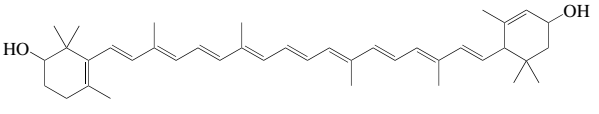
β,ε-Carotene-2,3′-diol C-133

Tilefishxanthin I
[70858-55-8]



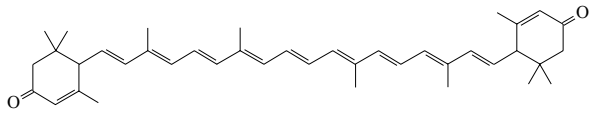
$C_{40}H_{56}O_2$ 568.8813

Isol. from red tile fish, *Branchiostegus japonicus*.

Asahara, M. *et al., Nippon Suisan Gakkaishi*, 1979, **45**, 485 (*isol, uv, struct*)

ϵ,ϵ-Carotene-3,3′-dione C-134

[28840-14-4]



$C_{40}H_{52}O_2$ 564.85

Constit. of *Sebastes flavidus* and other fish. Also found in chitons. Light red cryst. (CH_2Cl_2/Et_2O).

Mp 194°.

(6*S*,6′*S*)-*form* [97169-05-6]

Isol. from marine fish-eggs and egg yolk. Biosynth. precursor of Tunaxanthin, T-795. λ_{max} 415; 438; 468 (petrol).

[57545-55-8, 82880-34-0, 82915-88-6, 97169-05-6]

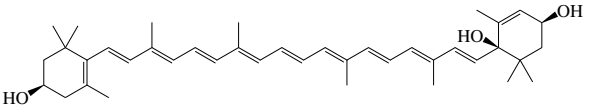
β,ϵ-Carotene-3,3′,6-triol C-137



$C_{40}H_{56}O_3$ 584.881

(3*R*,3′*S*,6′*R*)-*form*

Deepoxysalmoxanthin

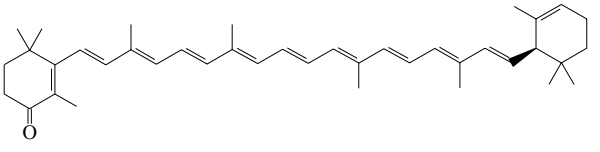
[342425-09-6]

Isol. from the salmon *Oncorhynchus keta*. λ_{max} 420 (sh); 444; 473 (no solvent reported).

Matsuno, T. *et al., J. Nat. Prod.*, 2001, **64**, 507-510 (*isol, pmr, cmr, cd, uv, abs config*)

β,ϵ-Caroten-4-one C-138

4-Keto-α-carotene. Phoenicopterone



$C_{40}H_{54}O$ 550.866

(*R*)-*form* [3297-23-2]

Partially synthesised from BF_3 complex of α-carotene; isol. from the Red Sea crinoid *Lamprometra klunzingeri*.

Salmon-pink platelets (C_6H_6/MeOH).

Mp 189-190°. λ_{max} 452 (hexane).

4-Alcohol: β,ϵ-Caroten-4-ol. 4-Hydroxy-α-carotene

[2213-16-3]

$C_{40}H_{56}O$ 552.882

Presumed to be naturally occurring, but lit. citations are inaccessible. Large rectangular orange plates (C_6H_6/MeOH).

Mp 177°. λ_{max} 446; 474 (hexane).

Entschel, R. *et al., Helv. Chim. Acta*, 1958, **41**, 983 (*synth*)

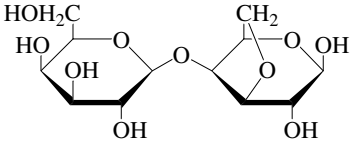
Carrabiose C-139

3,6-Anhydro-4-O-β-D-galactopyranosyl-D-galactose, 9CI. Carrobiose

[19253-99-7]



β-Pyranose-*form*

$C_{12}H_{20}O_{10}$ 324.284

Produced by partial methanolysis of the polysaccharide from marine alga *Chondrus crispus* (κ-carrageenan) and the red alga

Furcellaria fastigiata. Amorph. solid. $[\alpha]_D^{17}$ +15.2 (c, 1.25 in H_2O).

Phenylosazone: Mp 214-215°. $[\alpha]_D^{10}$ +68.2 → +45 (c, 0.6 in EtOH/Py).

Phenylhydrazone:
Yellow cryst. (EtOH/Et_2O). Mp 211-213°. $[\alpha]_D^{21}$ +110 (c, 0.4 in MeOH).

Di-Et dithioacetal:
$C_{16}H_{30}O_9S_2$ 430.54
Cryst. (EtOH/Et_2O). Mp 116-117°. $[\alpha]_D^{25}$ +4 (c, 1.8 in H_2O).

Di-Et dithioacetal, hexa-Ac:
$C_{28}H_{42}O_{15}S_2$ 682.763
Cryst. (EtOH aq.). Mp 118-119°. $[\alpha]_D$ -4 (c, 1.2 in $CHCl_3$).

α-Pyranose-*form*

Me glycoside: Methyl α-carrabioside
$C_{13}H_{22}O_{10}$ 338.311
Cryst. (MeOH/EtOH). Mp 203-204°. $[\alpha]_D^{17}$ +36 (c, 1.0 in H_2O).

β-Pyranose-*form*

Me glycoside: Methyl β-carrabioside
$C_{13}H_{22}O_{10}$ 338.311
Needles (EtOH/Me_2CO). Mp 136-138° (as monohydrate).
$[\alpha]_D$ -78.6 (c, 0.70 in H_2O).

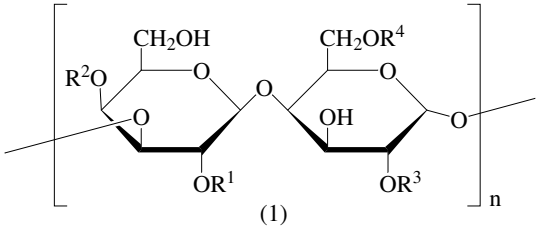
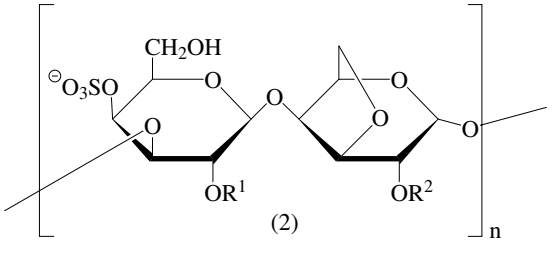
Carrageenan C-140

Carrageenin. Carragheen. Genuvisco J. FEMA 2596. E407
[9000-07-1]



(1)



(2)

A complex mixt. of polysaccharides composed of galactans, the proportions of which vary with spp., season and environment. The major structural feature is β(1→3) and α(1→4) linked galactose units with various degrees and sites of sulfation (sulfate ester content 15-40%). The Greek prefixes denote the idealised constitution of different disaccharide units although native carrageenans show variation from these idealised structs. The struct. also varies during life-cycle of the alga. Obt. from red seaweeds in the families Furcellariaceae, Gigartinacaceae, Phyllophorraceae and Solieraceae. Used for gelling, thickening and emulsion stabilisation of foods (salts may also be used). Sol. H_2O; fairly sol. DMSO; poorly sol. oils, MeOH, hexane. ν component also referred to in the lit. alongside those descr. below.

▶ FI0700000

Ethyldimethyl(1-methyl-3,3-diphenylpropyl)ammonium salt:
Emepronium carrageenate, BAN. *Cetiprin novum*
Anticholinergic agent. Muscarinic antagonist. Consists mainly of κ and λ fractions.

μ-*form* [51311-96-7]
Isol. from *Furcellaria fastigiata*. Structure (1) with $R^1 = R^3 = H$, $R^2 = R^4 = SO_3^{\ominus}$. Minor fraction of carrageenan samples.

λ-*form*
Picnin A
[9064-57-7]
Isol. from *Chondrus crispus*. Present particularly in algal tetrasporophytes. Structure (1) with $R^1 = R^3 = R^4 = SO_3^{\ominus}$, $R^2 = H$. Major fraction.

▶ FI0704000

ε-*form* [51311-95-6]
Isol. from *Furcellaria fastigiata*. Structure (1) with $R^1 = R^3 = SO_3^{\ominus}$, $R^2 = R^4 = H$.

ι-*form* [9062-07-1]
Isol. from *Eucheuma spinosum* and *Agardhiella tenera* red seaweeds. Structure (2) with $R^1 = H$, $R^2 = SO_3^{\ominus}$. Major fraction.

κ-*form* [11114-20-8]
Isol. from *Chondrus crispus*. Present particularly in algal gametophytes. Structure (2) with $R^1 = R^2 = H$. Major fraction.

▶ FI0703000

ξ-*form* [70431-33-3]
Isol. from *Gigartina* spp. tetrasporophytes. Structure (1) with $R^1 = R^3 = SO_3^{\ominus}$, $R^2 = R^4 = H$.

π-*form* [71078-00-7]
Structure (1) with $R^1 = R^3 = SO_3^{\ominus}$, $R^4 = H$, C_4-C_6 pyruvate bridge in left-hand residue.

θ-*form*
Structure (2) with $R^1 = R^2 = SO_3^{\ominus}$.

(6*E*,8α)-*form*

6β,7β-Epoxide: 6,7-Epoxy-3(15)-caryophyllen-8-ol. ***Suberosol A***
[444593-60-6]
$C_{15}H_{24}O_2$ 236.353
Constit. of *Subergorgia suberosa*. Oil. $[\alpha]_D^{29}$ -17.4 (c, 0.13 in $CHCl_3$).

(6*E*,8β)-*form*

Suberosol C
[444593-62-8]
Constit. of *Subergorgia suberosa*.
Oil. $[\alpha]_D^{29}$ -67.9 (c, 0.14 in $CHCl_3$).

6β,7β-Epoxide: ***Suberosol B***
[444593-61-7]
$C_{15}H_{24}O_2$ 236.353
Constit. of *Subergorgia suberosa*. Oil. $[\alpha]_D^{29}$ -10.7 (c, 0.24 in $CHCl_3$).

(6*Z*,8α)-*form*

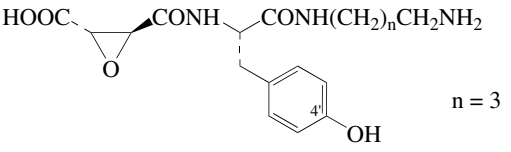
Suberosol D
[444593-63-9]
Constit. of *Subergorgia suberosa*.
Oil. $[\alpha]_D^{29}$ +2.5 (c, 0.045 in $CHCl_3$).
Wang, G.-H. *et al., J. Nat. Prod.*, 2002, **65**, 887-891 (*isol, pmr, cmr*)

Catch-releasing peptide C-144

*1-L-Alanine-3-L-prolinemyomodulin A (*Aplysia californica*), 9CI. AMPMLRL amide*
[111846-40-3]
H-Ala-Met-Pro-Met-Leu-Arg-Leu-NH_2
Isol. from pedal ganglion extracts of the mussel *Mytilus edulis*. Relaxes catch-tension of the anterior byssus retractor muscle.
Hirata, T. *et al., Brain Res.*, 1987, **422**, 374 (*isol, struct*)

Cathestatin B C-145

PF 1126B. Antibiotic PF 1126B
[162112-42-7]
[167818-23-7, 169735-72-2]



$C_{17}H_{23}N_3O_6$ 365.385
Prod. by *Aspergillus terricola*, *Penicillium citrinum* and the sponge-derived *Microascus longirostris*. Inhibitor of cysteine protease. Amorph. solid. Stereochemical identity with PF 1126 antibiotics not certain.

4′-Deoxy: ***Cathestatin A***. *PF 1126A. Antibiotic PF 1126A*
[162112-41-6]
[167818-22-6, 169735-71-1, 169735-75-5, 169735-77-7]
$C_{17}H_{23}N_3O_5$ 349.386
Prod. by *Aspergillus terricola*, *Microascus longirostris* and *Penicillium citrinum*. Inhibitor of cysteine protease. Amorph. solid. Sol. H_2O, MeOH.
Woo, J.-T. *et al., Biosci., Biotechnol., Biochem.*, 1995, **59**, 350-352 (*isol, pmr, cmr*)

Cathestatin C C-146

PF 1138B. Antibiotic PF 1138B
[176486-11-6]
[172940-60-2]
As Cathestatin B, C-145 with

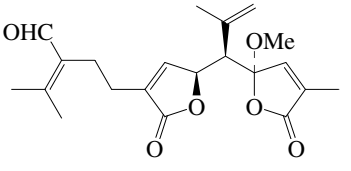
n = 4

$C_{18}H_{25}N_3O_6$ 379.412
Prod. by *Chaetomium globosum* and the sponge-derived *Microascus longirostris*. Inhibitor of cysteine protease. Sol. H_2O. Stereochemical identity with PF 1138 antibiotics not certain.

4′-Deoxy: ***Antibiotic PF 1138A***. *PF 1138A*
[172940-59-9]
$C_{18}H_{25}N_3O_5$ 363.413
Prod. by *Chaetomium globosum*. Thiol protease inhibitor.
Japan. Pat., 1995, 95 252 245; *CA*, **124**, 117071u (*PF 1138*)
Yu, C.-M. *et al., J. Antibiot.*, 1996, **49**, 395 (*isol, pmr, cmr*)

Caucanolide A C-147

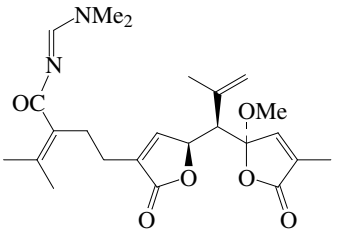
[869801-88-7]



$C_{21}H_{26}O_6$ 374.433
Constit. of *Pseudopterogorgia bipinnata*. Oil. $[\alpha]_D^{20}$ -42 (c, 0.7 in $CHCl_3$). λ_{max} 204 (ε 26200); 246 (ε 15500) (MeOH).
Ospina, C.A. *et al., J. Nat. Prod.*, 2005, **68**, 1519-1526 (*Caucanolide A*)

Caucanolide B C-148

[869801-89-8]



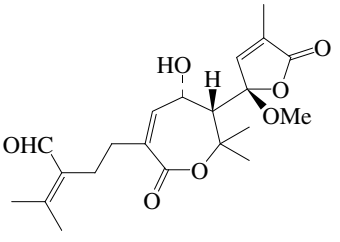
$C_{24}H_{32}N_2O_6$ 444.527

Constit. of *Pseudopterogorgia bipinnata*. Oil. $[\alpha]_D^{20}$ -20.8 (c, 0.6 in $CHCl_3$). λ_{max} 195 (ϵ 17200); 205 (ϵ 16200) (MeOH).

Ospina, C.A. *et al., J. Nat. Prod.*, 2005, **68**, 1519-1526 (*Caucanolide B*)

Caucanolide C C-149

[869801-90-1]



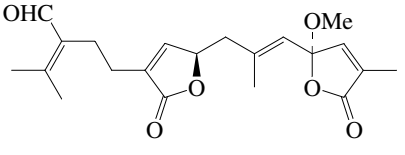
$C_{21}H_{28}O_7$ 392.448

Constit. of *Pseudopterogorgia bipinnata*. Oil. $[\alpha]_D^{20}$ -7.1 (c, 1.1 in $CHCl_3$). λ_{max} 210 (ϵ 16100); 244 (ϵ 6000) (MeOH).

Ospina, C.A. *et al., J. Nat. Prod.*, 2005, **68**, 1519-1526 (*Caucanolide C*)

Caucanolide D C-150

[869801-91-2]



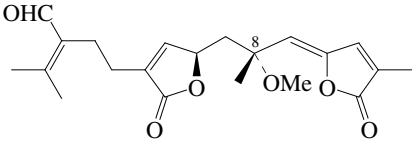
$C_{21}H_{26}O_6$ 374.433

Constit. of *Pseudopterogorgia bipinnata*. Oil. $[\alpha]_D^{20}$ -16.2 (c, 1.4 in $CHCl_3$). λ_{max} 205 (ϵ 16600); 240 (ϵ 12800) (MeOH).

Ospina, C.A. *et al., J. Nat. Prod.*, 2005, **68**, 1519-1526 (*Caucanolide D*)

Caucanolide E C-151

[869801-92-3]



$C_{21}H_{26}O_6$ 374.433

Constit. of *Pseudopterogorgia bipinnata*. Oil. $[\alpha]_D^{20}$ +72.2 (c, 1.3 in $CHCl_3$). λ_{max} 206 (ϵ 16500); 261 (ϵ 16100) (MeOH).

8-Epimer: ***Caucanolide F***

[869801-93-4]

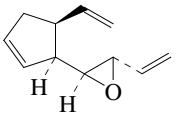
$C_{21}H_{26}O_6$ 374.433

Constit. of *Pseudopterogorgia bipinnata*. Oil. $[\alpha]_D^{20}$ +34.5 (c, 1.3 in $CHCl_3$). λ_{max} 209 (ϵ 19900); 261 (ϵ 21500) (MeOH).

Ospina, C.A. *et al., J. Nat. Prod.*, 2005, **68**, 1519-1526 (*Caucanolides E and F*)

Caudoxirene C-152

[117415-46-0]



Absolute Configuration

$C_{11}H_{14}O$ 162.231

Metab. of *Perithalia caudata*. Gamete releasing factor (threshold conc. = 30 pmol). Oil. $[\alpha]_D$ +238.3 (CH_2Cl_2).

Muller, D.G. *et al., Biol. Chem. Hoppe-Seyler*, 1988, **369**, 655 (*ms, pharmacol*)

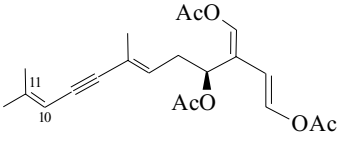
Lebreton, J. *et al., Tetrahedron*, 1997, **53**, 145 (*synth*)

Caulerpenyne C-153

[70000-22-5]



$C_{21}H_{26}O_6$ 374.433

Constit. of *Caulerpa prolifera*, *Caulerpa vanbosseae*, *Caulerpa taxifolia* and *Volvatella* sp. Inhibitor of prenyl transferase, 5-lipoxygenase and phospholipase A2. Ichthyotoxin. Cryst. Sol. $CHCl_3$, MeOH; poorly sol. H_2O.

Mp 57-58°. $[\alpha]_D^{20}$ +7.1 (c, 1 in EtOH). λ_{max} 252 (ϵ 33100); 265 (ϵ 27900); 280 (ϵ 1700) (MeOH) (Berdy). λ_{max} 252 (ϵ 33100) (EtOH) (Berdy).

10ξ,11ξ-Epoxide: ***10,11-Epoxycaulerpenyne***

$C_{21}H_{26}O_7$ 390.432

Constit. of *Caulerpa taxifolia*. Oil. $[\alpha]_D$ -12.3 (c, 0.56 in EtOH).

▶ Mutagenic.

1,2-Dihydro: 1,2-Dihydrocaulerpenyne

$C_{21}H_{28}O_6$ 376.449

Isol. as a mixt. of higher acyl homologues (1-Ac replaced by long chain acyl groups) from green alga *Caulerpa prolifera*.

Amico, V. *et al., Tet. Lett.*, 1978, 3593-3596 (*isol*)

De Napoli, L. *et al., Experientia*, 1983, **39**, 141-143 (*Dihydrocaulerpenyne analogues*)

Commeiras, L. *et al., Tet. Lett.*, 2003, **44**, 2311-2314 (*synth*)

Cutignano, A. *et al., Org. Biomol. Chem.*, 2004, **2**, 3167-3171 (*metab*)

Caulerpicin C-154

[11003-42-2]

$C_{43}H_{87}NO_2$ 650.166

Consists of a mixt. of ceramides derived from 2-Amino-1,3-octadecanediol, A-376 with $C_{18} \rightarrow C_{26}$ saturated fatty acids. Toxic principle, isol. from the green alga *Caulerpa racemosa* and other *Caulerpa* spp. Concentrates in crabs, shrimps and other

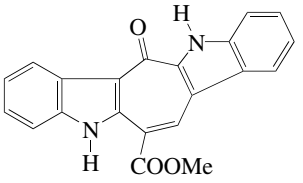
organisms in the marine food chain. Cryst. Sol. MeOH, Et_2O; poorly sol. H_2O.
Mp 95°.

▶ Toxic agent causing sensory numbness.

Doty, M.S. *et al., Nature (London)*, 1966, **211**, 990
Nielsen, P.G. *et al., Phytochemistry*, 1982, **21**, 1643 (*pmr, ms, struct*)

Caulersin C-155

[196803-51-7]



$C_{21}H_{14}N_2O_3$ 342.353
Alkaloid from the alga *Caulerpa serrulata*. Bright yellow cryst. (MeOH).
Mp 269-270°. λ_{max} 206 (log ϵ 4.51); 220 (log ϵ 3.62); 265 (log ϵ 2.02); 273 (log ϵ 1.1); 311 (log ϵ 1.36) (EtOH).

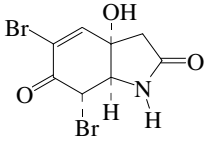
Cavernicolin 1 C-156

[84590-04-5]



Absolute Configuration

$C_8H_7Br_2NO_3$ 324.956
Alkaloid from the sponges *Aplysina cavernicola* and *Suberea* aff. *praetensa*. λ_{max} 200 (sh) (MeOH/NaOH) (Derep). λ_{max} 257 (ϵ 8300) (MeOH) (Derep).

5-Debromo, 5-chloro: ***7-Bromo-5-chlorocavernicolin***
$C_8H_7BrClNO_3$ 280.505
Metab. from *Aplysina cavernicola*. Racemic. Isol. as a mixt. of C(7)-epimerising monoacetates.

7-Debromo: ***5-Bromocavernicolin***
$C_8H_8BrNO_3$ 246.06
Isol. from the sponge *Suberea* aff. *praetensa*.

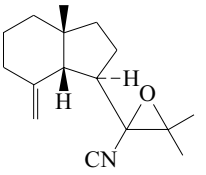
5,7-Bisdebromo, 5-chloro: ***5-Chlorocavernicolin***
$C_8H_8ClNO_3$ 201.609
Alkaloid from *Aplysina cavernicola* and *Suberea* aff. *praetensa*. Nearly racemic.

7-Epimer: ***Cavernicolin 2***
[84590-06-7]
$C_8H_7Br_2NO_3$ 324.956
Alkaloid from *Aplysina cavernicola* and *Suberea* aff. *praetensa*. λ_{max} 200 (sh) (MeOH/NaOH) (Derep). λ_{max} 257 (ϵ 8300) (MeOH) (Derep).

D'Ambrosio, M. *et al., Helv. Chim. Acta*, 1984, **67**, 1484-1492 (*isol, uv, pmr, cmr, ms, struct*)
Kijjoa, A. *et al., Z. Naturforsch., C*, 2002, **57**, 732-738 (*Suberea aff. praetensa alkaloids*)

Cavernoisonitrile C-157

[145543-56-2]



$C_{16}H_{23}NO$ 245.364
Constit. of *Acanthella* cf. *cavernosa* and *Phyllidia ocellata*. Sol. MeOH, Et_2O; fairly sol. hexane; poorly sol. H_2O. $[\alpha]_D$ +27 (c, 0.17 in MeOH).

Fusetani, N. *et al., Tet. Lett.*, 1992, **33**, 6823-6836 (*isol, pmr, cmr*)

Cavernosine C-158

[84316-05-2]
