H_3CCl

CH_3Cl 50.487

Manuf. by chlorination of methane or by liquid-phase hydrochlorination of methanol. A natural chloroalkane prod. by the marine and terrestrial biomass (estimated 5 m t a^{-1}). Probably the most abundant natural organohalogen. Accounts for ca. 25% of the chlorine in the atmosphere. Refrigerant. Methylating reagent used in manuf. of silicones and $PbMe_4$, low-temp. solv., extractant. Topical anaesthetic. Gas with ethereal odour. Mod. sol. H_2O.

Mp -97.7°. Bp -23.7°.

▶ Extremely flammable, fl. p. -50°, autoignition temp. 625/632°. Ignites or explodes on contact with BrF_3, BrF_5 and some metals. Effects of acute or chronic exposure often delayed. Mild exp. causes inebriation. Higher conc. produce a range of CNS effects plus gastrointestinal disturbances. Prolonged or repeated exposure to low conc. produces CNS effects which may persist for several months. Exp. reprod. and teratogenic effects. OES: long-term 50 ppm; short-term 100 ppm. PA6300000

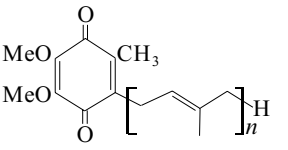
Coenzyme Q C-723

Mitoquinone. Ubiquinone



A group of related substances having n = 1-12; the main naturally occurring homologues have n = 6-10. Subscript number (≡ Ubiquinone no.) indicates n. Conotoxins C-834

Conopeptides

Peptides, mostly having 10-25 residues and showing a wide variety of primary struct. and 0-3 disulfide bridges. Up to 50,000 different conotoxins may exist (approx. 100 toxins in each of 500 known spp., with v. little duplication). Those on which the most work has been done have individual entries. A few conotoxins have been called Conantokins, Contulakins, Contryphans or Conorfamides. Prod. by carnivorous marine molluscs of the genus *Conus* (Neogasteropoda). Toxic substances having different modes of action where known, e.g. potassium channel blockers. Neuropharmacological tools used in study of ion channels. Different *C.* spp. feed on worms, other molluscs or fish. The piscivorous spp. have the most powerful toxins.

▶ Some conotoxins v. highly toxic, capable of human fatality.

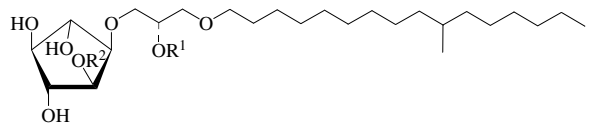
Crasserides C-901

Keruffarides
[146908-95-4]



Crasserides R^1 = Acyl, R^2 = H
Isocrasserides R^1 = H, R^2 = Acyl

A group of cyclitol glycolipid analogues. Keruffarides are considered to be identical with Crasserides. Present in all sponges examined incl. *Aplysina* spp., *Luffariella* sp. and *Pseudoceratina crassa*. It is proposed that these compounds are the distinguishing metabolite of the phylum Porifera. Exhibit fish antifeedant activity.

Occurs in many essential oils, usually as a partial racemate. Obt. mainly from geranium oil or synthetically. Widely used fragrance material for floral perfumes. Flavour for use in citrus compositions. Both enantiomers and the racemate are among the most widely used fragrance materials, used in floral compositions. Esters used in foods etc. are mostly of unreported enantiomeric composition. They are given here under the racemate and the props. reported presumably refer to the racemic forms.
