Welch, Bigelow, and Company,
Cambridge.

PREFACE.

The utility of a complete dictionary of the solubilities of chemical substances, or in fact of any of the physical constants of chemistry, needs no explanation. In publishing, however, these *First Outlines* of the Dictionary of Solubilities, which some years ago I began to compile, I wish to state the circumstances which have occasioned this course, and to request that the purport and aim of the book may be kept constantly in view.

Some six years since, while attending lectures on applied science in Paris, I was first impressed with the great practical importance of a wider dissemination of our knowledge of the solubilities of salts, while at the same time I was convinced that Chemical Science itself might gain many advantages if all known facts respecting solubilities were gathered from the widely scattered original sources into one special comprehensive work, and thus presented in an easily accessible form. I at that time conceived the idea of collecting all the materials and embodying them in a dictionary, where each of the determinations already made might be within the reach of all persons interested, and which might, moreover, serve as a body of facts into which new and scattered observations should be incorporated, and from which erroneous statements, now current, could be eliminated, as they are from time to time disproved. The importance of such a work was the more clearly impressed upon me, since I had learned, by previous experience, how many difficulties and delays attend the correct determination of solubilities, and had observed how little attention is usually paid to the labors of earlier experimenters, either as regards avoiding or refuting their errors, or bearing witness to the accuracy of their results. Besides furnishing, as an aid to chemical research, either in the scientific or the practical laboratory, a catalogue of known (or supposed) facts, such a compilation might answer the further purpose of indicating to those willing to labor for the advancement of science the numerous gaps in our knowledge of the subject which remain to be filled up.

In proceeding to carry out this scheme, it was thought best to prepare, in the first place, a rough outline list of the names of substances, together with such general statements of their solubilities as are contained in standard systematic works on Chemistry, like Gmelin's Handbook, the treatises of Gerhardt, Dumas, etc. From these materials an alphabetical catalogue — the first of the kind, it is believed, ever attempted in our language — was framed, into which more detailed statements from original memoirs were to be inserted; the matter previously taken from text-books serving merely as a guide in collating materials drawn directly from first sources, and as a means of controlling the accuracy of the final abstracts. This part of the plan having been in a measure accomplished, it was my intention, before publishing the work, to pursue the method, just indicated, of compiling from original sources until the leading chemical publications of this century, at least, had all been carefully searched, and the collected items duly digested. But owing to the great bulk and rapidly increasing complexity of the manuscript, with its innumerable interpolations, the mere mechanical labor of comparing newly found data with the intricate notes already made soon became so great that the work could no longer be carried on except at a great disadvantage. It was therefore deemed advisable to print the matter already accumulated, in order to facilitate the completion of the projected work; it being also hoped and believed that these Outlines, even as they now stand, may be useful to others. The student, investigating in detail all that is known of the solubility of any one special substance, may no doubt sometimes find the account of it here given meagre and unsatisfactory. But he should remember that the work makes no pretension to be more than a general outline, each special feature of which must be filled up in detail before anything like a complete dictionary can be hoped for.

Of the statements not credited to any authority, and which have been condensed from text-books, as already mentioned, it should be remarked, that these are much less complete than I could wish, since they were not originally intended to be published as they now stand, but were to be superseded by fuller and more careful abstracts from the original memoirs.

Many practical men will be inclined to object to the manner in which all the statements found relating to any subject have been copied, without special indication that any attempt has been made to single out the more trustworthy among them. To this objection I reply by denying that the compiler has, as a general rule, any right to pass judgment upon experimental results with which he has no special familiarity. The correction of errors of experiment, excepting occasional instances of palpable inaccuracy, should be left to subsequent experimenters, i. e. to persons practically conversant with the subject; and the criticisms of such have been given already in most of the instances in which they have fallen under my notice.

When the writer of a memoir makes no mention of the labors of his predecessors, it is but fair to attribute this silence to ignorance of the earlier experiments, and, other things being equal, to hold each set of observations equally liable to error. To my mind, a recent date is of itself no indication whatsoever of the superior accuracy of any series of results. In cases of conflicting authority, the reader has but to refer to the original memoirs, and decide for himself. It is true that special prominence might justly be given to experiments made with unusual care and with superior facilities, as, for example, those recently published by Kremers, Gerlach, Schiff, and others; and that, on the other hand, suspicious matter, and that which has been actually disproved, should properly be printed in smaller type than the ordinary text, and I would gladly have had this done if a more mature condition of the work had warranted the expenditure of this kind of labor. I may here say, that any information which will contribute to the growth or accuracy of the work, or in any way add to its usefulness, will be most gratefully received.

The term "solubility" in the title of the present publication is to be taken in its most comprehensive sense. I have no intention, at this time, of attempting a strict definition of the word, or of discussing the forces upon which solution may depend. In the present state of science, the collection of experimental data, and the study and comparison of well-authenticated special observations, seem to be of far greater importance than the disputes of the earlier chemists whether the phenomena in question should be referred to the domain of chemical affinity, or be studied as a purely physical problem.*

---

* "Dans les sciences naturelles, et surtout dans la chimie, les généralités doivent résulter de la connaissance minutieuse de chaque fait, et non la précéder." — Gay-Lussac, *Premier Mémoire sur la Dissolubilité des Sels dans l'Eau.*

It need only be remarked, that I am accustomed to class among phenomena of solubility all those reactions of liquids upon solids or gases, and those combinations of liquids with liquids, — excluding for the present molten metals and other substances in a state of igneous fusion, — in which the chemical force, as understood by Berzelius, for instance, is not the principal and as it were overwhelming force in action; we may have, perhaps, "solution" depending upon merely physical forces, like adhesion or cohesion, and also upon these forces plus a certain amount of chemical force. It can indeed hardly admit of a doubt that the chemical force is exerted in many cases of solution, while at the same time other forces unquestionably come into play; in which connection the old adage, that "like dissolves like," should be borne in mind. Hence, while the manifestations of chemical affinity proper, as evinced by the combination of bodies in simple and definite proportions, constitute the main subject of chemical text-books, many of the less clearly defined phenomena of chemical science may fairly come within the scope of a treatise on solubilities. Thus, though in the term "solubility of a substance," we ordinarily include only the comportment of the substance towards water, alcohol, wood-spirit, ether, oil of turpentine, benzin, and analogous hydrocarbons, and the other "neutral solvents," it is obviously sometimes proper to add observations on the action of acids and alkalies; for example, any account of the solubility of nitrate of baryta would be manifestly incomplete without a statement of the fact that this salt is taken up but sparingly by nitric acid. Again, in the solution of chloride of silver in ammonia-water, and that of various salts, as sulphate of lime, for example, in acids, there are probably at work other forces than the usual solvent power; but until the whole theory of solution is better understood, we must be content to treat of these allied phenomena under the same general head of "solubilities." Pains have also been taken to bring forward facts known respecting those cases in which two or more salts acting upon each other in presence of water, or the like, are, to a certain extent, mutually decomposed and dissolved, as in the familiar instance of nitrate of potash and chloride of sodium, which promote each other's solubility; or that of the reciprocal decomposition which ensues when sulphate of baryta is treated with a solution of an alkaline carbonate.

Any extended discussion of the methods ordinarily employed in determining solubilities, and the precautions necessary to insure accuracy, would perhaps hardly be in place in a mere compilation of results like the present work. Directions for making such experiments may be found in several chemical hand-books; — for example, in Fresenius's System of Instruction in Quantitative Chemical Analysis, or, better, in the original memoirs of those chemists who have occupied themselves with the experimental determination of solubilities, references to which may be found in the body of this work. It may, nevertheless, be well to remark here, that the text-books do not usually lay sufficient stress upon *the preparation of the solution* of the substance under examination; and yet this is the single fundamental point of a correct determination, the other steps of the process being altogether subsidiary, and in general easy of execution as well as comparatively free from sources of error. It is commonly stated that an exactly saturated solution of a salt may be prepared either by exposing a large excess of the salt to the action of the solvent during several hours at the desired temperature [*method by digestion*], or by heating a mixture of the salt and solvent until a strong solution has been obtained at a temperature higher than that at which the determination is to be made, and then cooling this solution to the desired degree, and maintaining it at this point for some time in contact with crystals of the salt, the whole being frequently agitated [*method of cooling*]. Now the latter method, though theoretically correct, is in practice peculiarly liable to error, and great care should consequently be exercised in employing it. It is no doubt true, that, as regards most substances, the saturated solutions prepared by either method would finally coincide in composition, provided the cooled solution be allowed to stand, under proper conditions, for a sufficient length of time. Yet it is often exceedingly difficult thus to obtain normally saturated solutions, even of our most common and easily crystallized salts, within the limits of time which can be conveniently allotted to a single experiment. This depends upon the tendency of the solutions of many, if not of most, substances to an indeterminate supersaturation when cooled from a higher to a lower temperature. This supersaturation is not always to be easily detected unless comparative solutions are prepared by the method of digestion, and the length of time required by any given solution to assume the normal condition is a point not readily ascertained. Gay-Lussac, in his classical memoir upon the solubility of salts in water,* enjoins the necessity of maintaining the final temperature constant during at least two hours.† His own experiments were made in the cellar of the Observatory at Paris, in which the thermometer varies but a fraction of a degree centigrade in the course of the year; they are unquestionably correct in themselves, and there can be little doubt that his statement regarding the preparation of normally saturated solutions by the method of cooling is true, not only for the limited number of salts upon which he operated, but in general for crystalline substances. Yet the rule seems hardly safe to be followed in all cases by experimenters less favorably circumstanced, and is obviously inapplicable to numerous uncrystallizable substances, or those liable to pass into an amorphous, gum-like condition, or to undergo other molecular changes. The difficulty of avoiding supersaturation is moreover illustrated by the experience of Legrand, who found that solutions might become supersaturated to a certain extent even while they were actually boiling.‡ Indeed, it is my opinion, that, next to impurity of the material operated upon, by which many published determinations have unquestionably been vitiated, there is no source of error so grave, none which has so seldom been fully guarded against, or so often altogether overlooked, as this tendency to supersaturation.

On the other hand, in the preparation of solutions by the method of digestion, a difficulty is encountered in the tendency of many substances, like arsenious acid, for example, to dissolve with extreme slowness; this can, however, be overcome by the exercise of patience, and, in any event, admits of being detected and controlled. It would, therefore, appear that, where practicable, the method by digestion should generally be preferred, at least for temperatures low enough to insure the experiment against the influence of evaporation. The completion of the solution can then always be ascertained by determining from time to time the amount of substance dissolved; the operation being considered finished when the results of two of these tests accord with each other. As frequent agitation is indispensable, some process of stirring by machinery moved by clock-work, analogous to that described in Mohr's *Lehrbuch der pharmaceutischen Technik*, might probably here be used with advantage.§ Kemp's regulator || for maintaining constant temperatures might also be found serviceable in some cases.

---

* *Annales de Chimie et de Physique*, 1819, (2.) **11.** 298.

† "Dans chaque cas il faut maintenir constante la temperature finale pendant deux heures au moins, et remuer fréquemment la dissolution saline, pour être bien assuré de sa parfaite saturation."

‡ "Il semble d'abord que pour avoir cette température, il n'y a qu'à observer celle à laquelle le sel *commence* à se déposer; mais on n'aurait ainsi rien de constant, il faut prendre celle qui a lieu *pendant* que le sel se dépose. En effet, j'ai remarqué que la dissolution pouvait se saturer malgré le mouvement d'ébullition, et atteindre une température de plus en plus élevée; mais aussitôt que le sel se dépose, le thermomètre redescend en un point où il se tient parfaitement fixe." — *Ann. Ch. et Phys.*, (2.) **59.** 428.

§ Compare Berzelius, in his *Lehrbuch*, **3.** 32, *et seq.*

|| *Liebig & Kopp's Jahresbericht*, **3.** 620; **10.** 612; **12.** 709; also *Journ. of the Franklin Instit.*, (3.) **25.** 319.

It was my original intention to designate the method employed in determining each of the solubilities given, whenever this could be ascertained; but in the present stage of the work this idea cannot be conveniently carried out. It may be said, in this connection, that the commendable example of several recent investigators, who have carefully stated the details of the methods employed by them in obtaining saturated solutions, ought to be generally followed.

The alphabetical arrangement adopted I believe to be altogether the best for a work of this kind. Several slight departures from the purely alphabetical order were, however, deemed advisable. Thus, the names of acids are made to precede the names of their salts: — Sulphuric Acid, for example, standing immediately before Sulphate of Acediamin, the first in the list of Sulphates. In the arrangement of the names of the radicals constituting the compound ammonias, custom seems to have already determined a different arrangement, as in "Hydrate of MethylEthylAmylammonium,"* instead of Hydrate of AmylEthylMethylammonium, which a strictly alphabetical system would require.

Prefixes, as *bi*, *di*, etc., being mere appendages to the names of substances, have not been allowed to separate names which really belong together. Thus, *Bi*-Chromate of Potash will be found next to Chromate of Potash, and not among substances the names of which begin with B. In all cases these prefixes have been printed in italics, in order to indicate more clearly their extrinsic character.

Many synonymes have been unavoidably omitted; but as an aid to the identification of compounds, all established formulæ have been given. In choosing from the multiplicity of names which in many instances have been applied to a single substance, I have usually endeavored to select the one which would probably be most familiar to the general reader, without holding strictly to any particular system of nomenclature; and the same remark applies to the formulæ employed. In making this statement, I must, however, confess that I should have preferred a more uniform system. Had the excellent work of Weltzien on Organic Compounds† been published earlier, it is probable that many of the names therein suggested would have been incorporated into the present work; as it is, several praiseworthy innovations have been adopted from it, for which I would here express my acknowledgments.

In the matter of prefixes, the English custom has been followed of employing those of Latin origin, as *bi*, *ter*, *quadri*,‡ *quinqui*, &c., in case the acid or electro-negative ingredient of the compound is doubled, trebled, &c., and the abbreviated Greek numeral adverbs *di*, *tri*, *tetra*, *penta*, &c., when the basic or electro-positive constituent is multiplied; thus, *bi*-Chromate of Potash refers to the compound $KO + 2\,CrO_3$, and *ter*-Chloride of Antimony to the compound $Sb\,Cl_3$; while *di*- or *din*-Oxide of Mercury refers to the compound $Hg_2\,O$, and *tri*- or *tris*-Acetate of Lead to the compound $3\,Pb\,O + C_4\,H_3\,O_3$. In many of the names of organic compounds terminating in *yl*(*e*), *in*(*e*), and *id*(*e*), the final French *e* has been dropped, in accordance with the usage of several standard authors. A sufficient reason for this omission is found in our liability to confound such words as Camphene (of Berthelot), and Camphin (of Claus), if the latter be written with a final *e* and pronounced accordingly. Moreover, there can be no propriety in attaching to this last term, which, with Benzin, Ethyl, and many others, has been transferred to our language from the German, a letter not used in the original, and answering no purpose in our own tongue. If it be argued by some, that the ety-

---

* In most of these exceptional instances the names of the radicals are in the order of the homologous series.

† *Systematische Zusammenstellung der organischen Verbindungen.* Von C. Weltzien. Braunschweig, 1860.

‡ Introduced by Wollaston.

mology of our language demands that the final *e* should be likewise omitted from the names chloride, sulphide, nitride, etc.,* it may be replied, that the case is hardly parallel, for all these names have become thoroughly incorporated by common consent in the language of science, and cannot now well be changed; and, moreover, no confusion can arise in this case from retaining the *e*, whereas the terms designating the above-mentioned organic compounds are still unsettled, and have acquired no such circulation in general literature.

The Centigrade thermometric scale is employed throughout the work; but, for the convenience of those who use other thermometers, a comparative table of the different scales is given in the Appendix.

In stating the degree of solubility of substances, each of the several methods employed by chemists has been sometimes followed, no attempt having been made to reduce the various expressions of different authors to any uniform mode of statement. The following proportions may consequently be found convenient in making such reduction. When the expression "100 parts of water dissolve x parts of the substance" is used, x is a quantity determined in the following manner. If the weight of the saturated solution taken be called W, and the weight of substance found to be therein dissolved be w, then $(W-w)$ will equal the weight of the water; and $(W-w) : w = 100 : x$, or $x = \frac{100 \,.\, w}{W-w}$. And if y represent the weight of water required to dissolve one part of the substance, then $x : 100 = 1 : y$, or $w : (W-w) = 1 : y$, or $y = \frac{(W-w)}{w}$. If the statement is one of percents, the relation is, of course, $W : w = 100 : n\%$.

In preparing any compilation, there must always be great difficulty in bringing the subject up to the date of publication, and this is especially true of a work like the present, which, as has been already explained, only presents the outlines of the subject. It is unnecessary to particularize the various delays which have tended to aggravate the difficulty in question to so great an extent, that the date of this Preface is some months later than the real date of the work.

I am not insensible to the fact that many errors and imperfections will be discovered in the following pages. In the words of Lempriere, "A Dictionary, the candid reader is well aware, cannot be made perfect all at once; it must still have its faults and omissions, however cautious and vigilant the author may have been, and in every page there may be found, in the opinion of some, room for improvement and for addition."

In conclusion, I again beg the reader, who may detect errors, to bring them to my attention.†

All temperatures are given in degrees of the Centigrade thermometer, — excepting when otherwise expressly stated.

In the references to authorities, the larger figures indicate the volume, and the smaller figures the page, of the journal or work alluded to; single figures in parentheses ( ) denote the number of the series of the journal.

The names of authors who have labored in concert are connected by the character *&*, — not by *and.*

Ppt. = Precipitate.
Pt. = Part.
% = Per cent.
@ = to; as, 9 @ 10%, from 9 to 10 per cent.

FIRST OUTLINES

OF

A DICTIONARY

OF THE

SOLUBILITIES OF CHEMICAL SUBSTANCES.

Abietic Acid.
Abietin. } See under Resins (of Turpentine).

Aboleic Acid. *Vid.* Œnanthylic Acid.

Absinthin. (*Absynthin. Bitter of Wormwood.*) $C_{32}H_{22}O_{10}$ Scarcely soluble in 1000 parts of water; more easily soluble in ether, and still more readily in alcohol. (Mein.) Soluble in concentrated acetic acid, from which it is partially reprecipitated on the addition of water, and in the strong mineral acids with more or less decomposition. Sparingly soluble in ammonia-water.

AceChlorPlatin. (*Proto Chloride of Platinum with Oxide of Mesityl; or with Metacetone. ChlorAcePlatin.*) $C_{12}H_{10}Cl_2Pt_2O_2$ (?) Very sparingly soluble in water; the aqueous solution undergoing partial decomposition when left to itself, and more quickly on being heated. Ether dissolves but little of it; alcohol somewhat more, especially if it be hot, the compound crystallizing out unchanged as the solution cools. Much more abundantly soluble in acetone, though 1 pt. of acetone dissolves scarcely more than $\frac{1}{30}$ pt. of it at the ordinary temperature, and but little more at higher temperatures. Chlorhydric acid, even when concentrated, dissolves it only at elevated temperatures, but the acid solution is not perceptibly decomposed by boiling. Completely soluble, with alteration in a solution of caustic potash. Very much more abundantly soluble at the ordinary temperature in aqueous solutions of the chlorides of potassium or sodium than in pure water; at more elevated temperatures these solutions dissolve still more of it, and no decomposition occurs even on continuous boiling. (Zeise, *Ann. Ch. u. Pharm.*, 1840, **33.** 41.)

AceChlorPlatinAmmonia. Remarkably easily and very abundantly soluble in water. Easily soluble in alcohol. An excess of ether precipitates it from the alcoholic solution. Pure acetone has but little solvent action upon it. (Zeise, *Ann. Ch. u. Pharm.*, 1840, **33.** 59.)

Acediamin. $C_4H_6N_2 = N_2\left\{\begin{matrix}C_4H_3''' \\ H_3\end{matrix}\right.$ Not isolated.

Acephogenic Acid. (*Acephosgenic Acid.*) Very soluble in water. Most of its salts are insoluble, or but sparingly soluble in water. (Zeise, *Ann. Ch. et Phys.*, (3.) **6.** pp. 504, 505.)

Acephogenate of Lead. Insoluble in water. (Zeise, *loc. cit.*, pp. 503, 504.)

Acephogenate of Lime. Insoluble in water. (Zeise, *loc. cit.*, pp. 503, 504.)

Acephogenate of Silver. Ppt.

Acephogenate of Soda. More soluble in water than phosphate of soda. (Zeise, *loc. cit.*, p. 503.)

Acephosic Acid. (*Acephoric Acid.*) Very soluble in water. Most of its salts are easily soluble in water, and alcohol. (Zeise, *Ann. Ch. et Phys.*, (3.) **6.** pp. 504, 505.)

Acephosate of Ammonia. Soluble in water, and alcohol. (Gm.)

Acephosate of Baryta. Soluble in water, and alcohol. (Zeise, *loc. cit.*)

Acephosate of Lead. Soluble in water, and alcohol, but on evaporating the aqueous solution a portion of the lead salt passes into the insoluble state. (Zeise, *loc. cit.*)

Acephosate of Lime. Soluble in water, and alcohol. Ether precipitates it from the alcoholic solution. (Zeise, *loc. cit.*, p. 503.)

Acephosate of Silver. Ppt.

Acephosate of Soda. Soluble in water, and alcohol. (Gm.)

Acetal. (*Ethylate of Ethylene.*) $C_{12}H_{14}O_4 = \left.\begin{matrix}C_4H_4'' \\ (C_4H_5)_2\end{matrix}\right\}O_4$

Soluble in about 18 vols. water at 25°, less soluble as the temperature is more elevated. (Stas, *loc. infra cit.*) Soluble in 6 @ 7 pts. water. (Liebig.) Miscible in all proportions with alcohol and ether. Soluble in monohydrated sulphuric acid, with subsequent decomposition. Chloride of calcium, and in general all very soluble salts, when added to its solution in water, cause it to separate out. From the alcoholic solution chloride of calcium does not precipitate it unless water is added at the same time. (Stas, *Ann. Ch. et Phys.*, (3.) **19.** 150.)

Acetamic Acid. Identical with Glycocoll, *q. v.*

Acetamid. (*Acetic Amid. Acetylamid.*) $C_4H_5NO_2 = N\left\{\begin{matrix}C_4H_3O_2 \\ H_2\end{matrix}\right.$

Deliquescent. Soluble in water, the solution undergoing decomposition when boiled. Soluble in alcohol, and ether. Decomposed by acids and by alkaline solutions. (Strecker.)

Acetamid with *di*Acetamid. $C_4H_5NO_2, C_8H_7NO_4$ Readily soluble in water, alcohol, and ether. (Strecker.)

Acetamid with **Mercury.** *Vid.* Mercur(*ic*) Acetamid.

Acetamid with **Silver.** *Vid.* ArgentAcetamid.

***Di*Acetamid.** Very easily soluble in water, alcohol, and ether. Decomposed when boiled with acids. (Strecker.)

$C_8H_7NO_4 = N\left\{\begin{matrix}(C_4H_3O_2)_2\\H\end{matrix}\right.$

Acetanilid. *Vid.* PhenylAcetamid.

Acetic Acid (Anhydrous). Decomposes in moist air. Not immediately miscible with water; dissolving, with decomposition, only after continued agitation, or on the application of heat. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** 314.)

(*Acetate of Acetyl. Acetic Acetate.*)

$\left.\begin{matrix}C_4H_3O_2\\C_4H_3O_2\end{matrix}\right\}O_2$

Acetic Acid with **Aldehyde (Hydride of Acetyl).** $C_{12}H_{10}O_8$ Insoluble in water. (Geuther.)

Acetic Acid. $C_4H_4O_4 = C_4H_3O_3,HO$ Hygroscopic. Miscible in all proportions with water, alcohol, and many of the essential oils; and with chlorhydric, sulphuric, nitric, and phosphoric acids. Glacial acetic acid is miscible with ether, but on the addition of water it separates from this solution.

Glacial acetic acid is soluble in oil of copaiba (Gerber). When 80 vols. of acetic acid of 1.075 sp. gr. are shaken up with 80 vols. of oil of lavender, 45 vols. of the acid are dissolved, a weaker acid containing oil being left, which, if agitated with 80 vols. of fresh oil, produces 110 vols. of oil containing acetic acid, while 5 vols. of still weaker acid remain, containing a large quantity of oil separable by water. The oil charged with acetic acid gives up the greater part of this acid when agitated with an equal volume of water, and the whole when agitated with four times the quantity of water, a certain quantity of the oil dissolving in the water at the same time. (Vauquelin.)

On exposing a mixture containing 90% of $C_4H_4O_4$ and 10% of water to a pressure of 1100 atmospheres for several minutes, it was found that $\frac{7}{8}$ of the space occupied by it was filled with crystals of very strong acid, while the remaining liquid was only a very weak vinegar. (Perkins, *Ann. Ch. et Phys.*, 1823, (2) **23.** 410.)

Concentrated acetic acid dissolves many resins, camphors, coloring matters, essential oils, sugars, gums, proteine compounds, organic acids, &c., &c.

(Van der Toorn, *Rep. Br. Assoc.*, 1834, p. 571.)

With the exception of the salts of silver and suboxide of mercury, which are difficultly soluble,

---

* Glacial acetic acid.

almost all of the normal acetates are easily soluble in water and in alcohol.

Acetate of Allyl. (*Acetate of Acryl. Acetate of Propylenyl.*) $C_{10} H_8 O_4 = C_4 H_3 (C_6 H_5) O_4$ Nearly insoluble in water. Miscible in all proportions with alcohol, and ether. (Zinin.)

Acetate of Alumina.

I.) *ter.* Deliquescent. Soluble in water.

$C_{12} H_9 Al_2''' O_{12}$ The aqueous solution saturated at 12.5° contains 10.6% of it. (Hassenfratz, *Ann. de Chim.*, **28.** 291.) A solution prepared by decomposing *pure* sulphate of alumina with acetate of lead may be heated without becoming cloudy, and this no matter how concentrated the solution may be; but a solution which contains sulphate of potash, such as is formed when acetate of lead is decomposed by alum, the sulphates of magnesia, soda, or ammonia, chloride of sodium, or alum, deposits an abundant precipitate on being similarly heated: this precipitate gradually redissolves as the liquid becomes cold, especially if it be frequently agitated, and a transparent solution is again obtained; on heating the solution a second time, it becomes troubled anew, and again clears up on cooling. The experiment, being repeated 20 times, constantly afforded the same result; the reaction occurring not only in concentrated, but also in dilute solutions, even at temperatures as low as 50°. The reaction occurs as well in hermetically closed vessels as in those which are open, and the same phenomena are observed in solutions which are strongly acidulated with acetic acid. When nitrate of potash is substituted for the salts above named, the precipitate which forms on heating will be less abundant, while the chlorides of calcium and of barium, nitrate of baryta and acetate of lead, produce nothing of the kind. The longer the heat is continued, so much the less readily does the precipitate redissolve on cooling, since it becomes more coherent. (Gay-Lussac, *Ann. Ch. et Phys.*, 1817, (2.) **6.** 201, and *Ann. de Chim.*, 1810, **74.** 193; Osann, *Gilbert's Ann. der Phys.*, 1821, **69.** 294.)

The aqueous solution is readily decomposed by evaporation, with loss of acetic acid and formation of binacetate. Solutions, prepared by decomposing [partially] purified sulphate of alumina with acetate of lead, containing 4 @ 5% of alumina being allowed to stand at a temperature of 15° @ 21° begin to deposit a crust of the insoluble binacetate, which afterwards gradually increases. At lower temperatures the solution remains unaltered during a much longer time. If the abovementioned solution be heated, it quickly becomes cloudy, and a heavy white precipitate separates out. At 38° a considerable quantity of this powder separated out in the course of several days, but at 71° the whole of the dissolved salt separated out in 2 or 3 hours, and at the temperature of boiling this was effected in a much shorter time, and besides acetic acid only a trace of alumina could be detected in the filtrate. With a weaker solution of the acetate, containing, for example, only 3% of alumina, the insoluble binacetate is formed in like manner; but in this case a considerable quantity of alumina remains in solution. Solutions containing 2% of alumina may be precipitated on boiling after they have been kept for several weeks, but not when recently prepared. The formation of the insoluble salt seems to be promoted by the presence of free acetic acid; thus a solution of the teracetate, which contained 0.75% of alumina, and could not be precipitated by boiling, was readily precipitated thereby after having been mixed with so much acetic acid that it contained as much as would be present in a solution of the teracetate containing 4% of alumina. On mixing a solution of the teracetate with chloride of sodium, sulphate of potash, or nitrate of potash, and heating the mixture, precipitation occurs. (W. Crum, *Ann. Ch. u. Pharm.*, 1854, **89.** pp. 158, 161, 162, 177, 178.)

An aqueous solution of Sp.Gr. (at 12°.5).	Contains per cent of it.	An aqueous solution of Sp.Gr. (at 12°.5).	Contains per cent of it.

1.0380	4	1.0880	9
1.0470	5	1.0990	10

(Hassenfratz, *Ann. de Chim.*, **28.** 302.)

II.) *bin.*

α = *Soluble Modification.* Easily and completely soluble in water. The solution is gradually decomposed by evaporation. (W. Crum, *Ann. Ch. u. Pharm.*, 1854, **89.** 164.)

$Al_2 O_3, 2 C_4 H_3 O_3 + 4 Aq$

β = *Insoluble Modification.* Exceedingly insoluble in water, either hot or cold, or in acetic acid. When 1 pt. of it is boiled with 200 pts. of water during an hour and a half it dissolves, with decomposition. Soluble in 2 equivalents of sulphuric, chlorhydric, or nitric acid. Soluble in a hot concentrated solution of tersulphate of alumina with evolution of acetic acid; also soluble in a hot solution of potash alum. (W. Crum, *Ann. Ch. u. Pharm.*, 1854, **89.** pp. 163, 158, 178.)

$Al_2 O_3, 2 C_4 H_3 O_3 + 2 Aq, \& 3-5 Aq$

Tissier describes a 6 hydrated salt insoluble in water, sparingly soluble in dilute acids, and readily soluble in solutions of the caustic alkalies.

III.) *Polybasic.* Compounds containing as many as six equivalents of the base to ~~one~~ of thr acid may be obtained in solution. These slightly opalescent liquids may be diluted or boiled without undergoing decomposition. They are precipitated on the addition of soluble sulphates, but may be mixed with nitrates, or chlorides. Compounds more basic than the hexa salt are insoluble. (Ordway, *Am. J. Sci.*, (2.) **26.** 203.)

Acetate of Amarin. Very readily soluble in water. (Fownes.)

Acetate of *bi*AmidoBenzoic Acid. Soluble in water, but the aqueous solution is decomposed by evaporation. (Voit.)

Acetate of Ammolin (of Unverdorben). Very readily soluble in water, and alcohol. Insoluble in ether.

Acetate of Ammonia.

I.) *normal.* Deliquescent. Very soluble in cold water, and in alcohol. Readily soluble in creosote. (Reichenbach.) The aqueous solution gradually undergoes decomposition when kept for some time.

$C_4 H_3 (NH_4) O_4$

II.) *acid.* Very deliquescent, and soluble in water. Easily soluble in alcohol. (Lassone.)

$C_4 H_3 (NH_4) O_4, C_4 H_4 O_4$

Acetate of Ammonia & of Copper. Efflorescent. (Coulon, *Ann. de Chim.*, **96.** 327, [T.].)

Acetate of Ammonia & *of protoxide* of Mercury. Easily soluble in water. Almost entirely insoluble in alcohol. (Hirzel.)

$NH_4 O, HgO, C_4 H_3 O_3$

ACETATE OF AMMONIA & OF URANIUM. $C_4 H_3 (NH_4) O_4 ; 2 (Ur_2 O_3, C_4 H_3 O_3) + 6 Aq.$ Very soluble in water. The solution not being decomposed on ebullition. (Wertheim, *Ann. Ch. et Phys.*, (3.) **11.** 64.) Very easily soluble in water, and alcohol. (Berzelius's *Lehrb.*)

ACETATE OF AMYL. $C_4 H_3 (C_{10} H_{11}) O_4$ Insoluble in water. Soluble in alcohol, or spirit, ether, and fusel oil (hydrate of amyl). (Cahours.)

ACETATE OF AMYL*chloré*. *Vid.* ChlorAcetate of Amyl; and Acetate of *bi*ChlorAmyl.

"ACETATE OF AMYLENE." *Vid.* Acetate of Amyl.

ACETATE OF AMYLENE. (*Acetate of Amyl Glycol.*) $C_{18} H_{16} O_8 = C_8 H_6 (C_{10} H_{10}'') O_8$ Insoluble in water. (A. Wurtz.)

ACETATE OF AMYLENE*chloré*. *Vid.* ChlorAcetate of Amyl.

ACETATE OF ANILIN. Soluble in water.

ACETATE OF ANTIMONY. $C_{12} H_9 Sb''' O_{12}$ Easily soluble in water. (Berzelius's *Lehrb.*)

ACETATE OF ATROPIN. Permanent. Readily soluble in water.

ACETATE OF BARYTA. $C_4 H_3 Ba O_4 + Aq$ & $3 Aq$ Efflorescent. The monohydrated salt is soluble in
1.25 pts. of water at 12.5° @ 15°
1.1 " " boiling. (Bucholz, *Beiträge*, **3.** 105, cited by Gehlen, *Schweigger's Journ. für Ch. u. Phys.*, 1812, **4.** pp. 41, 35.)
100 pts. of water at 15.5° dissolve about 88 pts. of it.
" " boiling " 96 " "
Soluble in 100 pts. of pure cold alcohol, and scarcely any more soluble in hot alcohol. (Bucholz, *Beiträge*, **3.** 102. [T.].) More soluble in *cold* than in hot water. (Liebig, in Kolbe's *Lehrb.*, **1.** 624.)
Soluble in 1.75 pts. of cold water.
" " 1.03 " boiling water; the saturated cold solution containing 36.36% of it, and the saturated boiling solution 50%. (Berzelius's *Lehrb.*) The monohydrated salt is soluble in 100 pts. of cold, and in 67 pts. of boiling alcohol. (Bucholz.) Insoluble in cold absolute alcohol. (Schlieper.) Insoluble in absolute alcohol, or very strong spirit. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **11.** 254.) Insoluble in ether. (Wurtz.) Insoluble in creosote. (Reichenbach.)

When one equivalent of $C_4 H_3 BaO_4$, in aqueous solution, is mixed with a solution of an equivalent of nitrate of lead (PbO, NO_5) 0.77 of it are decomposed to nitrate of baryta, which may be precipitated by adding alcohol, while 0.23 of it remain unchanged; when mixed with the solution of an equivalent of nitrate of potash (KO, NO_5) 0.72 of it are decomposed as before, while 0.28 of it remain unchanged. (Malaguti, *Ann. Ch. et Phys.*, 1853, (3.) **37.** 203.)

ACETATE OF BARYTA & OF URANIUM. $C_4 H_3 Ba O_4 ; 2 (C_4 H_3 O_3, Ur_2 O_3) + 6 Aq$ Very soluble in water. (Wertheim, *Ann. Ch. et Phys.*, (3.) **11.** 71.)

ACETATE OF BARYTA with NITRATE OF BARYTA. $C_4 H_3 Ba O_4 ; Ba O, NO_5 + 8 Aq$ Efflorescent. Easily soluble in water. Insoluble in absolute alcohol. (Lucius, *Ann. Ch. u. Pharm.*, **103.** 113.)

ACETATE OF BENZIDIN. Readily soluble in water, and alcohol.

ACETATE OF BENZOL. (*Acetate of Benzol Ether.*) $C_{22} H_{12} O_8 = C_8 H_6 (C_{14} H_6'') O_8$ Very easily soluble in spirit, and ether. Water precipitates it from the alcoholic solution. (Wicke, *Ann. Ch. u. Pharm.*, **102.** 367.)

ACETATE OF BENZYL. *Vid.* Acetate of Toluenyl.

ACETATE OF BISMUTH. $Bi_2 O_3, 3 C_4 H_3 O_3$ Easily ("sparingly") soluble in water.

ACETATE OF BRUCIN. Extremely soluble in water.

ACETATE OF BUTYL. (*Acetate of Tetryl.*) $C_{12} H_{12} O_4 = C_4 H_3 (C_8 H_9) O_4$

*Bin*ACETATE OF BUTYLENE. $C_8 H_8 (C_4 H_3 O_2)_2 O_4$ Insoluble in water. Soluble in alcohol, and ether. (A. Wurtz.)

ACETATE OF CADMIUM. $C_4 H_3 Cd O_4 + 3 Aq$ Permanent. Very soluble in water. (Stromeyer.)

ACETATE OF CADMIUM & OF URANIUM. $C_4 H_3 Cd O_4 ; C_4 H_3 (Ur_2 O_3) O_3 + 5 Aq$ Soluble without decomposition in water acidulated with acetic acid. (Weselsky.)

ACETATE OF CAPRYL. (*Acetate of Octyl.*) $C_{20} H_{20} O_4 = C_4 H_3 (C_{18} H_{17}) O_4$ Insoluble in water. Soluble in alcohol. Soluble in concentrated sulphuric acid, from which it is precipitated on the addition of water. (Bouis, *Ann. Ch. et Phys.*, (3.) **44.** 136.)

ACETATE OF CERIUM. $C_4 H_3 Ce O_4$ Permanent. Very soluble in water. Very sparingly soluble in alcohol. (Berzelius.)

ACETATE OF CETYL. $C_4 H_3 (C_{32} H_{33}) O_4$ Insoluble, or very sparingly soluble, in water. Soluble in ether. (Becker.)

ACETATE OF CHELERYTHRIN. Readily soluble in water, and alcohol.

ACETATE OF CHELIDONIN. Very soluble in water, and alcohol.

ACETATE OF *bi*CHLORAMYL. (*BiChlor Acetate of Amyl.*) $C_4 H_3 (C_{10} H_9 Cl_2) O_4$ Insoluble in water. Soluble in alcohol, and ether. (Cahours.)

ACETATE OF *bi*CHLORETHYL. (*Vinic bi Chlor Acetate. Bi Chloro Vinic Acetate. Acetate d'ethyle bichloré.*) $C_8 H_8 Cl_2 O_4 = C_4 H_3 Cl_2 O, C_4 H_3 O_3$ Slowly decomposed by water, in which it is itself insoluble. Slowly decomposed by alkaline lyes.

ACETATE OF *ter*CLHORETHYL. (*Acetate d'ethyle trichloré.*) $C_8 H_5 Cl_3 O_4 = C_4 H_2 Cl_3 O, C_4 H_3 O_3$ Decomposed by an aqueous solution of potash. (Leblanc.)

ACETATE OF *quadri*CHLORETHYL. (*Acetate d'éthyle quadrichloré. Quadrichlorovinic acetate.*) $C_8 H_4 Cl_4 O_4 = C_4 HCl_4 O, C_4 H_3 O_3$ Decomposed by an aqueous solution of potash. (Leblane.)

ACETATE OF *per*CHLORETHYL. (*Acetate d'éthyle quintichloré. Quinquichlorovinic Acetate.*) $C_8 H_3 Cl_5 O_4 = C_4 Cl_5 O, C_4 H_3 O_3$ Decomposed by a strong aqueous solution of potash. (Leblanc.)

ACETATE OF *bi*CHLOROMETHYL. (*Acetate de Methyle bichloré. Acetate de "methylene" chlore. Bichloromethylic Acetate.*) $C_6 H_4 Cl_2 O_4 = C_2 HCl_2 O, C_4 H_3 O_3$ Slowly decomposed by water. Quickly by a solution of caustic potash. (Malaguti.)

ACETATE OF *ter*CHLOROMETHYL. (*Chloracetate of Chloromethylase. Chloracetate méthylique. Ter Chloro Methylic Acetate. Acetate de Methyle trichloré.*) $C_6 H_3 Cl_3 O_4 = C_2 Cl_3 O, C_4 H_3 O_3$ Insoluble in water. Soluble in alcohol, and ether. (Laurent.)

Acetate of ChloroNicine. Soluble in water. (St. Evre.)
$C_{20}H_{12}Cl_2N_2, 2C_4H_4O_4$

Acetate of Cholesterin.
$C_{56}H_{46}O_4 = C_4H_3(C_{52}H_{43})O_4$

Acetate *of protoxide* of Chromium. Oxidizes when exposed to the air. Very sparingly soluble in cold water free from air, more soluble in hot water. Very sparingly soluble in alcohol. (Peligot, *Ann. Ch. et Phys.*, (3.) **12.** 542. Lœwel, *Ibid.*, (3.) **39.** 53.)
$C_4H_3CrO_4 + Aq$

Acetate *of sesquioxide* of Chromium.

I.) *normal.* Very soluble in water. (Brandenburg.)
$C_{12}H_9Cr_2'''O_{12}$

II.) *basic.* Compounds containing three equivalents and less of the base to ~~one~~ three of the acid may be obtained soluble in water. Those which contain more base that this are insoluble in water. (Ordway, *Am. J. Sci.*, (2.) **26.** 203.)

Acetate of Cinchonidin. Very sparingly soluble in cold water.

Acetate of Cinchonin. Decomposed by cold water to an insoluble basic and a soluble acid salt. Completely soluble in acetic acid. (Pelletier & Caventou.)

Acetate *of protoxide* of Cobalt. Deliquescent. Very soluble in water.
$C_4H_3CoO_4 + 4Aq$

Acetate *of sesquioxide* of Cobalt. Deliquescent. Soluble in water.

The aqueous solution is decomposed on boiling, with separation of Co_2O_3. (H. Rose, *Pogg. Ann.*, **83.** 148.)

Acetate *of protoxide* of Cobalt & of Uranium. Soluble, without decomposition in water acidulated with acetic acid. (Weselsky.)
$C_4H_3CoO_4; 2(Ur_2O_3, C_4H_3O_3) + 7Aq$

Acetate of Coniin.

Acetate *of dinoxide* of Copper. Permanent. (Berzelius.) Hygroscopic. (Gehlen.) Insoluble in water, by which, however, it is slowly decomposed. Partially soluble in alcohol. (Lassone.)
$C_4H_3Cu_2O_4$

Acetate *of protoxide* of Copper.

I.) *normal.* Somewhat efflorescent. Soluble in 13.4 pts. of water at 20°. (Gehlen, *Schweigger's Journ. für Ch. u. Phys.*, 1812, **4.** pp. 29, 31.) Soluble in 5 pts. of boiling water. (Wenzel, in his *Verwandtschaft*, p. 444, cited by Gehlen.) Soluble in 14.06 pts. of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) 1 pt. of the dry salt is soluble in 5.061 pts. of water at 101.1°; or, 100 pts. of water at 101.1° dissolve 19.796 pts. of it: the aqueous solution saturated at its boiling-point (101.1°) containing 16.5% of the dry salt. (T. Griffiths, *Quar. J. Sci.*, 1825, **18.** 90.) The dilute aqueous solution is decomposed by boiling. Much less quickly soluble in water which contains sugar than in pure water. (Holger.)
$a = C_4H_3CuO_4 + Aq$
(*Crystallized, distilled, purified Verdigris. Verdet.*)

Soluble in 13.333 pts. of boiling alcohol. (Wenzel, in his *Verwandtschaft*, p. 437, cited by Gehlen.) Insoluble in ether (Unverdorben), sparingly soluble in cold, more readily soluble in hot creosote. (Reichenbach.)

$b = C_4H_3CuO_4 + 5Aq.$

II.) *sesquibasic.* Easily soluble in water; the aqueous solution undergoing decomposition when diluted with much water or boiled. Sparingly soluble, or insoluble, in alcohol.
$3CuO, 2C_4H_3O_3 + 5Aq$

III.) *di.* When treated with a little water it swells up, and if more water be added a portion of it (No. 2) dissolves, while a quantity (No. 4) remains undissolved.
(*Common blue verdigris.*)
$2CuO, C_4H_3O_3 + 7Aq$

IV.) *tri.* Insoluble, even in boiling water. (Proust.) Decomposed by large quantities of water, especially when this is boiling. (Berzelius.) Insoluble in alcohol.
$3CuO, C_4H_3O_3 + 2Aq$

V.) *hyperbasic.* Very sparingly soluble in cold water. (Berzelius.)
$48CuO, C_4H_3O_3 + 12Aq$

The basic acetates of copper are soluble in an aqueous solution of cane-sugar. (Ure.)

Acetate of Copper & of Lime. Slightly efflorescent. Readily soluble in water. (Ettling.) Readily soluble in water. (T. Thompson, in his *First Principles*, **2.** 449, and in his *System of Chem.*, London, 1831, **2.** 791.)

I.) $C_4H_3CuO_4; C_4H_3CaO_4 + 8Aq$

II.) $C_4H_3CuO_4, CuO, HO; C_4H_3CaO_4 + 3Aq$

Acetate of Copper & of Picolin. Slowly efflorescent. Readily soluble in water; but the solution is decomposed on boiling. Readily soluble in alcohol. Insoluble in ether. (Unverdorben.)

Acetate of Copper & of Potash.
$C_4H_3CuO_4; 2C_4H_3KO_4 + 12Aq$

Acetate of Copper with Arsenite of Copper. Insoluble in water, but is partially decomposed by continued boiling with water. (Ehrmann.) Soluble in ammonia-water.
(*Schweinfurt green. Vienna green.*)
$C_4H_3CuO_4; 3(CuO, AsO_3)$

Acetate of Copper with *proto*Chloride of Mercury. Scarcely at all soluble in cold, decomposed by boiling water. (Wœhler & Hütteroth.)
$2CuO, C_4H_3O_3; 2HgCl$

Acetate of Corydalin. Readily soluble in water.

Acetate of Cresyl.

Acetate of Cumidin.

Acetate of Cumol Soluble in ether.
$C_{28}H_{18}O_8 = C_8H_6(C_{20}H_{12}'')O_8$, or $C_{20}H_{12}O_2, 2C_4H_3O_3$

Acetate of Curarin. Soluble in water.

Acetate of Cyanethin.

I.) *basic.* Insoluble in water.

II.) *acid.* Soluble in water, and alcohol. (Kolbe & Frankland, *J. Ch. Soc.*, **1.** 72.)

Acetate of Delphin. Soluble in water.

Acetate of Ethyl. Soluble in 7 pts. of water at 16.6°. (Thénard.) Soluble in 9 pts. (or a trifle more) of water at 17.5°. (Gehlen, *Schweigger's Journ. für Ch. u. Phys.*, 1812, **4.** pp. 23, 22.) When uncontaminated with water or ether it is soluble in 11 @ 12 pts. of water at ordinary temperatures. (Mohr.) Soluble in 12 pts. of water at ordinary temperatures. (Becker.) Soluble in 8 pts. of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76. The aqueous solution slowly undergoes decomposition. Miscible with the strong mineral acids and with concentrated acetic acid. (Westendorff.) Miscible in all proportions with alcohol, and ether; on adding water it separates from the ethereal solution.
(*Acetic Ether. Ethylic Acetate.*)
$C_8H_8O_4 = C_4H_5O, C_4H_3O_3$

Eth Iron

Acetate of Ethylamin. Very deliquescent. (A. Wurtz, *Ann. Ch. et. Phys.*, (3.) **30.** 490.)

Acetate of Ethylene.

I.) *normal.* Soluble in 7 pts. of water at 22°. Soluble in all proportions in alcohol, and ether. On the addition of chloride of calcium it separates out from the aqueous solution. (A. Wurtz.)
$C_{12}H_{10}O_8 = C_8H_6(C_4H_4'')O_8$
(Binacetate of Glycol. Isomeric with the compound of Aldehyde with anhydrous Acetic Acid.)

II.) *mono.* Miscible with water, and alcohol. (Atkinson.)
$C_8H_8O_6 = C_4H_4'', C_4H_4O_6$
(Monacetate of Glycol.)

III.) *basic.*
$C_{16}H_{14}O_{10}$

Acetate of Ethyl *chloré — quintichloré.* *Vid.* Acetate of ChlorEthyl.

Acetate of Ethyl *sexchloré.* *Vid.* ChlorAcetate of *per*ChlorEthyl.

Acetate of Ethyl *septichloré.* *Vid.* *bi*ChlorAcetate of *per*ChlorEthyl.

Acetate of Ethyl *perchloré.* *Vid.* *ter*ChlorAcetate of *per*ChlorEthyl.

Acetate of EthylMethylConiin. Deliquescent. Readily soluble in water. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **89.** 139.

Acetate of EthylNicotin. Very easily soluble in water. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **87.** 6.)

Acetate of EthylStrychnine. Soluble in water.

Acetate of Fumarin. Soluble in water, and alcohol. (Hannon.)

Acetate of Furfurin. Very soluble in water. (Fownes.)

Acetate of Glaucin. Soluble in water.

Acetate of Glucina.

I.) *normal.* Very soluble in water. (Vauquelin.)
$C_{12}H_9Gl_2''', O_{12}$

II.) *terbasic.* Very deliquescent and soluble in water.

The basic acetates of glucina which contain more than six equivalents of base to ~~one~~ of acid are insoluble in water, but those containing less than six equivalents of base may be obtained in solution. (Ordway, *Am. J. Sci.* (2.) **26.** 207.)

Acetate of Glyceryl.

I.) *normal.* Insoluble in water and not miscible therewith. Readily soluble in spirit. Soluble in ether. Easily soluble in baryta-water. (Berthelot, *Ann. Ch. et Phys.*, (3.) **41.** 277.)
$C_{18}H_{14}O_{12} = C_6H_5O_3, 3\,C_4H_3O_3,$ or $C_{12}H_9(C_6H_5''')O_{12}$
(TrisAcetin.)

II.) *monobasic.* With 1 vol. water it forms a limpid mixture; 2 more vols. of water cause an opalescence; 5 vols. water render the liquor very opaline. With 200 vols. water it forms a transparent emulsion or solution. It is miscible with ether and dissolves in benzine; but is nearly or quite insoluble in bisulphide of carbon. (Berthelot, *loc. cit.*)
$C_{14}H_{12}O_{10} = C_6H_5O_3, HO, 2\,C_4H_3O_3$
(DiAcetin. Acetidin.)

III.) *bibasic.* Mixes with half its bulk of water, forming a clear liquor which becomes turbid when two additional volumes of water are added; it remains turbid also when a large excess of water is added to it. Miscible with ether. (Berthelot, *loc. cit.*)
$C_{10}H_{10}O_8 = C_6H_5O_3, 2\,HO, C_4H_3O_3$
(MonoAcetin.)

Acetate of Glycocoll. Soluble in water; less easily soluble in alcohol. (Horsford, *Am. J. Sci.*, (2.) **4.** 63.)
$C_4H_5NO_4, C_4H_4O_4 + Aq$

Acetate of Glycol. *Vid.* Acetate of Ethylene.

Acetate of Gold (AuO_2). Known only in solution. This solution slowly decomposes when left to itself, or immediately on being boiled. (H. Rose, *Pogg. Ann.*, **83.** 149.)

Acetate of Harmalin.

Acetate of Harmin.

Acetate of HydrargEthyl. *Vid.* Acetate of MercurEthyl.

Acetate *of protoxide* **of Iron.** Easily oxidizes in the air. Very soluble in water.
$C_4H_3FeO_4 + 3\,Aq$

Acetate *of sesquioxide* **of Iron.**

I.) *mono.* Very soluble in water. (Bette.) Soluble in 3 pts. of water. Soluble in 6 pts. of highly rectified alcohol. Soluble in 4 pts. of ordinary alcohol. (Walz, in Wittstein's *Handw.*) The aqueous solution is decomposed by boiling. (Duflos.)
$Fe_2O_3, C_4H_3O_3 + 4\,Aq$

II.) *bi.* Soluble in water and in alcohol. (Oudemans.) The aqueous solution undergoes partial decomposition in the cold and is totally decomposed on boiling. (W. Crum, *Ann. Ch. u. Pharm.*, **89.** 173.)
$Fe_2O_3, 2\,C_4H_3O_3 + Aq$

III.) *sesqui.* Slowly but completely soluble in 3 pts. of cold water. This solution has a great tendency to become gelatinous. Incompletely soluble in absolute alcohol or in highly rectified spirit; but is soluble for the most part in 8 pts. of ordinary alcohol. Behaves like the teracetate as regards ether, chloroform, and acetate of ethyl. (Walz, in Wittstein's *Handw.*)
$2\,Fe_2O_3, 3\,C_4H_3O_3 + 10\,Aq$

IV.) *ter, or normal.* When exposed to the air it effloresces, losing 2 equivs. of HO. The 2 hydrated salt thus formed is soluble in almost all proportions in water, in 4 pts. of absolute alcohol, and in 3 pts. of highly rectified spirit. Insoluble in ether or chloroform. Very sparingly soluble in acetate of ethyl. (Walz, in Wittstein's *Handw.*) Soluble in a moderate amount of water, but is precipitated from this solution when the latter is diluted or boiled. (Barker.) The aqueous solution is liable to be decomposed to a slight extent both when dilute or concentrated. This decomposition is somewhat greater at the temperature of boiling than in the cold. (Crum, *Ann. Ch. u. Pharm.*, **89.** 173.) Miscible with alcohol. Soluble in acetic ether. When a solution of acetate of peroxide of iron is maintained at a temperature near 100° during several hours, the properties of the salt are essentially changed. The addition of a trace of sulphuric acid or of an alkaline salt occasioning the precipitation of an oxide of iron which is insoluble in cold acids. [See under sesquioxide of iron hydrated ($Fe_2O_3, 3HO$).] (Pean St. Gilles.) Hence, if a solution of sesquioxide of iron, containing but little free acid, be treated with an excess of acetate of soda, and then boiled, all the iron will be precipitated. (Fresenius, *Quant.*, p. 141.)
$C_{12}H_9Fe_2'''O_{12} + 4\,Aq$

V.) *bibasic*, or *di.* Soluble in water; if this solution be diluted and boiled, a still more basic salt will be precipitated. (Janssen.)
$2\,Fe_2O_3, C_4H_3O_3$

VI.) *polybasic.* Basic acetates of iron which contain six equivalents or less of base to ~~one~~ three equivalent of acid may be obtained dissolved in water, but those which contain a larger proportion of base than this, are insoluble. (Ordway, *Am. J. Sci.*, (2.) **26.** 202.)

Insoluble in acetic acid. (Duflos.)

Lead

Acetate of Jervin. Soluble in water.

Acetate of Lanthanum. Easily soluble in water. (Mosander.)

Acetate of Lead.

I.) *normal, or mono.* Soluble in water. Sparingly soluble in hot absolute alcohol.

a = anhydrous. $C_4H_3PbO_4$

$b = C_4H_3PbO_4 + 3Aq$ (*Sugar of Lead. Salt of Saturn.*) Slightly efflorescent in dry air. Soluble in 0.5 pt. of boiling water. (Wenzel.) Soluble in 1 pt. of water at 38°. (Wenzel in his *Verwandtschaft*, p. 308 [T.].) Thompson (in his *System*, **2.** 641) affirms that this statement of Wenzel is a mistake. Soluble in 1.63 pts. of cold water; the saturated solution containing 37 % of it; still more readily soluble in hot water. (M. R. & P.) Soluble in 1.714 pts. of water at 18.75°. (Abl, from *Oesterr. Zeitschrift, für Pharm.*, **8.** 201, in Canstatt's *Jahresbericht, für* 1854, p. 76.)

100 pts. of boiling water dissolve about 29 pts. of it.
" " cold water retains in solution about 27 pts. of it. (Bostock, *Nicholson's Journ.*, **11.** 79, [T.].)

The aqueous solution saturated
at 10° contains 11.4% of it. (Eller.)
" ?° " 7.7% " (Mussembrock.)
" 12.5° " 24.4% " (Hassenfratz, *Ann. de Chim.*, **28.** 291.)

The aqueous solution saturated at 15° is of 1.236673 sp. gr., and contains dissolved in every 100 pts. of water at least 45.653 pts. of the salt. (Michel & Krafft, *Ann. Ch. et Phys.*, (3.) **41.** pp. 478, 482.) The aqueous solution saturated at its boiling-point (101.70°) contains 41.5% of the dry salt; or 100 pts. of water at 101.7° dissolve 70.94 pts. of it; or 1 pt. of the dry salt is soluble in 1.41 pts. of water at 101.7°. (T. Griffith's, *Quar. J. Sci.*, 1825, **18.** 90.)

Melts in its water of crystallization at about 57°.

An aqueous solution of sp. gr. (at 12.5°)	Contains per cent of the salt.	An aqueous solution of sp. gr. (at 12.5°)	Contains per cent of the salt.
1.0070	1	1.0731	10
1.0140	2	1.0891	12
1.0211	3	1.1055	14
1.0283	4	1.1221	16
1.0366	5	1.1330	18
1.0430	6	1.1560	20
1.0505	7	1.1740	22
1.0580	8	1.1928	24
1.0655	9		

(Hassenfratz, *Ann. de Chim.*, **28.** 302.)

Tolerably soluble in spirit, less so in absolute alcohol. Soluble in 8 pts. of alcohol. (M. R. & P.) Soluble in 1 pt. of strong alcohol at 68°. (Cited in Thompson's *System of Chem.*, **2.** 285.) 100 pts. of alcohol, of 0.835 sp. gr., dissolve 7.85 pts. of it at 15.5°. (*Ibid.*, p. 641.) Ether precipitates it from its alcoholic solution. Very readily soluble in boiling creosote, the solution becoming solid on cooling. (Reichenbach.)

When one equivalent of $C_4H_3PbO_4$, in aqueous solution, is mixed with a solution of an equivalent of nitrate of potash (KO, NO_5) 0.09 of it are decomposed to nitrate of lead, which may be precipitated by adding alcohol, while 0.91 of it remain unchanged; when mixed with a solution of an equivalent of nitrate of baryta (BaO, NO_5), 0.22 of it are decomposed as before, while 0.78 of it remain unchanged; when mixed with a solution of an equivalent of nitrate of strontia (SrO, NO_5), 0.33 of it are decomposed while 0.67 of it remain unchanged. (Malaguti, *Ann. Ch. et Phys.*, 1853, (3.) **37.** 203.)

II.) *sesquibasic.* The crystals dissolve in 0.9 pts. of water at 12.75°; therefore more abundantly than the normal salt. The saturated aqueous solution can still dissolve both monobasic and terbasic acetate of lead. Less soluble in alcohol than in water, but more soluble in alcohol than the normal acetate.

$3PbO, 2C_4H_3O_3 \,\&\, + Aq$

The anhydrous salt dissolves in strong alcohol; on adding water to this solution trisacetate of lead is precipitated, while the normal salt remains in solution. (Payen, in Berzelius's *Lehrb.*)

III.) *din.* Soluble in less than 1.5 pts. of water. Tolerably soluble in weak spirit. Soluble in about 30 pts. of alcohol of 90%. Insoluble in absolute alcohol. (Schindler.)

$2PbO, C_4H_3O_3 \,\&\, + Aq, \,\&\, 2Aq$

IV.) *tris.* Very soluble in water, though less so than the normal salt. Soluble in 5.56 pts. of boiling water.

$3PbO, C_4H_3O_3 + Aq$

Soluble in 18 pts. of cold water. Insoluble in strong alcohol. (Berzelius, *Lehrb.*) Soluble in spirit and in dilute wood-spirit, though less so than in water. Slightly soluble also in wood-spirit of 97%, but not in alcohol of 97%. (Payen.) Soluble in a saturated aqueous solution of the sesquibasic salt.

V.) *hexa.* Sparingly soluble in boiling water, from which it crystallizes on cooling.

$6PbO, C_4H_3O_3 + 3HO$

Acetate *of peroxide* **of Lead.**

$PbO_2, 3C_4H_3O_3$

Acetate of Lead & of Potash. Tolerably soluble in hot water. (Taddei.)

$3PbO, 2KO, 3C_4H_3O_3$

Acetate of Lead & of Soda.

$2C_4H_3PbO_4;\ C_4H_3NaO_4 + 3Aq$

Acetate of Lead & of Uranium. Readily soluble in water. (Wertheim, *loc. cit.*)

$C_4H_3PbO_4;\ Ur_2O_3, C_4H_3O_3 + 6Aq$

Acetate of Lead with Anacardate of Lead. Insoluble in water. Insoluble in cold alcohol, but is partially decomposed by long-continued washing therewith, or immediately by boiling alcohol. Decomposed by ether.

$C_4H_3PbO_4;\ C_{44}H_{31}PbO_7$

Acetate of Lead with Chloride of Lead. Efflorescent. Easily soluble in water. Decomposed by alcohol. (Poggiale.)

$5C_4H_3PbO_4;\ PbCl + 15Aq$

Acetate of Lead with HydroKinone. Difficultly soluble in cold, easily soluble in boiling water. Almost insoluble in cold alcohol; decomposed by boiling alcohol, and ether. (Kolbe's *Lehrb.*, **1.** 467.)

$2C_4H_3PbO_4;\ C_{12}H_6O_4 + 3Aq$

Acetate of Lead, with Picrate of Lead.

I.) $C_4H_3PbNO_4;\ C_{12}H_2Pb(NO_4)_3O_2 + 4Aq$ Readily soluble in water. The solution is decomposed by evaporation.

II.) $C_4H_3PbO_4;\ 2C_{12}H_2Pb(NO_4)_3O_2, PbO + 8Aq$ Decomposed by long-continued boiling with water.

Acetate of Lead with ThioNaphtamate of Lead. Sparingly soluble in cold, more readily soluble in hot water. (Piria, *Ann. Ch. et Phys.*, (3.) **31.** 247.)

$C_4H_3PbO_4;\ C_{20}H_8PbNS_2O_6$

Lime
Mag

Mn

Acetate of Lime. Effloresces in dry air. $C_4H_3CaO_4+xAq$ Very soluble in water.

The aqueous solution saturated at 12.5° contains 17.8% of it. (Hassenfratz, *Ann. de Chim.*, **28.** 291.) Less soluble in alcohol than in water.
100 pts. of alcohol of 0.900 sp. gr. dissolve 2.4 pts. of it.
" " " 0.848 " " 4.12 "
" " " 0.834 " " 4.75 "
" " " 0.817 " " 4.88 "
(Kirwan, *On Mineral Waters*, p. 274. [T.].) Insoluble in creosote. (Reichenbach.)

An aqueous solution of sp. gr. (at 12.5°)	Contains per cent of it.	An aqueous solution of sp. gr. (at 12.5°)	Contains per cent of it.

(Hassenfratz, *Ann. de Chim.*, **28.** 302.)

Acetate of Lime & of Uranium. Permanent. $C_4H_3CaO_4; 2(C_4H_3O_3, Ur_2O_3)+8Aq$ Soluble in water,—without decomposition if acetic acid be present. (Weselsky.)

Acetate of Lime with Chloride of Calcium. $C_4H_3CaO_4; CaCl+10Aq$ Permanent. Easily soluble in water. (Fritzsche.)

Acetate of Lithia. Permanent. (Winter.) $C_4H_3LiO_4+4Aq$ [Deliquescent. (Troost.); Berzelius's *Lehrb.*] Soluble in 0.2833 pt. of water at 15°; this solution solidifies at 4°. Soluble in 4.64 pts. of alcohol, of 0.81 sp. gr., at 14°. Sparingly soluble in ether. (Pleischl.) It begins to melt in its water of crystallization at 19°. (Berzelius's *Lehrb.*)

Acetate of Lobelin. Soluble in alcohol.

Acetate of Magnesia. Deliquescent. Very $C_4H_3MgO_4+4Aq$ soluble in water, and alcohol. (Bergman, *Essays*, **1.** 450; Wenzel.) The aqueous solution saturated at 12.5° contains 50% of it. (Hassenfratz, *Ann. de Chim.*, **28.** 291.)

An aqueous solution of sp. gr. (at 12.5°)	Contains per cent of it.	An aqueous solution of sp. gr. (at 12.5°)	Contains per cent of it.

1.0885	20	1.2520	50

(Hassenfratz, *Ann. de Chim.*, **28.** 303.)

Acetate of Magnesia & of Uranium. Less $a = 2C_4H_3(Ur_2O_3)O_3; C_4H_3MgO_4+8Aq$ soluble in cold than in warm water. (Wertheim, *Ann. Ch. et Phys.*, (3.) **11.** 65.)

$b = \text{ditto} + 12Aq$ Efflorescent. Soluble in water, without decomposition if this be acidulated with acetic acid. (Weselsky.)

Acetate of Manganese. Permanent. Soluble in 3.5 pts. of cold water (John.) $C_4H_3MnO_4+4Aq$ Soluble in 3.0 pts. of cold water. (Klauer.) 100 pts. of water at 15.5° dissolve 3 pts. of it. (Ure's *Dict.*) Soluble in alcohol.

Acetate of Manganese & of Uranium. $2C_4H_3(Ur_2O_3)O_3; C_4H_3MnO_4+12Aq$ Efflorescent. Soluble in water, without decomposition if this be acidulated with acetic acid. (Weselsky.)

Acetate of Melamin. Very soluble in water.

Acetate of Mercur(*ic*)ammonium. Readily $C_4H_3(N\left\{\begin{smallmatrix}H_3\\Hg\end{smallmatrix}\right)O_4+2Aq$ soluble in water. Insoluble in alcohol. (Hirzel, [Ger.].)

Acetate of *tetra*Mercur(*ic*)ammonium. $C_4H_3(N\{Hg_4)O_4+4Aq$; or "$C_4H_3(N\left\{\begin{smallmatrix}H_3\\Hg\end{smallmatrix}\right)O_4; 3HgO$" Slightly soluble in water, since 1000 pts. of boiling water dissolve 5.7 pts. of it, but the solution undergoes decomposition when boiled for some time. Insoluble in alcohol or ether. Decomposed by caustic potash. (Berzelius's *Lehrb.*)

Acetate of *tetra*Mercur(*ous*)ammonium. $C_4H_3(N\{(Hg_2)_4)O_4+2Aq$; or "$C_4H_3(N\left\{\begin{smallmatrix}H_2\\2Hg_2\end{smallmatrix}\right)O_4; 2HgO$" Insoluble in water. (Berzelius's *Lehrb.*)

Acetate of MercurEthyl.

Acetate *of dinoxide* of Mercury. Permanent. $C_4H_3Hg_2O_4$ Soluble in 600 pts. of cold, much more soluble in hot water.

Soluble in 133 pts. of water at 12° @ 15°. (Garot.) Soluble in 320 pts. of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) 1000 pts. of water at 15° dissolve only 1.3 pts. of it [or, 1 pt. of the salt is soluble in 769 pts. of water at 15°]. Partially decomposed by boiling water. Much more soluble in water acidulated with acetic acid than in pure water, a considerable quantity being dissolved on boiling. (Berzelius's *Lehrb.*) Insoluble, or almost insoluble, in alcohol. Decomposed on boiling with water or alcohol.

It is one of the least soluble of the metallic acetates. When treated with aqueous solutions of the alkaline chlorides, and especially when these are hot, a certain amount of protochloride of mercury ($HgCl$) is formed and dissolves. (Mialhe, *Ann. Ch. et Phys.*, (3.) **5.** 179.)

Acetate *of protoxide* of Mercury. Suffers partial decomposition in the air. $C_4H_3HgO_4$ Soluble in 4 pts. of water at 10°. (Garot.) Soluble in 2.75 pts. of water at 19°. Soluble in about 1 pt. of boiling water. (Stromeyer.) The solution saturated at 19° contains 26.66% of it. Soluble in 17.7 pts. of alcohol (of 0.811 sp. gr.) at 19°, but with partial decomposition. (Stromeyer.) Alcohol, and ether, dissolve out its acid, leaving oxide of mercury. (Garot.) When the aqueous or alcoholic solution is boiled, a portion of the acid escapes, and a part of the HgO is reduced to Hg_2O. (Berzelius's *Lehrb.*) Instantly decomposed by ether. (Harff.)

Acetate *of protoxide* of Mercury with Cyanide of Mercury.

Acetate *of protoxide* of Mercury with Sulphide of Mercury. Ppt. Completely soluble in boiling water. (Taddei.)

Acetate of Methyl. Soluble in water, $C_4H_3(C_2H_3)O_4$ the aqueous solution suffering decomposition to a slight extent on

Pot

being boiled. Miscible in all proportions with alcohol, wood-spirit, and ether.

ACETATE OF METHYL*chloré*. *Vid.* Acetate of ChloroMethyl.

ACETATE OF METHYL *perchloré*. *Vid.* *Ter*Acetate of *ter*ChloroMethyl.

ACETATE OF METHYLENE. (*biAcetate of MethylGlycol.*) $C_{10}H_8O_8 = C_8H_6(C_2H_2'')O_8$ Slowly and sparingly soluble in water. Easily soluble with decomposition in alkaline solutions. Soluble in ether. (Boutlerow, *Ann. Ch. et Phys.*, (3.) **53.** 320.)

ACETATE OF METHYLNICOTIN. Soluble in water.

ACETATE *of protoxide* **OF MOLYBDENUM.** $C_4H_3MoO_4$ Insoluble in water. Slightly soluble in acetic acid. (Berzelius.)

ACETATE *of binoxide* **OF MOLYBDENUM.** $C_8H_6Mo''O_8$ Ppt. While yet moist it is soluble in boiling acetic acid, but the solution becomes gelatinous on cooling. (Berzelius, [*Gm.*].)

ACETATE OF MOLYBDIC ACID. Very sparingly soluble in water. (Berzelius.)

ACETATE OF MORPHINE. $C_4H_3(N\left\{\begin{matrix}C_{34}H_{18}O_8''.H\\H\end{matrix}\right.)O_4+4Aq$ Permanent. Soluble in 17 pts. of cold water. Soluble in 1 pt. of boiling water. Soluble in 44 pts. of cold alcohol of 80%. Soluble in 1 pt. of boiling alcohol of 80%. (Wittstein, in his *Handw.*) Soluble in 24 pts of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) 100 pts. of chloroform dissolve 1.66 pts. of it at the ordinary temperature. (Schlimpert, *Kopp & Will's Jahresbericht, für* 1859, p. 405.)

ACETATE OF NARCOTIN.

ACETATE OF NICKEL. $C_4H_3NiO_4+5Aq$ Slightly efflorescent. Soluble in 6 pts. of cold water. Insoluble in alcohol. (Tupputi.)

ACETATE OF NICKEL & *of sesquioxide* **OF URANIUM.** $2Ur_2O_3, NiO, 3C_4H_3O_3+7Aq$ Soluble in water, — without decomposition if this be acidulated with acetic acid. (Weselsky.)

ACETATE OF NICOTIN. Readily soluble in water, alcohol, and ether. (Schlœssing.)

ACETATE OF NITROHARMALIN. Soluble in water.

ACETATE OF NITROHARMIN. Partially decomposed by water, especially when this is hot.

ACETATE OF OCTYL. *Vid.* Acetate of Capryl.

ACETATE OF OXYCANTHIN.

ACETATE OF PHENYL. $C_{16}H_8O_4 = C_4H_3(C_{12}H_5)O_4$ Slightly soluble in cold water. Soluble with decomposition in hot water. (Scrugham, *J. Ch. Soc.*, **7.** 241.)

ACETATE OF PICOLIN. Soluble in water. (Unverdorben.)

ACETATE OF PLATINUM (PtO). $C_4H_3PtO_4$ Soluble in water. (Berzelius.)

ACETATE *of sesquioxide* **OF RHODIUM.** A red solution. (Berzelius.)

ACETATE OF RHODIUM & OF SODIUM. Easily soluble in water. Insoluble in alcohol.

ACETATE OF POTASH.

I.) *normal.* $C_4H_3KO_4$ Very deliquescent. Very easily soluble in water. Soluble in 0.531 pt. water at 2°. Soluble in 0.437 pt. water at 13.9°. Soluble in 0.321 pt. water at 28.5°. Soluble in 0.203 pt. water at 62.0°. (Osann.) Soluble in 1.02 pt. of water at 15.5°. (Speilmann.[T.].) Soluble in 1 pt. of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) Soluble in 0.125 pt. of water at 169° (boiling-point of the saturated solution), or 100 pts. of water at 169° dissolve 798.2 pts. of it. (Legrand, *loc. inf. cit.*) A very dilute aqueous solution decomposes when left to itself. (Berzelius, *Lehrb.*) Partial decomposition with loss of acetic acid also occurs when the aqueous solution is boiled down.

The point of ebullition of pure water, observed in a glass tube, containing bits of metallic zinc, having been 100.2°. (Legrand, *Ann. Ch. et Phys.*, 1835, (2.) **59.** 440.) Easily soluble in alcohol, though less so than in water. Soluble in 3 pts. of absolute alcohol at the ordinary temperature. Soluble in 2 pts. of absolute alcohol at the temperature of ebullition.

Pot

Soda

(Destouches.) Soluble in alcohol of 60%. (Trommsdorff.) Ether precipitates it from the alcoholic solution. Readily soluble in boiling, less so in cold creosote. (Reichenbach.) Soluble in both anhydrous and hydrated acetic acid. Soluble in warm, less soluble in cold hydrate of anisyl. When one equivalent of $C_4H_3KO_4$, in aqueous solution, is mixed with a solution of an equivalent of nitrate of lead (PbO, NO_5), 0.92 of it are decomposed to nitrate of potash, which may be precipitated by adding alcohol, while 0.08 of it remain unchanged; when mixed with a solution of an equivalent of nitrate of strontia (SrO, NO_5) 0.67 of it are decomposed as before, while 0.33 of it remain unchanged; when mixed with a solution of an equivalent of nitrate of baryta (BaO, NO_5), 0.27 of it are decomposed, while 0.73 of it remain unchanged; when mixed with a solution of an equivalent of sulphate of soda (NaO, SO_3), 0.62 of it are decomposed, while 0.38 of it remain unchanged. (Malaguti, *Ann. Ch. et Phys.*, 1853, (3.) **37.** 203.)

II.) "*Anhydrous bin*Acetate of Potash." Less deliquescent than the normal salt. Exceedingly soluble in water. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** 317.)
$2\,C_4H_3KO_4, C_8H_6O_6$

III.) *Bin*Acetate of Potash. Deliquescent, though less so than the normal salt. Easily soluble in water, and alcohol. More soluble in hot than in cold absolute alcohol.
(*Ordinary.*)
$C_4H_3KO_4, C_4H_4O_4$ & + 6 Aq

Acetate of Potash & of Thoria. Soluble in water.

Acetate of Potash & of Uranium. Easily soluble in cold water; partially decomposed by boiling water. (Wertheim, *Ann. Ch. et Phys.*, (3.) **11.** 62.)
$2\,C_4H_3(Ur_2O_3)O_3;\ C_4H_3KO_4+2\,Aq$

Acetate of Propyl.
(*Acetate of Trityl. Propyl Acetic Ether.*)
$C_{10}H_{10}O_4 = C_4H_3(C_6H_7)O_4$

***Bin*Acetate of Propylene.** Insoluble in a small quantity, but dissolves in about 10 times its volume of water. Soluble in all proportions in alcohol, and ether. (A. Wurtz.)
(*BinAcetate of Tritylene* (*of Gerhardt*). *Propyl Glycol diAcetique.*)
$C_{14}H_{12}O_8 = C_8H_6(C_6H_6'')O_8$

Acetate of Propylenyl.
Vid. Acetate of Allyl.

Acetate of Quinidin. Readily soluble in water; more soluble than the acetate of quinine.

Acetate of Quinine. Sparingly soluble in cold, readily soluble in boiling water. Soluble in alcohol.

Acetate *of sesquioxide* of Rhodium. Soluble in boiling water. (Berzelius, *Lehrb.*)

Acetate *of sesquioxide* of Rhodium & of Soda. Very readily soluble in water. Insoluble in alcohol. (Berzelius.)

Acetate of Salicylous Acid.
Vid. AcetoSalicyl.

Acetate of Silver. Difficultly soluble in water; being one of the least soluble of the metallic acetates. (Otto-Graham.) Soluble in 100 pts. of cold water. (Chenevix.) Readily soluble in cyanide of potassium.
$C_4H_3AgO_4$

Acetate of Silver & of Uranium. Easily soluble without decomposition in cold, but is decomposed by boiling water. (Wertheim, *Ann. Ch. et Phys.*, (3.) **11.** 61.)
$2\,C_4H_3(Ur_2O_3)O_3;\ C_4H_3AgO_4+2\,Aq$

Acetate of Silver with Propionate of Silver. Difficultly soluble in water.
$C_4H_3AgO_4;\ C_6H_5AgO_4$

Acetate of Soda.

I.) *normal.* Slowly efflorescent. Soluble in 2.86 pts. of cold water, the saturated solution containing 25.91% of it. (Bergman, **5.** 78, [T.].)
$a = C_4H_3NaO_4+6\,Aq$
(*Ordinary Commercial.*)

Soluble in 3.9 pts. of water at 6°.
" 2.4 " " 37°.
" 1.7 " " 48°.
(Osann.)

Soluble in 3 pts. of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) The aqueous solution saturated at 12.5° contains 51.7% of it. (Hassenfratz, *Ann. de Chim.*, **28.** 291.) 100 pts. of water at 15.5° dissolve 35 pts. of it. (Ure's *Dict.*) The aqueous solution saturated at its boiling-point (124.4°) contains 60% of the dry salt; or, 100 pts. of water at 124.4° dissolve 150 pts. of it; or 1 pt. of the dry salt is soluble in 0.66 pt. of water at 124.4°. (T. Griffiths, *Quar. J. Sci.*, 1825, **18.** 90.)

When heated, it melts in its water of crystallization, and if the fluid is covered with a layer of oil it will not solidify as it becomes cold, unless it be agitated as by adding a crystal of the salt. (Berzelius, *Lehrb.*)

The point of ebullition of pure water, observed in a glass tube containing bits of zinc, having been 100.1°. (Legrand, *Ann. Ch. et Phys.*, 1835, (2.) **59.** 439.)

Less soluble in alcohol than in water. Soluble in 2.143 pts. of strong boiling alcohol. (Wenzel, in his *Verwandtschaft*, p. 300, [T.].) Ether precipitates it from its cold alcoholic solution. (Dœbereiner.) Readily soluble in boiling, less so in cold creosote. (Reichenbach.)

When one equivalent of $C_4H_3NaO_4$, in aqueous solution, is mixed with a solution of an equivalent of sulphate of potash (KO, SO_3) 0.365 of it are decomposed to sulphate of soda, which may be precipitated by adding alcohol, while 0.635 of it remain unchanged. (Malaguti, *Ann. Ch. et Phys.*, 1853, (3.) **37.** 203.)

$b = C_4H_3NaO_4 + 9Aq$ Effloresces more rapidly than *a*.

*Bin*Acetate of Soda.

Acetate of Soda & of Uranium. Soluble in water. (Wertheim, *Ann. Ch. et Phys.*, (3.) **11.** 50.) Its aqueous solution is decomposed on boiling, with separation of sesquioxide of uranium. (H. Rose, *Pogg. Ann.*, **83.** 148.)

$2(Ur_2O_3, C_4H_3O_3); C_4H_3NaO_4$

Acetate of Soda with Cyanide of Mercury. Soluble in water. (Custer.)

$HgCy; C_4H_3NaO_4 + 7Aq$

Acetate of Soda with Propionate of Soda. Easily soluble in water. (Gottlieb.)

$C_4H_3NaO_4; C_6H_5NaO_4 + 9Aq$

Acetate of Soda with Sulphate of Soda. (Mill, *Ann. Phil.*, (2.) **10.** 113. [T.].)

(*SulphoAcetate of Soda.*)
$7C_4H_3NaO_4; NaO, SO_3 + x Aq$

Acetate of Solanin. Readily soluble in water.

Acetate of StanMethyl.

Acetate of StannEthyl. Soluble in water. (Cahours & Riche.)

Acetate of Stib*tri*Amyl.

Acetate of Stib*tri*Ethyl. Soluble in water. (Merck.)

Acetate of StibEthylium. Soluble in water, and alcohol. More soluble in water than the formiate.

Acetate of StibMethylEthylium. Slowly deliquescent. Readily soluble in water. (Friedlænder.)

$C_4H_3\left(Sb\left\{\begin{matrix}C_2H_3\\(C_4H_5)_3\end{matrix}\right.\right)O_4$

Acetate of StibMethylium. Soluble in water, the solution decomposing when evaporated.

Acetate of Strontia. Efflorescent. Soluble in 2.5 pts. of cold water. (Berzelius's *Lehrb.*, **3.** 389.) 100 pts. of water at 100° dissolve 40 pts. of it. (Ure's *Dict.*) Very easily soluble in water; less soluble in alcohol. (Vauquelin.) Insoluble in creosote. (Reichenbach.)

$C_4H_3SrO_4 + 4Aq, \& + \frac{1}{2}Aq$

When one equivalent of $C_4H_3SrO_4$, in aqueous solution, is mixed with a solution of an equivalent of nitrate of lead (PbO, NO_5) 0.655 of it are decomposed to nitrate of strontia, which may be precipitated by adding alcohol, while 0.345 of it remain unchanged; when mixed with a solution of an equivalent of nitrate of potash (KO, NO_5) 0.36 of it are decomposed as before, while 0.64 of it remain unchanged. (Malaguti, *Ann. Ch. et Phys.*, 1853, (3.) **37.** 203.)

Acetate of Strontia & of Uranium. Soluble in water; without decomposition if this be acidulated with acetic acid. (Weselsky.)

$2C_4H_3(Ur_2O_3)O_3; C_4H_3SrO_4 + 6Aq$

Acetate of Strontia with Nitrate of Strontia. Permanent. Soluble in water. (v. Hauer.)

$C_4H_3SrO_4; SrO, NO_5 + 3Aq$

Acetate of Strychnine. Soluble in 96 pts. of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) Very soluble in water, and alcohol. (Parrish's *Pract. Pharm.*, p. 409.)

Acetate of TellurMethyl. Easily soluble in water. (Wœhler & Dean.)

Acetate of Tetryl.
Vid. Acetate of Butyl.

Acetate of ThiAcetonin. Very soluble in water, and alcohol. (Stædeler.)

Acetate of Thoria. Scarcely at all soluble in water.

$C_4H_3ThO_4$

Acetate *of protoxide* of Tin. Soluble in water. Insoluble in alcohol.

$C_4H_3SnO_4$

Acetate *of binoxide* of Tin. Easily soluble in water. (Wenzel.)

$C_8H_6Sn''O_8$

Acetate of Titanium (TiO_2). Soluble in water.

Acetate of Toluenyl. Insoluble in water. Soluble in alcohol.

(*Acetate of Benzene.*)
$C_{18}H_{10}O_4 = C_4H_3(C_{14}H_7)O_4$

Acetate of Trehalose. Tolerably easily soluble in water.

$C_8H_6(C_{12}H_8O_6'')O_8$

Acetate *of protoxide* of Uranium. Soluble in water, at least when this is acidulated with acetic acid, but the solution is decomposed by evaporation.

$C_4H_3UrO_4$

Acetate *of sesquioxide* of Uranium.

I.) *normal.* Much less soluble in water than nitrate of uranium. Decomposed by boiling water. (Wertheim, *Ann. Ch. et Phys.*, (3.) **11.** pp. 50, 57.) Easily soluble in water, and alcohol. (Berzelius, *Lehrb.*)

$Ur_2O_3, C_4H_3O_3 + 2Aq \& + 3Aq$

II.) *terbasic.* Soluble in water. (Ordway, *Am. J. Sci.*, (2.) **26.** 209.)

Acetate of Uranium & of Zinc. Soluble in water, without decomposition if this is acidulated with acetic acid. (Weselsky.)

$2(Ur_2O_3, C_4H_3O_3); C_4H_3ZnO_4 + 7Aq$

Acetate of Vanadium. Very slowly soluble in water. (Berzelius.)

$C_8H_6Va''O_8$

Acetate of Yttria. Permanent. Soluble in 9 pts. of cold water, and in much less hot water. Soluble in alcohol. (Berlin.)

$C_4H_3YO_4 + 2Aq$

Acetate of Zinc.

I.) *normal.*

a = anhydrous. Soluble in water.

b = hydrated. Permanent. Very soluble in water.

$C_4H_3ZnO_4 + 3Aq$

Soluble in 3 pts. of cold water.
" 0.5 " boiling "
" 80 " cold alcohol of 80%.
" 30 " boiling " "
(Wittstein's *Handw.*)

Soluble in 3 pts. of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) Readily soluble in boiling, less so in cold creosote. (Reichenbach.)

II.) *basic.* There appear to be two basic compounds, one of which is difficultly soluble in water.

Acetate of Zirconia. Deliquescent. (Berzelius.) Permanent. (Vauquelin.) Easily soluble in water and in alcohol. (Klaproth.)

$C_{12}H_9Zr'''O_{12}$

Acetin, *mono, bi, tri.*
Vid. Acetate of Glyceryl.

AcetoBenzoic Acid(Anhydrous). Slowly acidified by boiling water. Decomposed by alcohol. Soluble in ether. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** 308.)

(*Benzoacetic Acid. Acetate of Benzoyl. Benzoate of Acetyl. Benzoic Acetate. Acetic Benzoate.*)

$C_{18}H_8O_6 = \left.\begin{matrix}C_4H_3O_2\\C_{14}H_5O_2\end{matrix}\right\}O_2$

AcetoButyrate of *X.*
Vid. ButyroAcetate of *X.*

AcetoClhorhydrin. Nearly insoluble in water. (Berthelot, *Ann. Ch. et Phys.*, (3.) **41.** 302.)

$C_{10}H_9ClO_6$

Aceto*di***Chlorhydin.** Sparingly soluble in water. (Berthelot, *Ann. Ch. et Phys.*, (3.) **52.** 460.)

$C_{10}H_8Cl_2O_4$

*Din***AcetoChlorhydrin.**

$C_{14}H_{11}ClO_8$

AcetoChlorhydroBromhydrin.

$C_{10}H_8ClBrO_4$

AcetoCinnamic Acid(Anhydrous). Soluble in ether. (Gerhardt.)

(*Cinnamic Acetate. Acetic Cinnamate. Acetate of Cinnamyl. Cinnamate of Acetyl.*

$C_{22}H_{10}O_6 = \left.\begin{matrix}C_{18}H_7O_2\\C_4H_3O_2\end{matrix}\right\}O_2$

AcetoCuminic Acid (Anhydrous). Readily acidified by water. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** 310.)

(*Acetate of Cumyl. Cuminate of Benzoyl. Cuminic Acetate. Acetic Cuminate.*)

$C_{24}H_{14}O_6 = \left.\begin{matrix}C_4H_3O_2\\C_{20}H_{11}O_2\end{matrix}\right\}O_2$

Acetonic Acid. Easily soluble in water, alcohol, and ether. (Stædeler.)

$C_{16}H_{16}O_{12} = C_{16}H_{14}O_{10}, 2HO$

Acetonate of Baryta. Easily soluble in water, and alcohol. Insoluble in ether. (Stædeler.)

$C_{16}H_{14}Ba_2O_{12}$

Acetonate of Zinc. Only very sparingly soluble even in boiling water. Insoluble in alcohol or ether. (Stædeler.)

$C_{16}H_{14}Zn_2O_{12} + 4Aq$

Acetone. Miscible in all proportions with water, alcohol, ether, and the volatile oils; also with many of the compound ethers, and with hot olive oil, but is somewhat less soluble in cold olive oil. On the addition of chloride of calcium, or hydrate, or carbonate of potash to the aqueous solution a portion of the acetone separates out.

(*Pyroacetic Spirit. Pyroacetic Ether. Mesitic Alcohol. Methyl Acetyl.*)

$C_6H_6O_2 = \left.\begin{matrix}C_4H_3\\C_2H_3\end{matrix}\right\}O_2$

It dissolves many of the fats, resins, camphors, waxes, &c. — But most of the metallic salts which are soluble in alcohol are insoluble in acetone. (Liebig.)

Acetone *Chloré.*
Vid. ChlorAcetone.

Acetonin. Readily soluble in water. The solution becomes turbid when heated. Readily soluble in alcohol, and ether. (Stædeler.)

$C_{18}H_{18}N_2 = N_2\left\{(C_6H_6'')_3\right.$

AcetoNitrate of *X.*
Vid. Acetate of *X* with Nitrate of *X.*

AcetoNitril.
Vid. Cyanide of Methyl.

AcetoNitrile, *trinitré.*

AcetoPropionate of Silver. Sparingly soluble in water, the solution undergoing decomposition when boiled. (Frankland & Kolbe.)

$C_{10}H_8Ag_2O_8 = \left.\begin{matrix}C_4H_3AgO_4\\C_6H_5AgO_4\end{matrix}\right\}$

AcetoPropionate of Soda. Very readily soluble in water. (Gottlieb.)

$C_{10}H_8Na_2O_8 + 9Aq = \left.\begin{matrix}C_4H_3NaO_4\\C_6H_5NaO_4\end{matrix}\right\} + 9Aq$

AcetoSalicyl. Insoluble in water, or in aqueous solutions of potash, or ammonia. Sparingly soluble in cold, more abundantly soluble in boiling alcohol. Sparingly soluble in ether. (Cahours, *Ann. Ch. et Phys.*, (3.) **52.** 192.)

(*Salicylide of Acetyl. Acetyl-Salicylous Acid.*)

$C_{18}H_8O_6 = \left.\begin{matrix}C_{14}H_5O_4\\C_4H_3O_2\end{matrix}\right\}$

AcetoSalicylic Acid (Anhydrous). Decomposed at once by an aqueous solution of carbonate of soda. (Gerhardt. *Ann. Ch. et Phys.*, (3.) **37.** 326.)

(*Acetate of Salicyl. Salicylate of Acetyl. Acetic-Salicylate.*

$C_{18}H_8O_8 = \left.\begin{matrix}C_{14}H_5O_4\\C_4H_3O_2\end{matrix}\right\}O_2$

Acetosamin. Hygroscopic. Easily soluble in water, with subsequent partial decomposition. Soluble in all proportions in alcohol. Insoluble in ether. Its salts are generally deliquescent; very soluble in water; insoluble, or but sparingly soluble, in alcohol, and insoluble in ether. (Natanson.)

(*Acetoylamin Acetosylamin. Acetylamin (of Natanson).*)

$C_{22} H_{11} N O_{12} = C_{18} H_7 (N O_4) (C_4 H_3 O_2) O_5, H O$

AcetylPhloretic Acid. Sparingly soluble in cold, easily soluble in boiling water. Easily soluble in ether. (v. Gilm.)
$C_{22} H_{12} O_8 = C_{18} H_8 (C_4 H_3 O_2) O_5, H O$

AcetylSalicylic Acid. Insoluble in cold, somewhat soluble in boiling water. Easily soluble in alcohol, and ether. (v. Gilm.)
$C_{18} H_8 O_8$

AcetylSulphide of X. *Vid.* ThiAcetate of X.

AcetylUrea. [See also MethylUrea.] More readily soluble in hot than in cold water, and alcohol. (Moldenhauer.) Very sparingly soluble in cold water. Soluble in 100 pts. of cold alcohol. Soluble in 10 pts. of boiling alcohol. Much more soluble in boiling water than in boiling alcohol. Insoluble in ether. (Zinin.)

$$C_6 H_6 N_2 O_4 = N_2 \left\{\begin{matrix} C_2 O_2'' \\ C_4 H_3 O_2 \\ H_3 \end{matrix}\right.$$

Achilleic Acid. Soluble in 2 pts. of water at 12.5°. (Zanon.)
(*Perhaps identical with Malic Acid.* (*Gmelin.*)

Achilleate of Ammonia. Very soluble in water. Insoluble in alcohol.

Achilleate of Lead. Ppt.

Achilleate of Lime. Insoluble in alcohol.

Achilleate of Magnesia. Soluble in water.

Achilleate of Potash. Permanent. Very soluble in water. Sparingly soluble in alcohol.

Achilleate of Quinine. Easily soluble in water, and alcohol.

Achilleate of Soda. Very soluble in water. Sparingly soluble in alcohol.

Achillein. (From *Achillea millefolium.*) Hygroscopic. Easily soluble in water, and in boiling alcohol. Insoluble in ether, but soluble in acidulated ether. Also soluble in ammonia-water. (Zanon.)

Acichloride. }
Acisulphide. } Names proposed by Berzelius for compounds of an acid and chloride, or sulphide. (See Berzelius's *Jahresbericht*, **20.** (2. *Abth.*) p. 478.)

AconitAnilic Acid. *Vid.* PhenylAconitamic Acid.

AconitAnilid. Soluble in cold alcohol. Partially soluble in ammonia-water. (Pebal.)
$C_{48} H_{21} N_3 O_6$ (?)

Aconitic Acid. Permanent. Soluble in 3 pts. of water at 15°, and in a smaller quantity of hot water. (Baup.) Very readily soluble in water, either hot or cold, being much more soluble than its isomer fumaric acid. (Buchner.) Soluble in 2 pts. of alcohol. of 88% at 12°. (Baup.) Readily soluble in alcohol, and ether. (Crasso.) Most of the normal aconitates are easily soluble in water.
(*Citridic Acid. Equisetic Acid. Achilleic Acid.*)
$C_{12} H_6 O_{12} = C_{12} H_3 O_9, 3 H O$

Aconitate of Ammonia.
a = tri, or normal. Readily soluble in water; but the solution loses ammonia when exposed to the air.

b = mono. Soluble in 6.5 pts. water at 15°; more soluble in hot water. (Baup, *Ann. Ch. et Phys.*, (3.) **30.** 322.)
$C_{12} H_5 (N H_4) O_{12}$

c = acid. More soluble than the monobasic salt, but is decomposed, with separation of the latter, as soon as it dissolves. (Baup, *loc. cit.*, p. 321.)
$C_{12} H_3 (N H_4)_3 O_{12} ; C_{12} H_6 O_{12}$

Aconitate of Baryta. Scarcely at all soluble in water. Soluble in an aqueous solution of aconitic acid. (Buchner.) By precipitating equisetic acid Regnault obtained a gelatinous baryta salt soluble in 9 pts. of water at 20°.
$C_{12} H_3 Ba_3 O_{12} + 6 Aq$

Aconitate of Copper. Somewhat soluble in water.

Aconitate of Ethyl. Soluble in an alcoholic solution of chlorhydric acid, from which it separates on the addition of water. (Crasso.)
$C_{24} H_{18} O_{12} = C_{12} H_3 (C_4 H_5)_3 O_{12}$

Aconitate *of peroxide* of Iron. Ppt.

Aconitate of Lead. Very sparingly soluble in boiling water. (Buchner.)
$C_{12} H_3 Pb_3 O_{12} + 3 Aq$

Aconitate of Lime. At first it is soluble in water, but after having crystallized it is but slowly soluble.
$C_{12} H_3 Ca_3 O_{12} + 6 Aq$

Soluble in 98 @ 99 pts. water at 15°. Soluble in dilute nitric acid. (Baup, *Ann. Ch. et Phys.*, (3.) **30.** 323.)

Aconitate of Magnesia. Very soluble in water.

Aconitate of Manganese. Permanent. Sparingly soluble in cold, more readily soluble in hot water. Partially decomposed by boiling water. (Baup, *Ann. Ch. et Phys.*, (3.) **30.** 323.)
$C_{12} H_3 Mn_3 O_{12} + 12 Aq$

ACONITATE *of dinoxide* OF MERCURY. Ppt.

ACONITATE *of protoxide* OF MERCURY. Sparingly soluble in water; decomposed when boiled therewith. (Buchner.)

ACONITATE OF POTASH.

a = normal. Very deliquescent.
$C_{12}H_3K_3O_{12}$

b = di. Permanent. When dissolved in 3 or 4 pts. of water it is at once partially decomposed, with deposition of a salt containing a larger proportion of acid. Much more soluble in water than the monobasic salt. (Baup, *Ann. Ch. et Phys.*, (3.) **30.** 316.)
(biAconitate) of Baup.
$C_{12}H_4K_2O_{12}$

c = mono. Soluble in 11 pts. water at 15° if it be dissolved directly in water, but if a solution saturated at a higher temperature be cooled, a larger amount than this will remain in solution even after standing during several days. Much less soluble in water than the bibasic salt. Baup, *loc. cit.*, p. 317.)
(triAconitate) of Baup.
$C_{12}H_5KO_{12}$

ACONITATE OF SILVER. Very slightly soluble in water. Readily soluble in alcohol, and ether. (Buchner.)
$C_{12}H_3Ag_3O_{12}$

ACONITATE OF SODA.

a = normal or *tri.* Hygroscopic. Very readily soluble in water. Insoluble in alcohol. (Buchner.)

b = acid. Efflorescent. Soluble in 2 pts. water at 15°; less soluble in alcohol. (Baup, *Ann. Ch. et Phys.*, (3.) **30.** 319.)
(bin) of Baup.
$C_{12}H_3Na_3O_{12}$; $C_{12}H_6O_{12} + 12\,Aq$

ACONITATE OF ZINC. Very soluble in water.

ACONITIN. Permanent. Soluble in 150 pts. of cold water. Soluble in 50 pts. of boiling water; the saturated cold solution containing 0.66% of it and the boiling saturated solution 2%, but the hot solution deposits nothing on cooling. (Hesse.) Sparingly soluble in cold, more soluble in boiling water. Readily soluble in alcohol and in ether, though less soluble in the latter than in the former. (v. Planta.) 100 pts. of chloroform dissolve 22 pts. of it. (Schlimpert, *Kopp & Will's J. B., für* 1859, p. 405.) Soluble in nitric acid. The salts of aconitin are generally permanent and easily soluble in water, and alcohol.
$C_{60}H_{47}NO_{14} = N\left\{C_{60}H_{47}O_{14}'''\right.$

ACONITOBIANIL. *Vid.* Phenyl Aconitimid.

ACONITO*bi*ANILIC ACID.(?) Sparingly soluble in water. Readily soluble in alcohol, and in ammonia-water. (Pebal.)
$C_{36}H_{16}N_2O_8$ (?)

ACROL. *Vid.* Hydride of Acryl.

ACROLEIN. *Vid.* Hydride of Acryl.

ACRYL. *Vid.* Allyl.

ACRYL RESINS. *Vid.* Resins of Acryl.

ACRYLIC ACID. Miscible in all proportions with water. The acrylates, with the exception of the silver salt, are easily soluble in water.
(Acronic Acid.)
$C_6H_4O_4 = C_8H_8O_3, HO$

ACRYLATE OF BARYTA. Very soluble in water, somewhat less so in alcohol.
$C_8H_3BaO_4$

ACRYLATE *of sesquioxide* OF IRON. Ppt. (Schlippe.)

ACRYLATE OF SILVER. Very sparingly soluble in cold, decomposed by boiling water.
$C_6H_3AgO_4$

ACRYLATE OF SODA. Efflorescent. Very soluble in water. More soluble in water than acetate of soda. (Redtenbacher.)
$C_6H_3NaO_4 + 5\,Aq$

ADIPIC ACID. 100 pts. of water at 18° *dissolve* 7.73 pts. of it. A solution prepared at a higher temperature which deposited crystals on cooling contained in 100 pts., at 18°, 8.61 pts. of the acid. (Wirz, *Ann. Ch. u. Pharm.*, **104.** 276.) Readily soluble in boiling, much less soluble in cold water. Soluble in alcohol, and ether. (Malaguti, *Ann. Ch. et Phys.*, (3.) **16.** 84.) Readily soluble in boiling, tolerably soluble in cold water. (Laurent.) Very readily soluble in boiling alcohol, and ether.
$C_{12}H_{10}O_8 + Aq = C_{12}H_8O_6, 2\,HO + Aq$

Soluble in somewhat more that 1 pt. of water, or of nitric acid. (Bromeis.) Soluble in water. Only sparingly soluble in concentrated nitric acid. (Lawrence Smith, *Ann. Ch. et Phys.*, (3.) **6.** 60.)

ADIPATE OF AMMONIA. Soluble in water.

ADIPATE OF BARYTA. Soluble in water.
$C_{12}H_8Ba_2O_8$

ADIPATE OF COPPER. Soluble in water. (L. Smith, *Ann. Ch. et Phys.*, (3.) **6.** 61.)

ADIPATE OF ETHYL. Soluble in alcohol, from which it separates on the addition of water. (Malaguti.)
$C_{20}H_{18}O_8 = C_{12}H_8(C_4H_5)_2O_8$

ADIPATE *of sesquioxide* OF IRON. Ppt.

ADIPATE OF LEAD.

I.) *normal.* Soluble in water. (L. Smith, *Ann. Ch. et Phys.*, (3.) **6.** 61; Bromeis.)
$C_{12}H_8Pb_2O_8$

II.) *basic.* Ppt. Soluble in an aqueous solution of basic acetate of lead. (Smith, *Ibid.*)

ADIPATE OF LIME. Soluble in water, from which alcohol precipitates it. (Laurent.)
$C_{12}H_8Ca_2O_8 + 4\,Aq$

ADIPATE OF SILVER. Ppt. Slightly soluble in water. (L. Smith, *Ann. Ch. et Phys.*, (3.) **6.** 61.)
$C_{12}H_8Ag_2O_8$

ADIPATE OF STRONTIA. Soluble in water, from which it is precipitated by alcohol. (Laurent.)
$C_{12}H_8Sr_2O_8 + 4\,Aq$

ADIPATE OF ZINC. Soluble in water. (L. Smith, *Ann. Ch. et Phys.*, (3.) **6.** 61.)

AESCULIN. *Vid.* Esculin.

(Bunsen's *Gasometry*, pp. 289, 128, 156, 174.)

100 vols. of water at 18°, and the ordinary pressure, absorb about 5 vols. of atmospheric air. (Th. de Saussure, *Gilbert's Ann. Phys.*, 1814, **47.** 167.)

When absolute alcohol is exposed to the air it takes up 0.11 of its volume of gas, ⅓ of which is oxygen and ⅔ nitrogen. On mixing the alcohol with an equal volume of water ⅔ of the dissolved gas is expelled. (Dœbereiner.)

AKCETHIN (of Zeise). Rather difficultly soluble in water. Easily soluble in alcohol, ether, and weak acids.

(*Probably identical with Thiacetonin.*)

ALANIN. Soluble in 4.6 pts. of water at 17°; more readily soluble in warm water, and still more soluble in dilute acids. Soluble in about 500 pts. of cold alcohol of 80%. Insoluble in ether. Soluble, without decomposition, in monohydrated sulphuric acid. Unacted on by boiling alkaline solutions. (Schlieper.)

(*Amido Propianic Acid. Isomeric with Sarcosin, Urethan, and Lactamid.*)

$$C_6H_7NO_4 = N\left\{\begin{matrix} C_2HO_2 \\ C_4H_5 \\ H \end{matrix}\right\}O_2$$

ALANIN with BARYTA. Very soluble in water.

ALANIN with COPPER. Tolerably soluble in water. Almost completely insoluble in alcohol.

$C_6H_6CuNO_4 + Aq$

ALANIN with LEAD. Soluble in water. Insoluble in spirit.

$2C_6H_6PbNO_4, PbO, HO + 5Aq$

ALANIN with SILVER. Very soluble in water.

$C_6H_6AgNO_4$

ALANTIN. *Vid.* Inulin.

ALBAN. *Vid. β.* Resin of Gutta-Percha.

ALBUMEN. Two modifications are distinguished; the one *soluble*, and the other *insoluble.*

I.) *Soluble Albumen.* Soluble in water. When a concentrated solution is heated to 59.5° it commences to become cloudy, at 61° @ 63° flocks form in the liquor, and at a slightly higher temperature the whole coagulates, the albumen being converted into the insoluble modification.

Neither alcohol nor ether dissolve albumen. When a large excess of strong alcohol is added to an aqueous solution of albumen the latter is precipitated in its insoluble modification, but if only a small quantity of dilute alcohol be employed the precipitate produced may be redissolved in water. When alcohol is added to a somewhat strongly diluted solution of albumen so that it becomes opaline, the liquor will gelatinize after a time, but on heating this jelly it redissolves. Dried white of eggs or serum of blood may be dissolved in alcohol which contains a litte alkali in solution. (Scherer.) When ether is agitated with a solution of albumen (of white of eggs or serum of blood), it coagulates only a very small quantity of the latter, the greater portion preserving the soluble state; if the albumen solution is concentrated, it becomes so thick that it appears to be coagulated. (Lieberkuehn.)

Insoluble in the fatty, or essential, oils. It is coagulated by creosote, and by anilin.

Most mineral acids — as sulphuric, chlorhydric, nitric, and pyrophosphoric — precipitate it in the insoluble state. Common (*c*) phosphoric, acetic, tartaric, and most organic, acids do not precipitate albumen from moderately concentrated solutions.

Soluble in an aqueous solution of potash, and in concentrated chlorhydric acid.

Soluble albumen behaves like fibrine, *q. v.*, with very dilute chlorhydric acid, dissolving therein. But coagulated albumen is insoluble in pure dilute chlorhydric acid. (Bouchardat & Sandras, *Ann. Ch. et Phys.*, (3.) **5.** 483.)

Alcohol, concentrated mineral acids, solutions of bichromate of potash, of alum, corrosive sublimate, subacetate of lead, &c., &c., all precipitate pure albumen from its aqueous solution, just as they do the white of egg. When several volumes of ether are added to a concentrated solution of albumen a gelatinous magma is formed; this mass redissolves in water if this be added immediately, but if it be left for a short time water can no longer dissolve it.

A very large excess of acetic acid does not precipitate albumen immediately, but after standing for several hours the solution gelatinizes, forming a mass insoluble in water, from which all the acid may be removed by prolonged washing; albumen thus prepared is remarkable for the facility with which it dissolves in solutions of potash, a trace of this alkali being sufficient to render a large quantity of the albumen soluble in water, — it undergoes change however. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **12.** 220.)

Soluble albumen, when submitted to the influence of agitation, may be transformed into an insoluble body. (Melsens, *Ann. Ch. et Phys.*, (3.) **33.** 177.)

Several weak acids do not precipitate albumen from its solutions: thus trihydrated phosphoric acid, or acetic acid, will not re-precipitate it excepting when certain salts are present. (Melsens, *loc. cit.*)

Albumen combines with various salts, forming compounds which are soluble in an excess of an aqueous solution of albumen; from these solutions c phosphoric acid precipitates the compound, excepting certain salts in solutions of which phosphoric acid produces no precipitate, for example, phosphate of soda, acetate of soda, and acetate of potash; but even in these a slight precipitate is produced after agitation. The precipitates which phosphoric acid produces are soluble in an excess of this acid. In general the acid phosphates behave like phosphoric acid.

Acetic acid also precipitates the compounds of albumen and salts, and the precipitates are not sensibly soluble in acetic acid. Sometimes the precipitates are granular, sometimes flocculent. In the former case they are soluble in phosphoric acid, in the latter case only very sparingly soluble. When a precipitate formed by acetic or by phosphoric acid has been dissolved in the latter, the addition of an excess of acetic acid will often reproduce the precipitate. The precipitates produced by an excess of acetic acid in solutions of albumen and salts are, in general, insoluble in alcohol, ether, oils, cold or hot water, cold or hot ammonia-water, or cold caustic potash, but are decomposed by hot caustic potash. They are attached by energetic acids, as concentrated chlorhydric acid. Albumen is precipitated by corrosive sublimate, the precipitate being soluble both in an excess of albumen or of the solution of corrosive sublimate; it is also soluble in a solution of chloride of sodium or of the alkaline chlorides, bromides, or iodides. Albumen is, however, precipitated, partially at least, when in presence of the chlorides, bromides, or iodides of the alkaline earths; the precipitate is usually soluble, however, in an excess of albumen. If to a mixture of albumen and corrosive sublimate, with excess of chloride of sodium, phosphoric acid be added, a precipitate forms which is soluble in an excess of the acid; with acetic acid a precipitate is also formed, but this is not soluble in an excess of the acid. (Melsens, *Ann. Ch. et Phys.*, (3.) **33.** pp. 179, 180.) Chloride of mercury (corrosive sublimate) precipitates albumen from its solution in many salts, as phosphate, sulphate, nitrate, or borate of soda, nitrate or sulphate of potash, and the like. These precipitates are often soluble in an excess of the compound of albumen and the salt; they are also soluble in phosphoric acid, in ammonia, and in potash ; an excess of acetic acid, however, always produces a permanent precipitate when added to these solutions. (Melsens, *loc. cit.*, p. 180.) Alcohol, ether, oil of turpentine, and creosote act sensibly in the same manner upon solutions of the compounds of albumen with salts as upon those of normal albumen. In general, acids produce precipitates more readily in dilute solutions of the compounds of albumen with salts than in equally dilute solutions of pure albumen. (Melsens, *loc. cit.*, p. 181.)

Soluble in cold concentrated chlorhydric acid, from which solution it is precipitated by alkalies. When this solution is mixed with a concentrated solution of potash or soda, it forms a firm jelly, which when decomposed by an acid furnishes albumen which is more difficultly soluble in chlorhydric acid than it was originally. (Caventou, *Ann. Ch. et Phys.*, (3.) **8.** pp. 326, 327.)

II.) *Insoluble Modification.* Insoluble in cold water, but is partially dissolved with alteration when boiled for a long time with water.

If it is maintained at 150° with a small quantity of water in a sealed tube, it gradually dissolves, and is no longer capable of coagulating. (L. Gmelin.) Insoluble in alcohol or ether. Soluble in warm acetic, tartaric, and (*c*) phosphoric acids.

Soluble in concentrated, but insoluble, even in exceedingly dilute chlorhydric acid alone, but dissolves therein when in presence of a peculiar substance ["pepsin"] which occurs in the stomachs of living animals. (Bouchardat & Sandras, *Ann. Ch. et Phys.*, (3.) **5.** 484.)

III.) *Vegetable Albumen.* Soluble in water, and is coagulated by heating. Soluble in acetic acid. Insoluble in boiling alcohol, or ether. (Dumas & Cahours, *Ann. Ch. et Phys.*, (3.) **6.** pp. 409, 389.)

ALBUMEN with X. *Vid.* Alhuminate of X. Also under Albumen (Soluble Modification).

ALBUMINATE OF BARYTA. Insoluble in water, alcohol, or ether.
$C_{144}H_{113}BaN_{18}S_2O_{44}+2\,Aq$ (?)

ALBUMINATE OF BARYTA & OF COPPER.

ALBUMINATE OF COPPER. Insoluble in water or alcohol.
$C_{144}H_{110}Cu_2N_{18}S_2O_{44}+2\,Aq$?

ALBUMINATE OF COPPER & OF LIME.

ALBUMINATE OF COPPER & OF MAGNESIA. Insoluble in water.

ALBUMINATE OF COPPER & OF POTASH. Is swollen up, and eventually dissolved by water.

ALBUMINATE OF LEAD. Insoluble in water. Soluble in a solution of acetate of lead. Decomposed by all acids, even by carbonic acid. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **12.** 218.)

ALBUMINATE OF LIME. Insoluble in water.

ALBUMINATE OF MERCURY, or rather of CHLORIDE OF MERCURY. [See also *Art.* Albumen (No. I.).] Insoluble in water.

Before having been dried, water dissolves traces of it. It is dissolved in considerable quantity by aqueous solutions of the alkaline chlorides, bromides, and iodides ; also by cold phosphoric, sulphurous, arsenic, acetic, oxalic, tartaric, malic, and racemic acids, but to no appreciable extent by sulphuric, nitric, chlorhydric, or tannic acids. It is also easily soluble in aqueous solutions of caustic potash, soda, lime, and ammonia, but with subsequent decomposition. (Wittstein's *Handw.*) 1 pt. of the freshly-precipitated compound is soluble in 4.1 pts. of chloride of sodium, in saturated aqueous solution. (Voit, *Ann. Ch. u. Pharm.*, **104.** 365. Soluble in solutions of iodide of potassium, either neutral or alkaline, or in presence of dilute acids. (Melsens, *Ann. Ch. et Phys.*, (3.) **26.** 221.)

ALBUMINATE OF POTASH.

a.) Soluble in boiling water, and in alcohol.

b.) $C_{144}H_{110}K_2N_{18}S_2O_{44}+2\,Aq$ Insoluble in boiling water, alcohol, or ether.

ALBUMINATE OF SILVER.
$C_{144}H_{111}AgN_{18}S_2O_{44}+2\,Aq$ (?)

ALBUMINATE OF SODA.

a.) *acid.* More soluble in water than pure albumen.
$C_{144}H_{111}NaN_{18}S_2O_{44}+2\,Aq$

b.) *normal.* Almost insoluble in cold water.
$C_{144}H_{110}Na_2N_{18}S_2O_{44}+2\,Aq$

ALBUMINATE OF STRONTIA. Insoluble in water.

ALBUMINATE OF ZINC. Insoluble in water, and alcohol.
$C_{144}H_{110}Zn_2N_{18}S_2O_{44}+2\,Aq$ (?)

ALBUMININ (of Courbe). (*Oonin.*) Insoluble in water, alcohol, ether, or acetic acid. Soluble in chlorhydric acid, and in aqueous alkaline solutions. (Courbe.)

ALKARSIN. *Vid.* Oxide of Cacodyl.

ALCOHOL. (*Hydrate of Ethyl. Hydrated Oxide of Ethyl.*
$C_4H_6O_2 = \left.\begin{matrix}C_4H_5O\\HO\end{matrix}\right\}$) Absorbs water from the air. Miscible in all proportions with water, heat being evolved ; contraction of volume also occurs, and this augments till the mixture contains 116 pts. of water to 100 pts. of alcohol. (Rudberg.) Miscible in all proportions with wood-spirit, chloroform, ether, acetic acid, formic acid, most of the essential oils, methylal, sulphide, bisulphide, and sulphocarbonate of methyl, &c. ; absolute alcohol is also miscible in all proportions with naphtha, and benzin.

1 vol. of ordinary alcohol dissolves in about 3 vols. of nitrotoluene when this has been warmed by the hand. (C. M. Warren.)

It can be said, in general terms, that alcohol is a good solvent for substances which contain much hydrogen, as resins, ethers, essential oils, including those which are oxygenated, fats, the alkaloids, coloring matters, and many organic acids. It does not dissolve the sulphates or carbonates of the metallic oxides. It also dissolves sugars and soaps.

"Those gases which are abundantly absorbed by water likewise dissolve in considerable quantity in alcohol ; and those which are sparingly absorbed by water are also taken up in small quantity only by alcohol ; but alcohol generally takes up a greater quantity of a gas, bulk for bulk, than water. Among the elementary substances, alcohol dissolves only a few, such as phosphorus $\frac{1}{240}$, sulphur $\frac{1}{200}$, bromine, iodine, &c., all of the non-metallic class. With respect to inorganic substances, it may be stated as a law, that all compounds soluble in alcohol are also soluble in water, but that there are some compounds soluble in water which are not soluble in alcohol ; moreover, that compounds which are soluble in both liquids, dissolve more abundantly in water than in hydrated alcohol, and in the latter more than in absolute alcohol. Such is the case with metallic sulphides, iodides, bromides, and chlorides, and with certain oxygen salts. There are, however, certain exceptions: thus, corrosive sublimate ($Hg Cl$) dissolves more abundantly in alcohol, especially in absolute alcohol, than in water, and, according to Kirwan, nitrate of magnesia dissolves more freely in alcohol of 0.817 sp. gr. than in alcohol of 0.900 sp. gr. Compounds sparingly soluble in water are, for the most part, quite insoluble in alcohol; so likewise are efflorescent compounds. But all deliquescent compounds, excepting carbonate of potash, phosphate of potash, and a few others, are soluble in alcohol." (Gmelin's *Handbook*, **8.** 257.)

"Alcohol dissolves only those metallic oxides which possess either an alkaline or an acid character. Of the metallic sulphides it dissolves only those of potassium and sodium; of the iodides and bromides it dissolves a somewhat greater, and of the chlorides a still greater number. The carbonates, borates, phosphites, phosphates, hyposulphites, sulphites, hyposulphates, sulphates, iodates, and periodates, it dissolves either not at all or in very small quantity. The only sulphates which dissolve readily in alcohol are those of ferric and platinic oxide. On the other hand, alcohol dissolves many hypophosphites, a still greater number of bromates, chlorates, and perchlorates, and very many nitrates." (Gmelin, *Ibid.*, p. 265.)

"With regard to the comportment of alcohol with *organic* compounds, the following general observations may be made:—

"Alcohol dissolves all Hydrocarbons, and therefore the primary Nuclei, and any compounds which those nuclei may form with hydrogen.—Among the compounds which likewise contain oxygen, alcohol dissolves especially those in which the number of atoms of all the elements together is comparatively small, and the oxygen is in comparatively small proportion; hence it is more inclined to dissolve aldides (in which class may be included many volatile oils, camphors, and resins), and acids of small atomic weight, than acids of greater atomic weight, or richer in oxygen. Acids which are but slightly soluble or quite insoluble in alcohol likewise yield salts of similar character. Acids containing but little oxygen, and their salts, often dissolve in alcohol more readily than in water. Compounds in which hydrogen is replaced by iodine, bromine, or chlorine, do not appear to have their solubility in alcohol diminished by the substitution; even the chlorides of carbon are all soluble in alcohol. All compounds of carbon, hydrogen, and nitrogen, *e. g.* the non-oxygenated alkaloids, are soluble in alcohol; but with regard to compounds of this nature containing oxygen, the observations above made concerning the influence of oxygen likewise hold good." (Gmelin, *loc. cit.*, p. 273.)

"Alcohol of 0.835 sp. gr. = 85%, called Druggists' Alcohol, is an excellent solvent for resins, camphor, benzoic acid, tannic acid, the balsams, grape-sugar, the vegetable alkalies, and castor-oil; also for iodine, carbonate of ammonia, chloride of ammonium, caustic potash or soda, nearly all deliquescent and a few other inorganic salts. It mixes freely in all proportions with water, ether, acetic acid, and most of the essential oils."

"Diluted Alcohol," of 0.935 sp. gr., "consists of equal vols. of druggists' alcohol and water. It dissolves gums, vegetable albumen, and many coloring matters; also, to a certain extent, resinous matters, essential oils, and vegetable alkalies; also sugar and tannic acid." (Parrish's *Pharmacy*, pp. 130, 131.)

Dilute alcohol (a mixture of equal vols. alcohol of 0.835 sp. gr. and of water) is a better solvent of resinous matters, and the extractive principles of plants, than the same quantity of these two liquids employed separately. (J. Personne, *Amer. J. Pharm.*, **18.** pp. 21, 103; cited by Parrish, *Pharm.*, *loc. cit.*)

An aqueous solution containing per cent, by vol., of alcohol of 0.7947 sp. gr. at 15° (the sp. gr. of water at 15° = 1).	Is of sp. gr. at 15°.	An aqueous solution containing per cent, by vol., of alcohol of 0.7947 sp. gr. at 15° (the sp. gr. of water at 15° = 1).	Is of sp. gr. at 15°.

(Gay-Lussac, in Berzelius's *Lehrb.*) For the elaborate tables which Gay-Lussac has constructed from these data we must refer the reader to his treatise entitled *Instruction pour l'usage de l'Alcoomètre centésimal et des Tables qui l'accompagnent.* Paris, 1824; in *Handwörterbuch der Chemie*, **1.** 235 *et seq.* See also Ure's *Dict. of Arts.* These tables which refer to the centesimal alcohometer of their author [compare Maroseau's table below] indicate the percentage by volume of alcohol, reduced to 15°, for every degree of temperature from 0° to 30° C. A tolerably close approximation to the figures of Gay-Lussac's table may be obtained by the formula of Francoeur (*Handwörterbuch*, **1.** 253); in which c being the number of per cents by volume indicated by the alcohometer in any spirit at the temperature t; x, the true percentage by volume of absolute alcohol at 15°, which is contained in the spirit in question, is found by the equation

$$x = c \mp 0.4\, t.$$

The temperature t is taken as positive above and as negative below 15°. Tables indicating the amount of water required in order to reduce strong alcohol to any required degree have also been given by Gay-Lussac. (*Handwörterbuch der Chem.*, **1.** 257, *et seq.*)

A MIXTURE OF ALCOHOL AND WATER

Containing per cent, *by volume*, of absolute alcohol of 0.7939 sp. gr. at 15.56° (the sp.gr. of water at 4.35° being equal to 1.000).	Is of sp. gr. at 15.56° (= 60° F.)	Difference between the sp. grs.

(McCulloh, in his *Report on Sugar and Hydrometers*, p. 502.)

The experiments of Gouvernain (*Table exacte de la Pesanteur Spécifique de Mélanges d'Alcool et d'Eau, etc.*; par M. de Gouvernain, 8vo, pp. 16 *et* 4 *tableaux*, Dijon, 1825; cited in *Ferrusac's Bulletin*, 1827, **7.** 147) being admitted to be of inferior accuracy, his table is not given here. The same remark applies to the tables of Meissner (in his *Aræometrie*, Wien, 1826, II. pp. 27, 30), which are frequently cited in German works (for example, *in extenso*, in Balling's *Gährungschemie*, Prag, 1854, **1.** table VII., facing page 118), which have been shown by Prof. R. S. McCulloh (in his *Report*, pp. 472–475, 498) to be less worthy of confidence than those of Gilpin, Delezenne, Tralles, Gay-Lussac, &c.

No reference to the subject of alcohometry, however slight, can be made without some allusion to the very remarkable determinations of Blagden & Gilpin, which are to be found in the *Philosophical Transactions of the Royal Society of London* for the year 1794, vol. **84.** p. 275. The tables of specific gravities given by these observers indicate the amounts *by weight* of alcohol and water in any mixture, and are computed for every degree of temperature between 30° and 80° of Fahrenheit's thermometer, and for the addition or subtraction of every one part in a hundred of water or alcohol. The alcohol employed by Blagden & Gilpin was, however, not absolutely anhydrous, having been of 0.825 sp. gr. at 60° F. (= 15.56° C.) the sp. gr. of water at 60° F. being taken as = 1. (Compare Blagden & Gilpin's earlier papers in *Phil. Trans.*, 1790, **80.** 321; and 1792, **82.** 425.) Tralles's tables, on the other hand, refer to alcohol of 0.7946 sp. gr. at 60° F. (water at 60° F. equalling 1). (Gilbert's *Ann. der Phys.*, 1811, **38.** pp. 365–369.) Subsequent researches have indeed shown that a slight correction must be made on this account, but the accuracy of Gilpin's determinations has only been made more clearly manifest by the rigid scrutiny to which they have been repeatedly subjected.

In his *Report in Relation to Sugar and Hydrometers*, Ex. Doc. No. 50, 30th Congress, 1st Session, Washington, 1848, to which we would here refer the reader as a work replete with valuable information upon the subject of this article, and very carefully compiled, Prof. McCulloh has constructed (pp. 495–497) tables of comparison between the results of Blagden & Gilpin and those of Delezenne which are shown to agree in a very remarkable manner; he has also (p. 497) verified the table of Tralles, and compared it (p. 498, *et seq.*) with the determinations of Gay-Lussac, Meissner, and Gouvernain, showing that, while the results of Gay-Lussac accord very closely with those of Tralles, those of Meissner and Gouvernain differ from them considerably, and by the method of curves are found to be improbable. On p. 514 of his Report, McCulloh gives a table comparing his own results with those of Delezenne.

In a preliminary notice of a memoir (which is said to have been published *in extenso* in the *Mémoires de l'Académie des Sciences de Paris*, **30.** 425) upon the density of alcohol and that of its mixtures with water, Pouillet remarks that the sp. gr. of absolute alcohol given by Lowitz is true to within $\frac{3}{10000}$, and that for all the mixtures between water and absolute alcohol the densities observed by Lowitz do not differ more than a thousandth or a thousandth and a half from those of Gay-Lussac. The results of Blagden and Gilpin are not less remarkable: on reducing them to the same standard as those of Gay-Lussac, they are found to agree with the latter for all the mixtures, and for each degree of temperature between 0° and 30°, in the thousandths places, the differences not exceeding some ten-thousandths. Pouillet himself found by direct experiment, in one instance, identically the same sp. gr. for absolute alcohol as Gay-Lussac (0.7947 at 15° referred to water = 1 at 15°), and in another experiment obtained a result a few ten-thousandths higher. Like many others who have carefully examined the matter, Pouillet expresses his conviction that the densities of mixtures of alcohol and water are sufficiently well known for all practical purposes, and that there is no occasion for new researches upon this subject. (*C. R.* 1859, **48.** 929.)

V. Baumhauer, in Holland, has, nevertheless, seen fit to repeat the labors of his predecessors, and has published an extended memoir (referred to by Pouillet as having been presented to the Amsterdam Academy May 27, 1860, and published by that Academy). The following is a comparison of his principal results with those of Gay-Lussac, and of Gilpin & Blagden: —

Per cent by weight of alcohol, of 0.7940 at 15° (sp. gr. of water at its maximum = 1).	Sp. gr. of the mixture at 15° (referred to water at its maximum).	Sp. gr. of the mixture at 15° (referred to water at 15°=1).		
	Baumhauer.	Baumhauer.	Gay-Lussac.	Gilpin.
100	0.7941	0.7948	0.7947	
95	0.8089	0.8096	0.8093	
90	0.8225	0.8232	0.8232	0.8232
85	0.8357	0.8364	0.8363	0.8362
80	0.8484	0.8491	0.8488	0.8487
75	0.8602	0.8610	0.8610	0.8608
70	0.8720	0.8728	0.8729	0.8727
65	0.8838	0.8846	0.8847	0.8845
60	0.8954	0.8962	0.8963	0.8962
55	0.9068	0.9076	0.9077	0.9075
50	0.9179	0.9187	0.9188	0.9187
45	0.9288	0.9296	0.9296	0.9295
40	0.9387	0.9395	0.9398	0.9397
35	0.9482	0.9490	0.9493	0.9492
30	0.9569	0.9577	0.9578	0.9578
25	0.9642	0.9650	0.9652	0.9653
20	0.9706	0.9715		0.9721
15	0.9766	0.9775		0.9776
10	0.9830	0.9839		0.9840
5	0.9903	0.9912		0.9913

The agreement is complete, since the differences are in general comprised between 2 and 3 ten-thousandths. (Cited by Pouillet, *C. R.*, 1860, **51.** 1006.) The previous hasty assertions of Baumhauer (*Verslagen en Mededeelingen der* [*Amsterdam*] *Akademie* (*Natuurkunde*), Feb. 25, 1860, **10.** 317, and *Comptes Rendus*, of the French Academy, 1860, **50.** 591; compare p. 251 of the *Verslagen*), that considerable errors exist in the table which Pouillet calculated from the observations of Gilpin and Gay-Lussac, are now admitted by Baumhauer himself to be false; the error having been one of incorrect comparison on his own part. (See *C. R.*, 1860, **51.** 1004.)

(Grœning, *Brandes's Archiv.*, 1823, **6.** 200; from G.'s brochure entitled *Die vortheilhafte Anwendung des Thermometers, zugleich als Alkoholometer bei dem Brenn- und Destillations-geschäfte*, etc., 8vo, Copenhagen, 1822. Another brochure by Grœning is entitled *Das neue ThermoAlkohometer nebst Barometer*, Post 8vo, Berlin, 1827.)

For Grœning's table of the quantities and strengths of alcohol which distil over at various temperatures from his patent apparatus, see *Edin. Phil. J.*, 1822, **7.** 214; also *Brandes's Archiv.*, 1823, **6.** 198.

Alcohol containing per cent of absolute alcohol (of 0.791 sp. gr. at 20°).	Boils at °C. (Bar. = 720mm. at 0°).
94	75.72°
95	75·74°
96	75 68° (Repeated.)
97	75.60°
98	75.60° (Repeated.)
99	75.65°
100	75.78° (Repeated.)

These experiments, in showing that alcohol, which contains 2 @ 2.5% of water, boils more easily than that which is completely anhydrous, corroborate those of v. Sœmmering, who found that, when very strong alcohol is subjected to distillation, the portions which first pass off contain more water than those which distil over at a later period. (v. Yelin & Fuchs, *Kastner's Archiv.*, 1824, **2.** pp. 347, 343, 349; compare Duflos, *Ibid.*, 1828, **14.** 291.)

In the research cited above, v. Yelin found that absolute alcohol boiled at 75.78° @ 76.9° under pressures of 720 and 759$^{\text{mm.}}$ of mercury, and argued therefrom that the statements of earlier text-books, which put the boiling-point of absolute alcohol at 78.75° @ 80°, were erroneous. In a subsequent elaborate set of experiments he corrects this, and fixes the boiling-point more accurately at 77.25° under a pressure of $0^{\text{m}}.7216$. (*Kastner's Archiv.*, 1824, **3.** 373.) [Compare Kopp's table below.]

Alcohol of sp. gr. (at 15.56°).	Boils at °C.	Alcohol of sp. gr. (at 15.56°).	Boils at °C.
0.9200	81.44°	0.9665	85.33°

(Casoria, *J. Chim. Méd.*, 1846, p. 467; cited by Pohl.)

Pohl finds that on heating hydrated alcohol the thermometer rises rapidly until the liquid begins to boil, when the temperature suddenly remains fixed during some seconds, after which the mercury slowly rises again, and in a short time reaches a second fixed point, at which it remains constant for a greater number of seconds than before, and then begins to rise again, and continues to rise, with several short cessations, until all the alcohol has been driven off. Pohl takes the second fixed point as the proper boiling-point, because it lasts longer than the first, and because its temperature was found to be more nearly constant when several samples of alcohol of the same composition were compared with each other. The temperatures of the second stationary interval are given in the following table: —

An aqueous solution containing per cent *by weight* of alcohol (of 0.7951 sp. gr).	Is of sp. gr. (at 15°) [sp. gr. of water at 15=1].	And boils at °C. (Bar.=760mm.
0	1 0000	100°
1	0.9982	98.79°
2	0.9964	97.82°
3	0.9947	96.85°
4	0.9930	95.90°
5	0.9913	95.02°
6	0.9898	94.21°

10	0.9840	91.40°
11	0.9827	90.83°
12	0.9814	90.27°

(Pohl, *Denkschriften der Wiener Akad., math-nat. classe*, 1851, vol. **2.** p. 12 of the memoir.

The presence of even 15% of sugar (extract of malt) in hydrated alcohol does not appear to exert any perceptible influence on the boiling-point of the latter. (*Ibid.*, p. 15.)

In his very elaborate memoir in the Vienna *Denkschriften*, 1851, **2.** 200, Pohl also gives tables of correction for temperature of the relation of per cent by volume to per cent by weight, &c., &c.

Boiling-Point of Absolute Alcohol.

Observer.	°C at	Bar. mm.	°C reduced to 760mm. Bar.
Dumas & Boullay,	76°	745	76.6°
Gay-Lussac,	78.4°	760	78.4°
Pierre,	78.3°	758	78.4°
Yelin,	77.3°	722	78.7°
Kopp (earlier),	78.8°	752	79.1°
Kopp (best),	77.7°	748	78.4°

(H. Kopp, *Pogg. Ann.*, 1847, **72.** 56.)

An ethereal solution of sp. gr.	Contains (by experiment) per cent of alcohol (of 0.809).	An ethereal solution of sp. gr.	Contains (by experiment) per cent of alcohol (of 0.809).
0.729	0	0.779	60
0.737	10	0.786	70
0.756	30	0.801	90
0.765	40	0.809	100

From these data Schiff calculates the following table, by means of the formula,—

$$D = 0.729 + 0.000966\,p - 0.00000222\,p^2,$$

in which D = the sp. gr. of the solution and p the percentage of alcohol contained in the solution.

An ethereal solution of sp. gr.	Contains per cent of alcohol (of 0.809).	An ethereal solution of sp. gr.	Contains per cent of alcohol (of 0.809).
0.729	0	0.775	55
0.734	5	0.779	60
0.738	10	0.782	65
0.742	15	0.786	70
0.747	20	0.789	75
0.752	25	0.798	80
0.756	30	0.796	85
0.760	35	0.800	90
0.765	40	0.804	95
0.768	45	0.809	100
0.772	50		

The sp. grs. corresponding to per cents of ether in the solution may be found by means of the formula,—

$$D = 0.809 - 0.000733\,p - 0.00000111\,p^2.$$

(H. Schiff, *Ann. Ch. u. Pharm.*, 1859, **111.** 374.)

Alcoholate of Baryta. Somewhat soluble $Ba\,O, C_4\,H_6\,O_2$ (?) in absolute alcohol: 10 c. c. of the saturated solution containing 0.77 grm. of it. Water precipitates it from its solution in absolute alcohol; but this precipitate is soluble in an excess of pure water. A precipitate falls also when the solution in absolute alcohol is boiled, but dissolves again as the liquid cools. (Berthelot, *Ann. Ch. et Phys.*, (3.) **46.** 180.)

Alcohol with Chloride of Calcium.

$$\left.\begin{array}{l}\text{I.)}\ 2\,C_4\,H_6\,O_2\,;\ Ca\,Cl \\ \text{II.)}\ 2\,C_4\,H_6\,O_2\,;\ 3\,Ca\,Cl + 2\,Aq\end{array}\right\}\ \text{Soluble in alcohol.}$$

Alcohol with Chloride of Manganese $C_4\,H_6\,O_2\,;\ Mn\,Cl$ The solution in absolute alcohol saturated at 11.25° contains 58.2% of it, and the same quantity at 37.5°; at 76.25° (boiling) it contains 62.7% of it. If Graham's (*Ann. Phil*, **1.** 333) composition of the salt be admitted, then the alcoholic solution saturated at 76.25° would contain 79% of the compound. (Brandes, *Pogg. Ann.*, 1831, **22.** 271.)

Alcohol with *bi*Chloride of Tin. Soluble $C_4\,H_6\,O_2\,;\ Sn\,Cl_2$ in absolute alcohol. (Robiquet.) Easily soluble in alcohol. (Lewy, *Ann. Ch. et Phys.*, (3.) **16.** 310.)

Alcohol with Chloride of Zinc. Soluble $C_4\,H_6\,O_2\,;\ Zn\,Cl$ in alcohol, from which it crystallizes on cooling.

Alcohol with Nitrate of Magnesia. Soluble $3\,C_4\,H_6\,O_2\,;\ Mg\,O, NO_5$ in hot absolute alcohol, crystallizing out as the solution cools. Decomposed by water. (Chodnew.)

Alcornin (from the bark of *Alchornea latifolia*). Easily soluble in alcohol, ether, and oil of turpentine. Insoluble in dilute acids, and in alkaline solutions. (Bilz, Frenzel.)

Aldehydate of X. *Vid.* Acetylide of X.

Aldehyde. *Vid.* Hydride of Acetyl.

AldehydeAmmonia. *Vid.* Acetylide of Ammonium.

AldehydeResin. When precipitated from its alcoholic solution by water, it dissolves again on washing; but when precipitated from the solution in potash, by means of dilute sulphuric acid, it is completely insoluble in water and only partially soluble in alcohol, and ether. (Liebig.) Sparingly soluble in water. Soluble in alcohol, and ether. Scarcely at all soluble in alkaline solutions. (Weidenbusch.)

"**Aldehydic Acid**" was a mixture of Aldehyde and Acetic Acid.

Alixia Camphor. See under Camphors.

Alizaric Acid. *Vid.* Phthalic Acid.

Alizarin. Sparingly soluble in boiling water. (*Lizaric Acid. Madder-Red.*) $C_{20}\,H_6\,O_6$ & $+ 4\,Aq$ Soluble in alcohol, and ether. Readily soluble in alkaline lyes, and in solutions of the alkaline carbonates. Unacted on by chlorhydric, and scarcely at all by nitric acid. Insoluble, or very sparingly soluble, in water acidulated with chlorhydric or sulphuric acid. Soluble in cold concentrated sulphuric acid, from which water precipitates it. Its compounds with the alkaline earths are sparingly soluble, those with the metallic oxides insoluble, in water. (Schunk, *Rep. Br. Assoc.*, 1846, p. 26.) Tolerably soluble in alcohol. Soluble in ether. Easily soluble in solutions of the fixed alkalies and alkaline carbonates, also in solutions of ammonia and carbonate of ammonia. Insoluble in cold, sparingly soluble in boiling solution of alum. (Strecker, *J. Ch. Soc.*, **3.** 245.) Very slightly soluble in cold, more readily soluble in boiling water. (Colin & Robiquet.) Difficultly moistened by cold water. (Wolff & Strecker.) The boiling aqueous solution deposits nothing on cooling (Gaultier & Persoz), but is precipitated by acids. (Kuhlmann.)

100 pts. of water at 100° dissolve 0.034 pt. of it; at 150°, 0.035 pt., the solubility in water rapidly increasing when the mixture is heated above 200° in a sealed tube: 100 pts. of water dissolve 0.82 pt. of it at 200°; 1.70 pts. at 225°: and 3.16 pts. at 250°. (Plessy & Schuetzenberger.) It is not affected by weak acids (Gaultier & Persoz); when boiled with dilute acids it dissolves, and is redeposited on cooling. (Runge.) Soluble in concentrated sulphuric acid, from which it is precipitated unchanged on the addition of water. (Colin & Robiquet, and others.)

Soluble in cold, and more abundantly in boiling alcohol. (Wolff & Strecker.) Soluble in alcohol in almost every proportion. (Colin & Robiquet.) Soluble in 210 pts. of alcohol at 12°. (Zenneck.) The hot alcoholic solution does not deposit crystals on cooling, but on dilution. (Schunck.) Precipitated from the alcoholic solution on the addition of water, or acids. (Kuhlmann.)

More readily soluble in ether than in alcohol. (Colin & Robiquet, and others.) Soluble in 160 pts. of ether, of 0.73 sp. gr., at 12°. (Zenneck.) Soluble in bisulphide of carbon, oil of turpentine, rock-oil, and the fatty oils. (Zenneck.) Slowly soluble in cold, rapidly and more abundantly soluble in hot glycerine. (Arnodon.) Sparingly soluble in boiling acetic acid. (Schunck.) Soluble in boiling bisulphide of carbon, from which it crystallizes on cooling. (Vilmorin.) Soluble in wood-spirit. In ammonia-water. (Runge, Colin & Robiquet, Schiel, Schunck, Strecker.) In sulphide of ammonium. (Gaultier & Persoz.) Soluble in aqueous solutions of the caustic alkalies.

(Colin & Robiquet, Gaultier & Persoz, Runge, Schiel.) In aqueous solutions of the alkaline carbonates. (Gaultier & Persoz, Schiel.) But insoluble in a cold solution of bicarbonate of soda; on heating, carbonic acid is evolved and the alizarin dissolves. (Zenneck.) Soluble in aqueous solutions of arsenite, arseniate, and silicate of potash. (Gaultier & Persoz.) Scarcely at all soluble in an aqueous solution of alum (Colin & Robiquet); insoluble therein (Gaultier & Persoz, and others). Soluble in a warm aqueous solution of ammonia-alum. (Vilmorin.) Soluble in an aqueous solution of aluminate of potash. (Gaultier & Persoz.) Readily soluble in an aqueous solution of protochloride of tin, also abundantly soluble in a solution of protoxide of tin in caustic potash (Gaultier & Persoz); with reduction (Schunck).

Alizarin combines with salifiable bases, forming compounds which are insoluble in water, and alcohol, with the exception of the potash, soda, and ammonia salts. (Debus.) Insoluble in a very concentrated solution of caustic potash; its compounds with the alkalies are also insoluble in concentrated saline solutions.

ALIZARITE OF ALUMINA. Insoluble in water or alcohol. (Schunck.)

ALIZARITE OF AMMONIA. Soluble in water.

ALIZARITE OF BARYTA.

I.) *din.* Insoluble in water or alcohol. (Wolff & Strecker.)

$C_{20}H_6O_6 ; 2 (BaO, HO)$

II.) *sesquibasic.*

$2 C_{20}H_6O_6 ; 3 (BaO, HO)$

III.) *sesquiacid.*

$3 C_{20}H_6O_6 ; 2 BaO$

ALIZARITE OF COPPER. Ppt.

ALIZARITE OF GOLD. Ppt.

ALIZARITE OF IRON. Ppt.

ALIZARITE OF LEAD.

I.) Ppt., in alcohol.

$2 C_{20}H_5O_5, 3 PbO$

II.) Insoluble in water or alcohol. Soluble in acetic acid and in an aqueous solution of caustic potash. (Debus.)

$3 C_{20}H_5O_5, 4 PbO$

ALIZARITE OF LIME. Ppt.

$2 C_{20}H_6O_6 ; 3 (CaO, HO)$

ALIZARITE OF MAGNESIA. Ppt.

ALIZARITE OF MERCURY. Ppt.

ALIZARITE OF POTASH. Easily soluble in water, and absolute alcohol. Insoluble in ether, or in cold saline solutions. (Strecker, *J. Ch. Soc.*, **3.** 246.)

ALIZARITE OF SILVER. Ppt.

ALIZARITE OF SODA. Easily soluble in water, and absolute alcohol. Insoluble in ether, in cold saline solutions, or in concentrated soda-lye. (Strecker, *J. Ch. Soc.*, **3.** 246.)

ALIZARITE OF STRONTIA. Ppt.

ALIZARITE OF TIN.

ALIZARITE OF ZINC. Ppt., in alcohol, and ether.

ALKALOIDS. Some alkaloids, as nicotin and picolin, and most of the compound ammonias, mix with water in all proportions; others dissolve in it but sparingly, many requiring several hundred or thousand parts. Alcohol dissolves the alkaloids much more freely; ether dissolves many of them readily, but several of those which contain oxygen, cinchonin, and morphin, for example, are nearly insoluble in this liquid. Certain alkaloids are soluble in caustic alkalies, *e. g.* morphin and atropin. (Gmelin.)

"Most of the alkaloids are sparingly soluble in water, but dissolve freely in alcohol, especially when this is hot. Some dissolve in ether, and in the fixed and essential oils, and almost all in benzin, bisulphide of carbon, and chloroform." (Parrish's *Pharm.*, p. 386.) Many alkaloids are soluble in creosote. (Reichenbach.) Alcohol seems to be the best and most general solvent of the alkaloids. (Graham, *et al.*, *J. Ch. Soc.*, **8.** 136.) The non-volatile alkaloids are generally much less soluble in ether than the volatile. Most salts of the alkaloids are entirely insoluble in ether, but soluble in alcohol. (Otto.)

ALKANET GREEN. Easily soluble in ether; more difficultly soluble in spirit.

ALKANET RED. *Vid.* Anchusin.

ALKARGEN. *Vid.* Cacodylic Acid.

$C_4 As H_7 O_4$

ALKARSIN. *Vid.* Oxide of Cacodyl.

ALLANTOIC ACID. *Vid.* Allantoin.

ALLANTOIN. Permanent. Soluble in 160 pts. of water at 20°, and in 30 pts. of boiling water. (Liebig & Wœhler.) Soluble in 400 pts. of cold water. (Lassaigne.) Decomposed by water when heated therewith to 110° @ 140° in a closed tube. (Pelouze, *Ann. Ch. et Phys.*, (3.) **6.** 72.) More soluble in alcohol than in water. (Vauquelin & Buniva.) Also soluble in aqueous solutions of potash, and of the carbonated alkalies.

(*Allantoic Acid. Amniotic Acid.*)

$C_6H_6N_4O_6$

ALLANTOIN with CADMIUM. Insoluble in alcohol. Partially soluble, with decomposition in water. (Limpricht, *Ann. Ch. u. Pharm.*, **88.** 100.)

$C_6H_5CdN_4O_6$

ALLANTOIN with COPPER. Soluble in water.

$CuO, 3 C_8H_5N_4O_5$

ALLANTOIN with LEAD. Soluble in water.

$2 PbO, C_8H_5PbN_4O_5$

ALLANTOIN with MERCURY.

I.) Insoluble in cold, sparingly soluble in hot water. Insoluble in cold spirit. Readily soluble in chlorhydric, nitric, and sulphuric acids. (Limpricht, *Ann. Ch. u. Pharm.*, **88.** 94.)

$5 HgO ; 3 C_6H_5N_4O_5$

II.) Decomposed by water.

$3 HgO, 5 C_8H_5N_4O_5$

III.) Insoluble in water.

$4 HgO, 3 C_6H_5N_4O_5$

IV. Ppt.

$5 HgO, 2 C_6H_5N_4O_5$

ALLANTOIN with SILVER. Ppt.

$C_6H_5N_4AgO_6$

ALLANTOIN with ZINC. Soluble in water, from which alcohol precipitates it. (Limpricht.)

$ZnO, C_6H_5ZnN_4O_6$

ALLANTURIC ACID. Deliquescent. Soluble in water. Almost insoluble in alcohol. (Pelouze, *Ann. Ch. et Phys.*, (3.) **6.** 71.)

(*Leucoturic Acid? Compare Lantanuric Acid.*)

$$C_6H_4N_2O_6 = N_2 \left\{ \begin{matrix} C_6O_4'' \\ H_4 \end{matrix} \right\} O_2$$

ALLANTURATE OF LEAD. Ppt. Soluble in an aqueous solution of acetate of lead, and in acids. (Pelouze, *loc. cit.*)

ALLANTURATE OF SILVER. Ppt. Soluble in an aqueous solution of nitrate of silver, and in acids. (Pelouze, *loc. cit.*)

ALLITURIC ACID. Soluble in 15 @ 20 pts. of boiling water. Soluble in concentrated

$C_6H_3N_2O_4$

sulphuric acid, from which it is reprecipitated, unchanged, on the addition of water. Unacted upon by warm nitric acid. Soluble in ammonia-water. (Schlieper.)

Allophanic Acid. Not known in the free state.
(*Cyano Carbamic Acid. Ureo-Carbonic Acid.*
$C_4H_4N_2O_8 = C_4H_3N_2O_5, HO$

Allophanate of Amyl. Insoluble in cold, readily soluble in boiling water. Very soluble in alcohol. (Schlieper.) Tolerably soluble in ether, from which solution it is precipitated by water. (Liebig.)
("*Cyanurate of Amyl.*")
$C_{14}H_{14}N_2O_6 = C_4H_3(C_{10}H_{11})N_2O_6$

Allophanate of Baryta. Slowly but completely soluble in water. Decomposed by boiling. (Liebig & Wœhler.)
$C_4H_3BaN_2O_8$

Allophanate of Ethyl. Scarcely at all soluble in cold, but tolerably easily soluble in boiling water, from which it crystallizes on cooling. May also be crystallized from alcohol. More soluble in ammonia-water than in pure water, but does not combine therewith. (Liebig, *Ann. der Pharm.*, 1837, **21.** 125, *note.*) Somewhat soluble in cold, and very easily soluble in boiling alcohol. Very sparingly soluble in ether, even when this is boiling. Soluble, apparently without decomposition, in boiling dilute sulphuric, nitric, and chlorhydric acids. (Wœhler & Liebig, Debus.)
("*Cyanurate of Ethyl.*" "*Cyanic Ether.*")
$C_8H_8N_2O_6 = C_4H_3(C_4H_5)N_2O_6$

Allophanate of Lime. Sparingly soluble in water. (Liebig & Wœhler.)

Allophanate of Methyl. Soluble, especially in warm water, alcohol, wood-spirit, and ether. (Richardson.)
("*Cyanurate of Methyl.*")
$C_8H_8N_2O_6 = C_4H_3(C_2H_3)N_2O_6$

Allophanate of Phenyl. Insoluble in water. Soluble in boiling alcohol.
$C_{18}H_8N_2O_8 = C_4H_3(C_{12}H_5)N_2O_8$

Allophanate of Potash. Soluble in alcohol.

Allophanate of Soda. Soluble in water. Sparingly soluble in alcohol.

Alloxan. The anhydrous crystals are permanent, the hydrate effloresces. Very easily soluble in water, from which it is precipitated on the addition of strong nitric acid, being insoluble in nitric acid. (Schlieper.) Readily soluble in alcohol. (Brugnatelli.) The concentrated aqueous solution is slowly decomposed on boiling.
(*Erythrischic Acid.*)
$C_8H_4N_2O_{10}$ & $+ 2\,Aq$ & $8\,Aq$

Alloxanic Acid. Permanent. Readily soluble in water, the solution undergoing decomposition when boiled; less soluble in 5 @ 6 pts. of alcohol; and still less soluble in ether. The aqueous solution is decomposed on boiling. The alkaline alloxanates are soluble in water. Most alloxanates are insoluble in alcohol, and many of them may be precipitated by it from their aqueous solutions.

$$C_8H_4N_2O_{10} = N_2\left\{\begin{array}{l} C_2O_2'' \\ C_6O_6'', 2\,HO \\ H_2 \end{array}\right.$$

Alloxanate of Ammonia.

I.) *normal.* Very easily decomposed.

II.) *acid.* Soluble in 3 @ 4 pts. of water. Insoluble in alcohol. (Schlieper.)
$C_8H_3(NH_4)N_2O_{10}$

Alloxanate of Baryta.

I.) *normal.* Very sparingly soluble in cold, more readily in hot water. Very readily soluble in acids. (Liebig & Wœhler.)
$C_8H_2Ba_2N_2O_{10} + Aq$ & $9\,Aq$

II.) *acid.* More soluble in water than the normal salt, and still more soluble in an aqueous solution of alloxanic acid. Soluble in alcohol. (Schlieper.)
$C_8H_3BaN_2O_{10} + 2\,Aq$

Alloxanate of Cadmium.

I.) *basic.* Ppt.

II.) *acid.* Soluble in water.

Alloxanate of Cobalt. Partially soluble in water.

Alloxanate of Copper.

I.) *normal.* Soluble in 5 @ 6 pts. of water.
$C_8H_2Cu_2N_2O_{10} + 8\,Aq$

II.) *basic.* Insoluble in water. (Schlieper.)
$CuO, C_8H_2Cu_2N_2O_{10} + Aq$

Alloxanate of Lead.

I.) *terbasic.* Insoluble in water. Soluble in alloxanic acid, and in the acids generally.
$PbO, C_8H_2Pb_2N_2O_{10}$

II.) *normal.* Insoluble in water.
$C_8H_2Pb_2N_2O_{10} + 2\,Aq$

III.) *acid.* Tolerably soluble in water. Decomposed by alcohol. (Schlieper.)
$C_8H_3PbN_2O_{10} + 2\,Aq$

Alloxanate of Lime.

I.) *normal.* More soluble in water than the baryta salt. Insoluble in alcohol. Very soluble in acetic acid. (Schlieper.)
$C_8H_2Ca_2N_2O_{10} + 10\,Aq$

II.) *acid.* Efflorescent. Soluble in 20 pts. of cold water. Soluble in spirit. (Schlieper.)
$C_8H_3CaN_2O_{10} + 6\,Aq$

Alloxanate of Magnesia.

I.) *normal.* Tolerably soluble in water. Sparingly soluble in alcohol. (Schlieper.)
$C_8H_2Mg_2N_2O_{10} + 10\,Aq$

Alloxanate of Manganese. Deliquescent. Somewhat soluble in water. Insoluble in spirit. (Schlieper.)

Alloxanate of Mercury (HgO). Insoluble in water, or alcohol. (Schlieper.)
$C_8H_2Hg_2N_2O_{10} + 4\,Aq$

Alloxanate of Potash.

I.) *normal.* Very soluble in water. Insoluble in alcohol, or ether.
$C_8H_2K_2N_2O_{10} + 6\,Aq$

II.) *acid.* Rather difficultly soluble in water. Sparingly soluble in spirit.
$C_8H_3KN_2O_{10}$

Alloxanate of Nickel.

I.) *normal.* Deliquescent. Soluble for the most part in water, a portion of basic salt remaining undissolved. Insoluble in alcohol or ether.
$C_8H_2N_2Ni_2O_{10} + 4\,Aq$

II.) *basic.* Permanent. Insoluble in water. (Schlieper.)
$C_8H_2Ni_2N_2O_{10}; NiO, HO$

Alloxanate of Silver.

I.) *normal.* Ppt.
$C_8H_2AgN_2O_{10}$

Alloxanate of Soda.

I.) *normal.* Deliquescent. Very soluble in water. Alcohol precipitates a concentrated solution of the salt from its dilute aqueous solution.

Alloxanate of Strontia.

I.) *normal.*
$C_8H_2Sr_2N_2O_{10} + 8\,Aq$

Alloxanate of Zinc.

I.) *terbasic.* Slowly soluble in water; dissolving with especial slowness when dry. Readily soluble in alloxanic acid. (Schlieper.)
$ZnO, C_8H_2Zn_2N_2O_{10} + 8\,Aq$

II.) *acid.* Tolerably soluble in water. Sparingly soluble in spirit. (Schlieper.)
$C_8H_8ZnN_2O_{10} + 4\,Aq$

Alloxantin. Permanent. Very sparingly soluble in cold, somewhat more soluble in boiling water. · Insoluble or very sparingly soluble in alcohol. (Liebig & Wœhler.)

(*Uroxin.*)
$C_{16}H_6N_4O_{16}+4Aq$

Its aqueous solution is very readily decomposed even in the cold, but especially on boiling.

10 grammes of alloxantin washed with 1 kilogramme of water at 10° lost 3 grammes. It is considerably more soluble in aqueous solutions of the alkaline chlorides than in pure water. 5 grammes of it having been dissolved in 100 c. c. of water at 100° and the solution cooled immediately to 20°, 81.81% of the alloxantin was deposited. This experiment being repeated with a saturated solution of chloride of sodium in place of water, only 48.17% of the alloxantin was deposited. Nearly insoluble in alcohol, and ether. (J. M. Merrick, *Thesis of the Lawrence Scientific School*, Cambridge, 1859.)

Alloxantin with Urea.

Aloeretic Acid. Soluble in water, and alcohol. (Mulder.)
$C_{14}H_3NO_{12}+Aq$

Aloeretate of Baryta. Soluble in water.

Aloeretate of Copper. Insoluble in water.

Aloeretate of Lead. Insoluble in water.

Aloeretate of Lime. Soluble in water and in alcohol.

Aloeretate of Potash. Soluble in water.

Aloeretate of Silver. Insoluble in water.

Aloeretate of Soda. Soluble in water. (Mulder.)

Aloes (dry sap of *Aloe spicata, perfoliata,* &c.). When treated with water a portion of it (bitter of aloes) dissolves; while from 26 to 42% of a resinous matter remains undissolved. See under **Resins.**

Aloetamid. Much more soluble than chrysamid. (Mulder.)
$C_{14}H_5N_3O_{10}$

Aloetic Acid. Soluble in 125 pts. of cold water. (Bracannot.) Soluble in 850 pts. of water at 100°. (Boutin.) Sparingly solnble in cold, more soluble in hot water. Tolerably soluble in alcohol. (Mulder.) Soluble in 70 @ 80 pts. of cold alcohol of 36°. (Boutin.) Most of its salts are easily soluble in water.
(*Polychromatic Acid. Artificial Bitter of Aloes. Chrysammic Acid, q. v., has also been called Aloetic Acid.*)
$C_{14}H_3(NO_4)_2O_3, HO$

Aloetate of Baryta. Nearly insoluble in water. (Mulder.)
$C_{14}H_3Ba(NO_4)_2O_4$

Aloetate of Lead. Insoluble in water. (Mulder.)
$C_{14}H_2Pb_2(NO_4)_2O_4$

Aloetate of Potash. Readily soluble in water.

Aloetate of Silver. Sparingly soluble in cold, readily in hot water. (Boutin.)

Aloetate of Soda. Readily soluble in water.

Aloetin. *(Aloin. Bitter of Aloes.)* Soluble in 10 pts. of water at 10°, in 2 pts. of alcohol of 36° B. at 10°, and in 8 pts. of ether of 66° B. at 10°. (Robiquet, in Wittstein's *Handw.*, from *J. de Pharm.*, **29.** 241.) Very soluble in water, and alcohol. (Robiquet, *Ann. Ch. et Phys.*, (3.) **20.** 484.) Easily soluble in water, and dilute spirit. But not at all soluble in ether or in absolute alcohol. Soluble without notable decomposition in concentrated sulphuric acid. (Braconnot.) Insoluble in oils.

Aloin (of Smith). $C_{34}H_{16}O_{14}+Aq$ Permanent. Sparingly soluble in cold, much more readily soluble in warm water, and alcohol. Easily soluble in aqueous solutions of the caustic and carbonated alkalies, as well as of ammonia and carbonate of ammonia; but these solutions are gradually decomposed on boiling and on exposure to the air.

Soluble in 60 pts. of cold water; soluble in 5 pts. of boiling water; extremely soluble in alcohol, and in chlorhydric and acetic acids, as well as alkaline solutions. Insoluble in ether, benzin, oil of turpentine, chloroform, or olive oil. (Parrish's *Pharm.*, p. 429.)

Aloisic Acid. $C_{16}H_{12}O_8$? Insoluble in water. Easily soluble in alcohol, and ether. (Robiquet, *Ann. Ch. et Phys.*, (3.) **20.** 488.)

Aloisol. $C_{16}H_{12}O_6$ Completely insoluble in water. Soluble in all proportions in alcohol, and ether. (Robiquet, *Ann. Ch. et Phys.*, (3.) **20.** 488.)

AlphaOrsellinic Acid. *Vid.* Orsellic Acid.

AlphaOrsellesic Acid. *Vid.* Orsellic Acid.

AlphaOrsellic Acid. *Vid.* Lecanoric Acid.

AlphaToluic Acid. — AlphaToluyl, &c. See under Toluic Acid, &c., as *alpha*Toluic Acid.

Althein. *Vid.* Asparagin.

Althionic Acid.
$C_4H_6S_2O_8 = C_4H_5S_2O_7, HO$

Althionate of Ammonia. $C_4H_5(NH_4)S_2O_6$ Deliquescent. Extremely soluble in water.

Althionate of Baryta. $C_4H_5BaS_2O_6$ Permanent. Much more soluble in water than the ethyl sulphate. More readily soluble in alcohol, especially in hot, than the isethionate.

Althionate of Copper.

Althionate of Lime. Soluble in water.

Alum (Ammonia). *Vid.* Sulphate of Alumina and of Ammonia.

Alum (Potash). *Vid.* Sulphate of Alumina and of Potash.

Alumina. *Vid.* Oxide of Aluminum.

Aluminic Acid. *Vid.* Oxide of Aluminum.
Al_2O_3

The aluminates of metallic oxides are all insoluble in water excepting those of potash and soda. (Fremy.)

Aluminate of Baryta. Insoluble in water.
a = BaO, Al_2O_3 (Vauquelin, Unverdorben.)
b = ditto, with excess of baryta (hydrated). Soluble in water. Vauquelin.)

Aluminate of Cobalt.

Aluminate of Copper.

Aluminate of Glucina. "Chrysoberyl."
GlO, Al_2O_3

Aluminate of Iron (Fe O). As it occurs in nature, acids have scarcely any action upon it.

Aluminate of Lime. CaO, Al_2O_3 Insoluble in water. (Unverdorben, Kuhlmann.)

Aluminate of Magnesia. *(Spinelle.)* MgO, Al_2O_3 Insoluble in water. Chlorhydric acid dissolves very little spinelle, and nitric acid none at all. (Abich.)

Aluminate of Nickel.

Aluminate of Potash.
a = anhydrous. Soluble in water and in acids.

b = hydrated. KO, Al_2O_3+3Aq Very soluble in water. Insoluble in alcohol. A certain quantity of water decomposes it; Al_2O_3 being pptd. while a very alkaline aluminate remains in solution. (Fremy, *Ann. Ch. et Phys.*, (3.) **12.** 362.) Decomposed by the carbonic acid of the air.

Aluminate of Soda. NaO, Al_2O_3 Decomposed by the carbonic acid of the air. Very soluble in water. (Schaffgotsch,)

Aluminate of Strontia.
a = Similar to the baryta salt.

b = ditto, with excess of strontia. Similar to the baryta salt. (Vauquelin.)

Aluminate of Zinc.
a = Insoluble in acids and alkaline solutions.
(Gahnite.)
ZnO, Al_2O_3

b = precipitated. Soluble in aqueous solutions of caustic potash and ammonia. (Berzelius, *Lehrb.*, **2.** 647.)

Aluminum. Al Unacted on by water. Unacted on by nitric acid, either concentrated or dilute, at ordinary temperatures, but is slowly dissolved therein on boiling. Scarcely at all acted upon by cold dilute sulphuric acid. Very easily soluble in chlorhydric acid, either dilute or concentrated, but especially in concentrated. Soluble in aqueous solutions of chloride of sodium. (Deville, *Ann. Ch. et Phys.*, (3.) **43.** 14.) Soluble in alkaline solutions. (Wœhler.) Only slightly acted upon by cold, but is dissolved by hot acetic acid. Most compounds of aluminum are soluble in water.

Amalic Acid. *Vid.* *Di*MethylAlloxantin.

AmAnilin. *Vid.* AmylAnilin.

Amanitin (from *Amanita muscaria*, &c.). Very soluble in water. Insoluble in alcohol or ether. Soluble in acids and in alkaline solutions. (Tellier.)

AmarErythrin. *(Erythrin Bitter.)* $C_{22}H_{13}O_{14}$ Easily soluble in water; less soluble in alcohol. Insoluble in ether. (Heeren, Kane.)

AmarErythrin with Lead. Ppt.
$C_{22}H_{14}O_{14}, 2PbO$

Amarin. *(Benzolin. Picramin.) (Isomeric with Hydrobenzamid.)* $C_{42}H_{16}N_2 = N_2\left\{\begin{matrix}(C_{14}H_5)_3\\ H_3\end{matrix}\right.$ Insoluble in water. Readily soluble in boiling, less soluble in cold alcohol. Very easily soluble in ether. The salts of amarin, excepting the acetate, are but sparingly soluble in water. (Laurent, Fownes.)

Amarone. $C_{32}H_{11}N$ Insoluble in water. Very sparingly soluble in alcohol; somewhat more readily soluble in ether. Soluble in hot, less soluble in cold naphtha. Sparingly soluble in hot, less soluble in cold nitric acid. Soluble in cold concentrated sulphuric acid without decomposition. (Laurent.)

Amaryl (of Laurent). *Vid.* Nitrate of Lophin.

Amarythrin. *Vid.* AmarErythrin.

Amasatin. *Vid.* Isamid.

Amber. *(Succinum.)* Water dissolves out a little succinic acid. Alcohol dissolves about 10% of a soft resin, besides any succinic acid which may be present. Ether and the fatty and essential oils also dissolve only a small portion of it. But it is soluble in oil of turpentine, and alcohol, when heated with either of these in a sealed tube.

Only slightly soluble in hot oil of amber ("ambereupion"). (Dœpping.) Completely soluble, with decomposition, in concentrated sulphuric or nitric acid. Alkaline solutions dissolve it with the exception of a peculiar bituminous matter, called succinin by John. According to Pelletier & Walter (*Ann. Ch. et Phys.*, 1843, (3.) **9.** 89), amber furnishes, when distilled,

I. Oils.

II. A yellowish substance; insoluble in water or cold alcohol. Scarcely soluble in boiling alcohol, or in ether. Unacted upon by cold, but soluble in warm concentrated sulphuric acid. (*Loc. cit.*, pp. 94, 95.) [Pelletier & Walter regard this substance as identical with Laurent's Chrysene.]

III. A white substance, Succisterene, *q. v.*

Ambergris. Consists principally of Ambrein, *q. v.* Ambergris is insoluble in water. Sparingly soluble in cold, more readily soluble in hot alcohol. Readily soluble in ether, and the volatile oils. Feebly acted upon by acids, excepting nitric acid.

Ambreic Acid. Very sparingly soluble in water. Easily soluble in alcohol, and ether. The alkaline salts of ambreic acid are readily soluble in water, but the others are only sparingly soluble or insoluble.

Ambrein (from *Ambergris*). Insoluble in water. Easily soluble in hot, less soluble in cold alcohol. Readily soluble in ether, and in the fatty and essential oils.

AmidAnisic Acid. *Vid.* Anisamic Acid.

Amid. Hypothetical.
NH_2

Ami*di*NitroPhenic Acid. *Vid.* Picramic Acid.

AmidoBenzoic Acid. *Vid.* Benzamic Acid.

***Bi*AmidoBenzoic Acid.** *(Oxide of Benzicylbiamid.)*
$C_{14}H_3N_2O_4=C_{14}H_7N_2O_3, HO$, or $N_2\left\{\begin{matrix}C_{14}H_4O_2''\\H_4\end{matrix}\right\}O_2$
Soluble in alcohol, ether, and, with especial ease, in water. (Voit.)

AmidoChloride of Mercury. *Vid.* Chloride of Mercurammonium.

AmidoChrysammic Acid. *Vid.* Chrysammidic Acid.

AmidoCuminic Acid. *Vid.* Cuminamic Acid.

***Bi*AmidoCuminic Acid.** Soluble in water.
$C_{20}H_{14}N_2O_4$ (Boullet.)

***Bi*AmidoCuminate of Lead.** Ppt.

***Bi*AmidoCuminate of Soda.** Soluble in water.

AmidoHippuric Acid. *Vid.* Hippuramic Acid.

***Bi*AmidoMeconic Acid.**
$C_{14}H_6N_2O_{10}=N_2\left\{\begin{matrix}C_{14}\ HO_8'''\\H_3\cdot H\end{matrix}\right.\cdot O, HO$
Difficultly soluble in cold water, and in dilute acids. Decomposed by caustic alkalies. (How.)

AmidoNitrAnilin. *Vid.* NitrAzoPhenylamin.

AmidoNitroCitraconanil. *Vid.* CitraconAzoPhenylimid.

AmidoNitrOxanil. *Vid.* NitrAzoPhenylOximid.

AmidoNitrOxanilic Acid. *Vid.* NitrAzoPhenylOxamic Acid.

AmidoPhenase. *Vid.* Anilin.

AmidoPhenol. *Vid.* Oxide of Anilin.

AmidoOxyChloride of Mercury. *Vid.* Chloride of *tetra*MercurAmmonium.

AmidoPropionic Acid. *Vid.* Alanin.

AmidoSulphoBenzid. *(AmidoSulphoBenzol. AmidoSulphoBenzene.) (Isomeric with SulphoPhenanilid.)*
$C_{24}H_9(NH_2)S_2O_4$
Sparingly soluble in cold, readily soluble in boiling water. Readily soluble in alcohol. Soluble in acids with combination. (Gericke, *Ann. Ch. u. Pharm.*, **100.** 210.)

***Bi*AmidoSulphoBenzid.**
$C_{24}H_8(NH_2)_2S_2O_4$
Readily soluble in boiling, sparingly soluble in cold water, or alcohol. Insoluble in alkalies. Soluble in acids with combination. (Gericke, *loc. cit.*)

AmidoSulphoBenzoic Acid.
$C_{14}H_7NS_2O_{10}=N\left\{\begin{matrix}C_{14}H_4O_2''\\H_2\end{matrix}\right.\cdot O, HO, 2SO_3$
Easily soluble in hot water, less soluble in spirit. Scarcely at all soluble in ether. Very easily soluble in ammonia-water.

AmidoSulphoBenzoyl. *Vid.* SulphoBenzamid.

Amidulin. Easily and completely soluble in hot water. (Schulze.)

AmiNitroPhenic Acid. *Vid.* NitroPhenamic Acid.

Ami*bi*NitroPhenic Acid. *Vid.* Picramic Acid.

Amisatin.
$C_{96}H_{39}N_{11}O_{18}$
Insoluble in water. Almost insoluble in alcohol. Soluble in boiling alcohol containing a little potash in solution. (Laurent.)

Ammelid.
$C_6H_4N_4O_4=N_3\left\{\begin{matrix}(C_2O_2'')_2\\C_2N\\H_4\end{matrix}\right.$
Completely insoluble in all neutral solvents, like water, alcohol, or ether. Easily soluble in acids, as sulphuric, nitric, and chlorhydric acids, with decomposition on boiling; and still more easily in an aqueous solution of caustic potash, especially if this be hot. Ammonia-water dissolves only an insignificant quantity, and acetic acid no trace of it. (Knapp, *Ann. der Pharm.*, 1837, **21.** 244.)

Ammelid with Oxide of Silver. *Vid.* ArgentAmmelid.

Ammelide *sulfuré*. *Vid.* SulphoMellonic Acid.

Ammelin.
$C_6H_5N_5O_2=N_3\left\{\begin{matrix}C_2O_2''\\(C_2N)_2\\H_5\end{matrix}\right.$
Insoluble in water, alcohol, or ether. Soluble in solutions of the caustic alkalies, from which it is precipitated by acetic acid, chloride of ammonium, or carbonate of ammonia. Easily soluble in most acids, with combination. Most of its acid solutions are partially decomposed by water.

Ammelin with Oxide of Silver. *Vid.* Argent Ammelin.

Ammeline anilique. *Vid.* PhenylAmmelin.

Ammolin (of Unverdorben). *(Probably a mixture of Lutidin and Collidin.)* Soluble in 200 pts. of cold, and 40 pts. of boiling water. Soluble in all proportions in alcohol, and ether. (Unverdorben.)

Ammonia. *(Volatile alkali.)* NH_3 Soluble in water with great evolution of heat; at + 10°, under a pressure of 29.8 inches water absorbs at the most 670 vols. — nearly half its weight — of ammonia (NH_3). The sp. gr. of the solution obtained is 0.875. (J. Davy.) At lower temperatures water absorbs more than ½ its weight, the sp. gr. falling to 0.850. (Dalton.) At 24°, 100 pts. of water absorb 8.41 pts. of it, and at 55°, 5.96 pts. of it. (Osann.) Water can take up 780 times its volume, 6 measures of the water becoming 10 measures of saturated solution of ammonia, and 1 vol. of water saturated with the gas containing 468 vols. of NH_3. (T. Thompson, in his *System of Chem.*, London, 1831, **1.** 140.) 100 vols. of water at 15° absorb 450 vols., *i. e.* 1 pt. water absorbs ⅓ pt. of ammonia. (Dumas.) At ordinary temperatures 1 vol. of water absorbs about 700 vols. of ammonia. (Otto-Graham.) 100 pts. of water placed in an atmosphere of ammonia gas, between 0° and 15° absorb 47.7 pts. (by weight) of it. (Berzelius, *Lehrb.*, **2.** 108.) 1 measure of water by absorbing 505 measures of ammonia is increased to 1.5 measures; the solution is of 0.900 sp. gr. (Ure.)

1 vol. of water under a pressure of 0m.76 of mercury at °C.	Dissolves of NH_3 gas: — vols. reduced to 0° and 0m.76 pressure of mercury.	1 vol. of water under a pressure of 0m.76 of mercury at °C.	Dissolves of NH_3 gas: — vols. reduced to 0° and 0m.76 pressure of mercury.

0.04	0.149	0.45	0.646	1.05	1.075	1.65	1.707
0.05	0.175	0.50	0.690	1.10	1.117	1.70	1.770
0.75	0.228	0.55	0.731	1.15	1.161	1.75	1.835
0.100	0.275	0.60	0.768	1.20	1.208	1.80	1.906
0.125	0.315	0.65	0.804	1.25	1.258	1.85	1.976
0.150	0.351	0.70	0.840	1.30	1.310	1.90	2.046
0.175	0.382	0.75	0.872	1.35	1.361	1.95	2.120
0.200	0.411	0.80	0.906	1.40	1.415	2.00	2.195

(Roscoe & Dittmar, *Ann. Ch. u. Pharm.*, 1859, **112.** p. 353, and fig.) From this it appears that the amount of NH_3 absorbed by water at 0° is not directly proportional to the pressure. A result different from that at which Carius arrived. For Roscoe and Dittmar's explanation of this discrepancy, see their memoir, p. 349.

Solubility of NH_3 in Water at a constant pressure, — the temperatures varying.

Height of Bar.	At the observed Temperature.	1 pt. by weight of water absorbed pts. of NH_3.
0.760	0.0°	0.875
0.766	6.2°	0.756
0.749	6.9°	0.723
0.749	6.9°	0.726
0.742	15.4°	0.586
0.755	15.4°	0.589
0.744	24.1°	0.465
0.751	24.1°	0.471
0.768	35.3°	0.350
0.760	35.3°	0.354
0.768	54.2°	0.202

From these results the following provisional table has been constructed.

At 0m.76 pressure of mercury and °C.	1 pt. by weight of water absorbs pts. of NH_3.	At 0m.76 pressure of mercury and °C.	1 pt. by weight of water absorbs pts. of NH_3.

P = "Partial pressure," *i. e.* the total pressure, minus the tension of aqueous vapor at the given temperature. G = weight of NH_3, in grammes, which is dissolved in 1 gramme of water at the pressure P. (Sims, *Ann. Ch. u. Pharm.*, 1861, **118**. p. 346 and fig.)

In proportion as the temperature is higher, so much the more nearly does the solubility of NH_3 in water conform to the law of Henry & Dalton, but only obeys it completely when the temperature has reached 100°. (Sims, *loc. cit.*, p. 348.)

An aqueous solution of sp. gr. (at 14°),	Contains per cent of NH_3.	An aqueous solution of sp. gr. (at 14°),	Contains per cent of NH_3.

(Carius, *Ann. Ch. u. Pharm.*, 1856, **99.** 141.)

Soluble in 3 pts. of alcohol, of 38° B. (Boullay.) 1 vol. of alcohol of 0.829 sp. gr. absorbs about 50 vols. of ammonia; this is expelled when the solution is gently heated. (J. Davy.) Readily soluble in ether.

Soluble in 0.4 vol. of rock-oil from Amiano. (De Saussure.)

1 vol. of oil of turpentine absorbs 7.25 vols. of it at 16°; 1 vol. of oil of lemons absorbs 8.5 vols. of it at 16°; 1 vol. of oil of rosemary absorbs 9.75 vols. of it at 29°; 1 vol. of oil of lavender absorbs 47 vols. of it at 20°. (Saussure.) 1 vol. of caoutchin absorbs 3 vols. of it. (Himly.) Valerol absorbs much of it. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **7.** 278.)

AMMONIAALUM. *Vid.* Sulphate of Alumina & of Ammonia.

AMMONI*a X* OF *Y*. *Vid.* Ammonio *X* of *Y*.

AMMONIA with IODINE. Soluble, with decom-
NH_3I position, in water. Readily soluble in alcohol. (Millon, Bineau.)

AMMONIA with SULPHURIC ACID. *Vid.* Sulphamid.

AMMONIA with SULPHUROUS ACID. *Vid.* Sulphurylamin.

AMMONIAC, *Gum*. See under RESINS.

AMMONIOACETATE OF COPPER. Efflorescent. (Coulon.)

AMMONIOACETATE OF MERCURY. *Vid.* Acetate of Mercurammonium.

AMMONIOARSENITE OF SILVER. Insoluble in
$4NH_3, 2AgO, AsO_3$ water or alcohol. (Girard.)

AMMONIOAZOPHOSPHATE OF IRON (Fe_2O_3). Very soluble in water. (Gladstone.)

AMMONIOBROMATE OF CADMIUM. Decom-
$3NH_3, 2(CdO, BrO_5)$ posed by water. (Rammelsberg.)

AMMONIOBROMATE OF COBALT (?) Deliques-
$7NH_3 . Co_2O_3, 6BrO_5 + 12Aq$ cent. Soluble in water. (Rammelsberg.)

AMMONIOBROMATE *of dinoxide* OF MERCURY. Soluble, with decomposition, in chlorhydric acid.

AMMONIO*sesqui*BROMIDE OF COBALT. Soluble
$3Co_2O_3, 2Co_2Br_3, 15NH_3 + 20Aq$ (?) in water. (Rammelsberg.)

AMMONIO*di*BROMIDE OF COPPER.

AMMONIO*proto*BROMIDE OF COPPER.

I.) $5NH_3, 2CuBr$ Soluble in a small quantity of water, but this solution is decomposed when more water is added; hydrate of copper being deposited. (Rammelsberg.)

II.) $3NH_3, 2CuBr$ Behaves like the preceding with water. Insoluble in alcohol.

AMMONIOBROMIDE OF CYANOGEN. *Vid.* Bromide of Cyanamin.

AMMONIOBROMIDE OF PHOSPHORUS. Slowly
$5NH_5, 3PBr_3$ but completely soluble, with decomposition, in water.

AMMONIOBROMIDE OF PLATINUM. *Vid.* Bromide of Platinamin.

AMMONIOBROMIDE OF STRONTIA. Soluble in
$4SrBr, NH_3$ (?) water. (Rammelsberg.)

AMMONIOBROMOCHLORIDE OF PLATINUM.
$2NH_3, PtClBr$ Nearly insoluble in cold water.

AMMONIOCARBONATE OF MERCURY. Insolu-
$NH_3, 4HgO, CO_2$ ble in cold water. (Millon, *Ann. Ch. et Phys.*, (3.) **18.** 407.)

AMMONIOCARBONATE OF SILVER. Easily soluble in water. Soluble in ammonia-water, from which it is precipitated on the addition of absolute alcohol. When this precipitate is washed with alcohol it is slowly decomposed, ammonia being dissolved out. (Berzelius's *Lehrb.*)

AMMONIOCHLORIDE OF ALUMINUM.

I.) $3NH_3, Al_2Cl_3$

II.) NH_3, Al_2Cl_3 Soluble, without residue, in water. (H. Rose, Persoz.)

AMMONIO*ter*CHLORIDE OF ANTIMONY. Not
$NH_3, SbCl_3$ readily deliquescent.

AMMONIO*penta*CHLORIDE OF ANTIMONY. De-
$6NH_3, SbCl_5$ composed by water. (Persoz.)

AMMONIOCHLORIDE OF ARSENIC.

I.) $2NH_3; AsCl_3$ Soluble, apparently without decomposition, in water, and alcohol. (Persoz.)

II.) $4NH_3, AsCl_3$ Soluble in water; those crystals which have formed in alcohol being especially soluble. Soluble in alcohol. (Liebig & Wœhler.)

AMMONIOCHLORIDE OF BISMUTH.

AMMONIOCHLORIDE OF BORON. Decomposed
$3NH_3, 2BCl_3$ by water.

AMMONIOCHLORIDE OF CALCIUM. Soluble in
$4NH_3, CaCl$ water, with decomposition, ammonia being evolved.

---

* By direct experiment. The other numbers were obtained by calculation, making no allowance for the condensation which occurs when ammonia-water is diluted.

AmmonioChloride of Cyanogen. *Vid.* Chloride of Cyan*bi*amin.

Ammonio*proto*Chloride of Iron. Decomposed by water. (Faraday.)

Ammonio*sesqui*Chloride of Iron. NH_3, Fe_2Cl_3 Deliquesces, but less rapidly than perchloride of iron. Soluble in water, with evolution of heat. (H. Rose.)

AmmonioChloride of Lead.

AmmonioChloride of Palladium. *Vid.* Chloride of Palladammonium.

Ammonio*ter*Chloride of Phosphorus. Ammonio*quinqui*Chloride of Phosphorus. $5NH_3, PCl_3$; & $5NH_3, PCl_5$ Both are insoluble, as such, in water, but are slowly decomposed, with solution, by boiling water. More easily soluble, with decomposition, in acids. Solutions of the fixed caustic alkalies appear to have no action at first, but on boiling decomposition ensues. (Berzelius's *Lehrb.*)

Ammonio*proto*Chloride of Platinum. *Vid.* Chloride of Platin(*ous*)*bi*amin.

Ammonio*bi*Chloride of Platinum. *Vid.* Chloride of Platin(*ic*)*bi*amin.

Ammonio*sesqui*Chloride of Rhodium. Slightly soluble in water. (Vauquelin.)

AmmonioChloride of Silicon. $4NH_3, SiCl_3$ (?) Decomposed by water. (Persoz.)

AmmonioChloride of Silver. $3NH_3, 2AgCl$

AmmonioChloride of Strontium. $4NH_3, SrCl$

Ammonio*di*Chloride of Sulphur. $2NH_3, S_2Cl$ Permanent in dry air. Insoluble in water, but is gradually decomposed thereby. Soluble, without decomposition, in absolute alcohol. If a little water be added to the alcoholic solution, the greater part of the compound will be precipitated, while that which remains in solution will be decomposed as if no alcohol were present. (Mertens, Berzelius's *Lehrb.*, **3.** 286.)

Ammonio*proto*Chloride of Sulphur.

I.) NH_3, SCl Soluble in water, with subsequent decomposition. Soluble in absolute alcohol, and in anhydrous ether. (H. Rose, *Ibid.*)

II.) $2NH_3, SCl$ Decomposed by water. Slightly soluble in absolute alcohol, and anhydrous ether. On evaporating these solutions, a small portion of it is decomposed.

The Ammoniochlorides of Sulphur, of Marten & Soubeiran (ClS, NH_3), and of H. Rose (ClS_2, NH_3), do not exist! (Fordos & Gélis, *Ann. Ch. et Phys.*, 1851, (3.) **32.** 409.)

AmmonioChloride of Uranium. $NH_3, 3UrCl$

Ammonio*ter*Chloride of Vanadium.

AmmonioChloride of Zirconium. $NH_3, ZrCl$

AmmonioChlorOxyCarbonic Acid. $2NH_3, COCl$ Deliquescent. (J. Davy.) Soluble in alcohol, but insoluble in ether. (Regnault.) Decomposed by acids.

AmmonioChromate of Copper. $5NH_3, 3CuO, 2CrO_3, 2HO$ Easily decomposes in the air. Decomposed by water at ordinary temperatures. Sparingly soluble, or insoluble in alcohol, ether, or an aqueous solution of ammonia. (Malaguti & Sarzeau, *loc. inf. cit.*, p. 434.) Decomposed by hot water. Insoluble in alcohol. (Bœttger.)

AmmonioCyanate of Silver.

Ammonio*proto*Cyanide of Gold.

AmmonioCyanide of Mercury. Soluble in water. (H. Rose.)

AmmonioCobaltiCyanide of Copper. $2NH_3, Cu_3Co_2Cy_6 + 5Aq$ Insoluble in water. Decomposed by acids.

AmmonioCobaltiCyanide of Nickel. $2NH_3, Ni_3Co_2Cy_6 + 7Aq$ Insoluble in water. Readily soluble in ammonia-water, from which alcohol precipitates it. (Zwenger.)

AmmonioCobaltiCyanide of Silver. $NH_3, Ag_3Co_2Cy_6 + Aq$ Insoluble in water.

AmmonioCyanide of *X*. *Vid.* Cyanide of *X*-ammonium.

AmmonioFerricyanide of Nickel. $2NH_3, 3NiCy, Fe_2Cy_3 + Aq$ Soluble in ammonia-water. (Reynoso, *Ann. Ch. et Phys.*, (3.) **30.** 254.)

AmmonioFerrocyanide of Copper. $4NH_3, C_6N_3FeCu_2$ Water decomposes it, dissolving out the ammonia. (Vauquelin.)

AmmonioFerrocyanide of Magnesium.

I.) $2MgCy, FeCy; 2NH_3Cy, FeCy + 2Aq$

II.) $7(2MgCy, FeCy); 5(2NH_3Cy, FeCy) + 6Aq$ Soluble in 260 pts. of cold, and in 178 pts. of boiling water. (Bunsen.)

AmmonioFerrocyanide of Mercury. $NH_3, Hg_2FeCy_3 + Aq$ Decomposed by water, and by acids. (Bunsen.)

AmmonioFerroCyanide of Nickel.

I.) $5NH_3, Ni_2FeCy_3 + 4Aq$ Decomposed by boiling with water. Also decomposed by alkalies and by acids, even weak. (Reynoso, *Ann. Ch. et Phys.*, (3.) **30.** 253.)

II.) "*biAmmonio ditto.*" *Vid.* Ferrocyanide of Nickelammonium.

AmmonioFluoride of Arsenic. $3NH_3, AsFl_3$ Sparingly soluble in boiling water. (Unverdorben.)

AmmonioFluoride of Boron. 1, 2 & $3NH_3$, with BFl_3 Soluble in water, with decomposition.

Ammonio*ter*Fluoride of Chromium.

AmmonioFluoride of Silicon. $2NH_3, 2SiFl_3$ Soluble, with decomposition, in water. (Davy.)

AmmonioFluoride of Tungsten.

AmmonioHypoSulphate *of protoxide* of Cobalt. $5NH_3, CoO, SO_3$ Soluble in ammonia-water, but the solution is decomposed by evaporation. (Rammelsberg.)

AmmonioHypoSulphate *of sesquioxide* of Cobalt. $5NH_3, Co_2O_3, 2S_2O_5$ Partially soluble, with decomposition, in water. Soluble, with decomposition, in chlorhydric acid. (Rammelsberg.)

AmmonioIodate of Zinc. $4NH_3, 3ZnO, IO_5$ Decomposed by water. Soluble in ammonia-water. Alcohol precipitates it from the ammoniacal solution. (Rammelsberg.)

AmmonioIodide of Aluminum. Soluble in hot water, and in chlorhydric acid. (Reade, *Rep. Br. Assoc.*, 1857, p. 57.)

AmmonioIodide of Cadmium (&c.). *Vid.* Iodide of Cadmium(&c.)amin.

AmmonioIodide of Cyanogen. *Vid.* Iodide of Cyanamin.

Ammonio*per*Iodide of Gold. Readily soluble in water. (Reade, *Rep. Br. Assoc.*, 1857, p. 56.)

AmmonioIodide (&c.) of Lead. *Vid.* Iodide (&c.) of Plumbammonium.

AmmonioIodide of Nitrogen.

I.) NH_3, NI_3 Decomposed by water. Insoluble in absolute alcohol. Soluble, with decomposition, in chlorhydric acid. (Bunsen.)

II.) $NH_3, 4NI_3$ Insoluble in water, but is gradually decomposed thereby.

Ammonio*prot*Iodide of Platinum. *Vid.* Iodide of Platin(*ous*)*bi*amin.

AmmonioNitrate of Cobalt. Partially soluble, with decomposition, in water. Soluble in ammonia-water. (Hess.)

Ammonio*proto*Nitrate of Platinum. *Vid.* Nitrate of Platin(*ous*)*bi*amin.

AmmonioNitrate of Silver. *Vid.* Nitrate of Argent*bi*amin.

AmmonioNitrite of Silver.

AmmonioOsmiamate of Zinc. $2NH_3, ZnO, (Os_2NO_5)$ Decomposed by water even in the cold. Insoluble in ammonia-water.

AmmonioOxalate of Cobalt.

I.) *of protoxide of Cobalt* (CoO). Efflorescent. "$9(NH_3, C_2O_3); CoO, C_2O_3 + 24Aq$" Sparingly soluble in cold, but soluble in all proportions in boiling water. (Winckelblech.)

II.) *of sesquioxide of Cobalt* (Co_2O_3). $12NH; C_{12}Co_4O_{24} + 6Aq$ Scarcely at all soluble in water, or ammonia-water; but tolerably soluble in an aqueous solution of carbonate of ammonia. (L. Gmelin.)

III.) *of cobaltoso-cobaltic oxide* (CoO, Co_2O_3). Easily soluble in water. (Winckelblech.)

AmmonioOxalate of Silver. *Vid.* Oxalate of Argent*bi*amin.

AmmonioOxide of Gold. *Vid.* Aurate of Ammonia.

Ammonio*sesquioxide of* Osmium. NH_3, Os_2O_3 Insoluble in water. Sparingly soluble in acids. (Berzelius.)

AmmonioOxide of Platinum. *Vid.* Oxide of Platinamin.

AmmonioPerChlorate of Silver.

AmmonioPicrate of *X*. *Vid.* Picrate of X-amin (as of Cobaltamin).

AmmonioPlatinoCyanide of *X*. *Vid.* Cyanide of X-ammonium (*e. g.* of Cobaltammonium) with *proto*Cyanide of Potassium.

AmmonioSulphate of Copper. $5NH_3, 2CuO, SO_3$ Soluble in water. (H. Rose.)

*Basic*AmmonioSulphate *of binoxide* of Platinum. Insoluble in water. Soluble in hot chlorhydric, or sulphuric acid. (E. Davy.)

AmmonioSulphate of Zinc. $5NH_3, 2(ZnO, SO_3)$ Soluble, with partial decomposition, in water. (H. Rose.)

Ammonio*ter*Sulphide of Arsenic. Decomposed by water.

Ammonio*quinqui*Sulphide of Arsenic. Soluble in water, the solution subsequently undergoing decomposition.

AmmonioSulphide of Phosphorus. NH_3, PS_3 Decomposed by water. (Bineau.)

Ammonium. NH_4 Known only in combination. The salts of ammonium are generally soluble in water. They not only undergo slight decomposition, with loss of ammonia when exposed to the air, but when treated with boiling water they evolve a small quantity of ammonia, and the solutions thus obtained exhibit an acid reaction. (Emmett, *Am. J. Sci.*, 1830, (1.) **18.** 255.)

AmmoniumAmalgam. Decomposed by water, more easily in presence of naphtha, alcohol, or ether.

Amniotic Acid. *Vid.* Allantoin.

Ampelic Acid. $C_{14}H_6O_6$ Almost insoluble in cold, sparingly soluble in boiling water. Tolerably soluble in boiling, less soluble in cold alcohol, and ether. Soluble in warm concentrated sulphuric acid, from which it is precipitated unaltered by water. (Laurent.)

Ampelate of Ammonia. Soluble in water, and alcohol. (Laurent.)

Ampelate of Baryta.	Ppts.
" Copper.	
" Lead.	
" Lime.	
" Magnesia.	
" Nickel.	
" Silver.	
" Strontia.	

Ampelin. Soluble in all proportions in water, if it be mixed with 40 or 50 times its volume of that liquid. From the aqueous solution it separates on the addition of sulphuric acid, carbonate of potash, and other acids and salts. Soluble in alcohol and in all proportions in ether. (Laurent.)

Amygdalic Acid. $C_{40}H_{26}O_{24}$ Hygroscopic. Easily soluble in water. Insoluble in cold, and only very slightly soluble in hot alcohol of 94%. Insoluble in ether.

Amygdalate of Baryta. $C_{40}H_{25}BaO_{24} + Aq$ Soluble in water.

Amygdalate of Ethyl. Tolerably soluble in water, especially if this be warm, but is decomposed by warm water. Soluble in ether. (Wœhler.)

Amygdalate of Lead. Sparingly soluble in water.

Amygdalate of Lime. Soluble?

Amygdalate of Zinc. Soluble?

Amygdalin. $C_{40}H_{27}NO_{22} + 6Aq$ Readily soluble in water. Scarcely at all soluble in cold absolute alcohol, but easily soluble in hot alcohol. Soluble in 240 pts. of cold alcohol of 94%. Insoluble in ether. Soluble, without decomposition, in cold baryta-water, but the solution is decomposed on boiling.

Amyl. $C_{10}H_{11}$. or $\left\{\begin{matrix}C_{10}H_{11}\\C_{10}H_{11}\end{matrix}\right.$ Insoluble in water. Soluble in all proportions in alcohol, and ether. (Frankland, *J. Ch. Soc.*, **3.** 34.) Insoluble in monohydrated or in fuming sulphuric acid, but it is decomposed by the latter after a time. Slowly decomposed by nitric acid. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **44.** 283.)

Amyl (or Amylic) Alcohol. *Vid.* Hydrate of Amyl.

AmylAldehyde. *Vid.* Hydride of Valeryl.

Amylamin. Miscible in all proportions with water. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 491.)
(*Valeramin.*)
$C_{10}H_{13}N = N\left\{\begin{matrix}C_{10}H_{11}\\ H_2\end{matrix}\right.$

*Din*Amylamin. Very sparingly soluble in water. Soluble in acids, with combination. Its salts are generally sparingly soluble in cold, more readily soluble in boiling water. (Hofmann.)
$C_{20}H_{23}N = N\left\{\begin{matrix}C_{10}H_{11}\\ C_{10}H_{11}\\ H\end{matrix}\right.$

*Tri*Amylamin. Resembles *din*amylamin.
$C_{30}H_{33}N = N\left\{(C_{10}H_{11})_3\right.$

*Tetr*Amylammonium. Not isolated. Compare Hydrate of Amylammonium.
(*Tetramylamin.*)

Amylammonia. *Vid.* Amylamin.

AmylAnilin. Soluble in ether, and in bromide of amyl.
(*AmylPhenylamin. Amanilin. Mylanilin.*)
$C_{22}H_{17}N = N\left\{\begin{matrix}C_{12}H_5\\ C_{10}H_{11}\\ H\end{matrix}\right.$

*Din*AmylAnilin. Its salts are nearly insoluble in water, and in dilute chlorhydric, or sulphuric acid.
(*DiAmylPhenylamin. BiAmanilin.*)
$C_{32}H_{27}N = N\left\{\begin{matrix}C_{12}H_5\\ (C_{10}H_{11})_2\end{matrix}\right.$

Amylate of *X*. *Vid.* Oxide of Amyl and of *X*.

$C_{10}H_{11}$
C_8H_9

AmylCarbonicChloride. *Vid.* ChloroCarbonate of Amyl.

Amyl*chloré*. *Vid.* ChlorAmyl.

AmylChinolin. Not isolated.
$C_{28}H_{17}N$

AmylCitric Acid. Soluble in all proportions in water, alcohol, and ether. Its salts are generally soluble in water. (Breunlin, *Ann. Ch. u. Pharm.*, **91.** 318.)
$C_{22}H_{18}O_{14} = C_{12}H_5(C_{10}H_{11})O_{12}, 2HO$

AmylCitrate of Ammonia.
I.) *normal.* Very readily soluble in water. Soluble in spirit, but insoluble in absolute alcohol.
$C_{22}H_{16}(NH_4)_2O_{14}$

AmylCitrate of Ethyl. Insoluble, or very sparingly soluble in water. Soluble in ether.
$C_{22}H_{17}(C_4H_5)O_{14}$

AmylCitrate of Lead.
I.) *basic.* Insoluble, or very sparingly soluble in water.

AmylCitrate of Lime.
I.) *acid.* Sparingly soluble in cold, easily soluble in boiling water.
$C_{22}H_{17}CaO_{14}$

AmylCitrate of Potash.
I.) *acid.* Extremely soluble in water; less soluble in spirit.
$C_{22}H_{17}KO_{14}$

AmylCitrate of Silver. Soluble in water.

AmylCitrate of Soda.
I.) *acid.* Extremely soluble in water; less soluble in spirit.
$C_{22}H_{17}NaO_{14}$

AmylCyanamid. *Vid.* CyanAmylamin.

AmylCyanAnilin.
(*AmylCyanPhenylamin.*)
$C_{24}H_{16}N_2 = N\left\{\begin{matrix}C_{12}H_4(C_2N)\\ C_{10}H_{11}\\ H\end{matrix}\right.$

Amylene. Insoluble in water. Easily soluble in fuming sulphuric acid, and in bromine.
(*Valerene. Paramylene.*)
$C_{10}H_{10}$

AmylEthylAnilin, &c. *Vid.* EthylAmylAnilin, &c.

AmylicMercaptan. *Vid.* Sulphydrate of Amyl.

Amylide of Zinc. *Vid.* ZincAmyl.

AmylMalic Acid. Easily soluble in water, alcohol, and ether. Its salts are generally soluble in water. (Breunlin, *Ann. Ch. u. Pharm.*, **91.** 323.)
(*Malamylic Acid.*)
$C_{18}H_{16}O_{10} = C_8H_4(C_{10}H_{11})O_9, HO$

AmylMalate of Ammonia. Soluble in water, and in spirit.
$C_{18}H_{15}(NH_4)O_{10}$

AmylMalate of Baryta. Soluble in water. Insoluble, or very sparingly soluble in alcohol.
$C_{18}H_{15}BaO_{10}$

AmylMalate of Lead. Insoluble in water.

AmylMalate of Lime. More soluble in hot than in cold water.
$C_{18}H_{15}CaO_{10} + Aq$

AmylMalate of Potash. Soluble in water, and in alcohol.

AmylMalate of Soda. Soluble in water, and in alcohol.

AmylMercaptan. *Vid.* Sulphydrate of Amyl.

AmylMucic Acid. Abundantly soluble in hot, but sparingly soluble in cold water, and alcohol.
$C_{22}H_{20}O_{16} = C_{12}H_9(C_{10}H_{11})O_{16}$

Amyl Nicotin. *Vid.* Hydrate of AmylNicotin.

AmylNitroPhenidin. *Vid.* Oxide of AmylNitroPhenylamin.

Amyl*o*—Acid. *Vid.* Amyl—Acid.

Amyloid. Soluble in water, in dilute acids, and in a dilute solution of caustic potash. Alcohol precipitates it from the aqueous solution. (Schleiden.)

AmylOxalic Acid. The aqueous solutions of its salts are quickly decomposed on boiling.
(*Oxamylic Acid. Oxalamylic Acid.*)
$C_{14}H_{12}O_8$

AmylOxalate of Amyl. Decomposed by water.
$C_{14}H_{11}(C_{10}H_{11})O_8$

AmylOxalate of Lime. More soluble in hot than in cold water. (Balard, *Ann. Ch. et Phys.*, (3.) **12.** 309.)
$C_{14}H_{11}CaO_8 + 2Aq$

AmylOxalate of Potash. Soluble in water. (Balard, *loc. cit.*)

AmylOxalate of Silver. Sparingly soluble in water. (Balard, *loc. cit.*)
$C_{14}H_{11}AgO_8$

*Di*AmylOxamid. Insoluble in water. Soluble in boiling alcohol, from which it is for the most part deposited on cooling. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 495.)
(*AmylOxamid.*)
$C_{24}H_{24}N_2O_4 = N_2\left\{\begin{matrix}C_4O_4''\\ (C_{10}H_{11})_2\\ H_2\end{matrix}\right.$

AmyloXanthic Acid. *Vid.* OxySulphoCarbonate of Amyl.
$C_{12}H_{12}O_2S_4$

AmylOxySulphoCarbonic Acid. *Vid.* OxySulphoCarbonate of Amyl.

AmylPhenylamin. *Vid.* AmylAnilin.

AmylPhloretic Acid. Soluble in alcohol, and ether. Water precipitates it from these solutions. (Hlasiwetz.)
(*Phloretate of Amyl.*)
$C_{28}H_{20}O_6 = C_{18}H_9(C_{10}H_{11})O_6$

AmylPhosphoric Acid. Deliquescent. Soluble in water, and alcohol. Insoluble in ether, which precipitates it from the concentrated alcoholic solution.

$C_{10}H_{13}PO_8 = C_{10}H_{11}O, 2HO, cPO_5$

Of its salts, those of the alkalies are soluble, the others are sparingly soluble, or insoluble, in water. They are, however, in general, more soluble than the corresponding terbasic phosphates. They all dissolve readily in nitric, and chlorhydric acids.

AmylPhosphate of Ammonia. Soluble in water, and alcohol.

$2NH_4O, C_{10}H_{11}O, cPO_5 + x\,Aq$

AmylPhosphate of Baryta. Insoluble, or very sparingly soluble, in water.

$2BaO, C_{10}H_{11}O, cPO_5$

AmylPhosphate of Copper. Insoluble in water. Soluble in chlorhydric acid.

$2CuO, C_{10}H_{11}O, cPO_5$

AmylPhosphate of Lead. Insoluble in water. Readily soluble in chlorhydric, and acetic acids.

$2PbO, C_{10}H_{11}O, cPO_5$

AmylPhosphate of Mercury (Hg O). Ppt.

AmylPhosphate of Potash. Deliquescent. Soluble in all proportions in water, either hot or cold. Easily soluble in warm alcohol. Insoluble in ether.

$2KO, C_{10}H_{11}O, cPO_5$

Amyl Phosphate of Silver. Appreciably soluble in warm, less soluble in cold water. It is decomposed when boiled for a long time with water. (Guthrie, *J. Ch. Soc.*, **9.** 131.)

$2AgO, C_{10}H_{11}O, cPO_5$

***Di*AmylPhosphoric Acid.** Only very sparingly soluble in water. Easily soluble in alcohol, and ether.

$C_{20}H_{23}PO_8 = 2C_{10}H_{11}O, HO, cPO_5$

Its alkaline salts are easily soluble in water, those of the alkaline earths are difficultly soluble in water, but more easily soluble in alcohol. They are all decomposed on boiling their aqueous solution.

***Di*AmylPhosphate of Ammonia.** Deliquescent. Soluble in water.

***Di*AmylPhosphate of Baryta.** Only sparingly soluble either in hot or cold water. Easily soluble in boiling alcohol. The aqueous solution is partially decomposed by boiling.

$BaO, 2C_{10}H_{11}O, cPO_5$

***Di*AmylPhosphate of Copper.** Ppt.

***Di*AmylPhosphate of Ethyl.**

$C_4H_5, 2C_{10}H_{11}O, cPO_5$

***Di*AmylPhosphate *of sesquioxide* of Iron.** Insoluble in water, or alcohol.

$Fe_2O_3, 6C_{10}H_{11}O, 3cPO_5 + 9Aq$

***Di*AmylPhosphate of Lead.**

I.) *normal.* Insoluble in water, or alcohol.

$PbO, 2C_{10}H_{11}O, cPO_5$

II.) *basic.* Ppt.

$PbO, 2C_{10}H_{11}O, cPO_5 + PbO, HO$

***Di*AmylPhosphate of Lime.** Easily soluble in water, and very easily soluble in alcohol.

***Di*AmylPhosphate of Magnesia.** Soluble in water.

***Di*AmylPhosphate of Manganese.** Ppt.

***Di*AmylPhosphate *of dinoxide* of Mercury.** Ppt.

***Di*AmylPhosphate of Potash.** Deliquescent. Soluble in water.

***Di*AmylPhosphate of Silver.** Ppt.

***Di*AmylPhosphate of Soda.** Deliquescent. Soluble in water.

AmylPhosphorous Acid. When recently prepared it is entirely soluble in pure water, from which solution it is precipitated by chlorhydric acid. But after it has been kept for some time it can no longer be completely dissolved by water. Even when directly prepared from a sample of its soda salt which has been kept for any length of time it is apt to be insoluble in water. The aqueous solution soon decomposes in any case. Readily soluble in alkaline solutions, with combination. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **16.** 228.) Readily soluble in alcohol.

$C_{10}H_{13}PO_6 = \left.\begin{matrix} C_{10}H_{11}O \\ HO \\ HO \end{matrix}\right\} PO_3$

AmylPhosphite of Amyl. *Vid. tri*Phosphite of Amyl.

AmylPhosphite of Baryta. Deliquescent. Very soluble in water. (Wurtz, *loc. cit.*)

AmylPhosphite of Lead. Sparingly soluble in water, and alcohol. (Wurtz, *loc. cit.*)

AmylPhosphite of Potash. Soluble in water. (Wurtz, *loc. cit.*)

AmylPhosphite of Soda. Soluble in water. (Wurtz, *loc. cit.*)

AmylPhosphorous Ether. *Vid.* Phosphite of Amyl.

AmylPiperidin. Less soluble in water than methylpiperidin or ethylpiperidin. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 99.)

$C_{20}H_{21}N = N\left\{\begin{matrix} C_{10}H_{10}'' \\ C_{10}H_{11} \end{matrix}\right.$

AmylSalicylic Acid. Insoluble in water. (Drion.)

$C_{24}H_{16}O_6 = C_{10}H_{11}O, C_{14}H_5O_5$

AmylSalicylate of Potash.

AmylSolanin. Resembles EthylSolanin.

$C_{52}H_{45}NO_{14} = N\left\{\begin{matrix} C_{42}H_{33}O_{14} \\ C_{10}H_{11} \\ H \end{matrix}\right.$

AmylSulphuric Acid. Very readily soluble in water, and alcohol. (Cahours.) When concentrated, these solutions are decomposed by ebullition.

(*SulphAmylic Acid.*)

$C_{10}H_{12}S_2O_8 = C_{10}H_{11}O, S_2O_6, HO$

Its salts are soluble in water. (Cahours.) Most of them are also soluble in alcohol and, very sparingly, in ether. (Kekulé.)

AmylSulphate of Alumina. Very deliquescent, with decomposition. Soluble in water, alcohol, and ether. (Kekulé.)

AmylSulphate of Ammonia. Slightly deliquescent in damp air. Very readily soluble in water; less soluble in alcohol. Insoluble in ether. (Kekulé.)

$C_{10}H_{11}(NH_4)S_2O_8$

AmylSulphate of Baryta. Effloresces in dry air. Very readily soluble in water. Soluble in warm, less soluble in cold alcohol. The solutions are decomposed by prolonged ebullition. Insoluble in ether. (Cahours.)

$C_{10}H_{11}BaS_2O_8 + 2Aq$

Pasteur finds the baryta salt of the active modification 2.5 more soluble than that of the inactive modification.

AmylSulphate of Cobalt. Very soluble in water. (Cahours.)

AmylSulphate of Copper. Permanent. Readily soluble in water, and spirit; less soluble in absolute alcohol. Insoluble in ether. (Kekulé.)

$C_{10}H_{11}CuS_2O_8 + 4Aq$

AmylSulphate *of protoxide* of Iron. Soluble in water, alcohol, and ether. (Kekulé.)

AmylSulphate *of sesquioxide* of Iron. Deliquescent. Readily decomposed. Soluble in water. (Kekulé.)

AmylSulphate of Lead.

I.) *normal.* Very readily soluble in water. (Cahours.) Readily soluble in alcohol. Insoluble in ether. (Kekulé.)
$C_{10}H_{11}PbS_2O_8 + 2\,Aq$

II.) *basic.* Soluble in water. (Kekulé.)
$C_{10}H_{11}PbS_2O_8;\ PbO, HO$

AmylSulphate of Lime. Effloresces in dry air. Readily soluble in *cold*, less easily soluble in hot water. (Cahours.) The hot aqueous solution solidifies on cooling. Soluble in alcohol, almost as well in cold as in hot. Insoluble in ether. (Kekulé.)
$C_{10}H_{11}CaS_2O_8 + 2\,Aq$

AmylSulphate of Magnesia. Soluble in water, and alcohol. Insoluble in ether. (Kekulé.)
$C_{10}H_{11}MgS_2O_8 + 4\,Aq$

AmylSulphate of Manganese. Permanent. Soluble in water, and alcohol. Insoluble in ether. (Kekulé.)
$C_{10}H_{11}MnS_2O_8 + 4\,Aq$

AmylSulphate of Mercury (HgO). Deliquesces in moist air. Soluble in water. (Kekulé.)
$C_{10}H_{11}HgS_2O_8 + 2\,Aq$

AmylSulphate of Nickel. Deliquesces in moist air. Soluble in water, and alcohol. Insoluble in ether. (Kekulé.)
$C_{10}H_{11}NiS_2O_8 + 2\,Aq$

AmylSulphate of Potash. Readily soluble in water, and spirit. Difficultly soluble in cold absolute alcohol. (Cahours.) Insoluble in ether. (Kekulé.) Soluble, without alteration, in ammonia water.
$C_{10}H_{11}KS_2O_8 + Aq$

AmylSulphate of Silver. Undergoes alteration when exposed to the air. Readily soluble in water, and alcohol. Insoluble in ether. (Kekulé.)
$C_{10}H_{11}AgS_2O_8$

AmylSulphate of Soda. Readily soluble in cold, and in all proportions in hot water. Soluble in boiling, less soluble in cold alcohol. Insoluble in ether. (Kekulé.)
$C_{10}H_{11}NaS_2O_8 + 3\,Aq$

AmylSulphate of Strontia. Readily soluble in water, and spirit. Sparingly soluble in absolute alcohol. Insoluble in ether. (Kekulé.)
$C_{10}H_{11}SrS_2O_8 + 2\,Aq$

AmylSulphate of Zinc. Soluble in water, and alcohol. (Kekulé.)
$C_{10}H_{11}ZnS_2O_8 + 2\,Aq$

AmylSulphide of *X*. *Vid.* Sulphide of Amyl & of *X*.

AmylSulphurous Acid. Deliquescent. Readily soluble in water. (Danson, *J. Ch. Soc.*, **3.** 159.) Its salts are soluble in water, and alcohol.

$C_{10}H_{12}S_2O_6 = C_{10}H_{11}O.\,S_2O_4, HO$

AmylSulphite of Ammonia. Readily soluble in water, and alcohol. (Erdmann & Gerathewohl.)

AmylSulphite of Baryta. Soluble in 10 pts. of water at 19°, more soluble in hot water. Soluble in alcohol. (Erdmann & Gerathewohl.) Very soluble in water, and alcohol. (Danson.) Extremely soluble both in water and in alcohol. (Medlock, *J. Ch. Soc.*, **1.** 376.)
$C_{10}H_{11}BaS_2O_6$

AmylSulphite of Copper. Soluble in water, and alcohol. (Medlock, *loc. cit.*, p. 377.)
$C_{10}H_{11}CuS_2O_6$

AmylSulphite of Lead. Extremely soluble in water. (Medlock.) Very readily soluble in hot alcohol, the solution solidifying on cooling. (Erdmann & Gerathewohl.)
$C_{10}H_{11}PbS_2O_6$

AmylSulphite of Lime. Easily soluble in water, and alcohol. (Erdmann & Gerathewohl.)

AmylSulphite of Potash. Readily soluble in water, and alcohol. (Erdmann & Gerathewohl.)

AmylSulphite of Silver. Soluble in water. (Erdmann & Gerathewohl.)
$C_{10}H_{11}AgS_2O_6$

Amyl*di*SulphoCarbonate of *X*. *Vid.* OxySulphoCarbonate of Amyl & of *X*.

AmylSulphydric Acid. *Vid.* Sulphydrate of Amyl.

AmylTartaric Acid. Very difficultly soluble in a small quantity of water, from which solution it is precipitated when more water is added. Easily soluble in alcohol; more difficultly soluble in ether. (Breunlin, *Ann. Ch. u. Pharm.*, **91.** 314.) Most of its salts are soluble in water, though some of them dissolve with difficulty.
(*Tartramylic Acid.*)
$C_{18}H_{16}O_{12} = C_8H_5(C_{10}H_{11})O_{12}$

AmylTartrate of Baryta.

I.) *amorphous.* Insoluble, or very sparingly soluble, in water. Soluble in boiling alcohol, from which solution it is precipitated by water.
$C_{18}H_{15}BaO_{12}$

II.) *crystalline.* Soluble in water. (Breunlin, *Ann. Ch. u. Pharm.*, **91.** 315.)
$C_{18}H_{15}BaO_{12} + 2\,Aq$

AmylTartrate of Lead.

I.) *basic.*

AmylTartrate of Lime. Readily soluble in water.
$C_{18}H_{15}CaO_{12}$

AmylTartrate of Potash. Sparingly soluble in cold, readily soluble in boiling water. (Breunlin.)
$C_{18}H_{15}KO_{12} + 2\,Aq$

AmylTartrate of Silver. Sparingly soluble in water. (Balard.)
$C_{18}H_{15}AgO_{12}$

AmylTartrate of Soda. Readily soluble in water. (Breunlin.)

Anacardate of Nickel. Ppt.

Anacardate of Potash.
I.) *normal.* Soluble in water.
$C_{44}H_{30}K_2O_7$
II.) *acid.* Easily soluble in water, and alcohol. Also soluble in ether.
$C_{44}H_{31}KO_7$

Anacardate of Silver.
I.) *acid.* Sparingly soluble in alcohol; but very easily soluble in acidulated alcohol.
$C_{44}H_{31}AgO_7$

Anamartic Acid. Soluble in boiling spirit.
(*Stearophanic Acid. Identical with Stearic Acid.*) (*Heintz.*)

Anamartate of Ethyl.

Anamartate of Silver. Easily soluble in caustic ammonia.

Anamartate of Soda. Forms a jelly with a small quantity of water, but is decomposed by a large quantity. Soluble in boiling absolute alcohol.

Anamirtin. Insoluble in water. Sparingly soluble in alcohol. Easily soluble in warm ether. (Francis, *Phil. Mag.*, (3.) **21.** 168.)
(*Stearophanin.*)
$C_{38}H_{36}O_4$

Anchietin. Insoluble in water. Easily soluble in alcohol. Insoluble in ether. Its salts are soluble in water. (Parrish's *Pharm.*, p. 399.)
(*From the root of Anchieta salutaris.*)

Anchoic Acid. Sparingly soluble in cold, but soluble in almost all proportions in hot water. Sparingly soluble in cold ether. (Buckton.) Less soluble than suberic acid in water. 100 pts. of water at 18° dissolve 0.46 pt. of it, or 1 pt. of it is soluble in 217.4 pts. of water at 18°. More soluble than suberic acid in ether. (Wirz, *Ann. Ch. u. Pharm.*, **104.** 265.)
(*Lepargic Acid. Lepargylic Acid.*)
$C_{18}H_{16}O_8$

Anchoate of Ammonia. Very soluble in water, and dilute alcohol.

Anchoate of Baryta. Very soluble in water. Insoluble in alcohol or ether.
$C_{18}H_{14}Ba_2O_8$

Anchoate of Copper. Insoluble in water.

Anchoate of Ethyl. Almost entirely insoluble in water. Readily miscible with alcohol, and ether.

Anchoate *of protoxide* **of Iron.** Ppt.

Anchoate *of peroxide* **of Iron.** Ppt.

Anchoate of Lead. Insoluble in water. Soluble in dilute nitric acid, without decomposition. (Buckton.)

Anchoate of Lime. Ppt.

Anchoate *of dinoxide* **of Mercury.** Ppt.

Anchoate *of protoxide* **of Mercury.** Ppt.

Anchoate of Potash.
I.) *normal.* Very soluble in water.
II.) *acid.* Permanent. Soluble in about 3 pts. of cold water. Exceedingly soluble in hot water. Readily soluble in wood-spirit. (Buckton.)
$C_{18}H_{15}KO_8$

Anchoate of Silver. Very sparingly soluble in water. Soluble in dilute acids. (Buckton.)
$C_{18}H_{14}Ag_2O_8$

Anchoate of Soda. Soluble in water.

Anchoate of Zinc. Ppt. (Buckton, *J. Ch. Soc.*, **10.** 170.)

Anchusin. Insoluble in water. Soluble in alcohol, and especially soluble in ether. Soluble in oil of turpentine, and in the fatty oils. Soluble in concentrated sulphuric acid, without decomposition. Also soluble in alkaline solutions.
(*Alkanet Red. Anchusic Acid.*)
$C_{36}H_{20}O_8$ (?)

Anchusate of Baryta. Soluble in water; less soluble in alcohol, and ether.

Anchusate of Lead.
I.) *basic.* Tolerably soluble in alcohol.

Anchusate of Lime.
" **Potash.**
" **Soda.**
" **Strontia.**
} Soluble in water; less soluble in alcohol, and ether.

Anemonic Acid (of Lœwig & Weidmann). Hygroscopic. Soluble in water. Very sparingly soluble in alcohol. Insoluble in ether.

Anemonic Acid (of Schwartz). Scarcely at all soluble in water, alcohol, ether, or the essential oils. Soluble in alkaline solutions.
$C_{30}H_{14}O_{14}$

Anemonin. Sparingly soluble in boiling water. Sparingly soluble in cold, much more soluble in hot alcohol. Sparingly soluble in ether. Soluble in fatty and essential oils. Soluble, without decomposition, in chlorhydric acid, but is decomposed by sulphuric acid. Easily soluble, with decomposition in alkaline solutions.
$C_{30}H_{12}O_{12}$

Anemonin with Oxide of Lead. Tolerably soluble in boiling, less soluble in cold water. Insoluble in alcohol.
$C_{30}H_{12}O_{11}, 2PbO$

Anethol. There are two varieties of Anethol:
(*Anisœl. Isomeric with Anisoïn and Cuminol.*)
$C_{20}H_{12}O_2$

a. = solid. (From the essential oils of anise, fennel, and star-anise.) Permanent. Anethol is slightly soluble in water, the solid variety dissolving less easily than the liquid. On cooling the boiling aqueous solution the solid variety crystallizes out. (Guenther.) Solid anethol is less soluble in alcohol than the liquid variety; the solution is not precipitated by water. (Guenther.) Solid anethol (from anise-oil) is soluble in 4 pts. of alcohol, of 0.806 sp. gr., at 10°, and in 0.6 pt. of the same alcohol at 15°. (Saussure.) Anethol is soluble in 10 pts. of oil of turpentine, and in an equal quantity of oil of almonds on heating, crystallizing out as the solution cools. (Guenther.) It is soluble in all proportions in ether.
(*Anise, or Fennel, Camphor. Stearoptene of Oil of Anise.*)

b. = liquid. (From the same sources as *a*, and also from oil of tarragon.) See also under *a*.
Soluble in an equal volume of warm alcohol. (Laurent.) When mixed with small quantities of concentrated sulphuric acid, oil of anise becomes heated and is converted into anisoïn. It dissolves, however, completely in 3 @ 4 pts. of oil of vitriol, and after standing for 24 hours water separates a portion of unaltered oil. (Cahours.) Unacted

upon by boiling aqueous solutions of potash, or ammonia, or by dilute sulphuric, or chlorhydric acids, even when these are hot. Decomposed by hot concentrated nitric acid.

Angelic Acid(Anhydrous). Is acidified by water only after having been for a long time in contact therewith. Readily acidified by warm strong alkaline solutions. (Chiozza, *Ann. Ch. et Phys.*, (3.) 39. 211.)

(Angelic Angelate.)

$C_{20}H_{14}O_6 = \left.\begin{matrix} C_{10}H_7O_2 \\ C_{10}H_7O_2 \end{matrix}\right\} O_2$

AngeloAcetic Acid(Anhydrous). Unites with water very slowly. (Chiozza.)

$C_{14}H_{10}O_6 = \left.\begin{matrix} C_{10}H_7O_2 \\ C_4H_3O_2 \end{matrix}\right\} O_2$

AngeloBenzoic Acid(Anhydrous). Is acidified very slowly when exposed to moist air. Scarcely attacked by cold, but readily soluble, with acidification, in hot alkaline solutions. (Chiozza, *Ann. Ch. et Phys.*, (3.) 39. 212.)

(Angelic Benzoate.)

$C_{24}H_{12}O_6 = \left.\begin{matrix} C_{10}H_7O_2 \\ C_{14}H_5O_2 \end{matrix}\right\} O_2$

Angelic Acid. Sparingly soluble in cold, abundantly soluble in boiling water. Very soluble in alcohol, ether, oil of turpentine, and the fatty oils. Its salts are generally soluble in water and in alcohol. (Meyer & Zenner.)

(Angelicic Acid. Sambulolic Acid. Sumbulic Acid.

$C_{10}H_8O_4 = C_{10}H_7O_3, HO$

Angelate of Ammonia. Soluble in water, and alcohol. (M. & Z.)

Angelate of Baryta. Soluble in water. (Reinsch.) Insoluble in alcohol.

Angelate of Copper. Sparingly soluble in water.

Angelate of Ethyl.

$C_{10}H_7(C_4H_5)O_4$

Angelate *of sesquioxide* **of Iron.** Insoluble in water. (Meyer, Buchner, Reinsch.)

Angelate of Lead.

I.) *normal.* Sparingly soluble in water. (Buchner.)

$C_{10}H_7PbO_4$

II.) *basic.*

Angelate of Lime. Readily soluble in water. (M. & Z.) Insoluble in alcohol.

$C_{10}H_7CaO_4 + 2\,Aq$

Angelate of Magnesia. Soluble in water. (Reinsch.)

Angelate *of dinoxide* **of Mercury.** Ppt.

Angelate *of protoxide* **of Mercury.** Apparently soluble in water.

Angelate of Oreoselone. *Vid.* Peucedanin.

Angelate of Potash. Readily soluble in water. Tolerably soluble in alcohol. (Reinsch.)

Angelate of Silver. Sparingly soluble in water, the solution undergoing change after a time. (Buchner.) Soluble in alcohol. (M. & Z.)

$C_{10}H_7AgO_4$

Angelate of Soda. Deliquescent. (Reinsch.) Easily soluble in water, and alcohol. (Meyer.)

Angelic Aldehyde. *Vid.* Hydride of Angelicyl.

Angelicanilid. Insoluble in water. Soluble in spirit. (Chiozza, *Ann. Ch. et Phys.*, (3.) 39. 211.)

$C_{22}H_{13}NO_2 = N\left\{\begin{matrix} C_{10}H_7O_2 \\ C_{12}H_5 \\ H \end{matrix}\right.$

Angelicic Acid. *Vid.* Angelic Acid.

Angelicin. Soluble in alcohol, and ether.

(From Archangelica officinalis.)

Angusturin. *Vid.* Cusparin.

Anilamid. *Vid.* NitroSalicylamic Acid.

AnilAnisamid. *Vid.* PhenylAnisylamid.

Anilate of Methylene. *Vid.* MethylNitroSalicylic Acid.

Anilic Acid. *Vid.* NitroSalicylic Acid; and Anilotic Acid.

Anilic Ammelin. *Vid.* PhenylAmmelin.

Anilin or PhenylAmin. Readily soluble in water. (Runge.) Sparingly soluble in water. (Fritzsche.) Insoluble in water. (Zinin.) Very sparingly soluble in water at ordinary temperatures, and but sparingly soluble in hot water. It can itself dissolve a little water. (Hofmann, *Ann. Ch. et Phys.*, (3.) 9. 141.)

(Krystallin. Kyanol (of Runge). Benzidam. Phenylammonia. Phenic Amid. Phenamid. Amidophenase.)

$C_{12}H_7N = N\left\{\begin{matrix} C_{12}H_5 \\ H_2 \end{matrix}\right.$

Miscible in all proportions with alcohol, ether, bisulphide of carbon, wood-spirit, aldehyde, acetone, and the fixed and volatile oils. Ether removes it from the aqueous solution. (Hofmann, *loc. cit.*) It may also be separated from its solution in water by the addition of caustic or carbonated alkalies, chloride of sodium, or sulphate of magnesia. (Hofmann.)

When obtained by the fractional distillation of the bases from coal-tar, anilin — still containing impurities — comports itself towards water very differently from the pure anilin obtained by decomposing purified oxalate of anilin.

The anilin obtained by fractional distillation is largely soluble in water, a portion of the latter being also dissolved by it. At the temperature of +12° the solution separates into two layers, of which the inferior is an aqueous solution of anilin, while the superior layer consists of hydrated anilin (containing about three equivalents of water). Perfectly pure anilin, from the oxalate, dissolves very much less water than this. Pure anilin dissolves the more readily in water in proportion as the temperature is more elevated, and a portion of the anilin separates out when the solution is cooled. On the other hand, a saturated cold aqueous solution of impure anilin becomes cloudy when it is heated, even when heated by holding it in the hand, — this cloudiness augments with the temperature, and when the liquid begins to boil it separates into two layers, the lower of which contains water almost pure, while the original anilin floats above. When sulphuric, or oxalic, acid is added to an aqueous solution of the impure anilin, the latter separates in drops, and the liquid does not become clear until an excess of acid has been added. A solution of pure anilin does not exhibit this reaction. (Hofmann, *loc. cit.*, p. 141 *et seq.*)

The salts of anilin are almost all soluble in water, and alcohol.

Anilin with *proto***Chloride of Mercury.**

I.) $NC_{12}H_7; HgCl$ Insoluble, or very difficultly soluble, in alcohol.

II.) $NC_{12}H_7; 3\,HgCl$ Very sparingly soluble in cold water; partially decomposed when boiled with water. Sparingly soluble in boiling, less soluble in cold alcohol. Easily soluble in hot, less soluble in cold chlorhydric acid. (Hofmann, *Ann. Ch. et Phys.*, (3.) 9. 153.)

Anilin with *proto***Chloride of Palladium.** Ppt. Permanent. Insoluble in anilin.

Anilin with *proto*Chloride of Platinum.
$a = NC_{12}H_7, PtCl$
$b =$ ditto.
$c = 2NC_{12}H_7, PtCl$
$d = NC_{12}H_7, HCl, PtCl$

AnilinAmmelin. *Vid.* PhenylAmmelin.

AniloBenzamid. *Vid.* PhenylBenzoylamid.

AnilinUrea. *Vid.* PhenylCarbamid, and PhenylUrea.

AniloCuminamid. *Vid.* PhenylCuminamid.

AniloCyanic Acid. *Vid.* Cyanate of Phenyl.

AniloUrea. *Vid.* PhenylCarbamid.

Anilotic Acid. (*Isomeric, but not identical, with NitroSalicylic Acid.*) $C_{14}H_4NO_9, HO + 3 Aq$ Very sparingly soluble in cold, somewhat more soluble, though still sparingly, in warm water. Boiling water dissolves a portion of it and removes the water of crystallization from the remainder, which is left as an insoluble powder. Easily soluble in alcohol, and ether. Soluble, without decomposition in warm concentrated sulphuric acid, separating out again as the solution cools.

Most of its salts are soluble in water.

Anilotate of Ammonia. Soluble in water.

Anilotate of Potash. Soluble in water.

Anilotate of Silver. Insoluble in water. (Piria, *Ann. Ch. u. Pharm.*, **97.** 253.)

Animin (of Unverdorben). (*Supposed to have been a mixture of Lutidin and Collidin.*) Soluble in 20 pts. of water, the solution becoming turbid when heated, and depositing animin, which redissolves as the liquor cools. Soluble in all proportions in alcohol, ether, and the fatty and essential oils. Its salts are soluble in water. (Unverdorben.)

AnisAlcohol. *Vid.* Hydrate of Anisoyl.

AnisAldehyde. *Vid.* Hydride of Anisyl.

Anisamic Acid. (*AmidAnisic Acid. Oxide of Anisylamid.*) $C_{16}H_9NO_6 = C_{16}H_8NO_5, HO$ Soluble in 800 pts. of boiling water; less soluble in cold water. Readily soluble in hot alcohol. Sparingly soluble in ether. Soluble, without alteration, in boiling, moderately strong, acetic and chlorhydric acids, — separating out again unchanged as the solutions cool. (Zinin.)

Sparingly soluble in water. Tolerably readily soluble in alcohol, and ether, especially when these are hot. Very easily soluble in alkaline liquids, and in acids, with combination in both cases. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 341.)

Anisamate of Ammonia. Very soluble in water. (Zinin; Cahours, *l. c.*)

Anisamate of Baryta. Appears to be soluble in water.

Anisamate of Cadmium. Ppt.

Anisamate of Ethyl. $C_{16}H_8(C_4H_5)NO_6$ Easily soluble in alcohol, especially when this is warm. Less readily soluble in ether. Insoluble in aqueous solutions of caustic potash, soda, or ammonia. Soluble in acids, with combination, forming salts which are soluble in alcohol. (Cahours, *loc. cit.*, p. 346.)

Anisamate of Lead. Ppt.

Anisamate of Lime. Appears to be soluble in water.

Anisamate of Methyl. $C_{16}H_8(C_2H_3)NO_6$ Easily soluble in alcohol, and ether. Insoluble in alkaline liquids. Very easily soluble, with combination, in acids. (Cahours, *loc cit.*, p. 350.)

Anisamate of Silver. $C_{16}H_8AgNO_6$ Insoluble in water. Readily soluble in acids, and in ammonia-water.

Anisamid. (*Anisylamid.*) $C_{16}H_9NO_4 = N\left\{\begin{matrix}C_{16}H_7O_4\\H_2\end{matrix}\right.$ Soluble in alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **23.** 353.)

Anisanilid. *Vid.* PhenylAnisylamid.

Anisic Acid (Anhydrous). (*Anisic Anhydride.*) $C_{32}H_{14}O_{10} = \left.\begin{matrix}C_{16}H_7O_4\\C_{16}H_7O_4\end{matrix}\right\}O_2$ Insoluble in cold water. Acidified by long-continued boiling with water. Readily soluble in alcohol, and ether, especially when these are warm; still more easily soluble in a mixture of alcohol and ether. Insoluble in cold, but is acidified by warm aqueous solutions of caustic potash, and ammonia. (Pisani.)

Anisic Acid. (*Anisylic Acid. Draconic Acid. Dracic Acid. Ombellic Acid. Badianic Acid.*) $C_{16}H_8O_6 = C_{16}H_7O_5, HO$ Permanent. Scarcely at all soluble in cold, tolerably soluble in boiling water. Very soluble in alcohol, and ether, especially when these are hot. Most of its salts are soluble in water.

"According to Persoz, ombellic acid is but slightly soluble in cold ether, while badianic acid is easily soluble. Hempel found no difference between the dissolved and the undissolved portions." (Gmelin)

Anisate of Alumina. Somewhat soluble in water.

Anisate of Ammonia. $C_{16}H_7(NH_4)O_6$ Easily soluble in water. Soluble in alcohol.

Anisate of Baryta. $C_{16}H_7BaO_6$ Sparingly soluble in water. (Engelhardt.)

Anisate of Cadmium. Soluble in hot water. Sparingly soluble in ordinary alcohol. (Schiff.)

Anisate of Cobalt. Appears to be soluble in water.

Anisate of Copper. Soluble, with decomposition, in boiling acetic acid. Insoluble in ether.

Anisate of Ethyl. (*Anisic Ether.*) $C_{20}H_{12}O_6 = C_{16}H_7(C_4H_5)O_6$ Insoluble in water. Easily soluble in alcohol, and ether. Insoluble in caustic ammonia, but is decomposed by long-continued contact therewith. (Cahours, *Ann. Ch. et Phys.*, (3.) **14.** 492.)

Anisate *of protoxide* of Iron. Soluble in water.

Anisate *of sesquioxide* of Iron. Ppt.

Anisate of Lead.

I.) *normal.* $C_{16}H_7PbO_6 + Aq$ Soluble in boiling water, crystallizing out on cooling. (Engelhardt.) Insoluble in cold, sparingly soluble in boiling water. (Cahours, *loc. cit.*)

II.) *bibasic.* Ppt.
$C_{16}H_7PbO_6; PbO, HO$

Anisate of Lime. $C_{16}H_7CaO_6 + Aq$ Somewhat soluble in water.

Anisate of Magnesia. $C_{16}H_7MgO_6 + 4Aq$ Readily soluble in water, and alcohol.

Anisate of Manganese.

Anisate *of dinoxide* of Mercury. Ppt.

Anisate *of protoxide* of Mercury. Insoluble in cold, sparingly soluble in boiling water.

Anisate of Methyl. (*Anisate of Methylene. Methyl Anisic Ether.*) $C_{18}H_{10}O_6 = C_{16}H_7(C_2H_3)O_6$ Insoluble in water, even when this it hot. Readily and abundantly soluble in alcohol, and ether, especially when these are warm. (Cahours, *loc. cit.*, p. 494.)

Anisate of Nickel. Appears to be soluble in water.

Anisate of Potash. $C_{16}H_7KO_6$ Soluble in water. Soluble in warm, less soluble in cold hydrate of anisyl (Canizzaro & Bertagnini), and ordinary spirit.

Anisate of Silver. $C_{16}H_7AgO_6$ Insoluble in cold, sparingly soluble in boiling water. Gmelin and Kolbe say: "But slightly soluble in cold, more soluble in hot water. (Cahours.)"

Anisate of Soda. $C_{16}H_7NaO_6 + Aq$ & $10\,Aq$ The 10-hydrated salt is very efflorescent. Soluble in water. Soluble in boiling, less soluble in cold alcohol.

Anisate of Strontia. $C_{16}H_7SrO_6 + Aq$ Difficultly soluble in water.

Anisate of Zinc. Ppt.

Anise Camphor. *Vid.* Anethol.

AnisEugenic Acid (Anhydrous). (*AnisEugenyl.*) $C_{36}H_{18}O_8 = \left.\begin{matrix}C_{20}H_{11}O_2\\ C_{16}H_7O_4\end{matrix}\right\}O_2$ Insoluble in an aqueous solution of caustic potash. (Cahours.)

Anishydramid. *Vid.* Hydride of AzoAnisyl.

Anisidin. *Vid.* MethylPhenidin.

Anisin. $C_{48}H_{24}N_2O_6$ Scarcely at all soluble in boiling water. Soluble in alcohol. Sparingly soluble in ether. (Bertagnini, *Ann. Ch. u. Pharm.*, **87.** 128.)

Anisoic Acid. $C_{20}H_{18}O_{12} = C_{20}H_{17}O_{11}, HO$ Very easily soluble in water, spirit, and ether. (Limpricht, *Ann. Ch. u. Pharm.*, **97.** 355.)

Anisoate of Baryta. $C_{20}H_{17}BaO_{12}$ Easily soluble in water. (Limpricht, *ib.*)

Anisoate of Silver. $C_{20}H_{17}AgO_{12}$ Easily soluble in water. (Limpricht, *ib.*)

Anisoate of Soda. $C_{20}H_{17}NaO_{12}$ Easily soluble in water. (Limpricht, *ib.*)

Anisœl. *Vid.* Anethol.

Anisoin. (*Isomeric with Anethol and Cuminol.*) $C_{20}H_{12}O_2$ Insoluble in water. Scarcely at all soluble in alcohol, even when this is warm; more soluble in ether, and the essential oils. Alcohol precipitates it from the ethereal solution. Unacted upon by dilute acids, or by boiling aqueous solutions of caustic potash, or ammonia. Soluble in strong sulphuric acid, from which it is precipitated on the addition of water.

Anisol. *Vid.* Phenate of Methyl.

AnisoNitrAnisic Acid. (*Nitrodraconasic Acid.*) $C_{32}H_{15}NO_{16}$ Nearly insoluble in water. Tolerably readily soluble in alcohol, and ether. (Laurent.)

AnisoNitrAnisate of Ammonia. Sparingly soluble in water. Soluble in boiling, less soluble in cold alcohol.

AnisoSalicyl. $C_{30}H_{12}O_8$ Scarcely at all soluble either in hot or in cold water. Tolerably soluble in alcohol, especially when this is boiling, and in ether. (Cahours, *Ann. Ch. et Phys.*, (3.) **52.** 199.)

Anisoyl. $C_{16}H_9O_2$ Not isolated.

AnisSalicylous Acid (Anhydrous). *Vid.* AnisoSalicyl.

Anisuric Acid. $C_{20}H_{11}NO_8$ Soluble in alcohol. Decomposed by boiling with acids. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 357.)

Anisurate of Silver. $C_{20}H_{10}AgNO_8$

Anisyl. $C_{16}H_7O_4$ Not isolated.

Anisyl Alcohol. *Vid.* Hydrate of Anisoyl.

Anisylamid. *Vid.* Anisamid.

Anisylous Acid. *Vid.* Hydride of Anisyl.

Annotto. ("*Arnotto*" *or* "*Arnatto*" — "*Rocou*" *or* "*Roucou*" *of the French.* "*Orlean*" *of the Germans. Inspissated extract from the seeds of Bixa orellana.*) More easily soluble in alcohol and in alkaline solutions than in water. Water dissolves from it only a little yellow coloring-matter; but it is soluble in alcohol, ether, fatty and essential oils (as of turpentine), and in alkaline solutions.

Anthokirrin. (*Yellow coloring-matter from flowers of Antirrhinum linaria.*) Difficultly soluble in water; more readily soluble in alcohol, ether, and the essential oils. Soluble in acids, and in alkaline solutions. (Riegel.)

Anthokyan. *Vid.* Cyanin.

AnthoXanthin. *Vid* Xanthin, & Xanthein.

Anthracene. *Vid.* ParaNaphthalin.

Anthracoxene. See under Resins.

Anthranilic Acid. *Vid.* PhenylCarbamic Acid.

Anthropic Acid }
Anthropin } (of Heintz). Consisted of a mixture of stearic and margaric acids.

Antiarin. (*Anthiarin.*) $C_{28}H_{20}O_{10} + 4\,Aq$ Permanent. Soluble in 254 [251] pts. of water at 22.5°, and in 27.4 pts. of boiling water. In 70 pts. of alcohol at 22.5°; and in 2792 pts. of ether at 22.5°. Soluble in dilute acids, as, for example, sulphuric, nitric, chlorhydric, and acetic acids. Soluble in concentrated nitric, and chlorhydric acids at the ordinary temperature. Decomposed by strong sulphuric acid. Soluble in dilute aqueous solutions of caustic potash, and ammonia. It is much more readily soluble in dilute acids and alkaline solutions than in pure water. Very easily soluble in an aqueous solution of sugar, also easily soluble in water containing extractive matters. (Mulder, *Pogg. Ann.*, 1838, **44.** pp. 424, 428; and *J. pr. Chem.*, **15.** pp. 425, 428.)

AntimonEthyl, &c. *Vid.* StibEthyl, &c.

Antimonic Acid. SbO_5 There are two allotropic modifications:

I.) *ordinary* Antimonic Acid, and
II.) *met* Antimonic Acid.

I.) *ordinary.* SbO_5, HO [or $SbO_5, 5\,HO$ according to Fremy] Insoluble in water. (Berzelius.) Sparingly soluble in water. (Capitaine.) Soluble, with combination, in boiling aqueous solutions of the alkalies, and in warm ammonia-water. (Berzelius.) Soluble in an excess of an aqueous solution of triethyltoluenylammonium.

Readily soluble in tartaric acid. (Buchner.) Slightly soluble in water acidulated with nitric acid. (Ansell, *J. Ch. Soc.*, **5.** 211.) Insoluble in other acids. (Berzelius.) Soluble in concentrated chlorhydric acid: if a small quantity of water be added to this solution, a precipitate is formed, but if a large quantity of water be at once quickly added, no precipitate will form. (L. Gmelin.) Each of the oxides of antimony is almost insoluble in nitric acid. (H. Rose, *Tr.*) Completely insoluble in ammonia-water. It appears to dissolve in acids more slowly than metantimonic acid. (Fremy, *loc. inf. cit.*)

Of the antimoniates, only those of the more soluble alkalies are soluble in water. They are all decomposed even by weak acids. All acid antimoniates are difficultly soluble or insoluble in water.

II.) *meta.*
$SbO_5, 4HO$
Completely soluble in a large quantity of cold water, from which solution it is precipitated by acids. When in contact with water it is very easily transformed into ordinary antimonic acid.

Slowly soluble in cold ammonia-water. It appears to dissolve more readily in acids than ordinary antimonic acid. The normal metantimoniates are only stable when in presence of a large excess of alkali, being decomposed by solvents with separation of acid salts. (Fremy, *Ann. Ch. et Phys.*, (3.) **23.** 407.

ANTIMONIATE OF ALUMINA.
$Al_2O_3, 3SbO_5$
Ppt. Insoluble in an aqueous solution of antimoniate of potash, but somewhat soluble in solutions of alumina salts. (Berzelius, *Lehrb.*, **3.** 489.)

ANTIMONIATE OF AMMONIA.

I.) *ordinary.* Completely insoluble in water.
$NH_4O, SbO_5 + 4Aq$
(Fremy, *Ann. Ch. et Phys.*, (3.) **23.** pp. 406, 411.)

II.) *meta.* Soluble in water; this solution is
a = *mono.* $NH_4O, SbO_5 + 6Aq$
decomposed by boiling. Insoluble in alcohol. (Fremy, *loc. cit.*)

b = *din.* $2NH_4O, SbO_5$
Soluble in a dilute solution of ammonia; from which alcohol precipitates the preceding compound. (Fremy, *loc. cit.*)

ANTIMONIATE OF ANTIMONY.
(*Antimonious Acid* (*Improperly.*)
Deutoxide of Antimony.)
$2(SbO_4, HO) = SbO_3, SbO_5 + 2Aq$
Scarcely at all soluble in water. Very difficultly soluble in chlorhydric acid. Insoluble in sulphide of ammonium. (Fresenius, *Quant.*, p. 154.) Rather more soluble in water than antimonic acid. (Capitaine.) Insoluble in water, alcohol, or the oxygen acids. It is not dissolved when digested with concentrated sulphuric acid, only a small portion of oxide of antimony being dissolved out. Difficultly soluble in concentrated chlorhydric acid, and is reprecipitated therefrom on the addition of a small quantity of water. But if a large quantity of water be added at once, oxide of antimony alone is precipitated, the greater part of the antimonic acid remaining in solution. Soluble in a boiling aqueous solution of bitartrate of potash. (Berzelius, *Lehrb.*, **2.** 292.) Soluble in a boiling solution of sulphide of potassium, also in a boiling solution of Schlippe's salt ($3NaO, SbS_5 + 18Aq$). Sparingly soluble in a few acids, as nitric acid, and still more soluble, though still very sparingly, in concentrated chlorhydric acid. (Dumas, *Tr.*) A quantity of chlorhydric acid capable of dissolving 100 pts. of SbO_3 dissolves only 33 pts. of SbO_4, and the latter is precipitated from this solution on the addition of water. (Dumas, *Tr.*) Each of the oxides of antimony is scarcely at all soluble in nitric acid. (H. Rose, *Tr.*) Soluble, with decomposition, in alkaline solutions. (Fremy, *Ann. Ch. et Phys.*, (3.) **12.** 496.)

ANTIMONIATE OF BARYTA.
BaO, SbO_5
Permanent. Scarcely at all soluble in water. (Berzelius.) Soluble to a certain extent in an aqueous solution of chloride of barium. (Wackenroder.)

ANTIMONIATE OF COBALT.
CoO, SbO_5
Slightly soluble in water. (Berzelius.) Almost as soluble as the zinc salt. (Dumas, *Tr.*) Somewhat soluble in boiling aqueous solutions of cobalt salts. After ignition it is not acted upon by acids or by alkaline solutions.

ANTIMONIATE OF COPPER.
$CuO, SbO_5 + xAq$
Insoluble in water. (Berzelius.) After having been ignited, it is not acted upon by acids or by alkaline solutions.

ANTIMONIATE *of protoxide* OF IRON. Slightly soluble in water. (Berzelius.)

ANTIMONIATE *of sesquioxide* OF IRON. Insoluble in water. (Berzelius, *Lehrb.*)

ANTIMONIATE OF LEAD.

a = *mono.*
$PbO, SbO_5 \& + xAq$
(*Naples Yellow.*)
Completely insoluble in water. Incompletely decomposed by acids, even when recently precipitated. (Berzelius, *Lehrb.*, **3.** 751.)

b = *tris.*
$3PbO, SbO_5 + 4Aq$

ANTIMONIATE OF LIME.
CaO, SbO_5
Very slightly soluble in water. (Berzelius.)

ANTIMONIATE OF LITHIA.
LiO, SbO_5
Difficultly soluble in cold, more soluble in hot water. Much more easily soluble than the soda salt. (Berzelius, *Lehrb.*)

ANTIMONIATE OF MAGNESIA.
$MgO, SbO_5 + xAq$
Ppt. Soluble in an aqueous solution of sulphate of magnesia, but insoluble in a solution of antimoniate of potash. (Berzelius, *Lehrb.*)

ANTIMONIATE OF MANGANESE.
MnO, SbO_5
Permanent. Very sparingly soluble in water. (Berzelius.)

ANTIMONIATE *of dinoxide* OF MERCURY. Insoluble in water. (Berzelius.)

ANTIMONIATE *of protoxide* OF MERCURY.
HgO, SbO_5
Ppt. Scarcely attacked by alkalies or by acids. Slightly soluble in hot sulphuric and chlorhydric acids.

ANTIMONIATE OF NICKEL.
$NiO, SbO_5 + 6Aq$
Insoluble in water. (Berzelius.)

ANTIMONIATE OF POTASH.

I.) *ordinary.*
a = KO, SbO_5
Insoluble in cold water. When boiled for a long time with water it is dissolved, with combination. (Fremy, *Ann. Ch. et Phys.*, (3.) **23.** 406.)

b = $KO, SbO_5, + Aq$
Cold water dissolves no trace of it. By long boiling with water it is dissolved, with decomposition. (Fremy, *Ibid.*, (3.) **23.** 406.)

c = $KO, SbO_5 + 3Aq$
Completely insoluble in cold water. Decomposed, with solution, by long boiling with water. (Fremy, *Ibid.*, p. 406.)

d = "*Gummy Antimoniate of Potash.*"
$KO, SbO_5 + 5Aq$
Slowly soluble in cold, readily soluble in hot water, from which solution acids, even carbonic acid, precipitate the bi-antimoniate. It is all precipitated by a solution of chloride of ammonium. (Fremy, *Ibid.*, (3.) **12.** 502.)

II.) *bi.*
"*Insoluble Antimoniate of Potash.*"
$KO, 2SbO_5, \& + 6Aq$
Insoluble in water. Soluble in solutions of the preceding (gummy) compound, from

which it may again be precipitated by adding almost any soluble salt. Soluble in a boiling concentrated solution of caustic potash, but is deposited again almost entirely on cooling; the last portions which remain in solution may be precipitated by adding some soluble potash salt. (Fremy, *Ann. Ch. et Phys.*, (3.) **12.** 499.) Almost insoluble in water. (Berzelius.)

III.) *meta.* *a* = "*Granular Antimoniate of Potash.*" $KO, SbO_5 + 7 Aq$ Permanent. Slowly soluble in cold water. Soluble in a solution of chloride of ammonium. (Fremy, *Ann. Ch. et Phys.*, (3.) **12.** 502.) The aqueous solution decomposes by standing.

b = (*Bibasic metantimoniate. Normal metantimoniate* (of Fremy). *Deliquescent antimoniate.*) $2 KO, SbO_5$ Very deliquescent. Decomposed by water, even when this is cold. Soluble in water containing potash, and in alkaline liquors generally; the solutions undergoing decomposition when boiled or evaporated. It is stable only when in presence of a great excess of potash. (Fremy, *loc. cit.*, (3.) **12.** 502, and (3.) **23.** 408.)

Antimoniate of Potash with SulphAntimoniate of Potash. $KO, SbO_5; 3 KS, SbS_5 + 10 Aq$ Decomposed by cold water, which dissolves out the sulphur salt and leaves the oxygen salt, but is completely dissolved by boiling water. (Rammelsberg, in Berzelius's *Lehrb.*, **3.** 202.)

Antimoniate of Quinine. Soluble in hot, less soluble in cold water. Soluble in alcohol. (Parrish's *Pharm.*, p. 402.)

Antimoniate of Silver. AgO, SbO_5 Insoluble in water. (Berzelius.)

Antimoniate of Soda. (*Acid metantimoniate of Soda.*) $NaO, SbO_5 + Aq$ & $7 Aq$ Almost insoluble in cold, very sparingly soluble in boiling water. Insoluble in alcohol. Soluble in alkaline solutions. (Fremy, *Ann. Ch. et Phys.*, (3.) **12.** 501, *et seq.*) Somewhat soluble in a solution of carbonate of potash: — thus the solution of one part of a soda salt in 350 pts. of water may still be precipitated by antimoniate of potash, even when the solution contains 100 pts. of carbonate of potash to one part of carbonate of soda; but in a larger excess of carbonate of potash the antimoniate of soda is slightly soluble. (Fremy, *C. R.*, **16.** 187.)

Antimoniate of Strontia. SrO, SbO_5 Very difficultly soluble in water; so much so that a solution of sulphate of strontia is made cloudy by the addition of antimoniate of potash. (Berzelius, *Lehrb.*)

Antimoniate of Tin (SnO_2).

Antimoniate of Uranium. $5 UrO, 3 SbO_5 + 15 Aq$ Ppt. Soluble in hot concentrated chlorhydric acid, and in an aqueous solution of sesquichloride of uranium. (Rammelsberg.)

Antimoniate of Zinc. ZnO, SbO_5 Permanent. Very slightly soluble in water. (Berzelius.) Soluble in solutions of the salts of zinc. Sensibly soluble in water. (Dumas, *Tr.*)

Antimonide of Amyl. *Vid.* StibAmyl.

Antimonide of Bismuth.

Antimonide of Ethyl. *Vid.* StibEthyl.

Antimonide of Mercury.

Antimonide of Nickel. $SbNi_2$ Insoluble in simple acids. Easily soluble in aqua-regia.

Antimonide of Nickel with Sulphide of Nickel. $NiSb, NiS_2$ Soluble in nitric acid, with separation of sulphur, and in aqua-regia.

Antimonide of Potassium. Decomposed by water.

Antimonide of Potassium with Arsenide of Potassium. $(SbAs)K_2$ Decomposed by water.

Antimonide of Silver. $SbAg_4$ Decomposed, with partial solution, by nitric acid.

Antimonide of Sodium. Decomposed by water.

Antimonide of Zinc.

I.) *bi.* $SbZn_2$ (*StibiobiZincyl.*) Does not decompose boiling water except very feebly. It is not attacked by dilute mineral acids, but is decomposed by strong chlorhydric, and nitric acids. (J. P. Cooke, *Mem. Amer. Acad.*, 1855, [N. S.] **5.** 348.)

II.) *ter.* $SbZn_3$ (*StibiotriZincyl.*) Decomposes water very rapidly at the temperature of boiling, especially when it has previously been treated with a solution of bichloride of platinum or with chlorhydric acid, and afterwards washed. Decomposed with great violence by dilute chlorhydric and sulphuric acids. Nitric acid also decomposes it violently. Completely soluble in chlorhydric acid mixed with a little nitric acid. (Cooke, *loc. cit.*, pp. 342, 345.)

"Antimonious Acid." SbO_4 *Vid.* Antimoniate of Antimony.

Antimonious Acid. SbO_3 *Vid. ter* Oxide of Antimony.

Antimonite of Alumina. Insoluble in water. (Berzelius, *Lehrb.*)

Antimonite of Ammonia.

I.) *bi.* Slightly soluble in water, inasmuch as this abstracts ammonia, in a solution of which the compound is sparingly soluble. (Berzelius, *Lehrb.*, **3.** 327.)

Antimonite of Baryta. Permanent. Difficultly soluble in water. Decomposed by acids. (Berzelius.)

Antimonite of Cobalt. Slightly soluble in water. (Berzelius.) Much more soluble in water than the antimoniate. (Dumas, *Tr.*)

Antimonite *of dinoxide* of Copper. Soluble in chlorhydric acid, more completely than in any other acid. (Hausmann & Stromeyer.)

Antimonite *of protoxide* of Copper. Insoluble in water. (Berzelius; Dumas, *Tr.*)

Antimonite *of protoxide* of Iron. Ppt. More soluble than the antimoniate in water. (Dumas, *Tr.*)

Antimonite of Lime. Insoluble in water. (Berzelius.)

Antimonite of Manganese. More soluble than the antimoniate in water. (Dumas, *Tr.*)

Antimonite of Potash. KO, SbO_3 Decomposed by water, only a very small portion of it being dissolved. (Berzelius, *Lehrb.*, **3.** 189.) Fremy denies its existence. When a solution of antimonious acid (SbO_3) in an excess of caustic potash is allowed to stand for a very long time out of contact with the air, all of the antimonious acid finally separates from the solution in crystals; the same statement applies to the solution in carbonate of potash. (H. Rose *Tr.*, **1.** 266)

Antimonite of Potash with *ter*Sulphide of Antimony. (*Kermes mineral*) $KO, SbO_5 ; 2 SbS_3 + Aq$ (*or a mixture of these two ingredients, or of antimoniate of soda and sulphide of antimony, in other proportions.* Soluble in great part, with decomposition, in water. Soluble in a hot concentrated aqueous solution of caustic potash, and in concentrated chlorhydric acid.

Antimonite of Soda. Similar to the potash salt. (Berzelius.) A solution of antimonious acid in carbonate of soda, on being left to itself deposits the antimonious acid completely after a time. (H. Rose, *Tr.*)

Antimonite of Stib*tri*Amyl. $(C_{10} H_{11})_3 SbO_2, 2 SbO_3$ (?) Insoluble in water, alcohol, or ether. Imperfectly soluble in nitric acid. Slowly soluble in aqua-regia. Insoluble in chlorhydric acid. (Berlé.)

Antimonite of Stib*tri*Ethyl. $(C_4 H_3)_3 SbO_2, 2 SbO_3$ Difficultly soluble in ether; more readily soluble in water, and alcohol. (Lœwig.)

Antimonite of Zinc. More soluble than the antimoniate in water. (Dumas, *Tr.*)

Antimoniuretted Hydrogen. Not sensibly absorbed by water, but is decomposed by long-continued contact therewith. Neither absorbed nor altered by concentrated potash lye, or concentrated nitric acid. (F. Simon.) Soluble, with subsequent decomposition, in an alcoholic solution of caustic potash. (Meissner.)

Antimony. Sb Insoluble in, and unacted upon by water, or alkaline solutions. But when exposed to the simultaneous action of air and water it oxidizes slowly, and a portion of the oxide dissolves. It is not attacked by any of the dilute acids excepting nitric acid and aqua-regia. Warm concentrated sulphuric acid converts it into sulphate of antimony. Oxidized, but not dissolved, by strong nitric acid. Scarcely at all acted upon by boiling concentrated chlorhydric acid. Completely soluble in warm aqua-regia, which is its best solvent. Antimony is attacked with extreme slowness by pure concentrated nitric acid of 1.512 @ 1.419 sp. gr.; acid weaker than this has no marked action, whether it contains nitrous acid or not. Nor does a mixture of nitric and chlorhydric acids have any action upon the metal so long as the acids, either from being too dilute or at too low a temperature, cannot react upon each other; but if the antimony is treated with a mixture of these acids in an extremely diluted state and a few drops of a solution of nitrite of potash be added to the mixture an action will commence at once. (Millon, *Ann. Ch. et Phys.*, (3.) **6.** 101.) Solutions of the salts of antimony when mixed with tartaric acid can no longer be precipitated by water, or the caustic alkalies. (H. Rose.)

Antirrhic Acid. (from *Digitalis purpurea.*) Difficultly soluble in water. Easily soluble in alcohol. (Morin.)

AntiTartaric Acid. *Vid.* Tartaric Acid, (*left.*)

Apiin. $C_{24} H_{14} O_{13} + 2 Aq$ & $4 Aq$ Scarcely at all soluble in cold, easily soluble in boiling water. Soluble in boiling alcohol, the liquid gelatinizing on cooling. Soluble in alkaline solutions, even the weakest, *ex. gr.* in lime-water, solution of magnesia, very dilute ammonia, or bicarbonate of potash. Its solution in caustic potash is not decomposed by long-continued boiling. Decomposed by boiling sulphuric acid, even dilute; also by other acids. (Braconnot, *Ann. Ch. et Phys.*, (3.) **9.** 250.) Its aqueous solution is decomposed by long-continued boiling, and more rapidly if it be acidulated with sulphuric, or chlorhydric acid. Insoluble in ether.

Soluble in 8500 pts. of cold water, and 389 pts. of cold alcohol. Easily soluble in alkaline solutions. (*v.* Planta & Wallace, in *Wittstein's Handw.*)

Apiol (from *Apium petroselinum*). Insoluble in water. Easily soluble in alcohol of from 50 to 90%. Soluble in all proportions in ether, and chloroform. Completely soluble in acetic acid. (Homolle & Joret.)

Apirin. *Vid.* Apyrin.

Apocrenic Acid. $C_{48} H_{12} O_{24}$ (?) Sparingly soluble in water; more soluble in absolute alcohol. On the addition of chloride of ammonium it is precipitated from the aqueous solution. Readily soluble in solutions of the alkaline acetates. The alkaline apocrenates are soluble in water, the others are difficultly soluble, or insoluble.

Apocrenate *of protoxide* of Iron. Soluble in water.

Apocrenate *of sesquioxide* of Iron. Insoluble in water. (Berzelius.)

Apoglucic Acid. (*Perhaps identical with Assamar.*) (*Gerhardt, Tr.*, **2.** 565.) $C_{18} H_{10} O_{10}$ Readily soluble in water, from which it is not precipitated by alcohol. Sparingly soluble in alcohol. Insoluble in ether. Soluble, without decomposition, in dilute sulphuric, or concentrated chlorhydric acid. Soluble in cold concentrated sulphuric acid. (Mulder.)

Apoglucate of Ammonia. Soluble in water.

Apoglucate of Baryta. Soluble in water.

Apoglucate of Copper. Ppt.

Apoglucate of Lead. $C_{18} H_9 Pb O_{10}$ Sparingly soluble in water.

Apoglucate of Lime. $C_{18} H_9 Ca O_{10}$ Soluble in water. Insoluble in alcohol.

Apoglucate of Potash. Soluble in water.

Apoglucate of Silver. $C_{18} H_9 Ag O_{10}$ Sparingly soluble in water.

Apoglucate of Soda. Soluble in water.

Apophyllic Acid. $C_{16} H_7 NO_8 = C_{16} H_6 NO_7, HO$ Slowly and very difficultly soluble in cold water. Insoluble in alcohol, and ether. Soluble in concentrated sulphuric acid. Decomposed by nitric acid. Its salts are all very easily soluble in water.

Apophyllate of Ammonia. Readily soluble in water.

Apophyllate of Baryta. Soluble in water; less soluble in dilute alcohol.

Apophyllate of Lead. Soluble in water.

Apophyllate of Silver. $C_{16} H_6 Ag NO_8$ Readily soluble in water. Insoluble in alcohol or ether. (Anderson.)

Apophyllate of Silver with Nitrate of Silver. $C_{16} H_6 Ag NO_8 ; Ag O, NO_5$ Sparingly soluble in water.

Aporetin. Insoluble in water. Nearly insoluble in alcohol, ether, benzin, or chloroform. Insoluble in dilute chlorhydric acid. Readily soluble in tolerably concentrated potash lye, and in ammonia-water.

Aposepedin. *Vid.* Leucin.

Apyrin (from *Cocos lapidea*). Sparingly soluble in water, but more soluble in *cold* than in hot water. Soluble in ammonia-water. (Bizio.)

Arabic Acid. (*Arabin*) Easily soluble in water so long as it is moist, but after having become dry it is insoluble even in boiling water; it swells up, however, somewhat, and then dissolves in solutions of the alkalies and alkaline earths. Its aqueous solution is not precipitated by alcohol; but is precipitated at once by alcohol containing a few drops, or even a trace, of chlorhydric, or nitric acid, or of a saline solution.

Arabate of Lime.
" Magnesia.
" Potash.
" Soda.
&c.
Soluble in water, from which alcohol precipitates them. (Neubauer, *Ann. Ch. u. Pharm.*, **102.** 105.)

Arabin. *Vid.* Arabic Acid; see also under Gum.

Arachamid. *Vid.* Arachinamid.

Arachic Acid. *Vid.* Arachidic Acid.

Arachidic Acid. (*Arachic Acid. Butic Acid.*) $C_{40} H_{40} O_4 = C_{40} H_{39} O_3, HO$ Insoluble in water. Exceedingly sparingly soluble in cold spirit. Sparingly soluble in cold, readily soluble in boiling absolute alcohol. Very easily soluble in ether. The alkaline salts of arachidic acid are soluble in water, and alcohol; the other salts are insoluble in water, but soluble in boiling alcohol. (Gœssmann, *Ann. Ch. u. Pharm.*, **89.** 1.)

Arachidate of Ammonia. $C_{40} H_{39} (NH_4) O_4$ Soluble in alcohol.

Arachidate of Amyl. $C_{50} H_{50} O_4 = C_{40} H_{39} (C_{10} H_{11}) O_4$ Insoluble in water. Easily soluble in hot alcohol and in cold ether. (Caldwell.)

Arachidate of Baryta. $C_{40} H_{39} Ba O_4$ Insoluble in water. Sparingly soluble in boiling alcohol.

Arachidate of Copper. $C_{40} H_{39} Cu O_4$ Sparingly soluble in boiling alcohol.

Arachidate of Ethyl. $C_{44} H_{44} O_4 = C_{40} H_{39} (C_4 H_5) O_4$ Insoluble in water. Soluble in alcohol. (Gœssmann, *Ann. Ch. u. Pharm.*, **89.** 10.)

Arachidate of Glyceryl. *Vid.* Arachin.

Arachidate of Lead. Soluble in an alcoholic solution of acetic acid.

Arachidate of Lime. $C_{40} H_{39} Ca O_4$ Insoluble in water.

Arachidate of Magnesia.

I.) *normal.* $C_{40} H_{39} Mg O_4$ Insoluble in water. Sparingly soluble, with partial decomposition, in hot alcohol.

II.) *basic.* Insoluble in water, and alcohol.

Arachidate of Methyl. $C_{42} H_{42} O_4 = C_{40} H_{39} (C_2 H_3) O_4$ Insoluble in water. Easily soluble in alcohol, and ether. (Caldwell.)

Arachidate of Potash. $C_{40} H_{39} K O_4$ Soluble in 15 @ 20 pts. of boiling water. When this solution is diluted with much water, an acid salt separates. Soluble in strong alcohol.

Arachidate of Silver. $C_{40} H_{39} Ag O_4$ Tolerably soluble in boiling, less soluble in cold alcohol. (Scheven & Gœssmann, *Ann. Ch. u. Pharm.*, **97.** 257.)

Arachidate of Soda. $C_{40} H_{39} Na O_4$ Soluble in strong alcohol.

Arachidate of Strontia. $C_{40} H_{39} Sr O_4$ Insoluble in water. Somewhat more soluble than the baryta salt in boiling alcohol.

Arachin. (*Arachidate of Glyceryl.*) $C_{126} H_{124} O_{14} = \left.\begin{matrix} C_6 H_5{}'' \\ (C_{40} H_{39} O_2)_3 \end{matrix}\right\} O_6 + 2\,Aq$ Very sparingly soluble in alcohol of 90 %; more readily soluble in absolute alcohol. Especially soluble in ether. (Gœsmann & Scheven, *Ann. Ch. u. Pharm.*, **94.** 230.) "The 'Arachin' of Scheven & Gœssmann is nothing but free arachidic acid." (Berthelot, *Ann. Ch. et Phys.*, (3.) **47.** 355.)

*Mono*Arachin. $C_{46} H_{46} O_8 = C_6 H_5 O_3, 2\,HO, C_{40} H_{39} O_3$ Almost insoluble in cold, sparingly soluble in boiling ether. (Berthelot, *loc. cit.*)

*Di*Arachin. $C_{86} H_{86} O_{12} = C_6 H_5 O_3, 3\,HO, 2\,C_{40} H_{39} O_3$ Almost insoluble in cold, very sparingly soluble in warm ether; more soluble in bisulphide of carbon. (Berthelot, *loc. cit.*)

*Tri*Arachin. $C_{126} H_{122} O_{12} = C_6 H_5 O_3, 3\,C_{40} H_{39} O_3$ Like the preceding, it is very sparingly soluble in ether. (Berthelot, *loc. cit.*)

Arachamid. $C_{40} H_{41} N O_2 = N \left\{\begin{matrix} C_{40} H_{39} O_2 \\ H_2 \end{matrix}\right.$ Insoluble in water. Tolerably easily soluble in hot, less soluble in cold alcohol of 95 %. (Scheven & Gœssmann, *Ann. Ch. u. Pharm.*, **97.** 263.)

Arbutin (Glucoside of HydroKinone). $C_{24} H_{16} O_{14} = \left.\begin{matrix} C_{12} H_4{}'' \\ H . C_{12} H_{11} O_{10} \end{matrix}\right\} O_4 \,\&\, + Aq$ Very easily soluble in boiling, less soluble in cold water. Less soluble in alcohol. Almost insoluble in ether.

Arctuvin. *Vid.* HydroKinone.

Arethose. $C_4 H_5 As$ Miscible in all proportions with water, and alcohol.

ArgentAcetamid. Soluble in water. (Strecker, *Ann. Ch. u. Pharm.*, **103.** 324.)

ArgentAmmelid. $C_6 H_3 Ag N_4 O_4 = N_3 \left\{\begin{matrix} (C_2 O_2{}'')_2 \\ C_2 N \\ H_3 \\ Ag \end{matrix}\right.$ Very hygroscopic. Completely insoluble in water. Easily soluble in nitric acid and in ammonia-water. (Knapp, *Ann. der Pharm.*, 1837, **21.** 252.)

ArgentAmmelin. Ppt. $C_6 H_4 Ag N_5 O_2 = N_3 \left\{\begin{matrix} C_2 O_2{}'' \\ (C_2 N)_2 \\ H_4 \\ Ag \end{matrix}\right.$

Argentate of Potash. Insoluble in water. (Dumas, *Tr.*)

ArgentoBromate(&c.) of Ammonia. *Vid.* AmmonioBromate(&c.) of Silver.

ArgentoCyanide of X. *Vid.* Cyanide of X and of Silver.

Aricin. (*Cinchovatin. Cusconin. Isomeric with Brucin.*) $C_{46} H_{26} N_2 O_8 = N_2 \left\} C_{46} H_{20} O_8{}^{vi} \right.$ Almost insoluble in water. Readily soluble in alcohol, but much more in hot than in cold; less easily soluble in ether. Soluble in acids, with combination, forming salts which are generally tolerably easily soluble in water. (Manzini, *Ann. Ch. et Phys.*, (3.) **6.** 127.) Less soluble in an aqueous solution of chloride of sodium than in water. Sparingly soluble in ammonia-water. Its salts are generally readily soluble in water, and alcohol, but insoluble in ether.

Aristolochin. (*Serpentarin, from Aristolochia Serpentaria.*) Soluble in water, and alcohol. (Chevallier.)

Arnatto. *Vid.* Annotto.

Arnicin. Very sparingly soluble in water. Soluble in all proportions in alcohol. Soluble in ether. (Lebourdais, *Ann. Ch. et Phys.*, (3.) **24.** 63.) Sparingly soluble in water; more abundantly soluble in alcohol, and ether. Decomposed by caustic alkalies. Soluble in chlorhydric acid, with combination. (Bastick.)

Asclepiadin.

Arsen*tetr*Allylium.
(*Tetrallylarsonium.*)
$C_{24}H_{20}As = As(C_6H_5)_4$

ArsenAmyl (?). Soluble in water. (W. Gibbs.)

ArsenButyl. Soluble in water. (W. Gibbs.)
(*Cacodyl of Valeric acid.*)

Arsen*di*Ethyl. Insoluble in water. Readily soluble in ether and in absolute alcohol; water precipitates it from the alcoholic solution. (Landolt, *Ann. Ch. u. Pharm.*, **89.** 319.)
(*Vinocacodyl. DiArsenide of Ethyl. Ethylcacodyl.*)
$As(C_4H_5)_2$

Arsen*tri*Ethyl. Insoluble in water. Soluble in absolute alcohol. Easily soluble in spirit, and ether. (Landolt, *Ann. Ch. u. Pharm.*, **89.** 322.)
(*Arsen Ethyl. TriArsen-Ethylamin.*)
$C_{12}H_{15}As = As\left\{\begin{matrix}C_4H_5\\C_4H_5\\C_4H_5\end{matrix}\right.$

ArsenEthylic Acid. Very deliquescent. Easily soluble in water, and alcohol. Very sparingly soluble in ether. Only slightly attacked by acids.
(*Ethyl Cacodylic Acid. MetArsenMethylic Acid*)
$C_8H_{11}AsO_4 = (C_4H_5)_2AsO_3, HO$

ArsenEthylate of Baryta. Deliquescent. Very easily soluble in water; more difficultly soluble in alcohol.

ArsenEthylate of Copper. Ppt.

ArsenEthylate *of sesquioxide* of Iron. Ppt. Difficultly soluble in chlorhydric acid.

ArsenEthylate of Lead. Ppt.

ArsenEthylate *of dinoxide* of Mercury. Ppt.

ArsenEthylate *of protoxide* of Mercury. Deliquescent.

ArsenEthylate of Silver. Ppt. Soluble in ammonia-water.

ArsenEthylium. Not isolated. Its salts are readily soluble in water.
$(C_4H_5)_4As$

Arsenic Acid. On allowing a portion of the anhydrous acid to deliquesce in the air, the deliquium being poured off twice a day and kept by itself, and finally concentrating this solution by heat, until on cooling it to 12.5° a portion of solid acid separated out, a clear liquid of 2.55 sp. gr. was obtained: on exposure to the air this liquid absorbed moisture, and after a few days its sp. gr. had fallen to 1.935. On cooling the concentrated solution, of 2.55 sp. gr., to — 26.25° by means of a freezing mixture, and keeping it at this temperature during half an hour, it exhibited no tendency to solidify, but remained perfectly fluid. 100 pts. of this strong solution were found to contain 71 pts. of AsO_5, hence 1 pt. of the acid is soluble is 0.405 pt. of water at 12.5°; or 100 pts. of water at 12.5° dissolve 244.81 pts. of it. (A. Vogel, *Kastner's Archiv.*, 1826, **9.** 319.) Soluble in 0.5 pt. of water. (Thènard.) Soluble in 6 parts of cold water, and, more quickly in 2 parts of hot water. (Bucholz.) 100 pts. of water at 15.56° dissolve 150 pts. of arsenic acid. (Ure's *Dict.*) The aqueous solution saturated at 15° contains 15% of it. (M. R. & P.) When anhydrous arsenic acid is treated with water, a portion dissolves at once, but the remainder separates as a powder, which, however, dissolves completely after long-continued digestion with water, especially if the mixture is frequently agitated. Easily soluble in alcohol. Only very slightly soluble in the fatty oils, 1000 pts. of oil dissolving only 0.2 pt. of it in the cold, and about 1 pt. of it, with partial decomposition, when boiling. (Berzelius, *Lehrb.*, **2.** 259.) 1000 pts. of boiling poppy-oil dissolve 27 pts. of it. 1000 pts. of boiling castor-oil dissolve 34 pts. of it. (Heimpel & Grundner.) Much more soluble in alcohol than arsenious acid. (L. Gmelin.) It is not precipitated by sulphuretted hydrogen from solutions containing citric acid. (Spiller.)
AsO_5

E. Kopp distinguishes several definite hydrates of arsenic acid, as follows:

a = *anhydrous.* AsO_5 Permanent. Insoluble in water or in ammonia-water.

$b = AsO_5, HO$ Slowly soluble in cold water. Tolerably easily soluble in slightly warm water, with evolution of heat.

$c = AsO_5, 2HO$ Tolerably easily soluble in water, with evolution of much heat.

$d = AsO_5, 3HO$ Easily soluble in water, without notable change of temperature.

$e = AsO_5, 4HO$ Extremely deliquescent. Instantly soluble in water, with production of cold. (E. Kopp, *Ann. Ch. et Phys.*, (3.) **48.** 106.)

Of the trisarseniates, water dissolves only those of the more soluble alkalies; the others are soluble in acids and in solutions of ammoniacal salts.

Most of them are soluble in arsenic acid. (Dumas, *Tr.*)

An aqueous solution of sp. gr. (at 15°)	Contains (by experiment) per cent of $3HO, AsO_5$.	An aqueous solution of sp. gr. (at 15°)	Contains (by experiment) per cent of $3HO, AsO_5$.
1.0495	7.5	1.2350	30
1.1052	15.0	1.3973	45
1.1666	22.5	1.7346	67.4

From these results Schiff deduces the formula: $D = 1 + 0.006634\,p + 0.00001964\,p^2 + 0.0000006474\,p^3$, in which D = the sp. gr. of the solution and p the percentage of substance in the solution, by means of which Ott has calculated the following table: —

Sp. Gr. (at 15°)	Per Cent of $3HO, AsO_5$.	Per Ct. of AsO_5	Sp. Gr. (at 15°)	Per Cent of $3HO, AsO_5$.	Per Ct. of AsO_5.

(H. Schiff, *Ann. Ch. u. Pharm.*, 1860, **113.** 193.)

ARSENIATE OF ALUMINA.

I.) Insoluble in water, soluble in acids. $2 Al_2O_3, 3 AsO_5$ (Berthier.)

II.) *acid.* Easily soluble in water. (Berzelius, *Lehrb.*)

ARSENIATE OF AMMONIA.

I.) *tris.* $3 NH_4O, AsO_5$ Difficultly soluble in water. Less soluble in water than the dinarseniate.

II.) *din.* $2 NH_4O, HO, AsO_5 + Aq$ Effloresces, with decomposition. More soluble in water than the trisarseniate. (Mitscherlich.)

III.) *mono.* $NH_4O, 2 HO, AsO_5$ Permanent. Very easily soluble in water.

ARSENIATE OF AMMONIA & OF BARYTA.

I.) $= NH_4O, BaO, HO, AsO_5$ Easily efflorescent. Insoluble in water. (Baumann.)

II.) $= NH_4O, 2 BaO, AsO_5 + 4 Aq$ Ppt.

ARSENIATE OF AMMONIA & OF COPPER. $3 NH_4O, CuO, AsO_5 + Aq$ Permanent. Soluble in ammonia-water.

ARSENIATE OF AMMONIA & OF LIME. Ppt.

I.) NH_4O, CaO, HO, AsO_5

II.) $NH_4O, 2 CaO, AsO_5 + 13 Aq$ Efflorescent. Slightly soluble in water, and in a solution of chloride of ammonium. Sparingly soluble in ammonia-water. (Wach.)

ARSENIATE OF AMMONIA & OF MAGNESIA. $2 MgO, NH_4O, AsO_5 + 12 Aq$ Slowly efflorescent. Very difficultly soluble in water, easily soluble in acids. (Wach.)

Very difficultly soluble in ammonia-water. (Levol.) Of the salt dried at 100° ($= 2 MgO, NH_4O, AsO_5 + Aq$), 1 part dissolves in 4926. pts. water at 15°; and of the anhydrous salt, 1 pt. requires 5154 pts. water at 15°. It is much more difficultly soluble in ammoniacal water: 1 pt. of the salt dried at 100° requiring 9260 pts. of a mixture of 1 pt. of solution of ammonia (of 0.96 sp. gr.) and 7 pts. water, at 15°; 1 pt. of the anhydrous salt requires 9709 pts. of the same mixture at 15°. It is much more soluble in water which contains chloride of ammonium: — 1 pt. of the anhydrous salt requiring 1600 pts. of a solution of 1 pt. chloride of ammonium in 70 pts. water, and 1044 pts. of a solution of 1 pt. chloride of ammonium in 7 pts. water. The presence of ammonia diminishes its solubility in solutions of chloride of ammonium: — 1 pt. of the anhydrous salt requiring for its solution 2790 pts. of a liquor containing 60 pts. water, 10 pts. ammonia (of 0.96 sp. gr.) and 1 pt. chloride of ammonium, and 1810 pts. of a mixture of 1 pt. chloride of ammonium, 1 pt. caustic ammonia solution, and 6 pts. water. (Fraenkel, in Fresenius's *Quant.*, p. 156; from *J. pr. Chem.*, **56.** 33.)

ARSENIATE OF AMMONIA & OF MANGANESE. $2 MnO, NH_4O, AsO_5, + 12 Aq$ Insoluble in water, and alcohol. Readily soluble in dilute acids. (Otto.)

ARSENIATE OF AMMONIA & OF SODA. $NH_4O, NaO, HO, AsO_5 + 8 Aq$ Soluble in water.

ARSENIATE OF AMMONIA & OF STRONTIA. $2 SrO, NH_4O, AsO_5 + Aq$ Ppt.

ARSENIATE OF AMMONIA with MOLYBDIC ACID. $3 NH_4O, AsO_5; 6 (HO, 4 MoO_3)$ Insoluble in water, and in nitric or other acid, or in solutions of salts, when in presence of a tolerable excess of molybdate of ammonia mixed with excess of acid. (Seligsohn, cited by Fresenius, *Quant.*, p. 157.)

ARSENIATE OF ANTIMONY. Ppt. Decomposed by water. (Berthier.) Insoluble in water. Insoluble in acids after it has once been ignited; but when recently precipitated it is soluble in concentrated boiling chlorhydric and sparingly soluble in nitric acid. (Dumas, *Tr.*)

ARSENIATE OF BARYTA.

I.) *tris.* $3 BaO, AsO_5 \& + 4 Aq$ Permanent. Very sparingly soluble in water; somewhat more soluble in ammonia-water.

Soluble in an aqueous solution of chloride of ammonium. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 315.) Its solubility in water is not increased by the presence of salts of ammonia, soda, or potash (Laugier); but arseniate of baryta is not precipitated from solutions containing citrate of soda. (Spiller.) Readily soluble in cold nitric or chlorhydric acid (Berzelius), or tartaric, or acetic acid. (Anthon.)

II.) *din.* $2 BaO, HO, AsO_5 + 3 Aq$ Very difficultly soluble in water, but is decomposed to an insoluble basic and a soluble acid salt when washed with water. (Berzelius.) Insoluble in water. (Dumas, *Tr.*) Sparingly soluble in cold acids. (Kotschouby.)

III.) *mono.* $BaO, 2 HO, AsO_5$ Easily soluble in water. (Berzelius, Mitscherlich.)

IV.) $BaO, 4 HO, 2 AsO_5$ The crystals of the monacid salt (III.) are decomposed by cold water, but this bin-acid salt is scarcely decomposed by boiling water. (Setterberg.)

V.) *Compound of Nos.* I. & II. $3 BaO, AsO_5; 2 BaO, HO, AsO_5$ Ppt. (Berzelius, *Lehrb.*, **3.** 378.)

ARSENIATE OF BISMUTH. $BiO_3^{\prime\prime\prime}, AsO_5 + 2 Aq$ Insoluble in water, or nitric acid. Soluble in chlorhydric acid. (Thènard.) Very soluble in arsenic acid. (Dumas, *Tr.*)

ARSENIATE *of protoxide* OF CERIUM. $2 CeO, AsO_5$ Insoluble in water. Soluble in arsenic acid (Berzelius), and in the acids generally.

ARSENIATE *of sesquioxide* OF CHROMIUM.

I.) *Ppt.* Insoluble in water. Soluble in an aqueous solution of chloride of chromium, but insoluble in a solution of arseniate of soda. (T. Thompson, *Phil. Trans.*, 1827, Part I. p. 212.)

II.) *acid.* Decomposed by water. (*Ibid.*)

Arseniate *of protoxide* of Cobalt.

I.) *tris.* $3\,CoO, AsO_5+8\,Aq$ (*Cobalt bloom.*) Permanent. Insoluble, even in boiling water. Easily soluble in chlorhydric, and nitric acids, and in ammonia-water. (Proust.) Soluble in arsenic acid. Soluble in a weak aqueous solution of protosulphate of iron. (Kersten.)

II.) *acid.* Soluble in water. (Kersten.)

Arseniate *of sesquioxide* of Cobalt. Ppt.

transfer to col 2 10.48

Arseniate *of protoxide* of Chromium.

Arseniate of Cinchonin. Readily soluble in water.

Arseniate *of dinoxide* of Copper.

I.) *acid.* Known only in solution.

II.) *tris?* Ppt. Soluble in ammonia-water.

Arseniate *of protoxide* of Copper.

I. *tris.* $3\,CuO, AsO_5$ Insoluble in water. Easily soluble in the stronger acids, and even in sulphurous acid; also soluble in ammonia-water. (A. Vogel.)

Arseniate of Copper & of Uranium.
$CuO, Ur_2O_3, AsO_5+8\,Aq$

Arseniate of Didymium. $5\,DiO, 2\,AsO_5+2\,HO$ Insoluble or very nearly insoluble in water. Sparingly soluble in weak acids. (Marignac, *Ann. Ch. et Phys.*, (3.) **38.** 164.)

Arseniate of Ethyl.
(*diEthyl Arsenic Acid.*)

Arseniate of Ethyl & of Baryta.

Arseniate of Glucina. $2\,Gl_2O_3, 3\,AsO_5$ Insoluble in water. Soluble in arsenic acid, a soluble acid salt being formed. (Berzelius, in his *Lehrb.*)

Arseniate of Iridium (IrO_2). Ppt.

Arseniate *of protoxide* of Iron.

I.) *tris.* Insoluble in water.
$3\,FeO, AsO_5+6\,Aq$

II.) *din.* $2\,FeO, HO, AsO_5$ Sparingly soluble in ammonia-water. Insoluble in solutions of arseniate of ammonia or of other ammonia salts. (Wittstein.)

Arseniate *of protoxide* & *of peroxide* of Iron. $FeO, Fe_2O_2, AsO_5+6\,Aq$ Insoluble in water. Readily soluble in chlorhydric, and nitric acids. Decomposed by caustic potash.

Arseniate *of sesquioxide* of Iron.

I.) "*proto.*" $Fe_2O_3, AsO_5+5\,Aq$ Easily soluble in acids. Insoluble in ammonia-water. (Berzelius.)

II.) "*neutral.*" $2\,Fe_2O_3, 3\,HO, 3\,AsO_5+9\,Aq$ Insoluble in water. When recently precipitated it is soluble in caustic ammonia, more slowly after having once become dry. (Dœbereiner, Wittstein, Berzelius.) Soluble in chlorhydric, and nitric acids. Insoluble in acetic acid, in arseniate of ammonia, or in other ammoniacal salts. (Wittstein.) Soluble in warm sulphurous acid, and in a warm solution of sulphite of ammonia, with decomposition. (Berthier, *Ann. Ch. et Phys.*, (3.) **7.** 79.)

III.) *din.* $2\,Fe_2O_3, AsO_5+12\,Aq$ Insoluble in water, or ammonia-water.

IV.) Insoluble in water, or ammonia-water.
$16\,Fe_2O_3, AsO_5+24\,Aq.$ (Berzelius.)

Arseniate *of sesquioxide* of Iron & of Lime.

Arseniate & Sulphate *of sesquioxide* of Iron & of Manganese.
$(Mn_2O_3, 6\,Fe_2O_3)\,3\,AsO_5, 4\,SO_3+45\,Aq$

By long-continued boiling with water it is decomposed, sulphuric acid being removed. Easily soluble in chlorhydric, and nitric acids. (Laugier.)

Arseniate of Lead.

I.) *tris.* $3\,PbO, AsO_5$ Insoluble in water. Insoluble in ammonia-water, and in solutions of ammoniacal salts. (Wittstein.) "Arseniate of lead" is not precipitated from solutions containing citrate of soda (Spiller); it is soluble in a saturated aqueous solution of chloride of sodium. (Becquerel, *C. R.*, 1845, **20.** 1523.)

II.) *din.* $2\,PbO, AsO_5$ Insoluble in water, or acetic acid. Soluble in chlorhydric, and nitric acids.

Arseniate of Lead with Chloride of Lead.
$3\,(3\,PbO, AsO_5); PbCl$

Arseniate of Lime.

I.) *tris.* $3\,CaO, AsO_5+3\,Aq$ Insoluble in water. Soluble in arsenic acid.

II.) *din.* $2\,CaO, HO, AsO_5+3\,Aq$ Insoluble in water. Soluble in chlorhydric, and nitric acids; also in aqueous solutions of sulphate, nitrate, and acetate of ammonia, and of chloride of ammonium. (Pfaff.) Soluble in arsenic acid.

Soluble in an aqueous solution of chloride of ammonium. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 315.)

III.) *mono.* Soluble in water.
$CaO, 2\,HO, AsO_5+Aq$

IV.) *basic.*
$6\,CaO, AsO_5+6\,Aq$

Arseniate of Lime & of Magnesia. $3\,CaO, AsO_5; 3\,MgO, AsO_5$ Soluble in nitric acid. (Kuehn.)

Arseniate of Magnesia.

I.) *din.* $2\,MgO, HO, AsO_5+14\,Aq$ Insoluble in water. Previous to ignition it is easily soluble in nitric acid, but after ignition it is insoluble. (Graham.) 1000 pts. of boiling water dissolve 1.5 pts. of it. (T. Thompson, in his *System of Chem.*, London, 1831, **2.** 533.) [Compare Bergman, *Essays*, **1.** 446.]

II.) *mono.* Easily soluble in water.
MgO, HO, AsO_5

III.) *tris.* Ppt.
$3\,MgO, AsO_5+15\,Aq$

Arseniate of Magnesia & of Potash. $2\,MgO, KO, AsO_5$ Partially decomposed by water. (H. Rose.)

Arseniate of Magnesia & of Soda.

Arseniate of Manganese.

I.) *din.* $2\,MnO, HO, AsO_5$ Insoluble in water. Soluble in nitric, and sulphuric acids. (Liebig.) Soluble in arsenic acid. (John.)

II.) *tris.* Ppt.

Arseniate *of dinoxide* of Mercury.

I.) *din.* $2\,Hg_2O, HO, AsO_5+Aq$ Insoluble in water, alcohol, acetic acid, or ammonia-water. Soluble in arsenic, and nitric acids. Sparingly soluble in nitrate of ammonia. (Simon.)

II.) *mono.* Hg_2O, AsO_5 Insoluble in water, alcohol, or acetic acid. Less soluble in nitric acid than the di-salt. (Simon.)

Arseniate *of dinoxide* of Mercury with Nitrate *of dinoxide* of
$2\,Hg_2O, AsO_5; Hg_2O, NO_5$

Mercury. Insoluble in water, or acetic acid. Soluble in nitric acid. (Simon.)

Arseniate *of protoxide* of Mercury. $2HgO, AsO_5$ Insoluble in water. Soluble in arsenic, and nitric acids. (Bergman.)

Arseniate *of protoxide* of Molybdenum. $2MoO, HO, AsO_5$ Soluble in an excess of protochloride of molybdenum.

Arseniate *of binoxide* of Molybdenum.

I.) *mono.* Ppt.
MoO, HO, AsO_5

II.) *acid.* Soluble in arsenic acid, and ammonia-water.

Arseniate of Molybdic Acid.

I.) *crystals.* Soluble in water. Decomposed at first, but finally dissolved by alcohol. (Berzelius, *Lehrb.*)

II.) *basic.* Insoluble in water.

Arseniate of Nickel.

tris. $3NiO, AsO_5 + 8Aq$ Insoluble in water. Easily soluble in ammonia-water. Soluble in arsenic acid, and in the stronger mineral acids.

Arseniate of Palladium. Ppt.

Arseniate *of binoxide* of Platinum. Easily soluble in nitric acid. (Thompson.)

Arseniate of Potash.

I.) *tris.* $3KO, AsO_5$ Deliquescent. Soluble in water. (Graham.) "Arseniate of potash" is soluble in 26.666 pts. of strong boiling alcohol. (Wenzel, in his *Verwandtschaft*, p. 300. [T.].)

II.) *din.* $2KO, HO, AsO_5$ Deliquescent. Soluble in water. (Scheele, in Dumas's *Tr.*)

III.) *mono.* Very soluble in water, especially

a = anhydrous. KO, AsO_5 in hot water. (Dumas, *Tr.*, **6.** 223.)

b = hydrated. $KO, 2HO, AsO_5$ Permanent. Soluble in 5.3 pts. of water at 6°. 100 pts. of water at 5.5° dissolve 19.047 pts. of it, forming a solution of 1.1134 sp. gr. (at 15.5°). Much more soluble in hot than in cold water. Insoluble in alcohol. (Thompson.)

Arseniate of Potash & of Soda. $KO, NaO, HO, AsO_5 + 16Aq$ Similar to the corresponding phosphate. Soluble in water.

Arseniate of Quinine. Soluble in water. It resembles the phosphate.

Arseniate *of binoxide* of Rhodium. Ppt.

Arseniate of Silver.

I.) *tris.* $3AgO, AsO_5$ Insoluble in water. Soluble in ammonia-water, and in acids. (Scheele.) Readily soluble in a solution of carbonate of ammonia, but not in solutions of sulphate, nitrate, or succinate of ammonia, even when these are hot. (Wittstein.) Very sparingly soluble in a solution of nitrate of ammonia; more freely soluble in acetic acid. (Graham.) Soluble in aqueous solutions of the soluble hyposulphites, though less readily than the phosphate, chloride, carbonate, oxalate, borate, or sulphite of silver. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 397.) Arseniate of silver is not precipitated from solutions containing citrate of soda. (Spiller.)

II.) *acid.* Decomposed by water.

Arseniate of Silver with Sulphate of Silver. $2AgO, AsO_5; AgO, SO_3$ Decomposed by water, and dilute sulphuric acid. (Setterberg.)

Arseniate of Soda.

I.) *tris.* $3NaO, AsO_5 + 24Aq$ Permanent in dry air. Soluble in 3.57 pts. of water at 15.5° (Graham); or 100 pts. of water at 15.5° dissolve 28 pts. of it. (Berzelius, *Lehrb.*) Melts in its water of crystallization at 85.5°.

Soluble in 3.75 pts. of water at 17°; or 100 pts. of water at 17° dissolve 26.7 pts. of it; or, the aqueous solution saturated at 17° contains 21.1% of it, or 10.4% of the anhydrous salt, and is of 1.1186 sp. gr. (H. Schiff, *Ann. Ch. u. Pharm.*, 1860, **113.** 350.)

An aqueous solution of sp. gr. (at 17°)	Contains (by experiment) per cent of $3NaO, AsO_5 + 24Aq.$
1.0226	4.22
1.0460	8.44
1.0577	10.55
1.0938	16.88
1.1186	21.10

From these results Schiff deduces the formula: $D = 1 + 0.005331\,p + 0.00001351\,p^2$, in which D = the sp. gr. of the solution and p the percentage of substance in the solution, by means of which Ott has calculated the following table: —

Sp. Gr. (at 17°).	Per Cent of $3NaO, AsO_5 + 24Aq.$	Per cent of $3NaO, AsO_5.$
1.0053	1	0.491
1.0107	2	0.981
1.0161	3	1.472
1.0215	4	1.962
1.0270	5	2.453
1.0325	6	2.944
1.0380	7	3.434
1.0435	8	3.925
1.0491	9	4.415
1.0547	10	4.906
1.0603	11	5.396
1.0659	12	5.887
1.0716	13	6.378
1.0773	14	6.868
1.0830	15	7.359
1.0887	16	7.849
1.0945	17	8.340
1.1003	18	8.831
1.1061	19	9.321
1.1120	20	9.812
1.1179	21	10.302
1.1238	22	10.793

(H. Schiff, *Ann. Ch. u. Pharm.*, 1860, **113.** 195.)

"Arseniate of Soda" is soluble in 60 pts. of boiling alcohol. (Wenzel, in his *Verwandtschaft*, p. 300. [T.].)

II.) *din.*

a = anhydrous. $2NaO, AsO_5$ Less soluble in water than the mono-arseniate.

b = $2NaO, HO, AsO_5 + 15Aq$ Permanent. Soluble in water. (L. Gmelin.)

c = $2NaO, HO, AsO_5 + 24Aq$ Quickly efflorescent. Readily soluble in water. (Mitscherlich.) Soluble in 1.79 pts. of water at 14°; or 100 parts of water at 14° dissolve 56 pts. of it; or an aqueous solution saturated at 14° contains 35.9% of it, or 16.5% of the anhydrous salt, and is of 1.1722 sp. gr. (H. Schiff, *Ann. Ch. u. Pharm.*, 1860, **113.** 350.) 100 pts. of water at 7.2° dissolve 22.268 pts. of it. Insoluble in alcohol. When heated it melts in its water of crystallization. (Thompson? [T.].)

An aqueous solution of sp. gr. (at 14°)	Contains (by experiment) per cent of $2NaO, HO, AsO_5 + 24Aq.$
1.0169	4.0
1.0344	8.0
1.0525	12.0
1.0714	16.0
1.1102	23.9
1.1722	35.9

From these results Schiff deduces the formula: $D = 1 + 0.00416\ p + 0.00001805\ p^2$, in which D = the sp. gr. of the solution and p the percentage of substance contained in it, by means of which Ott has calculated the following table: —

Sp. Gr. (at 14°).	Per Cent of $2NaO, HO, AsO_5 + 24Aq.$	Per Cent of the anhydrous salt.
1.0042	1	0.463
1.0084	2	0.925
1.0126	3	1.388
1.0168	4	1.850
1.0212	5	2.313
1.0256	6	2.776

1.1786	37	17.116
1.1841	38	17.579
1.1896	39	18.041
1.1952	40	18.504

(H. Schiff, *Ann. Ch. u. Pharm.*, 1860, **113.** 194.)

III.) *mono.* Permanent. More soluble in water than the dinarseniate. (Mitscherlich.)
$NaO, 2HO, AsO_5 + 2Aq$

ARSENIATE OF SODA & OF URANIUM. Ppt.
$NaO, 2Ur_2O_3, AsO_5 + 5Aq$

ARSENIATE OF SODA with FLUORIDE OF SODIUM. Soluble in 9.5 pts. of water at 25°. Soluble in 2 pts. of water at 75°. (Briegleb, in Wittstein's *Handw.*)
$3NaO, AsO_5; NaFl + 24Aq$

ARSENIATE OF SODA with SULPHATE OF SODA. Permanent.
$a = 2NaO, AsO_5; NaO, SO_3$
$b = 4NaO, 3AsO_5; 2(NaO, SO_3)$

ARSENIATE OF STRONTIA.

I.) *din.* Insoluble in cold water. Decomposed by hot water to a basic, and a soluble acid salt. Soluble in acetic acid, and very easily in chlorhydric acid. (Kotschoubey.) 100 pts. of water at 15.5° dissolve 0.284 pt. of it. (T. Thompson, in his *System of Chem.*, London, 1831, **2.** 500.) Soluble in nitric acid.
$2SrO, HO, AsO_5 + 3Aq$

II.) *mono.* Easily soluble in arsenic acid.

ARSENIATE OF THORIA. Insoluble in water, or arsenic acid. (Berzelius.)
$2ThO, AsO_5$

ARSENIATE *of protoxide* OF TIN. Insoluble in water.

ARSENIATE *of binoxide* OF TIN. Insoluble in water, and in dilute nitric acid. (Haeffely, *Phil. Mag.*, (4.) **10.** 291.)
$2SnO_2, AsO_5 + 10Aq$

ARSENIATE OF TITANIUM. Insoluble in water. Soluble in chlorhydric, titanic, and arsenic acids; also soluble in solutions of titanium salts. (H. Rose.)

ARSENIATE *of protoxide* OF URANIUM.

I.) *tris.*

II.) *din.* Ppt. Easily soluble in chlorhydric acid, and is not precipitated from this solution on the addition of water. (Rammelsberg.)
$2UrO, HO, AsO_5 + 3Aq$

ARSENIATE *of sesquioxide* OF URANIUM.

I.) *din.* Insoluble in water. (Berzelius.) Soluble in an aqueous solution of carbonate of potash. (Ebelmen, *Ann. Ch. et Phys.*, (3.) **5.** 220.)
$2Ur_2O_3, HO, AsO_5 + 8Aq$

II.) *mono.*
$Ur_2O_3, 2HO, AsO_5 + 3Aq$

ARSENIATE OF VANADIUM.

I.) *"basic."* Easily soluble in water.

II.) *mono.* Very slowly soluble even in boiling water, or in water acidulated with arsenic acid, but when once dissolved it does not separate out again on cooling the solution. Insoluble in alcohol. Quickly soluble in chlorhydric acid. (Berzelius.)
VO_2, HO, AsO_5

ARSENIATE *of teroxide* OF VANADIUM (VANADIC ACID). Resembles the phosphate.
$2VO_3, 3HO, 3AsO_5$

ARSENIATE OF YTTRIA.

I.) *tris.* Insoluble in water or ammonia-water. Soluble in nitric acid.

II.) *din.* Insoluble in water. Easily soluble in nitric acid. Ammonia water decomposes it to the tris-salt.
$2YO, AsO_5$

III.) *mono.* Soluble in arsenic acid, the solution being decomposed on boiling.

ARSENIATE OF ZINC.

I.) *tris.* Insoluble in water. Soluble in arsenic, and nitric acids.

II.) *"acid."*

ARSENIATE OF ZINC & OF ZINCAMMONIUM. Insoluble in water. Soluble in acids, and in aqueous solutions of caustic potash, and ammonia. (Bette.)
$N\left\{\begin{matrix}H_3\\Zn\end{matrix}\right. O, 2ZnO, AsO_5 + 3Aq$

ARSENIATE OF ZIRCONIUM. Insoluble in water. (Berzelius.)

ARSENIC. Insoluble in water. Decomposed by water which contains air, arsenious acid being formed and dissolved. Unacted upon by chlorhydric acid when out of contact with the
As

air, but when the two are exposed to the atmosphere a small quantity of chloride is formed. Oxidized, with violence, by nitric acid, and aqua-regia, also oxidized by concentrated sulphuric acid.

Insoluble in alcohol, or ether, but soluble in many fatty oils, when heated therewith.

Arsenic is not attacked at the ordinary temperature, 20°, by nitric acid of any degree of concentration whether pure or contaminated with nitrous acid. Nor is it attacked by a mixture of nitric and chlorhydric acids, so long as these, either from being dilute or on account of a low temperature, cannot react upon each other; but if the arsenic is treated with a mixture of these acids in a state of extreme dilution and a few drops of an aqueous solution of nitrite of potash added, an action will commence at once. (Millon, *Ann. Ch. et Phys.*, (3.) **6.** 101.) All the metallic arsenides are insoluble in water; but those of the alkalies are decomposed by water, and many of the others are decomposed by weak acids.

Arsenide of Aluminum. Slowly decomposed by cold, rapidly by hot water.

Arsenide of Antimony.

Arsenide of Bismuth.

Arsenide of Butyl. *Vid.* ArsenButyl.

Arsenide of Cobalt.
$Co\,As$

Arsenide of Cobalt with Sulphide of
(*Cobalt Glance.*) Cobalt. Soluble, with decomposition, in nitric acid.
$Co\,As, Co\,S$

Arsenide of Ethyl. *Vid.* ArsenEthyl.

Arsenide of Glucinum. Decomposed by water.

Arsenide of Hydrogen. *Vid.* Arseniuretted Hydrogen.

Arsenide of Iron. Soluble, with decomposition, in nitric acid.

*Proto*Arsenide of Iron with *bi*Sulphide of
$Fe\,As\,;\ Fe\,S_2$ Iron. Soluble, with decomposition, in strong nitric acid, and aqua-regia.

Arsenide of Manganese. Slowly soluble
$Mn_2\,As$ in nitric acid. Soluble in aqua-regia. (Kane.)

Arsenide of Mercury with Chloride of Mercury.

I.) Decomposed by boiling water. (Capitaine.)
$Hg\,As\,;\ Hg\,Cl$

II.) ? Unacted upon by water or chlorhydric
(*Brown sublimate.*) acid. Decomposed by alkaline solutions. (Berzelius, *Lehrb.*)

Arsenide of Methyl. *Vid.* Cacodyl.

Arsenide of Nickel.

Arsenide of Nickel with *bi*Sulphide of
$Ni\,As\,;\ Ni\,S_2$ Nickel. Soluble, with decomposition, in nitric acid.

Arsenide of Platinum.

Arsenide of Potassium. Decomposed by
$As\,K_3$ water.

Arsenide of Propyl. *Vid.* ArsenPropyl.

Arsenide of Sodium. Decomposed by water.

Arsenide of Tin. Decomposed by acids.

Arsenide of Zinc.

Arsenious Acid. Occurs in two allotropic
$As\,O_3$ modifications: —

$\alpha =$ Crystalline (octohedral), white, or opaque.

$\beta =$ Amorphous, transparent, or glassy.

Both modifications are very slowly soluble in cold, more quickly soluble in boiling water.

The remarkable variations in the results of the different chemists who have attempted to determine the solubility of arsenious acid is not merely dependent upon the fact that the two modifications are of unlike solubility, but also upon the slowness with which the acid dissolves, and upon the circumstance that it does not completely dissolve in the space of time usually allotted to similar experiments when a portion of it is boiled with very many times as much water as is required for its ultimate solution, by which many observers have doubtless been deceived. (Berzelius, *Lehrb.*, **2.** 256.) The hot aqueous solution contains 1 pt. of $As\,O_3$ in 10 @ 12 pts. of water; on cooling the solution a portion of arsenious acid separates out, leaving a solution which contains 1 pt. of the acid in every 20 @ 30 pts. of water

1 pt. of $As\,O_3$ is soluble in 10.55 pts. of boiling water. (Wenzel, in his *Lehre von d. Verwandtschaft*, p. 444. [K.].) In 11.34 pts. of boiling water. (Fischer.) Soluble in 11.86 pts. of water after having been boiled therewith during ¼ of an hour; the saturated boiling solution containing 7.78% of it. (Klaproth, *loc. inf. cit.*) Soluble in 12.2 pts. of boiling water (Bucholz); in 15 pts. (Brandt, Justi; Bergman, *Opusc.*, II. p. 192 [N.]); in 16 pts. (Vogel); in 24 pts. (Lametherie); in 40 pts. (Pœrner); in 64 pts. (Baumé); in 80 pts. (Navier, *Gegengifte des Arseniks*, I. 12 [N.]); in 200 pts. (Aschof & Nasse, *Schweigger's Journ. für Ch. u. Phys.*, 1812, **5.** 218); in 640 pts. (Hagen, *Gründsätze der Chemie*, Königsberg, 1796, p. 456 [K.]; in 7.72 pts., if it has previously become opaque, and in 9.33 pts., if it is still transparent (Guibourt); in 21 pts., if it is transparent, and in 24 pts., if opaque. (Taylor.) 1 pt. of arsenious acid is soluble in 53.3 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in Canstatt's *Jahresbericht, für* 1854, p. 75.) Soluble in 30 pts. of water at ?. (Mussembroek, cited in *Ann. de Chim.*, **28.** 288.) To dissolve 1 pt. of arsenious acid in 12 pts. of water it is necessary to boil an excess of it with the water; if one part of the acid is boiled with only 12 pts. of water a considerable quantity remains undissolved; even with 1 pt. of the acid in 50 or 60 parts of water, long-continued boiling is necessary to effect complete solution. If a clear solution, saturated by long boiling with excess of acid, and then poured off from the undissolved portion, be boiled down continuously to one half of its original bulk, the whole of the acid remains dissolved, so that the concentrated liquid contains 1 pt. of the acid in 6 pts. of water. (Fischer.) After this solution has been left to stand for some time at ordinary temperatures, 1 pt. of arsenious acid remains dissolved in 16 pts. of water at 16°, and in 20 pts. of water at 7° (Bucholz); in 33 pts. of water (Klaproth); in 38.45 pts. of water after three days, in 55 pts. of water after eight days, and in 64.50 pts. of water after two or three weeks at 10° (Fischer); in 33.52 pts. of water if the acid had become opaque before it was dissolved, and in 55.06 pts. of water if it was transparent at the time of solution (Guibourt); in 38 pts. of water, after half a year, if it was opaque, and in 53 @ 71 parts of water, after forty-eight hours, if it was transparent. (Taylor.)

When pulverized arsenious acid in excess is left to digest for several days in cold water, 1 pt. of it dissolves in 50 pts. of the water (Bucholz); 1 pt.

of it dissolves in 66 pts. of the water (Fischer); 1 pt. of it dissolves in 80 pts. of the water at 15° (Bergman, *Opusc.*, II. p. 192 [N.]); 1 pt. of it dissolves in 80 pts. of water, if it had become opaque, and in 103 pts., if it was still transparent (Guibourt); 1 pt. of it dissolves in 96 pts. of water at 10° (Spelman); 1 pt. of it dissolves in 96 pts. of water at 35.55° (Hahneman, *Ueber die Arsenikvergiftung*, p. 10 [N.]); 1 pt. of it dissolves in 320 pts. of water at 20°. (Aschof & Nasse, *Schweigger's Journ. für Ch. u. Phys.*, 1812, **5.** 218.)

100 pts. of water, after boiling ¼ hour, dissolve 8.434 pts. of it. After being in contact with it, with frequent agitation, during 24 hours, 0.25 pt., and when a hoiling saturated solution is cooled to about 15° and kept at this temperature during 3 days, 0.3 pt. (Klaproth, *Schweigger's Journ. für Ch. u. Phys.*, 1812, **6.** 231.) "According to Klaproth, boiling water dissolves from 7 @ 8% of white oxide of arsenic, but on cooling it retains only about 3%; and this I find is gradually deposited on the sides of the vessel till it is reduced to 2% or less in cold weather, and by some months standing. Water of 15.56°, or under, dissolves no more than ¼% of the oxide." (Dalton, in his *New System*, **2.** 63.) 100 pts. of the aqueous solution of the transparent modification saturated at 15° contain 0.96 pt. of it, and 9.68 pts. when the solution is saturated at the boiling-point. If one part of pulverized arsenious acid be digested for 10 days at 19° to 25° in from 5 to 10 parts of water, the resulting solution contains 1 pt. of the acid in 50 pts. of water; a solution of the same strength is obtained in 25 days by digesting one part of the acid in 40 pts. of water. If 1 pt. of the acid be immersed in 80 pts. of water, the resulting solution contains $\frac{1}{90}$; with 160 pts. of water $\frac{1}{180}$; with 240 pts. of water $\frac{1}{280}$; with 1000 pts. of water $\frac{1}{1200}$; and even when 1 pt. of acid is digested at ordinary temperatures for several days with 16000 to 100,000 pts. of water a portion still remains undissolved. Pulverized opaque arsenious acid was immersed in various proportions of water, and the liquid set aside in closed bottles and in a cool place. After 18 years, the following results were obtained: 1 pt. of AsO_3 in 1000 pts. of water: perfect solution; the liquid contained nothing but arsenious acid and arsenic acid. 1 pt. AsO_3 in 100 pts. of water: 0.017 pt. of the acid remained undissolved. 1 pt. of the acid in 35 pts. of water: the undissolved portion amounted to 0.35 pt., so that the solution contained 1 pt. of acid in 54 pts. of water. (L. Gmelin, in his *Handbook*, **4.** 257.) 100 pts. of the aqueous solution of the opaque modification saturated at 15° contain 1.25 pts. of it, and 11.47 pts. when the solution is saturated at the boiling-point. When the hoiling solution has become cold 2.90% of arsenious acid is retained in solution.

Berzelius (*Lehrb.*, **2.** 255), citing [Guibourt?], remarks: the porcelaneous modification is much the more soluhle in water. 100 pts. of water at the ordinary temperature dissolve 0 96 pt. of the glassy modification and 1.25 pts. of that which has become opaque; 100 pts. of boiling water dissolve 9.68 pts. of the former and 11.47 pts. of the latter, and when the temperature of this solution has fallen to 15° the solution prepared with the glassy modification retains 1.78 pts. while that prepared with the opaque acid retains 2.9 pts.

Bussy finds that the vitreous acid dissolves more quickly and more abundantly in water than that which has become opaque; the same quantity of water which at 12° or 13° will take up 36 @ 38 pts. of the former, will not dissolve more than 12 or 14 pts. of the latter. By long boiling with water, the opaque acid is converted into the transparent variety, — that is to say, it acquires the solubility of the latter, so that a litre of the fluid takes up 110 grms. of the acid. On the other hand by the continued action of water and of a low temperature, the vitreous acid is converted into the opaque, — that is to say, the solution after a while becomes weaker, retaining only the proportion of acid which corresponds to the solubility of the opaque variety. Comminution diminishes the solubility of the opaque and increases that of the vitreous acid. Arsenious acid which has been rendered opaque by the action of ammonia, and that which has been crystallized from an aqueous solution, are equally soluble in water. The anomalies relating to the solubility of arsenious acid in water may perhaps be due to the simultaneous occurrence of both modifications of it in the solution. (Bussy, *C. R.*, **24.** 774.) Very sparingly soluble in absolute alcohol at ordinary temperatures. (A. Vogel.) Soluble in 80 pts. of highly rectified alcohol. (Wenzel, in his *Verwandtschaft*, p. 300. [T.].) When 1 pt. of powdered arsenious acid is digested for 30 days in from 10 to 40 pts. of alcohol a solution is formed containing 1 pt. of acid in 60 pts. of alcohol; when 1 pt. of the acid is digested with from 60 to 150 pts. of alcohol a solution is formed containing 1 pt. of acid in 124 @ 140 pts. of alcohol. (N. Fischer.) Soluble in 70 @ 80 pts. of alcohol. Soluble in oils. (Thompson's *System.*) Insoluble in ether.

Readily soluble in an aqueous solution of arsenite of ammonia (or in caustic ammonia) when digested therewith at 70° @ 80°, crystallizing out again in a state of purity as the solution cools. (Berzelius, *Lehrb.*, **2.** 253.) Slightly soluble without alteration in the fatty oils, but the degree of solubility varies with the different oils; castor-oil dissolves the most of any, 1000 pts. of this oil dissolving 1.33 pts. of AsO_3 at the ordinary temperature, and 9 pts. at the temperature of boiling. Other oils dissolve in 1000 pts. 0.6 @ 0.8 pt. of it in the cold, and about 1.7 pts. at the temperature of boiling. (Berzelius, *Lehrb.*, **2.** 256.) Insoluble in quinolein (leukol), or in anilin (*Ann. Ch. et Phys.*, (3.) **9.** pp. 143, 169.) Soluble in chlorhydric acid; in smaller quantity in sulphuric, or nitric acid, and in still smaller in acetic acid.

The vitreous modification dissolves more rapidly in chlorhydric acid than the opaque. (Bussy, *loc. cit.*) Much more easily and abundantly soluble in acids than in water. Some of the acids dissolve it when hot, and deposit it entirely on cooling; but some of the vegetable acids as well as chlorhydric acid retain a considerable quantity even in the cold.

Readily soluble in a hot aqueous solution of benzoic acid, with combination; the compound formed being readily soluble in hot water. (Trommsdorff.) Soluble in aqueous solutions of tartaric and phosphoric acids.

Easily soluble in a cold aqueous solution of oxalic acid. (Bergman, *Essays*, **1.** 327.) When finely pulverized, it dissolves in a concentrated boiling solution of oxalic acid, hut separates again on cooling, not appearing to combine with it. A hot solution of binoxalate of potash dissolves arsenious acid much more readily, with combination. (Souchay & Lennssen.) Soluble to a considerable extent in anhydrous terchloride of arsenic. (Penny & Wallace.) Readily soluble in potash and soda lye. More readily soluble in ammonia-water than in pure water.

Some of the arsenites are soluble in water, those of the alkalies being easily soluble; those of the alkaline earths are difficultly soluble or insoluble, and the others all insoluble in water. But all are soluble in chlorhydric acid, and several are soluble in aqueous solutions of sulphate, or nitrate of ammonia, and of chloride of ammonium.

Arsenite of Ammonia.

I.) *basic.* Soluble in ammonia-water.

II.) *din.* $2NH_4O, AsO_3$ Soon decomposes when exposed to the air. Insoluble in alcohol or ether. (J. Stein.)

III.) *mono.* Soluble in water, with loss of some of its ammonia. (Pasteur.)

IV.) *acid.* Soluble in water; less easily soluble in a large excess of ammonia-water. (Fischer.) When an aqueous solution of arsenite of ammonia is exposed to the air, the ammonia gradually evaporates [to a certain extent], and crystals of arsenious acid are deposited. (Berzelius, *Lehrb.*, **2.** 253.)

Arsenite of Antimony. Soluble in a small amount of water, but is insoluble in a large quantity. (Berzelius.) Completely soluble in potash lye. (Reynoso.)

Arsenite of Baryta.

I.) *din.* $2BaO, AsO_3 + 4Aq$ Sparingly soluble in water. Also somewhat soluble in alcohol. (J. Stein.) Sparingly soluble in aqueous solutions of arsenious acid, and of caustic baryta. (Dumas, *Tr.*) Soluble in an aqueous solution of chloride of ammonium. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 316.) Arsenite of baryta is not precipitated from solutions containing citrate of soda. (Spiller.)

II.) *mono.* BaO, AsO_3 Easily soluble in water when recently precipitated, but is insoluble after having once become dry. It is precipitated from its aqueous solution when the latter is boiled. (Filhol.)

"**Arsenite of Bromide of Arsenic.**" $AsBr_3, AsO_3$ Water dissolves out some of the arsenious acid. Insoluble in alcohol. (Sérullas.)

Arsenite of Cobalt. $3CoO, 2AsO_3 + 4Aq$ Easily soluble in chlorhydric, and nitric acids, and in ammonia-water. (Proust.) Completely soluble in potash lye. (Reynoso.)

Arsenite of Copper. (*Scheele's Green.*) $2CuO, AsO_3$ Insoluble in water, Easily soluble in most acids, in alkaline solutions, and ammonia-water. (Berzelius.) It is not precipitated from solutions containing citrate of soda. (Spiller.)

Arsenite of Copper with Butyrate of Copper. $2(CuO, AsO_3); C_8H_7CuO_4$ Ppt.

"**Arsenite of Iodide of Arsenic.**" AsI_3, AsO_3 Very sparingly soluble in water, though more soluble in hot than in cold. Still less soluble in alcohol. (Sérullas.)

"**Arsenite of Iodide of Potassium.**" $KI, 3AsO_3$ Soluble in 19 pts. of boiling water. (Emmet.) Soluble in 20 pts. of boiling, and in 40 pts. of cold water. (Emmet, in Wittstein's *Handw.*) Boiling water dissolves 5% of its weight of it, of which one half separates out again as the solution cools. (Berzelius, *Lehrb.*)

Arsenite *of protoxide* of Iron. $2FeO, AsO_3$ Ppt. Soluble in ammonia-water. Insoluble in solutions of arsenite of ammonia, or of other ammoniacal salts. (Wittstein.)

Arsenite *of sesquioxide* of Iron.

I.) *din.* $2Fe_2O_3\ 3AsO_3 \& + 7Aq$ Partially soluble in an aqueous solution of caustic potash. (Damour.) Completely soluble in potash lye. (Reynoso.) Soluble in an aqueous solution of caustic soda, and the residue left when this solution is evaporated to dryness is completely soluble in water. (Guibourt.)

II.) *tetra.* $4Fe_2O_3, AsO_3 + 5Aq$ Unacted on by acetic acid. Dissolved with decomposition by other acids. (Bunsen.)

Arsenite of Lead.

I.) *tris.* Ppt.
$3PbO, AsO_3$

II.) *din.* $2PbO, AsO_3 + xAq$ Insoluble in water, ammonia-water, an aqueous solution of arsenite of ammonia, or of other ammonical salt. (Wittstein.)

III.) *mono.* $PbO, AsO_3 + xAq$ Slightly soluble in water. (Berzelius.) Insoluble in potash, but soluble in soda-lye.

Arsenite of Lime.

I.) *din.* $2CaO, AsO_3 + Aq$ Sparingly soluble in water. Insoluble in water, especially if this contain hydrate of lime in solution. (Berzelius, *Lehrb.*, **3.** 424.) It is no longer precipitated if 4000 @ 5000 pts. of water are present. (Harting, Lassaigne.) It is not precipitated from solutions which contain ammoniacal salts; and the precipitated salt is itself dissolved by aqueous solutions of sulphate, nitrate, and acetate of ammonia, and of chloride of ammonium (Gieseke & Schweigger); also by a solution of succinate of ammonia, but by solutions of carbonate and phosphate of ammonia it is decomposed without being dissolved. (Wittstein.) When recently precipitated it is soluble in an aqueous solution of chloride of ammonium. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 316.) Soluble in an aqueous solution of arsenite of ammonia, if too great an excess of alkali be avoided. (Schweigger.) Soluble in an aqueous solution of chloride of calcium. (J. M. Ordway.) "About 3000 or 4000 parts of chloride of potassium or chloride of sodium, dissolved in water, slightly increase its solubility." (Gmelin's *Handbook*, **4.** 303.) Readily soluble in dilute and weak acids.

Arsenite of lime is not precipitated from solutions containing citrate of soda. (Spiller.)

II.) *mono.* $CaO, AsO_3 \& + \frac{1}{2}Aq$ Somewhat soluble in water. (Simon.) Soluble in a large excess of lime-water or of an aqueous solution of arsenious acid. (Dumas, *Tr.*)

III.) *basic.* $3CaO, 2AsO_3 + 3Aq$ Soluble in an aqueous solution of arsenious acid. (J. Stein.)

Arsenite of Magnesia. Ppt.
$3MgO, AsO_3$

Arsenite of Manganese. Ppt.
$3MnO, 2AsO_3 + 5Aq$

Arsenite *of dinoxide* of Mercury. $2Hg_2O, AsO_3$ Insoluble in water. Soluble in nitric acid.

Arsenite *of protoxide* of Mercury. $2HgO, AsO_3$ Insoluble in water. Soluble in nitric acid, and in an aqueous solution of arsenite of potash.

Arsenite of Nickel.

I.) $2NiO, AsO_3$ Insoluble in water. Easily soluble in ammonia-water, and chlorhydric acid. (Proust.) Completely soluble in potash-lye. (Reynoso.)

II.) $3NiO, 2AsO_3 + 4Aq$ Ppt. (Girard.)

Arsenite of Potash.

I.) *din.* $2\,KO, As\,O_3$ Hygroscopic. Soluble in water. (Dumas, *Tr.*) Insoluble in alcohol. (Pasteur.)

II.) *mono.* $KO, As\,O_3$ Slightly soluble in alcohol. (Pasteur.)

III.) *bin.* $KO, 2\,As\,O_3 + 2\,Aq$ Sparingly soluble in alcohol. (Pasteur.)

Some of the above, if not all of them, are soluble in water. (Simon.)

Arsenite of Potash with **Iodide of Potassium.**

I.) $3\,(KO, HO, As\,O_3); KI$ Tolerably readily soluble, especially in boiling water, and alcohol. Decomposed by acids.

II.) $KO, HO, 3\,As\,O_3; KI$ Difficultly soluble in water. (Harms, *Ann. Ch. u. Pharm.*, **91**. 372.)

Arsenite of Quinine. Soluble in hot, less soluble in cold water. Soluble in alcohol at 80° (C.).

Arsenite of Silver. $3\,Ag\,O, As\,O_3$ Insoluble in water. Soluble in acids, for example, in nitric acid. When recently precipitated it is soluble, but after having been dried is insoluble in ammonia-water. (Marcet.) More readily soluble in acetic acid than phosphate of silver. (H. Rose.) Partially, but imperfectly, soluble in aqueous solutions of carbonate, sulphate, or nitrate of ammonia. (Wittstein.) Decomposed by a solution of chloride of ammonium. When in presence of 20,000 pts. of water it ceases to be precipitated. (Harting.) It is not precipitated in solutions containing any of the soluble citrates. (Spiller.) Completely soluble in potash-lye, from which it is not precipitated on the addition of chloride of potassium. This alkaline solution gradually decomposes, metallic silver separating out. (Reynoso.) Contrary to Reynoso's statement, it is not soluble in a solution of caustic potash; when treated therewith it remains unaltered at first, but is partially decomposed after a time. (Kuehn.) Soluble in an aqueous solution of arsenite of potash. (Kuehn.)

Arsenite of Soda.

I.) *din.* $2\,Na\,O, As\,O_3$ Soluble in water.

II.) *mono.* $Na\,O, As\,O_3$ Soluble in water.

III.) *bin.* $Na\,O, 2\,As\,O_3$ Soluble in water. (Pasteur.)

Arsenite of Strontia. $Sr\,O, As\,O_3 + 4\,Aq$ Sparingly soluble in water, and in aqueous solutions of caustic strontia, and arsenic acid. (Dumas, *Tr.*) Tolerably soluble in water. Very sparingly soluble in spirit. (J. Stein.)

Arsenite *of protoxide* **of Tin.** Ppt.

Arsenite *of binoxide* **of Tin.** $Sn\,O_2, As\,O_3$ Insoluble in water.

Arseniuretted Hydrogen (Gas). $As\,H_3$ Water absorbs $\frac{1}{5}$ of its own volume of the gas. It is absorbed rapidly by oil of turpentine, slightly by fixed oils, and not at all by alcohol, ether, or aqueous solutions of the alkalies. (Gm) No more soluble in alkaline solutions than in pure water. (Berzelius, *Lehrb.*) Insoluble in an alcoholic solution of caustic potash. (Meissner.) Decomposed by strong acids.

Arsen*di*Methyl. *Vid.* Cacodyl.

Arsen*tri*Methyl.
$As\,(C_2\,H_3)_3$

ArsenMethylic Acid. (*MethylArsenious Acid.*) $C_2\,H_5\,As\,O_8 = C_2\,H_3\,As\,O_4, 2\,HO$ Permanent in dry air. Very soluble in water. Dissolves in absolute alcohol much more readily than cacodylic acid. Soluble in ether. (Bæyer.)

ArsenMethylate of Ammonia.

ArsenMethylate of Baryta. $C_2\,H_3\,Ba_2\,As\,O_8, \& + 10\,Aq$ Soluble in water. Insoluble in alcohol.

ArsenMethylate of Silver. Ppt.
$C_2\,H_3\,Ag_2\,As\,O_6$

ArsenMethylEthylium. Not isolated.
$As \left\{ \begin{matrix} (C_2\,H_3)_2 \\ (C_4\,H_5)_2 \end{matrix} \right.$

ArsenMethylium. Not isolated.
$As\,(C_2\,H_3)_4$

ArsenPropyl.
(*Cacodyl of Butyric Acid.*)

ArsenSulphuric Acid. Not isolated.
$HO, As\,S_2\,O_3$

ArsenSulphate of Potash. $KO, 2\,HO, As\,S_2\,O_3$ Permanent. Slightly soluble in water, the solution soon undergoing decomposition, especially on boiling. (Bouquet & Cloez.)

Arthanitin. (*Cyclamin.* From *Cyclamen europæum.*) Soluble in 500 pts. of cold water; more easily soluble in acidulated water. Easily soluble in alcohol. Insoluble in ether, or in the fatty or essential oils. Partially decomposed by boiling water, or alcohol, being less soluble in alcohol after such treatment. Decomposed by concentrated sulphuric and nitric acids.

Asarone (from *Asarum europæum*). (*Asarin. Asarit. Camphor of Asarum.*) $C_{40}\,H_{26}\,O_{10}$ Insoluble, or only very slightly soluble, in water. Easily soluble in alcohol. Also soluble in ether, and the essential oils. Soluble in cold concentrated sulphuric acid, without immediate decomposition, and may be re-precipitated by water if this be added soon after its solution, but the solution in sulphuric acid soon decomposes.

Asbolin. Somewhat soluble in water. Easily soluble in alcohol, and ether. Insoluble in oil of turpentine, or the fatty oils. Easily soluble in nitric acid. (Braconnot.)

Asclepiadin (from *Asclepias vincetoxicum*). (*Asclepin.*) Easily soluble in water, alcohol, and a mixture of alcohol and ether. (Feneulle.)

Asclepion. $C_{40}\,H_{34}\,O_8$ Entirely insoluble in water, or alcohol. Easily soluble in ether; less soluble in oil of turpentine, naphtha, and concentrated acetic acid. (C. List.)

Asparagic Acid. *Vid.* Aspartic Acid.

Asparagin.
(*Asparamid. Althein. Isomeric with Malamid.*)

a = anhydrous. $C_8\,H_8\,N_2\,O_6 = N_2 \left\{ \begin{matrix} C_8\,H_4\,O_6'' \\ H_4 \end{matrix} \right.$ Insoluble in ether.

b = hydrated. (*ordinary.*) $C_8\,H_8\,N_2\,O_6 + 2\,Aq$ Permanent. Very sparingly soluble in cold water. (Pasteur.) Sparingly soluble in cold, more soluble in hot water.

Soluble in 58 pts. of water at 13°; the saturated solution containing 1.7% of it. (Plisson & Henry.) Soluble in about 60 pts. of cold water. (Leroy.) Soluble in 40 pts. of cold, and in 4 pts. of boiling water (Wittstein's *Handw.*); soluble in 11 pts. of cold, and in 4.44 pts. of boiling water (Biltz);

soluble in 40 parts of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) Less readily soluble when contaminated with aspartate of lime or of magnesia. (Regimbeau.) Insoluble in cold, sparingly soluble in warm absolute alcohol (Plisson & Henry); it is the more soluble in spirit in proportion as this is more dilute. Alcohol precipitates it after a while from the saturated aqueous solution.

Soluble in 700 pts. of boiling alcohol of 98%; soluble in 290 pts. of boiling alcohol of 80%; soluble in 40 pts. of boiling alcohol of 60%; soluble in 1000 pts. of cold alcohol of 80%; soluble in 500 pts. of cold alcohol of 60%. (Biltz.) Insoluble in ether, and in the fixed or essential oils. (Plisson & Henry.) Easily soluble in aqueous solutions of caustic potash, soda, and ammonia. More easily soluble in acids than in water. On boiling these solutions for a long time the asparagin is decomposed. The aqueous solution also is gradually decomposed by long-continued ebullition.

ASPARAGIN with CADMIUM. Soluble in hot water. (Dessaignes & Chantard.)
$C_8H_7CdN_2O_6$

ASPARAGIN with CHLORIDE OF MERCURY.
$C_8H_8N_2O_8; 4HgCl$ Soluble in water.

ASPARAGIN with COPPER. Almost insoluble in cold, sparingly soluble in boiling water. Very soluble in acids and in ammonia-water. (Piria, *Ann. Ch. et Phys.*, (3.) **22.** 164.)
$C_8H_7CuN_2O_8$

ASPARAGIN with LEAD. Soluble in water.

ASPARAGIN with LIME. Soluble in water.
$C_8H_7CaN_2O_6 + Aq$

ASPARAGIN with *protoxide of* MERCURY.
I.) $C_8H_7HgN_2O_6$ Soluble in water; the concentrated aqueous solution is decomposed by the addition of much water, a basic compound being precipitated. (Dessaignes.)

II.) $2HgO, C_8H_7N_2O_5$ Insoluble in water.

ASPARAGIN with POTASH. Sparingly soluble in water. Insoluble in alcohol.
$C_8H_7KN_2O_6 + Aq$

ASPARAGIN with SILVER. Soluble in hot water.
$C_8H_7AgN_2O_6$

ASPARAGIN with NITRATE OF SILVER. Soluble in water.
$C_8H_8N_2O_6; 2AgO, NO_5$

ASPARAGIN with ZINC. Soluble in hot water.
$C_8H_7ZnN_2O_8$

ASPARAMIC ACID. *Vid.* Aspartic Acid.

ASPARAMID. *Vid.* Asparagin.

ASPARTIC ACID.
(Asparagic Acid.
Asparamic Acid.)

$$C_8H_7NO_8 = N\left\{\begin{matrix}C_8H_4O_6''\\H_2\end{matrix}\right. .O, HO$$

α = *active modification.* Dissolves in 364 pts. of water at 11°. If a hot saturated solution be allowed to cool, it will be found that 1 pt. is held in solution in 232 pts. of water at 6°. (Pasteur, *Ann. Ch. et. Phys.*, (3.) **34.** 33.) Soluble in 128 pts. of water at 8.5°; and much more abundantly soluble in hot water, from which it separates as the solution cools. (Plisson.) Much less soluble in water than asparagin.

Insoluble in alcohol of 0.817 sp. gr. at the ordinary temperature. Less soluble in dilute alcohol than in water, and is insoluble in absolute alcohol. (Plisson.) Soluble, without decomposition, in cold oil of vitriol. Tolerably soluble in chlorhydric, and nitric acids, also in alkaline solutions. (Plisson.)

β = *inactive modification.* Very sparingly soluble in water; yet much more soluble than the active modification. Dissolves in 208 pts. of water at 13.5°; but if a saturated solution be allowed to cool supersaturation will occur, as with the active modification. (Pasteur, *Ann. Ch. et Phys.*, (3.) **34.** 36.) Very soluble in nitric, and chlorhydric acids. (Pasteur.) Aspartic acid is very soluble in chlorhydric acid. (Piria, *Ann. Ch. et Phys.*, (3.) **22.** 170.)

Most of the metallic aspartates are soluble in water; though their solubility differs accordingly as they have been prepared with the active or inactive modification.

ASPARTATE OF AMMONIA. Very soluble in water. (Plisson & Henry.)

ASPARTATE OF BARYTA.

I.) α (*active.*) Easily soluble in water.
$C_8H_6BaNO_8 + 4Aq$

II.) β (*inactive.*)

III.) *basic.* Soluble in water. (Dessaignes.)
$C_8H_5Ba_2NO_8 + 6Aq$

ASPARTATE OF COPPER.

I.) *normal.* Known only in solution.
α (*active.*)

II.) *basic.* Very sparingly soluble in cold, easily soluble in hot water. Soluble in warm aspartic acid, and in an aqueous solution of aspartate of soda. (Plisson & Henry.)
$C_8H_8CuNO_8, CuO, + 9Aq$

ASPARTATE *of sesquioxide* OF IRON. Soluble in aqueous solutions of terchloride of iron, and of basic aspartate of magnesia.

ASPARTATE OF LEAD.

I.) *bibasic.*
α (*active.*)
β (*inactive.*)
$C_8H_6NO_7, 2PbO$ Somewhat soluble in water. (Pasteur, *Ann. Ch. et Phys.*, (3.) **34.** 43.)

II.) *normal.* Soluble in aqueous solutions of acetate of lead, and of aspartate of potash. Easily soluble in nitric acid. (Plisson.)
$C_8H_6PbNO_8$

ASPARTATE OF LEAD with NITRATE OF LEAD.
$C_8H_6PbNO_8; PbO, NO_5$ Very sparingly soluble in cold, decomposed by warm water. (Piria, *Ann. Ch. et Phys.*, (3.) **22.** 172.)

ASPARTATE OF LIME.

I.) *normal.*
$C_8H_6CaNO_8 + Aq$
$\left.\begin{matrix}\alpha = \textit{active.}\\ \beta = \textit{inactive.}\end{matrix}\right\}$ Very soluble in water.

II.) *bibasic.* Soluble in water. (Boutron & Pelouze.)
$C_8H_5Ca_2NO_8 + 8Aq$

ASPARTATE OF MAGNESIA.

I.) *normal.* Very soluble in water. Soluble in 16 pts. of boiling water. (Wittstock.) Soluble in weak alcohol, but insoluble in strong alcohol.
$C_8H_6MgNO_8 + Aq$

II.) *basic.* Soluble in water.
$C_8H_5Mg_2NO_8 + 2Aq$

ASPARTATE *of dinoxide* OF MERCURY. Ppt. Soluble in aqueous solutions of the aspartates of potash and lime.

ASPARTATE *of protoxide* OF MERCURY.

I.) *basic* = $C_8H_5Hg_2NO_8 + Aq$ Insoluble in warm water. Easily soluble in aqueous solutions of the aspartates of potash and soda.

ASPARTATE OF MORPHINE. Soluble in water.

Aspartate of Nickel. Easily soluble in water.

Aspartate of Potash. $C_8 H_8 K N O_8$ Deliquescent. Very soluble in water. Alcohol precipitates it from the concentrated aqueous solution.

Aspartate of Silver.

I.) *normal.* $C_8 H_6 Ag N O_8$ Soluble in watcr, the aqueous solution undergoing decomposition when boiled. Insoluble in alcohol. (Laurent, in his *Chemical Method*, p. 251.)

II.) *bibasic.* $C_8 H_5 Ag_2 N O_8 + Aq$ Insoluble in water. (Laurent, *loc. cit.*) Soluble in aqueous solutions of aspartate of potash, or of soda, and of nitrate of silver.

Insoluble in an aqueous solution of nitrate of silver. (Pasteur.)

Aspartate of Soda.

I.) *normal.*

α (*active.*) $C_8 H_8 Na N O_8 + 2 Aq$ 100 pts. of water at 12.2° dissolve 89.194 pts. of it; or 1 pt. of the salt is soluble in 1.12 pts. of water at 12.2°. (Pasteur, *Ann. Ch. et Phys.*, (3.) **34.** 41.)

β (*inactive.*) 100 pts. of water at 12.5° dissolve 83.791 pts. of it; or, 1 pt. of it is soluble in 1.19 pts. of water at 12.5°. (Pasteur, *loc. cit.*)

Aspartate of Zinc. Permanent. Soluble in water.

AsperTannic Acid. (*from Asperula odorata.*) $C_{23} H_{18} O_{18} = C_{28} H_{18} O_{16}, 2 HO$ Very hygroscopic. Easily soluble in water, and alcohol. Difficultly soluble in ether. (Schwarz.)

AsperTannate of Lead. Ppt.

Asphaltene. $C_{40} H_{30} O_8$ Insoluble in water or alcohol. Soluble in ether, the fatty oils, and oil of turpentine. (Boussingault.)

Asphaltum (native). (*Asphalten.*) Insoluble in absolute alcohol. Readily soluble in ether, and oil of turpentine. Alcohol precipitates it from the ethereal solution. Insoluble in caustic lyes. (Vœlckel, *Ann. Ch. u. Pharm.*, **87.** 139.)

Asphaltum is insoluble in water. Absolute alcohol dissolves only 5% of a yellow resin, which is also soluble in ether. From the portion insoluble in alcohol, ether dissolves out 70%. Asphaltum is entirely soluble in naphtha, and in oil of turpentine. (Wittstein's *Handw.*)

The asphaltum of Albania is insoluble in water, alcohol, acids, or alkalies; but soluble in oils, petroleum, and ether. Soluble in 5 pts. of cold rectified petroleum. (Klaproth, in his *Beitræge*, **3.** 315. [T.].)

Assafœtida. Much more soluble in alcohol than in water. [See under Resins & Essences.]

Assamar. Very hygroscopic. Very easily soluble in water. Also soluble in alcohol. Insoluble in ether. Slightly soluble in a mixture of alcohol and ether. (Reichenbach.)

Athamantin. (*Valerianate of Peucedyl. Valerianate of Oreoselon.*) $C_{24} H_{15} O_7$ Insoluble in water. Easily soluble in alcohol, even when this is dilute, and ether. Abundantly soluble in oil of turpentine, and in the fixed oils. Decomposed by acids, and by alkaline solutions. (Schneidermann & Winckler.)

Atmerythrin. Insoluble in water. Soluble in alcohol. (Kane.)

Atropic Acid. Soluble in water.

Atropate of Ammonia. Soluble in water.

Atropate of Potash. Soluble in water. (Richter.)

Atropin. (*Daturin.*) $C_{34} H_{23} N O_6 = N \left\{ C_{34} H_{23} O_6''' \right.$ Permanent. Sparingly soluble in water. Soluble in 299 pts. of water at ordinary temperatures. (v. Planta.) Soluble in 500 pts. of cold water, and 30 pts. of boiling water; 1 pt. of the saturated cold solution containing 0.2% of it. (Geiger & Hesse.) Soluble in 280 pts. of cold water, and in 72 pts. of water at 100°; the saturated cold solution contains 0.36% of it, and the saturated boiling solution 1.25%. (Mohr, Redwood & Procter's *Pharmacy.*) Soluble in 200 pts. of cold water, and in 50 pts. of boiling water without crystallizing out on cooling; by continued boiling it dissolves in 30 pts. of water, from which solution the greater part of the alkaloid crystallizes, as it cools. (Parrish's *Pharm.*, p. 411.) Soluble in 3 @ 8 pts. of cold alcohol; in 21 @ 63 pts. of cold, and in 32 pts. of warm ether. Also soluble in fatty and essential oils. (Wittstein's *Handw.*) Easily soluble in alcohol, less soluble in ether. Soluble in 1.5 pts. of cold alcohol. The solution in 6 pts. of boiling ether gelatinizes on cooling. (Parrish's *Pharm.*, p. 411.) Very easily soluble in hot alcohol. More readily soluble in ether than in water. Soluble in aqueous solutions of the caustic and carbonated alkalies. (v. Planta.) Soluble in chloroform. (Rabourdin.) 100 pts. of chloroform dissolve 51.69 pts. of it. (Michael Pettenkofer, *Kopp & Will's Jahresbericht für* 1858, p. 363.) 100 pts. of chloroform dissolve 33 pts. of it. (Schlimpert, *Kopp & Will's Jahresbericht für* 1859, p. 405.) 100 pts. of olive-oil dissolve 2.62 pts. of it. (M. Pettenkofer, *loc. cit.*)

Soluble in concentrated sulphuric acid, apparently with subsequent decomposition. (Parrish's *Pharm.*, p. 411.) Easily soluble in most acids, with combination.

Its salts are permanent; ordinarily soluble in water, alcohol, and a mixture of alcohol and ether; but insoluble in pure ether. Easily soluble in alkaline solutions.

They are freely soluble in glycerin. (Parrish's *Pharm.*, p. 236.)

[In the experimental results above given, the lower numbers, with the exception of v. Planta's and Schlimpert's all refer to Daturin, which was formerly regarded as distinct from Atropin; these differences are now explained by referring to the gradual decomposition which atropin undergoes when its solutions are heated during a considerable time.]

Aurantiin. *Vid.* Hesperidin.

Auric Acid. *Vid. ter*Oxide of Gold.

Most metallic aurates are insoluble in water.

"Aurate of Ammonia." (*Fulminating gold.*) $2 N H_3, Au O_3$ Insoluble in water. Sparingly soluble without decomposition in boiling chlorhydric acid. Unacted on by cold, but decomposed by boiling concentrated sulphuric acids. Unacted on by boiling dilute sulphuric, or nitric acid. Alkalies, most acids, and alcohol, even when heated, have no action upon it. It is soluble in a solution of cyanide of potassium.

Aurate of Baryta.

Aurate of Baryta with Chloride of Barium. Soluble in an aqueous solution of chloride of barium.

Aurate of Lime. Insoluble in water. Soluble in an aqueous solution of chloride of calcium. (Fremy, *Ann. Ch. et Phys.*, (3.) **31.** 485.)

Aurate of Magnesia. Insoluble in water. Soluble in an aqueous solution of chloride of magnesium. (Pelletier.)

Aurate of Potash. Very soluble in water. $KO, AuO_3 + 6\,Aq$ (Fremy, *Ann. Ch. et Phys.*, (3.) **31.** 483.) Very soluble in water; the solution undergoing decomposition when evaporated. Soluble in alcohol. The alcoholic solution does not decompose on standing, but if heated, even to 50°, it is decomposed. (L. Figuier, *Ann. Ch. et Phys.*, (3.) **11.** 364.)

Aurate of Potash with Chloride of Potassium. Soluble in water.

Aurate of Potash with Sulphite of Potash. $4(KO, 2SO_2); KO, AuO_3 + 5\,Aq$ Soluble in water, with decomposition, especially at the temperature of boiling. Nearly insoluble in alkaline solutions. (Fremy, *Ann. Ch. et Phys.*, (3.) **31.** 485.)

Aurate of Soda with Chloride of Sodium.

Aurate of Strontia with Chloride of Strontium. Soluble in an aqueous solution of chloride of strontium. (Oberkampf.)

AuriCyanide of *X*. *Vid.* CyanAurate of *X*.

Aurite of Potash.

AuroCyanide of *X*. *Vid.* Cyanide of Gold and of *X*.

AuroSulphite of *X*. *Vid.* Aurate of *X* with Sulphite of *X*.

AuroSulphuret of *X*. *Vid.* SulphAurate of *X*.

Azadirin (from *Melia azadirachta*).

AzAnilin. *Vid.* AzoPhenylamin.

Azelaic Acid. Most of its properties are $C_{10}H_8O_4, HO$ similar to those of suberic acid (with which it is probably identical, according to Bromeis). But it is more soluble in ether than suberic acid. (Laurent.)

The salts of azelaic acid resemble closely those of suberic acid.

Azelate of Baryta. Soluble in water, and alcohol.

Azelate of Lead. Ppt.

Azelate of Lime. Sparingly soluble in water.

Azelate of Magnesium. Soluble in water, and alcohol.

Azelate of Mercury. Ppt.

Azelate of Silver. Ppt.

Azelate of Strontium. Soluble in water, and alcohol. (Laurent.)

AzErythrin. Insoluble in water. Soluble $C_{22}H_{19}NO_{22}$ in alkaline solutions.

AzErythrin with Oxide of Lead. Insoluble in alcohol or ether. (Kane.) $C_{22}H_{19}NO_{22}, 3PbO$

AzoBenzid. Very sparingly soluble in boiling water. Easily soluble in alcohol, and ether. Soluble in strong nitric, and sulphuric acids, from which solutions water separates it. Very sparingly soluble in concentrated chlorhydric acid, and in aqueous solutions of caustic potash, and ammonia. (Mitscherlich.)
(*AzoBenzol. AzoBenzene. DiPhenoyl biamin.*)
$C_{24}H_{10}N_2 = N_2 \left\{ \begin{matrix} (C_{12}H_4'')_2 \\ H_2 \end{matrix} \right.$

AzoBenzil. Nearly insoluble in water or in $C_{42}H_{15}NO_2$ aqueous solutions of potash, ammonia, or chlorhydric acid. Soluble in alcoholic solutions of potash, soda, ammonia, and chlorhydric acid, from which it crystallizes unchanged. Soluble in alcohol. (Zinin.)

AzoBenzol. *Vid.* AzoBenzid.

AzoBenzoid. Insoluble in boiling alcohol, or ether. (Laurent, *Ann. Ch. et Phys.*, 1837, (2.) **66.** 191)
(*Isomeric with Azobenzoydin.*)

AzoBenzoydin. Nearly insoluble in alcohol. $C_{86}N_5H_{37}$ Sparingly soluble in ether. Decomposed by hot acid. (Laurent.)

AzoBenzoyl. Insoluble in water. Not completely soluble in 100 pts. of boiling alcohol. Much more easily soluble in ether. Sparingly soluble in ether and very slightly soluble in alcohol. (Laurent, *Ann. Ch. et Phys.*, 1837, (2.) **66.** pp. 185, 183.)
(*Toluenyl CyanBenzoicyl-Benzoicylamin.*)
$C_{44}H_{16}N_2 = N \left\{ \begin{matrix} C_{14}H_4(C_2N) \\ C_{14}H_5 \\ C_{14}H_7 \end{matrix} \right.$

AzoBenzoylid. Insoluble in alcohol. Very sparingly soluble in ether. Soluble in hot nitric acid, without apparent decomposition.
(*Nitride of Azostilbase.*) $C_{84}H_{33}N_5$

AzoErythrin. *Vid.* AzErythrin.

Azoleic Acid. *Vid.* **Oenanthylic** Acid.

Azolitmin. Sparingly soluble in boiling water. $C_{18}H_{10}NO_{11}$ More soluble in water containing sulphuretted hydrogen than in pure water. Insoluble in alcohol, or ether. Readily soluble in aqueous solutions of potash, and ammonia. (Kane.)

Azolitmin with Oxide of Lead. Ppt.
$3PbO, C_{18}H_{10}NO_{11}$(?)

Azolitmin with *protoxide of* Tin. Decomposed when boiled with water acidulated with chlorhydric acid.
I.) $C_{18}H_{10}NO_{11}, 2SnO + 2\,Aq$
II.) $C_{18}H_{10}NO_{11}, 4SnO$ Ppt.

Azolitmin with *peroxide of* Tin. Ppt.
$C_{18}H_{10}NO_{11}, 2SnO_2 + 2\,Aq$

Azomaric Acid. *Vid.* Nitromarie Acid.

AzoNaphthylamin. Sparingly soluble in water. Readily soluble in alcohol, and ether. (Zinin.) Its solutions are easily decomposed when left in contact with the air. Soluble in most acids, with combination. No more abundantly soluble in cyanhydric acid than in pure water. (Zinin.)
(*Seminaphtalidam. Seminaphtalidin. Naphticylbiamin.*)
$C_{20}H_{10}N_2 = N_2 \left\{ \begin{matrix} C_{20}H_6'' \\ H_4 \end{matrix} \right.$

"**AzoPhenylamin**" (of Gottlieb). *Vid.* NitrAzoPhenylamin.

AzoPhenylamin. Insoluble in water. Soluble in boiling, less soluble in cold alcohol, and ether. (Zinin.)
(*Azanilin. Phenidamin. Semibenzidam. Phenoylbiamin.*)
$C_{12}H_8N_2 = N_2 \left\{ \begin{matrix} C_{12}H_4'' \\ H_4 \end{matrix} \right.$

AzoPhosphoric Acid. Deliquesces in moist $P_2NO_5 = (PN)PO_5$ air. Readily soluble in water, and alcohol. Slightly soluble in ether. (Gladstone, *J. Ch. Soc.*, **3.** 152.) Its alkaline salts are soluble in water, those of the alkaline earths and metals proper are insoluble. (Gladstone, *loc. cit.*, p 365.)

AzoPhosphate of Alumina.

AzoPhosphate of Ammonia. Very soluble in water, and alcohol.

AzoPhosphate of Ammonia & *of peroxide of* Iron. Soluble in cold water. (Gladstone, *J. Ch. Soc.*, **3.** 362.)
$2NH_4O, Fe_2O_3, P_2NO_5 + 5\,Aq$

AzoPhosphate of Baryta.
$3\,Ba\,O,\ P_2\,N\,O_5 + 2\,Aq$

AzoPhosphate of Cadmium. Ppt.

AzoPhosphate of Chromium. Ppt.

AzoPhosphate of Cobalt. Ppt.

AzoPhosphate of Copper.
$3\,Cu\,O,\ P_2\,N\,O_5 + 5\,Aq$

AzoPhosphate *of peroxide* of Iron. Insoluble in dilute acids.
$Fe_2\,O_3,\ P_2\,N\,O_5 + 4\,Aq$ or $+ 5\,Aq$
Easily soluble in ammonia-water. Soluble in cold concentrated sulphuric acid, the solution undergoing decomposition when heated. (Gladstone, *J. Ch. Soc.*, 3. 142.)

AzoPhosphate of Lead. Insoluble in ammonia-water, but is decomposed thereby.
$3\,Pb\,O,\ P_2\,N\,O_5 + 5\,Aq$

AzoPhosphate of Lime. Ppt.

AzoPhosphate of Magnesia. Ppt.

AzoPhosphate of Manganese. Ppt.

AzoPhosphate *of protoxide* of Mercury.

AzoPhosphate of Nickel. Ppt.

AzoPhosphate of Potash. Deliquesces in moist air. Soluble in water. Insoluble in alcohol.

AzoPhosphate of Silver. Ppt.
$3\,Ag\,O,\ P_2\,N\,O_5 + 5\,Aq$

AzoPhosphate of Soda. Soluble in water.

AzoPhosphate of Strontia. Ppt.

AzoPhosphate *of protoxide* of Tin. Ppt.

AzoPhosphate of Zinc. Ppt.

*Deut*AzoPhosphoric Acid. Deliquescent.
$3\,H\,O,\ P_3\,N_2\,O_5,\ 5\,H\,O$
Very soluble in water. Insoluble, or nearly insoluble, in alcohol. Soluble in ether. Soluble, without decomposition, in cold concentrated sulphuric acid.

Its alkaline salts are soluble in water, those of the alkaline earths are slightly soluble. (Gladstone, *J. Ch. Soc.*, 3. 353.)

*Deut*AzoPhosphate of Ammonia. Very deliquescent in damp air. Soluble in water.

*Deut*AzoPhosphate of Baryta. Somewhat
$3\,Ba\,O,\ P_3\,N_2\,O_5 + 3\,Aq$
difficultly soluble in water. Its solubility, however, appears to be greatly affected by the presence of different salts in the liquid. Tolerably soluble in ammonia. (Gladstone.)

*Deut*AzoPhosphate of Ethyl. Insoluble in water. Readily soluble in alcohol and in the essential oils. (Gladstone, *Ibid.*, p. 363.)

*Deut*AzoPhosphate of Lime. Ppt.

*Deut*AzoPhosphate of Magnesia. Ppt.

*Deut*AzoPhosphate of Silver. Difficultly soluble in water.

*Deut*AzoPhosphate of Strontia. Ppt.

AzoSalicylide of Copper; or of Copper & of Cuprammonium. Insoluble in water, or alcohol. Soluble in cold dilute acids, as chlorhydric acid.
(Tri*Copper* tri*Salicoyl teramid*.)
$C_{42}\,H_{18}\,Cu_3\,N_3\,O_6$; or $C_{42}\,H_{15}\,Cu_2\text{-}\left(N\left\{\begin{matrix}H_3\\Cu\end{matrix}\right.\right)N_2O_6$; or $N_3\left\{\begin{matrix}(C_{14}\,H_5\,O_2)_3\\Cu_3\\H_3\end{matrix}\right.$

AzoSalicylide of Iron; or of Iron & of Ferammonium. Partially soluble in alcohol. Soluble in a cold dilute alcoholic solution of chlorhydric acid. Soluble, with decomposition, in hot, strong nitric acid.
(*Ferri*tri*Salicoyl*ter*amin*.)
$C_{42}\,H_{18}\,Fe_2\,N_3\,O_6 = N_3\left\{\begin{matrix}(C_{14}\,H_5\,O_2)_3\\Fe_2{}'''\\H_3\end{matrix}\right.$

AzoSalicylide of Lead.

I.) Insoluble in water. Soluble in a hot, but insoluble in a cold mixture of ammonia and hydride of azosalicyl.

II.) Ppt.

AzOxyBenzid. Insoluble in water. Readily soluble in alcohol; and still more soluble in ether. Insoluble in dilute chlorhydric, or sulphuric acid, or in solutions of potash or ammonia. Soluble in concentrated sulphuric acid, apparently with combination. Soluble in an alcoholic solution of chlorhydric acid. (Zinin.)
(*Azoxybenzene. Oxide of di-Phenoylbiamin* [*Azo Benzid*].)
$C_{24}\,H_{10}\,N_2\,O_2 = N_2\left\{\begin{matrix}(C_{12}\ H_4{}'')_2\\H_2\end{matrix}\right..O_2$

AzOxyBenzid *bromé*. *Vid.* BromAzOxyBenzid.

AzOxyBenzid *nitré*. *Vid.* NitrAzOxyBenzid.

AzUlmic Acid. Insoluble, or but sparingly soluble, in water. (Pelouze & Richardson.) Insoluble, or very sparingly soluble, in alcohol. Insoluble in ether. Readily soluble in acetic acid. (P. & R.)
(*Azulmin.*)

Soluble in concentrated chlorhydric acid; also in concentrated sulphuric acid, from which water precipitates it. (Thaulow.) Easily soluble in solutions of potash, and of carbonate of potash or of ammonia. (Thaulow.)

Azulmin. *Vid.* Azulmic Acid.

B.

Badianic Acid. *Vid.* Anisic Acid.

Baldrianic Acid. *Vid.* Valeric Acid.

Balsams. See under Resins, and Essences.

The balsams are insoluble in water, but soluble in strong alcohol.

Baregin. *Vid.* Glairin.

Barium. Oxidizes quickly in the air. Decomposes water.
Ba

Baryta. *Vid.* Oxide of Barium.

Bassic Acid. Identical with Stearic Acid, *q. v.*

Bassorin (from *Bassora gum*). Insoluble in water; in which, however, it softens and swells up. Insoluble in alcohol or ether. It is almost entirely dissolved by warm dilute nitric, and chlorhydric acids. Decomposed by concentrated nitric, and sulphuric acids. Soluble in an aqueous solution of potash.
(*Cerasin.*)
$C_{12}\,H_{10}\,O_{10}$

Bdellium (Gum-resin from *Balsamodendron africanum*). Tolerably soluble in alcohol.

Bebeerin. *Vid.* Bebirin.

Bebiric Acid. Deliquescent. Soluble in water, and ether.
(*Bebeeric Acid.*)

Bebirate of Baryta. Very sparingly soluble in water.

Bebirate of Lead. Sparingly soluble in alcohol.

Bebirate of Lime. Very sparingly soluble in water.

Bebirate of Magnesia. Difficultly soluble in water.

Bebirate of Potash. Deliquescent. Soluble in water, and alcohol.

Bebirate of Soda. Deliquescent. Soluble in water, and alcohol.

Bebirin (from *Nectandra Rodiei*). Permanent. Almost completely insoluble in water. Readily soluble in alcohol, and ether, especially when these are warm.
(Bebeerin.)
$C_{38}H_{21}NO_6 = N\left\{C_{38}H_{21}O_6'''\right.$

Soluble in 6650 pts. of cold water. Soluble in 1766 pts. of boiling water. Soluble in 5 pts. of absolute alcohol. Soluble in 13 pts. of ether. Easily soluble in dilute sulphuric, and chlorhydric acids. Decomposed by hot nitric acid. (Wittstein's *Handw.*) Easily soluble in acetic, and chlorhydric acids. Insoluble in dilute nitric acid, by which it is even precipitated from its solutions. Decomposed by strong boiling nitric acid. Very sparingly soluble in alkaline solutions.

Behenic Acid. Soluble in spirit.
(Acide Benique. Said to be identical with Cetic Acid.)
$C_{30}H_{30}O_4 = C_{30}H_{29}O_3, HO$

Behenate of Baryta.

Behenate of Ethyl. Easily soluble in alcohol.
$C_{30}H_{29}(C_4H_5)O_4$

Behenate of Lead.

Behenate of Soda. Soluble in absolute alcohol.

Belladonin. Scarcely at all soluble in water. Easily soluble in pure, and in common ether; in absolute and in dilute alcohol. Somewhat soluble in olive-oil. (Parrish's *Pharm.*, p. 412.)

BenzAcetic Acid. *Vid.* (Anhydrous) AcetoBenzoic Acid.

BenzAcetoSulphoPhenamid. *Vid.* SulphoPhenylBenzoylAcetamid.

BenzAlcohol. *Vid.* Hydrate of Toluenyl.

BenzAldehyde. } *Vid.* Hydride of Benzoyl.
Benzaldid. }

Benzamic Acid. Sparingly soluble in cold, abundantly soluble in boiling water. Still more soluble in alcohol, and ether. The solution slowly decomposes, when exposed to the air. Tolerably soluble in cold water, dissolving more readily than benzoic, or nitrobenzoic acids. Very easily soluble in boiling water, in alcohol, and in ether. (Kolbe's *Lehrb.*) But slightly acted upon by ordinary nitric acid even when boiling. Soluble in fuming nitric acid. Easily soluble in concentrated sulphuric acid. The alkaline and earthy salts of benzamic acid are readily soluble in water, and alcohol. (Zinin.)
(Amido Benzoic Acid. Carbanilic Acid. Phenyl Carbamic Acid, with which it is isomeric.)
$C_{14}H_7NO_4$

Benzamate of Baryta. Readily soluble in water. (Voit)
$C_{14}H_6BaNO_4$

Benzamate of Copper. Insoluble in water or alcohol. Soluble in strong acids.
$C_{14}H_6CuNO_4$

Benzamate of Ethyl. Insoluble in water. Easily soluble in alcohol, from which it is precipitated on the addition of water. (Chancel.) Scarcely at all soluble in water. Soluble in all proportions in alcohol, and ether. Unacted upon by cold, decomposed by boiling potash lye. Also decomposed by ammonia-water. Easily soluble, with combination in acids. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 327.)
(Phenyl Carbamate of Ethyl. Carbanilethan. Carbanilate of Ethyl.)
$C_{18}H_{11}NO_4 = C_{14}H_6(C_4H_5)NO_4$

Benzamate of Lead.

I.) Insoluble in water.

II.) Sparingly soluble in water.

III.) Readily soluble in water.

Benzamate of Lime. Readily soluble in water. Soluble in hot alcohol. (Voit.)
$C_{14}H_6CaNO_4$

Benzamate of Magnesia. Rapidly decomposes in the air. Soluble in water. (Voit.)
$C_{14}H_6MgNO_4 + 7\,Aq$

Benzamate of Methyl. Its properties are similar to those of the ethyl salt. Its compounds with acids are very soluble. (Cahours, *loc. cit.*, p. 331.) Insoluble, or but sparingly soluble in water. Soluble in alcohol. (Chancel.)
(Phenyl Carbamate of Methyl. Carbanilate of Methyl. Carbanil methylane.)
$C_{14}H_6(C_2H_3)NO_4$

Benzamate of Silver. Insoluble in boiling water, by which however it is partially decomposed.
$C_{14}H_6AgNO_4$

Benzamate of Soda. Exceedingly soluble in water, from which it is precipitated on the addition of alcohol. (Voit, *Ann. Ch. u. Pharm.*, **99.** 100.)
$C_{14}H_6NaNO_4$

Benzamate of Strontia. Very easily soluble in water. Sparingly soluble in alcohol. (Voit.)
$C_{14}H_6SrNO_4 + 2\,Aq$

Benzamid. Readily soluble in boiling, almost insoluble in cold water. More soluble in a dilute aqueous solution of ammonia. Easily soluble in alcohol. Easily soluble in boiling, less soluble in cold ether. (Liebig & Wœhler.) Abundantly soluble in warm concentrated chlorhydric acid. (Dessaignes.)
(Benzoylamid.)
$C_{14}H_7NO_2 = N\begin{cases}C_{14}H_5O_2\\ H_2\end{cases}$

Benzamid with **Mercury.** Sparingly soluble in water; more soluble in alcohol. (Dessaignes, *Ann. Ch. et Phys.*, (3.) **34.** 146.)
(Benzoyl Mercuramid.)
$C_{14}H_6HgNO_2 = N\begin{cases}C_{14}H_5O_2\\ H\\ Hg\end{cases}$

Benzamil. Almost insoluble even in boiling alcohol, ether, or naphtha. Decomposed when boiled with alcohol, or chlorhydric acid. (Laurent.)
(Benzanil.)
$C_{56}H_{20}N_2O_4$

BenzAnilid. *Vid.* PhenylBenzoylamid.

Benzanilidyl. PhenoylBenzoicyl.

Benzene. *Vid.* Hydride of Phenyl.

Benzeoresic Acid. *Vid.* Benzoic Acid (Amorphous).

BenzEthyl. *Vid.* Toluenyl.

BenzEugenyl. *Vid.* BenzoEugenic Acid.

Benzhydramid. Insoluble in water. Sparingly soluble in cold, more readily soluble in hot alcohol. Very readily soluble in ether. (Laurent.)
$C_{44}H_{16}N_2O_2$

Benzhydrol. Soluble in an aqueous solution of bisulphite of soda. (Rochleder & Schwarz.) [Compare Camphor of Cassia.]
$C_{14}H_8O$

Benzhydrolic Acid. Very difficultly soluble in cold water.
$C_{42}H_{20}O_8 = C_{42}H_{19}O_7, HO + 2\,Aq\,(?)$

Benzhydrolate of Silver. Ppt.
$C_{42}H_{19}AgO_8 + 2\,Aq$

Benzidam. *Vid.* Anilin.

Benzidin. Permanent. Very sparingly soluble in cold, readily soluble in boiling water. Still more soluble in alcohol, and yet more in ether. Soluble in acids, with combination. (Zinin.)
(Phenyl Phenoyl biamin.)
$C_{24}H_{12}N_2 = N_2\begin{cases}C_{12}H_4''\\ C_{12}H_5\\ H_3\end{cases}$

Benzil. Insoluble in water. Very soluble in alcohol, and ether. Soluble in warm concentrated
(Suboxide of Stilbese.)
$C_{28}H_{10}O_4$

sulphuric acid, from which water precipitates it unchanged. Unacted on by boiling concentrated nitric acid, or potash lye. (Laurent.)

Benzilam. $C_{28}H_9N = N\left\{\begin{matrix}C_{28}H_7\\H_2\end{matrix}\right.$ Insoluble in water. Very readily soluble in alcohol, and ether. Readily soluble in concentrated sulphuric acid, from which solution water precipitates it. (Laurent.)

Benzilic Acid. (*Stilbic Acid.*) $C_{28}H_{12}O_6 = C_{28}H_{11}O_5, HO$ Sparingly soluble in cold, more readily soluble in boiling water. Very soluble in alcohol, and ether. Soluble in warm concentrated nitric acid, from which solution water precipitates it unchanged. (Zinin.)

Benzilate of Lead. $C_{28}H_{11}PbO_6$ Permanent. Sparingly soluble in boiling water.

Benzilate of Potash. $C_{28}H_{11}KO_6$ Very easily soluble in water, and alcohol. Insoluble in ether.

Benzilate of Silver. $C_{28}H_{11}AgO_6$ Sparingly soluble in boiling water. (Zinin.)

Benzilim. *Vid.* Benzilimid.

Benzilimid. (*Benzilim. Isomeric with ImaBenzil.*) $C_{56}H_{22}N_2O_4 = N_2\left\{\begin{matrix}(C_{28}H_9O_2)_2\\H_4\end{matrix}\right.$ Somewhat sparingly soluble in alcohol, and ether. Soluble, with decomposition, in concentrated sulphuric, and nitric acids. Unacted upon by chlorhydric acid, or by boiling potash lye. (Laurent.)

Benzimic Acid. Almost insoluble in water. Sparingly soluble in alcohol.

Benzimate of Ammonia. Soluble in water, and alcohol. (Laurent.)

Benzimid. *Vid.* Hydride of CyanoBenzoyl.

Benzin, or Benzine. *Vid.* Hydride of Phenyl.

BenzinSulphuric Acid. *Vid.* PhenylSulphurous Acid.

Benzoic Acid (Anhydrous). (*Benzoic Benzoate.*) $C_{28}H_{10}O_6 = \left.\begin{matrix}C_{14}H_5O_2\\C_{14}H_5O_2\end{matrix}\right\}O_2$ Insoluble in cold water. Acidified by boiling water. Tolerably soluble in alcohol, more readily in warm than in cold. It is decomposed by prolonged contact with alcohol. Tolerably soluble in ether. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** pp. 300, 302.)

Benzoic Acid. $C_{14}H_6O_4 = C_{14}H_5O_3, HO$ Soluble in 607 pts. of water at 0°. (Kolbe & Lantemann, *Ann. Ch. u. Pharm.*, **115.** 187. [K.].) Soluble in 480 pts. of cold water (Lichtenstein); in 200 pts. of water at 18.75°, and in 24.5 pts. at boiling (Bucholz, *Gehlen's Journ. für Ch. Phys. u. Min.*, 1810, **9.** pp. 340, 355); in 500 pts. of cold water (Dörffurt, Bergman); in 24 pts. of boiling water (Dörffurt, Lichtenstein, Bergman); in 400 pts. of cold water (?); in 30 pts. of boiling water (Trommsdorff); in 160 pts. of water at 18.75° (Abl, from *Oesterr. Zeitschrift, für Pharm.*, **8.** 201, in Canstatt's *Jahresbericht, für* 1854, p. 75). 100 pts. of water at 15.5° dissolve 0.208 pt. of it. 100 pts. of water at 100° dissolve 4.17 pts. of it. (Ure's *Dict.*) 100 pts. of the aqueous solution saturated at the ordinary temperature contain 0.5 pt. of it, and 3.25 pts. when saturated at 100°. Readily soluble in water containing 1.5 pts. of phosphate of soda, or 4 pts. of sulphate of soda. (Ure.) Soluble in 1.79 pts. of absolute alcohol at 18.75°, and in rather more than 1 pt. at the temperature of boiling. (Bucholz, *Gehlen's Journ. für Ch. Phys. u. Min.*, 1810, **9.** pp. 342, 355.) Abundantly soluble in alcohol, from which it is precipitated on the addition of water. (Lichtenstein.) Soluble in 1 pt. of boiling alcohol. (Wenzel, in his *Verwandtschaft*, p. 302 [T.]) 100 pts. of cold absolute alcohol dissolve scarcely 56 pts. of it. (Bucholz, cited by Wenzel, *loc. cit.*) Soluble in 25 pts. of ether, either hot or cold. (Bucholz.) 100 pts. of oil of turpentine dissolve 0.4 pt. of it; and at 100° more than their own weight, the acid crystallizing out on cooling. (Lecanu & Serbat.) Readily soluble in fixed and volatile oils, and in benzoic ether.

Soluble in benzin and the other light coal-naphthas. (De la Rue.) Largely soluble in hot caoutchin, a portion crystallizing out again on cooling. (Himly.) Soluble in creosote. (Reichenbach.) Soluble, without decomposition, in cold concentrated sulphuric acid, from which solution water precipitates it. (Lichtenstein.) Also soluble in nitric acid and sulphurous acid. Insoluble in chlorhydric or phosphoric acids. Hot acetic acid dissolves it precisely as water does, but it crystallizes out again when the acid cools. (Lichtenstein.)

Most benzoates are soluble in water; many of them being readily soluble. Many are soluble also in alcohol. The more sparingly soluble benzoates dissolve readily in aqueous solutions of acetate of soda, or of acetate of lead, and of nitrate of soda; but they do not dissolve in solutions of nitrate of potash, or of sulphate of soda, or chloride of sodium. (Lecanu & Serbat.)

Amorphous Benzoic Acid. (*ParaBenzoic Acid. Benzeoresic Acid.*) Easily soluble in boiling, nearly insoluble in cold water. Readily soluble in alcohol, and ether.

Its salts are generally less soluble than the ordinary benzoates. (E. Kopp.)

Benzoate of Allyl. $C_{20}H_{16}O_4 = C_{14}H_5(C_6H_5)O_4$ Insoluble in water. Readily soluble in alcohol, wood-spirit, and ether. (Hofmann & Cahours.)

Benzoate of Alumina. Deliquescent. Tolerably readily soluble in water. (Hisinger.) The hot saturated aqueous solution solidifies on cooling. (Berzelius.)

Benzoate of Ammonia.

I.) *normal.* $C_{14}H_5(NH_4)O_4$ Hygroscopic. Very readily soluble in water, and alcohol. Less readily soluble in alcohol than the potash salt. (Berzelius.)

II.) *acid.* Sparingly soluble in water. Less soluble than the normal salt in absolute alcohol. (Berzelius.)

III.) *of the amorphous acid.*

Benzoate of Ammonia & *of dinoxide* of Mercury. Insoluble in water or alcohol. Soluble in acetic acid. (Harff.)

Benzoate of Ammonia & *of protoxide* of Mercury. Insoluble in water. Soluble in 1500 pts. of alcohol, and in 2000 pts. of ether. (Harff.)

Benzoate of Amyl. (*Amylbenzoic Ether.* $C_{24}H_{16}O_4 = C_{14}H_5(C_{10}H_{11})O_4$ Insoluble, or very sparingly soluble, in water.

Benzoate of AmylSalicyl. *Vid.* Salicylate of Amyl & of Benzoyl.

Benzoate of Animin (of Unverdorben). Sparingly soluble in cold, more readily soluble in boiling water. It is less easily decomposed by boiling with water than the benzoate of picolin. (Unverdorben.)

Benzoate of Antimony. Permanent. Soluble in water.

Benzoate of Baryta. Permanent. Difficultly soluble in cold, more easily soluble in boiling water. (Trommsdorff.)
$C_{14} H_5 Ba O_4 + 2 Aq$

Benzoate of Baryta with Hippurate of Baryta. More soluble in water than the hippurate of baryta. (Schwarz.)
$C_{14} H_5 Ba O_4 ; C_{18} H_8 Ba O_8 + Aq$

Benzoate of Benzol. Insoluble in water. Tolerably soluble in spirit. Easily soluble in ether.
$C_{42} H_{18} O_8 = C_{28} H_{10} (C_{14} H_8'') O_8$

Benzoate of Benzoyl. *Vid.* Benzoic Acid, (Anhydrous).

Benzoate of Benzyl. *Vid.* Benzoate of Toluenyl.

Benzoate of Bismuth. Permanent. Soluble, with partial decomposition, in water, and alcohol. Soluble, without decomposition, in benzoic acid. (Trommsdorff.)

Benzoate of Borneol. Soluble in alcohol, and ether. (Berthelot.)
(*Camphol benzoique.*)
$C_{34} H_{22} O_4 = C_{14} H_5 (C_{20} H_{17}) O_4$

Benzoate of BromoPhenyl. Insoluble in water. Readily soluble in ether and in boiling alcohol.
$C_{26} H_9 Br O_4 = C_{14} H_5 (C_{12} H_4 Br) O_4$

Benzoate of *bi*BromoPhenyl. Insoluble in water. Readily soluble in ether and in boiling alcohol.
$C_{26} H_8 Br_2 O_4$

A mixture of $C_{26} H_9 Br O_4$, $C_{26} H_8 Br_2 O_4$, $C_{26} H_7 Br_3 O_4$, was found to be insoluble in water, very sparingly soluble in cold, readily soluble in hot alcohol, and ether.

Benzoate of Cadmium. Soluble in hot water. Sparingly soluble in ordinary alcohol. (H. Schiff, *Ann. Ch. u. Pharm.*, **104.** 325.)
$C_{14} H_5 Cd O_4 + 2 Aq$

Benzoate of Camphol. *Vid.* Benzoate of Borneol.

Benzoate of Cerium. Soluble in water. (Berzelius & Hisinger.)

Benzoate of Cetyl. Difficultly soluble in spirit. Easily soluble in ether. (Becker.)
$C_{14} H_5 (C_{32} H_{33}) O_4$

Benzoate of ChloroPhenyl. Soluble in ether. (Stenhouse.)
$C_{26} H_9 Cl O_4 = C_{14} H_5 (C_{12} H_4 Cl) O_4$

Benzoate of *ter*ChloroPhenyl. Soluble in ether. (Stenhouse.)
$C_{28} H_7 Cl_3 O_4 = C_{14} H_5 (C_{12} H_2 Cl_3) O_4$

Benzoate of Cholesterin. Very sparingly soluble in boiling alcohol. Easily soluble in ether.
$C_{66} H_{48} O_4 = C_{14} H_5 (C_{52} H_{43}) O_4$

Benzoate *of protoxide* of Chromium. Ppt.
$C_{14} H_5 Cr O_4$

Benzoate *of sesquioxide* of Chromium. Appears to be soluble in water.

When benzoate of potash is dropped into a concentrated aqueous solution of sesquichloride of chromium a green, flocky precipitate falls, but no precipitate is formed when the solution is dilute. (T. Thompson, *Phil. Trans.*, 1827, Part I. p. 203.)

Benzoate of Cobalt. Soluble in water, and alcohol. (Berzelius.)

Benzoate of Copper.

I.) *normal.* Permanent. Somewhat soluble in water. (Berzelius.) Soluble in warm, less soluble in cold dilute acetic acid. Insoluble in alcohol. (Trommsdorff.
$C_{14} H_5 Cu O_4 + x Aq$

II.) *of the amorphous acid.* Ppt.

Benzoate of Cumicyl. Decomposed by water.
(*Benzoate of CuminEther.*) $C_{14} H_5 (C_{20} H_{13}) O_4$

Benzoate of Cumol. Soluble in alcohol, especially when this is hot and anhydrous. Also easily soluble in ether, acetone, and chloroform. Water precipitates it from the alcoholic solution. Soluble in cold concentrated sulphuric acid, the solution undergoing decomposition when heated. Unacted upon by boiling nitric acid. (Tuettscheff.)
$C_{48} H_{22} O_8 = C_{28} H_{10} (C_{20} H_{12}'') O_8$

Benzoate of Cymelene.

Benzoate of Ethyl. Insoluble in cold, slightly soluble in hot water. Readily soluble in alcohol, and ether.
(*Benzoic Ether.*)
$C_{18} H_{10} O_4 = C_{14} H_5 (C_4 H_5) O_4$

Benzoate of Ethylene. Soluble in ether. (Wurtz.)
(*Dibenzoic Glycol.*)
$C_{32} H_{14} O_8 = C_{28} H_{10} (C_4 H_4'') O_8$

Benzoate of EthylSalicyl. *Vid.* Salicylate of Benzoyl & of Ethyl.

Benzoate of Glucina.

I.) *normal.* Soluble in water.

II.) *basic.* Insoluble in water.

Benzoate of Glyceryl.
(*Benzoin.*)

I.) *normal.*
$C_{48} H_{20} O_{12} = C_8 H_5 O_3, 3 C_{14} H_5 O_3 = C_{42} H_{15} (C_6 H_5''') O_{12}$
(*TriBenzoïcin.*) Soluble in ether. (Berthelot, *Ann. Ch. et Phys.*, (3.) **41.** 290.)

II.) *bibasic.* Insoluble in water. Extremely soluble in alcohol, ether, and benzin. Nearly or quite insoluble in bisulphide of carbon. (Berthelot, *loc. cit.*)
$C_{20} H_{12} O_8 = C_6 H_5 O_3, 2 H O, C_{14} H_5 O_3$
(*MonoBenzoïcin.*)

Benzoate of Gold. Permanent. Sparingly soluble in water. Insoluble in alcohol. (Trommsdorff.)

"Benzoate of Hydride of Benzoyl." *Vid.* Stilbous Acid.

Benzoate of Hydride of Benzoyl. Insoluble in water. Abundantly soluble in alcohol. Very sparingly soluble in cold ether. Easily soluble, with decomposition, in an alcoholic solution of caustic potash. (Liebig.)
$C_{42} H_{18} O_8 = 2 C_{14} H_8 O_2, C_{14} H_5 O_3 + Aq$

Benzoate *of protoxide* of Iron. Efflorescent. Soluble in water, and alcohol. (Berzelius.)
$C_{14} H_5 Fe O_4$

Benzoate *of sesquioxide* of Iron.

I.) *normal, i. e. teracid.* Soluble in water, and alcohol, with deposition of some of the basic salt. (Berzelius.)

II.) *basic.* Partially soluble in water, with decomposition. Insoluble in aqueous solutions of the alkaline benzoates.

III.) *perbasic.* Insoluble in water. (Berzelius.) Benzoate of sesquioxide of iron is not precipitated from solutions containing citrate of soda. (Spiller.)
$2 Fe_2 O_3, 3 C_{14} H_5 O_3 + 15 Aq$

IV.) *acid.* Soluble in water. (Berzelius.)

Benzoate of Lead.

I.) *normal.* Soluble in water, and alcohol. (Trommsdorff.) Difficultly soluble in water, and less so in cold than in hot. (Gerland, *Ann. Ch. u. Pharm.*, **91.** 195.) Soluble in boiling, less soluble in cold acetic acid. (Berzelius.)
$C_{14}H_5PbO_4 + Aq$

II.) *basic.* Ppt.
$2PbO, C_{14}H_5PbO_4$

III.) *of the amorphous acid.* Insoluble in water.
$2PbO, C_{14}H_5O_3$

Benzoate of Lime.

I.) *normal.* Efflorescent. Soluble in 29 pts. of cold, and in much less hot water. (Lichtenstein.) Soluble in 20 pts. of water at 18.75°; or 100 pts. of water at 18.75° dissolve 5 pts. of it; or the aqueous solution saturated at 18.75° contains 4.76% of it. (Bucholz, *Gehlen's Journ. für Ch. Phys. u. Min.*, 1810, **9.** pp. 352, 357.)
$C_{14}H_5CaO_4 + 2Aq$

II.) *of the amorphous acid.* Soluble in water.

Benzoate of Lithia. Hygroscopic. Readily soluble in water. (C. G. Gmelin, Berzelius.)

Benzoate of Magnesia. Slightly efflorescent. Easily soluble in water.
$C_{14}H_5MgO_4$

Benzoate of Manganese. Permanent. Soluble in 20 pts. of water at 18.8°, and in much less hot water. (John.) Sparingly soluble in alcohol. (Trommsdorff.)
$C_{14}H_5MnO_4 + Aq$

Benzoate of *tri*Mercurammonium.
$C_{14}H_5\left(N\left\{\begin{matrix}H\\Hg_3\end{matrix}\right)\right.O_4 + 2Aq$

Benzoate *of dinoxide* of Mercury. Insoluble in cold, and is decomposed by boiling water, and alcohol. (Harff, Burckhardt.) Insoluble in ether. Soluble in an aqueous solution of benzoic acid (Harff); insoluble in an aqueous solution of benzoic acid or of benzoate of potash or benzoate of ammonia. (Burckhardt.) Soluble in concentrated aqueous solutions of the alkaline acetates and of chloride of sodium. (Harff.)
$C_{14}H_5Hg_2O_4$

Benzoate *of protoxide* of Mercury.

I.) *normal.* Permanent. Insoluble in cold, rather freely soluble in hot water, without alteration. (Burckhardt.) Boiling water converts it into an insoluble basic salt. (Harff.) Partially soluble in alcohol, with separation of a basic salt. (Burckhardt.) Soluble in 370 pts. of alcohol. (Harff.) Insoluble in ether. (Burckhardt.) It is decomposed by ether to an acid and a basic salt; the acid salt being soluble in 2 pts. of ether. (Harff.)
$C_{14}H_5HgO_4 + Aq$

II.) *basic.* Insoluble in water or alcohol.

Benzoate of Methyl. Almost insoluble in water. Easily soluble in alcohol, and ether.
(*MethylBenzoicEther.*)
$C_{16}H_8O_4 = C_{14}H_5(C_2H_3)O_4$

Benzoate of Methyl Salicyl. *Vid.* Salicylate of Benzoyl & of Methyl.

Benzoate of Nickel. Soluble in water, and alcohol. (Berzelius.)

Benzoate of NitroBenzoyl. *Vid.* BenzoNitroBenzoic Acid (Anhydrous).

Benzoate of *bi*NitroPhenyl. Insoluble in water. Soluble in boiling, almost insoluble in cold alcohol. Tolerably soluble in warm ether. Partially soluble in boiling potash lye. (Laurent & Gerhardt.)
(*BiNitroBenzoPhenid. Benzoate of Phenyl binitré. Benzophenidebinitré.*)
$C_{26}H_8N_2O_{12} = C_{14}H_5(C_{12}H_3[NO_4]_2)O_4$

Benzoate of *ter*NitroPhenyl. Insoluble in water. Less soluble than the preceding in cold alcohol. Very sparingly soluble in cold, somewhat more soluble in hot ether. (Laurent & Gerhardt.) [Compare NitroBenzoate of *bi*NitroPhenyl.]
(*TriNitroBenzoPhenid. Benzoate of Phenyl trinitré. Benzophenidetrinitré.*)
$C_{26}H_7N_3O_{16} = C_{14}H_5[C_{12}H_2(NO_4)_3]O_4$

Benzoate of Œnanthyl. *Vid.* BenzoŒnanthylic Acid (Anhydrous).

Benzoate of Palladium. Somewhat soluble in water. (Hisinger.)

Benzoate of Phenyl. Insoluble in water. Tolerably soluble in cold, and readily soluble in hot alcohol, and ether. Insoluble in a boiling aqueous solution of caustic potash or ammonia. Unacted on by boiling chlorhydric acid.
(*Benzophenid. Phenidin. Benzoyloxyd. Benzoyl.*)
$C_{26}H_{10}O_4 = C_{14}H_5(C_{12}H_5)O_4$

Insoluble in water. Somewhat difficultly soluble in cold, very easily soluble in hot spirit. Easily soluble, with decomposition, in concentrated sulphuric acid. (List & Limpricht, *Ann. Ch. u. Pharm.*, **90.** 193.)

Benzoate of Phenyl*bromé*. *Vid.* Benzoate of BromoPhenyl.

Benzoate of Phenyl*chloré*. *Vid.* Benzoate of ChloroPhenyl.

Benzoate of Platinum. Sparingly soluble in water. Insoluble in alcohol. (Trommsdorf.)

Benzoate of Potash.

I.) *normal.* Deliquescent. Very easily soluble in water. (F. D'Arcet.) More readily soluble in water than the acid salt. (Bucholz, *loc. inf. cit.*) Soluble in warm, less soluble in cold hydrate of anisyl. Soluble in alcohol.*
$C_{14}H_5KO_4 + Aq$

II.) *acid.* Rather difficultly soluble in water, requiring almost 10 pts. of water at 18.75°, for its solution. (Bucholz, *Gehlen's Journ. für Ch. Phys. u. Min.*, 1810, **9.** 353.) Very sparingly soluble in cold water. Somewhat soluble in boiling, less soluble in cold alcohol. Tolerably soluble in alkaline solutions. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** 312.)
$C_{14}H_5KO_4; C_{14}H_6O_4$

Benzoate of Propylenyl. *Vid.* Benzoate of Allyl.

Benzoate of Salicyl. *Vid.* BenzoSalicylic Acid (Anhydrous).

Benzoate of Salicylous Acid. *Vid.* BenzoSalicyl.

Benzoate of Silver.

I.) *normal.* Permanent. Sparingly soluble in boiling, less soluble in cold water. (Wœhler & Liebig.) Soluble in 1.96 pts. of absolute alcohol at 20°. (Mitscherlich.)
$C_{14}H_5AgO_4$

II.) *of the amorphous acid.* Soluble in water.

Benzoate of Soda. Efflorescent. Soluble in water. Sparingly soluble in boiling alcohol. (Berzelius.)
$C_{14}H_5NaO_4 + x\,Aq$

Benzoate of Solanin. Soluble in water.

Benzoate of Strontia. Permanent. Sparingly soluble in cold, readily soluble in hot water. (Berzelius.)

---

* According to Gregory (*Ann. Ch. u. Pharm.*, **87.** 125), the benzoate of potash obtained by treating oil of bitter almonds with an alcoholic solution of potash is very readily soluble in spirit, while the salt prepared directly from potash and benzoic acid is very sparingly soluble in alcohol of the same strength.

Benzoate of Thoria. Sparingly soluble in water.

Benzoate *of protoxide* of Tin. Somewhat soluble in water, especially if this be hot. Insoluble in alcohol.

Benzoate *of binoxide* of Tin. Somewhat soluble in water, especially if this be hot. Insoluble in alcohol. (Berzelius.)

Benzoate of Toluenyl. Soluble in ether.
(*BenzoBenzoic Ether.*)
$C_{28}H_{12}O_4 = C_{14}H_5(C_{14}H_7)O_4$

Benzoate *of sesquioxide* of Uranium. Very slightly soluble in water.

Benzoate of Urea. Decomposed by water. Soluble in alcohol. (Dessaignes.)
$2C_2H_4N_2O_2;\ C_{14}H_6O_4$

Benzoate of Yttria. Insoluble in water. (Berzelius.) Sparingly soluble in water. (Hisinger.) Soluble in 89 pts. of cold, and more readily in warm water. (Berlin.)

Benzoate of Zinc. Efflorescent. Readily soluble in water, and alcohol. (Trommsdorff.)

Benzoate of Zirconia. Sparingly soluble in water. (Hisinger.)

BenzoCarbolic Acid. *Vid.* Benzoate of Phenyl.

BenzoChloranilid. *Vid.* ChloroPhenylBenzoylamid.

BenzoChlorhydrin. Insoluble in water. (Berthelot, *Ann. Ch. et Phys.*, (3.) **41.** 301.)
(*Chlorhydrate of Benzoyl Glyceryl.*)
$C_{20}H_{11}ClO_8 = C_6H_5O_3 . C_{14}H_5O_3, HCl$

BenzoCinnamic Acid (Anhydrous). Slowly acidified when in contact with water. Soluble in carbonate of ammonia. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** 307.) [Soluble in ether ?]
(*Benzoate of Cinnamyl. Cinnamate of Benzoyl. Benzo Cinnamic Anhydride. Cinnamic Benzoate. Benzoic Cinnamate.*)
$C_{32}H_{12}O_8 = \left.\begin{matrix}C_{14}H_5O_2\\C_{18}H_7O_2\end{matrix}\right\}O_2$

BenzoCuminic Acid (Anhydrous). Insoluble in water, but is slowly acidified by contact therewith. Decomposed by alcohol. Soluble in ether. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** 306.)
(*Cuminate of Benzoyl. Benzoate of Cumyl. Cuminic Benzoate. Benzoic Cuminate.*)
$C_{34}H_{18}O_8 = \left.\begin{matrix}C_{14}H_5O_2\\C_{20}H_{11}O_2\end{matrix}\right\}O_2$

Benzoene. *Vid.* Hydride of Toluenyl.

Benzoene*chloré* (&c.). *Vid.* Hydride of Chloro (&c.) Toluenyl.

BenzŒnanthylic Acid (Anhydrous).
(*Œnanthylo Benzoic Acid. Œnanthylate of Benzoyl. Benzoate of Œnanthyl.*)
$C_{28}H_{18}O_6 = \left.\begin{matrix}C_{14}H_5O_2\\C_{14}H_{13}O_2\end{matrix}\right\}O_2$

BenzoEugenic Acid (Anhydrous). Insoluble in water, either hot or cold. Tolerably soluble in boiling, much less soluble in cold alcohol. Tolerably readily soluble in ether. (Cahours, *Ann. Ch. et Phys.*, (3.) **52.** 203.)
(*Benzeugenyl.*)
$C_{34}H_{16}O_6 = \left.\begin{matrix}C_{20}H_{11}O_2\\C_{14}H_5O_2\end{matrix}\right\}O_2$

BenzoGlycol. *Vid.* Hydrate of Benzol.

BenzoGlycolic Acid. Very sparingly soluble in cold, more soluble in boiling water. It is, however, gradually decomposed by the latter. Easily soluble in alcohol, and ether.
(*Benzoyl Glycolic Acid. Isomeric with Insolinic Acid.*)
$C_{18}H_8O_8 = C_{18}H_7O_7, HO = \left.\begin{matrix}C_4H_2O_2''\\C_{14}H_5O_2\\H\end{matrix}\right\}O_4$

Most of its salts are soluble in water; some of them are also soluble in alcohol.

BenzoGlycolate of Ammonia. Soluble in water.

BenzoGlycolate of Baryta.
$C_{18}H_7BaO_8 + 2Aq$

BenzoGlycolate of Copper. Sparingly soluble in cold, somewhat more readily soluble in boiling water.
$C_{18}H_7CuO_8 + x\,Aq$

BenzoGlycolate of Iron. Insoluble in water. (Socoloff & Strecker.)
$2Fe_2O_3, 3C_{18}H_7O_7$

BenzoGlycolate of Lead.

I.) *normal.* Sparingly soluble in cold, more soluble in hot water.
$C_{18}H_7PbO_8$

II.) *sesquibasic.* Soluble in boiling, sparingly soluble in cold water.
$2C_{18}H_7PbO_8, PbO + 3Aq$

III.) *sexbasic.* Very sparingly soluble in boiling water.
$C_{18}H_7PbO_8, 5PbO + 2Aq$

BenzoGlycolate of Lime. Permanent. Soluble in 42.32 pts. of water at 11°, and 7.54 pts. at boiling. It has a great tendency to form supersaturated solutions. Soluble in alcohol. (Socoloff & Strecker.)
$C_{18}H_7CaO_8 + Aq$

BenzoGlycolate of Lime with Chloride of Calcium. Permanent. Decomposed by water, and alcohol.

BenzoGlycolate of Magnesia. Soluble in hot, less soluble in cold water. Soluble in absolute alcohol.

BenzoGlycolate of Potash. Very readily soluble in water, and alcohol.

BenzoGlycolate of Silver. Sparingly soluble in cold, readily soluble in boiling water. (Socoloff & Strecker.)
$C_{18}H_7AgO_8$

BenzoGlycolate of Soda. Readily soluble in water, and alcohol.
$C_{18}H_7NaO_8 + 6Aq$

BenzoGlycolate of Zinc. Sparingly soluble in cold, somewhat more soluble in hot water.
$C_{18}H_7ZnO_8 + 4Aq$

BenzoHelicin. Soluble in boiling, less soluble in cold water. Slowly soluble in cold concentrated sulphuric acid, the solution being decomposed when water is added. Decomposed by boiling chlorhydric acid. Unacted on by cold, but is decomposed by boiling solutions of the alkalies. (Piria, *Ann. Ch. u. Pharm.*, **96.** 379.)
(*Benzoyl Helicin.*)
$C_{40}H_{20}O_{16} = \left.\begin{matrix}C_{12}H_{11}O_{10}\\C_{14}H_4(C_{14}H_5O_2)O_2\end{matrix}\right\}O_2$

Benzoic Alcohol. *Vid.* Hydrate of Toluenyl.

Benzoic Anhydride. *Vid.* Benzoic Acid (Anhydrous).

Benzoic Ether. *Vid.* Benzoate of Ethyl.

Benzoicin. *Vid.* Benzoate of Glyceryl.

BenzoicNitroBenzoate. *Vid.* BenzoNitroBenzoic Acid (Anhydrous).

BenzoicSalicylate. *Vid.* BenzoSalicylic Acid (Anhydrous).

BenzoicylSulphoPhenoylamic Acid. Easily soluble in warm, less soluble in cold water. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **53.** 306.)
(*Benzoyl Sulpho Phenylamic Acid.*)
$C_{28}H_{11}NS_2O_6 = N\left\{\begin{matrix}C_{14}H_5\\C_{12}H_4S_2O_4''\\H\end{matrix}\right\}O, HO$

BenzoicylSulphoPhenoylamate of Soda. (*BenzoylSulphoPhenylamidate of Soda.*)
$N \left\{\begin{matrix} C_{14} H_5 \\ C_{12} H_4 S_2 O_4'' \\ Na \end{matrix}\right. . O, H O$
Soluble in water, and alcohol. (Gerhardt, *Ibid.*, p. 305.)

BenzoicylSulphoPhenoyl*bi*amid. (*BenzoylSulphoPhenylbiamid. Amid of BenzoylSulphophenylamidyl.*)
$C_{26} H_{12} N_2 S_2 O_4 = N_2 \left\{\begin{matrix} C_{12} H_4 S_2 O_4'' \\ C_{14} H_5 \\ H_3 \end{matrix}\right.$
Insoluble in cold water. Soluble in boiling, less soluble in cold alcohol. Very sparingly soluble even in boiling ammonia-water, which even precipitates it from the alcoholic solution. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **53.** 303.)

Benzoilal. *Vid.* Hydride of Benzoyl.

"**Benzoin**" (Gum). *Vid.* Resins of Benzoin.

"**Benzoin**" (Fat). *Vid.* Benzoate of Glyceryl.

Benzoin(Camphor of Oil of Bitter Almonds).
$C_{28} H_{12} O_4 = C_{28} H_{11} O_3, H O$
Insoluble in cold, sparingly soluble in boiling water. Tolerably soluble in alcohol, and ether, especially when these are boiling. Soluble in concentrated sulphuric acid. (Wœhler & Liebig.)

Benzoinam. $C_{50} H_{24} N_2 O_2$ Insoluble in water. Insoluble in alcohol and in an alcoholic solution of potash. A boiling alcoholic solution of chlorhydric acid dissolves it easily; from this solution it is precipitated by water. Sparingly soluble in ether, and petroleum. (Laurent.) Soluble in warm monohydrated sulphuric acid; in which solution water produces a precipitate. (Laurent.)

Benzoinamid.
$C_{84} H_{36} N_4 = N_4 \left\{\begin{matrix} (C_{28} H_9)_8 \\ H_9 \end{matrix}\right.$
Insoluble in water. Very sparingly soluble in boiling alcohol, somewhat more soluble in boiling ether. (Laurent.)

BenzoLactic Acid.
$C_{20} H_{10} O_8 = \left.\begin{matrix} C_6 H_4 O_2'' \\ C_{14} H_5 O_2 \end{matrix}\right\} O_3, H O$
Soluble in 400 pts. of cold water; much more soluble in boiling water, by which, however, it is very slowly decomposed. Very readily soluble in alcohol; and in ether, which removes it from the aqueous solution.

Most of the benzolactates are soluble in water. (Strecker, *Ann. Ch. u. Pharm.*, **91.** 361.)

Benzolactate of Baryta. Soluble in water.
$C_{20} H_9 Ba O_8 + 6 Aq$

Benzolactate of Silver. $C_{20} H_9 Ag O_8$ Soluble in boiling, less soluble in cold water.

Benzolactate of Soda. Readily soluble in water. Soluble in boiling absolute alcohol.

"**Benzol**" (or **Benzin**). *Vid.* Hydride of Phenyl.
$C_{12} H_6 = \left.\begin{matrix} C_{12} H_5 \\ H \end{matrix}\right\}$

Benzol. Not isolated.
$C_{14} H_6''$

Benzol(ic) Alcohol. *Vid.* Hydrate of Benzol.

Benzolin. *Vid.* Amarin.

Benzolone. Insoluble in water or alcohol.
$C_{22} H_8 O_2$ (?) Unacted upon by an aqueous solution of caustic potash. Soluble in strong nitric acid, from which it is precipitated unchanged on the addition of water. (Rochleder.)

BenzoMyristic Acid(Anhydrous). (*Myristate of Benzoyl. Benzoate of Myristyl.*)
$C_{42} H_{32} O_6 = \left.\begin{matrix} C_{14} H_5 O_2 \\ C_{28} H_{27} O_2 \end{matrix}\right\} O_2$
Soluble in boiling, less soluble in cold ether. (Chiozza, *Ann. Ch. u. Pharm.*, **91.** 104.)

Benzone. *Vid.* BenzoPhenone.

BenzoNitranilid. *Vid.* NitroPhenylBenzoylamid.

BenzoNitranisid. (*BenzoNitrAnisamid. NitroBenzanisidid. Oxide of MethylNitroPhenylBenzoylamid.*)
$C_{28} H_{12} N_2 O_8 = N \left\{\begin{matrix} C_{14} H_5 O_2 \\ C_{12} H_4 (N O_4) \\ C_2 H_3 \end{matrix}\right. . O_2 ; \text{or } N \left\{\begin{matrix} C_{14} H_5 O_2 \\ C_{14} H_8 (N O_4) O_2 \\ H \end{matrix}\right.$

Completely insoluble in cold or hot water. Scarcely at all soluble in alcohol at the ordinary temperature, but tolerably soluble in boiling alcohol. Sparingly soluble in boiling ether, from which it separates as the solution cools. Soluble in concentrated sulphuric acid when this is gently warmed. (Cahours, *Ann. Ch. et Phys.*, (3.) **27.** 451.)

BenzoNitril. *Vid.* Cyanide of Phenyl.

BenzoNitroBenzoic Acid(Anhydrous). (*Benzoic NitroBenzoate. Benzoate of NitroBenzoyl. Nitro-Benzoate of Benzoyl.*)
$C_{28} H_9 N O_{10} = \left.\begin{matrix} C_{14} H_5 O_2 \\ C_{14} H_4 (N O_4) O_2 \end{matrix}\right\} O_2$
Soluble in warm, less soluble in cold alcohol; decomposed by long-continued contact with alcohol. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** 322.)

BenzoNitroCumid.
BenzoNitroCuminamid.
} *Vid.* BenzoylNitroCumenylamid.

BenzoPelargonic Acid(Anhydrous). (*BenzoPelargonic Anhydride. Pelargonate of Benzoyl.*)
$C_{32} H_{22} O_6 = \left.\begin{matrix} C_{18} H_{17} O_2 \\ C_{14} H_5 O_2 \end{matrix}\right\} O_2$
Easily decomposed by alkaline solutions. Soluble in ether. (Chiozza, *Ann. Ch. et Phys.*, (3.) **31.** 209.)

BenzoPhenid. *Vid.* Benzoate of Phenyl.

BenzoPhenone. (*Benzone. CarboBenzid. Phenylide of Benzoyl.*)
$C_{26} H_{10} O_2 = C_{12} H_5, C_{14} H_5 O_2$
Insoluble in water. Tolerably soluble in alcohol. Very soluble in ether. Largely soluble, without decomposition, in cold concentrated sulphuric, and nitric acids; from which solutions it is precipitated in its original state by water.

BenzoPhenone *nitré*. *Vid.* NitroBenzoPhenone.

BenzoPiperid. *Vid.* PiperylBenzamid.

BenzoPropylenyl. *Vid.* Benzoate of Allyl.

BenzoResic Acid.

BenzoSalicin. *Vid.* Populin.

BenzoSalicyl. (*ParaSalicyl. Spirin. SalicylBenzoyl. BenzoylSalicylous Acid. Salicylide of Benzoyl. Benzoate of Salicylous Acid.*)
$C_{28} H_{10} O_8 = \left.\begin{matrix} C_{14} H_5 O_2 \\ C_{14} H_5 O_2 \end{matrix}\right\} O_2$
Insoluble in water or in alkaline solutions. Easily soluble in alcohol, and ether. Soluble, without decomposition, in cold concentrated sulphuric acid. Decomposed by nitric acid. (Ettling.) Sparingly soluble in cold, tolerably soluble in warm alcohol. (Chiozza, *Ann. Ch. et Phys.*, (3.) **36.** 104.)

BenzoSalicylic Acid(Anhydrous). (*Benzosalicylic Anhydride. Benzoate of Salicyl. Salicylate of Benzoyl. Benzoic Salicylate.*)
$C_{28} H_{10} O_8 = \left.\begin{matrix} C_{14} H_5 O_4 \\ C_{14} H_5 O_2 \end{matrix}\right\} O_2$
Easily decomposed by boiling water. Soluble in ether. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** 325.)

BenzoStearic Acid.
$C_{48} H_{38} O_6 = \left.\begin{matrix} C_{34} H_{33} O_2 \\ C_{14} H_5 O_2 \end{matrix}\right\} O_2$
Soluble in boiling anhydrous ether. (Chiozza, *Ann. Ch. u. Pharm.*, **91.** 104.)

BenzoStilbin. Sparingly soluble in alcohol. $C_{62}H_{22}O_4$ Somewhat soluble in ether. Soluble in concentrated sulphuric acid. Unacted on by a strong boiling solution of caustic potash. (Rochleder.)

BenzoSuccinin. Decomposed by continued $C_{28}H_{14}O_{12}$ boiling with water or with alcohol. Also soluble, with decomposition, in solution of caustic potash. (Van Bemmelen.)

BenzoSulphoPhenamid. *Vid.* BenzoylSulphoPhenylamid.

BenzoSulphuric Acid. *Vid.* PhenylSulphurous Acid.

BenzosylAnilid. *Vid.* BenzoylAnilid.

BenzoTartaric Acid. More soluble than benzoic acid in cold water, but less soluble than it in alcohol.

$C_{22}H_{16}O_{14} = C_{22}H_8O_{12}, 2\,HO$

BenzoTartrate of Silver. Ppt.

Berberin. Only sparingly soluble in cold water.
$C_{42}H_{19}NO_{10} + 10\,Aq = N\left\{C_{42}H_{19}O_{10}''' + 10\,Aq\right.$
Soluble in 500 pts. of water at 12°, and easily soluble in boiling water.

Easily soluble in alcohol, from which solution it is precipitated by ether. (Stenhouse.) Soluble in 250 pts. of cold alcohol, and in all proportions in boiling alcohol. Somewhat soluble in several of the essential and fatty oils. Insoluble in ether, bisulphide of carbon, naphtha, or oil of coal-tar. Decomposed by concentrated sulphuric, and nitric acids. These acids, as well as chlorhydric and phosphoric acids, precipitate it from the aqueous solution. Soluble, without alteration, in the vegetable acids, excepting tannic acid, with which it forms an insoluble compound. Soluble in alkaline solutions. (Wittstein's *Handw.*) About as soluble in a solution of ammonia as in pure water. Soluble in concentrated sulphuric acid. Most of its salts are but sparingly soluble in water.

Bergaptene. Nearly insoluble in water. (Ohme.) Soluble in 2000 pts. of boiling water, from which it separates out as the solution cools, even when the latter is four times diluted. (Kalkbruner.) Soluble in 200 pts. of alcohol, of 0.85 sp. gr., at 15°. (Kalkbruner.) Abundantly soluble in boiling alcohol, so that the solution forms a solid mass on cooling.
(Bergamot Camphor. Hydrate of Bergamot-Oil. Stearoptene of Bergamot-Oil.)
$C_6H_2O_2$

Difficultly soluble in ether. (Ohme.) Soluble in ether. (Mulder.) Insoluble in dilute, but soluble in warm concentrated acetic acid; from this solution water precipitates it. (Kalkbruner.) Insoluble in chlorhydric, and dilute sulphuric acids. Soluble in monohydrated sulphuric acid, from which it is precipitated by water, but not by alcohol. Soluble in cold concentrated nitric acid, from which solution water precipitates it. (Kalkbruner.) Insoluble in ammonia. (Mulder.) Partially soluble in boiling ammonia. Soluble in solution of potash, from which it is precipitated by acids, but not by water or alcohol. (Kalkbruner.)

BetaOrcein. *Vid.* Orcein.

BetaOrcin. Tolerably soluble in cold water, though much less soluble than orcin. Readily soluble in boiling water. Easily soluble in alcohol, and ether. (Stenhouse.)

Bilifulvate of Potash & of Soda. Readily soluble in water. Soluble in alcohol. Insoluble in anhydrous ether. (Berzelius.)
(Bilifulvin.)

Bilin. *Vid.* Cholate of Soda.

Biliphein. Difficultly soluble in boiling water. Somewhat more easily soluble in boiling alcohol. Very sparingly soluble in boiling chlorhydric acid. Soluble in aqueous solutions of the alkalies and alkaline carbonates.
$C_{32}H_{18}N_2O_9$

Biliphein with Baryta. Insoluble in water.

Biliphein with Lime. Insoluble in water.

Biliverdin. Insoluble in cold, and nearly insoluble in boiling water. Partially soluble in alcohol. Completely soluble in ether. Easily soluble in solutions of the alkalies and alkaline carbonates. Soluble in sulphuric, chlorhydric, and concentrated acetic acids.
$C_{16}H_9NO_5$ (?)

BisEthyl. *Vid.* BismuthEthyl.

BismEthyl. *Vid.* BismuthEthyl.

Bismuth. Permanent. Scarcely at all acted upon by water. Very slowly and sparingly soluble in hot concentrated chlorhydric acid; more easily in hot concentrated sulphuric acid, but this acid, when cold or dilute, does not act upon it; and still more easily in nitric acid, which dissolves it even at the ordinary temperature. Bismuth is not attacked by pure nitric acid, of 1.512 @ 1.419 sp. gr., at 20°; a more dilute acid attacks it with extreme violence, but the acid thus becomes more concentrated; this is specially marked with an acid as dilute as that of 1.108 sp. gr. To bring about an action with the strong acid, it is necessary to heat it or to add some nitrous acid. At very low temperatures bismuth behaves like copper (*q. v.*) towards nitric acid. (Millon, *Ann. Ch. et Phys.*, (3.) **6.** pp. 95, 99.)
Bi

BismuthPotassium. Decomposes in the air, and by contact with water. (Breed, *Am. J. Sci.*, (2.) **13.** 404.)

Bismuth Ethyl. Not isolated.
(BisEthyl.)
C_4H_5Bi''

Bismuth*di*Ethyl.
$Bi(C_4H_5)_2$

Bismuth*tri*Ethyl. Quite insoluble in water. Easily soluble in absolute alcohol. Slightly soluble in ether. (Breed, *Am. J. Sci.*, (2.) **13.** 406.)
(Bismethyl. Bismuthide of Ethyl. BistriEthyl.)
$C_{12}H_{15}Bi = Bi(C_4H_5)_3$

Bismuthic Acid(Anhydrous). Not readily attacked by acids. (Fremy, *loc. cit.*)
BiO_4

Bismuthic Acid(Hydrated). Insoluble in water. Easily decomposed by acids. (Fremy, *Ann. Ch. et Phys.*, (3.) **12.** 495.) De-
(PerOxide of Bismuth.)
BiO_4, HO

composed by sulphuric acid. Unacted upon by a saturated solution of sulphurous acid. Neither dissolved nor decomposed by dilute nitric acid, but when left in contact with it for some time is converted into an allotropic modification. Partially decomposed by concentrated nitric acid, which also converts a part of it into the yellow insoluble modification. When treated with hot concentrated nitric acid it is slowly but completely dissolved, with decomposition. Slightly soluble in an aqueous solution of caustic potash, acid bismuthate of potash being precipitated when this solution is diluted with water. (Arppe, in Berzelius's *Lehrb.*, **2.** pp. 575 – 578.) Somewhat soluble in boiling solutions of caustic potash and soda.

BISMUTHATE OF BISMUTH. Ppt. Decomposed, with partial solution, by nitric acid.

BISMUTHATE OF POTASH. Insoluble in water, but is decomposed by boiling therewith. (Fremy, *loc. cit.*)

BITTER ALMOND OIL. *Vid.* Hydride of Benzoyl.

BITUMENS OR ALPHALTS. Insoluble in water. Some are soluble in alcohol, others only partially soluble. Most of them are partially soluble in ether, and oil of turpentine, and other volatile oils, also in the fixed oils.

BIXIN. Sparingly soluble in water. Readily soluble in alcohol, and ether. Soluble in oil of turpentine, fatty oils, alkaline solutions, and sulphuric acid. (Preisser.)

(*Coloring matter of Bixa Orellana.*)
$C_{16}H_{13}O_2$ (?)

BOHEIC ACID. Very deliquescent. Very easily soluble in water; and in all proportions in alcohol. (Rochleder.)

$C_{14}H_{10}O_{12} = C_{14}H_8O_{10}, 2HO$

BOHEATE OF BARYTA. Insoluble, or very sparingly soluble, in water or alcohol.

$C_{14}H_8Ba_2O_{12} + 2Aq$

BOHEATE OF LEAD.

I.) Insoluble in alcohol.

$C_{14}H_8Pb_2O_{12} + 2Aq$

II.) Ppt.

$C_{14}H_8Pb_2O_{12}, 2PbO$

BOLETIC ACID. Identical with Fumaric Acid, *q. v.*

BOLORETIN. Soluble in warm alcohol, separating out again as the solution cools. Soluble in cold ether. (Forchammer.)

$C_{40}H_{32}O_6$

BORACIC ACID.

a = anhydrous. Slightly deliquescent.
BO_3

(R. Brandes & Firnhaber, *Brandes's Archiv.*, 1824, **7.** 52.)

The saturated aqueous solution boils at 100° (B. & F., *loc. cit.*, p. 55); at 103.3° (T. Griffiths, *Quar. J. Sci.*, 1825, **18.** 90). Soluble in 4.5 pts. boiling water, less soluble in cold water. (Berzelius, *Lehrb.*, **1.** 662.) Sparingly soluble in water; boiling water scarcely dissolving 0.02 of it, and cold water still less. Soluble in alcohol. (Thompson's *System*, **2.** 19.) Anhydrous boracic acid is insoluble in alcohol; the acid becomes soluble, however, after it has combined with water. (Graham, cited by Persoz, *Ann. Ch. et Phys.*, (2.) **63.** 281.) It is *soluble* in alcohol. (Berzelius, *Lehrb.*, **1.** 663; Ebelmen.) Soluble in oils, in acetic acid, and in several of the strong acids when these are warm, *ex. gr.*, in concentrated sulphuric, nitric, and chlorhydric acids; from these acid solutions it separates on cooling, and on the addition of water.

Largely soluble in sulphuric acid, especially if this be hot.

“		25	“	“	20°
“		3	“	“	100°

(Berzelius's *Lehrb.*, **1.** 662.)

Soluble in 20 pts. of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) 100 pts. of the aqueous solution saturated at 19° contain 3.75 pts. of it, and 25.18 pts. when saturated at 100°. (M. R. & P.) 100 pts. of water at 100° dissolve 2 pts. of it. (Ure's *Dict.*) An aqueous solution saturated at 8° is of 1.014 sp. gr. (Anthon, *Ann. der Pharm.*, 1837, **24.** 211.) More readily soluble in spirit than in absolute alcohol.

Soluble in 6 pts. of alcohol. (Wittstein's *Handw.*) Soluble in 5 pts. of strong boiling alcohol. (Wenzel, in his *Verwandtschaft*, p. 300. [T.].) Soluble in essential oils.

When the aqueous solution is evaporated a large portion of boracic acid is volatilized. All of the borates, excepting those of the fixed alkalies and ammonia are difficultly soluble in water, but are soluble in boracic acid. They are all insoluble or sparingly soluble in alcohol.

They are more soluble in water which contains in solution tartaric acid or tartrate of potash than in pure water. (Soubeiran.) The normal (*mono*) borates of the alkaline earths are soluble to no inconsiderable extent in water, and more readily in hot than in cold water. (Berzelius, *Pogg. Ann.*, 1835, **34.** 568.)

*Sex*BORATE OF ALUMINA. Very sparingly soluble in water. (Beudant.)

BORATE OF AMMOLIN (of Unverdorben). Very readily soluble in water and in alcohol. Insoluble in ether.

BORATE OF AMMONIA.

I.) $3NH_4O, 4BO_3 + 3Aq$ Soluble in hot, less soluble in a cold solution of ammonia. (Arfvedson.)

II.) *bi.* $NH_4O, 2BO_3 + 4Aq$ Efflorescent. Soluble in about 12 pts. of cold water. The solution loses ammonia on being heated. (Arfvedson.)

III.) $NH_4O, 4BO_3 + 6Aq$ Permanent. Soluble in about 8 pts. of cold water; when boiled the solution gives off ammonia. (L. Gmelin.)

IV.) $NH_4O, 5BO_3 + 8Aq$ Permanent. Soluble in water.

BORATE OF AMMONIA & OF MAGNESIA. Soluble in cold water. The solution becomes turbid on being heated.

BORATE OF AMYL.

I.) $C_{30}H_{33}O_6B = 3C_{10}H_{11}O, BO_3$ Decomposed by water and by a solution of ammonia. (Ebelmen & Bouquet, *Ann. Ch. et Phys.*, (3.) **17.** 61.)

II.) *bi.* $C_{10}H_{11}O, 2BO_3$ Decomposed by water. Soluble in ether. (Ebelmen, *Ann. Ch. et Phys.*, (3.) **16.** 139.)

BORATE OF BARYTA.

I.) $BaO, BO_3 + 10Aq$ Soluble to no inconsiderable extent in water, and more readily in hot than in cold. (Berzelius, *Pogg. Ann.*, **34.** 568.) Soluble in an aqueous solution of normal citrate of soda. (Spiller.) Insoluble in wood-spirit. (Ebelmen, *Ann. Ch. et. Phys.*, (3.) **16.** 139.)

II.) *bi.* $BaO, 2BO_3 + 5Aq$ Soluble in 100 pts. of cold, and more freely soluble in hot water. When recently precipitated it is soluble in cold aqueous solutions of chloride of ammonium (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 315; Brett, *Phil. Mag.*, 1837, (3.) **10.** 96), nitrate of ammonia (Brett, *Ibid.*), and chloride of barium. (H. Rose.)

III.) *quadri.*

IV.) *sex.* $BaO, 6BO_3$ Sparingly soluble in water. (Laurent.) The bi, quadri, and sex salts (Nos. 2, 3, & 4) are all somewhat soluble in water, and still more soluble in solutions of ammoniacal salts, and even of chloride of barium. (Berzelius, *Lehrb.*, **3.** 272.)

BORATE OF BISMUTH. Insoluble in water.

BORATE OF CADMIUM. $CdO, 2BO_3$ Difficultly soluble in water. (Stromeyer.) Insoluble in water. Soluble in chlorhydric acid. (Odling.) Easily soluble in a warm aqueous solution of chloride of ammonium. (H. Rose, *Tr.*)

BORATE *of protoxide* OF CHROMIUM. Soluble in acids. Insoluble in an aqueous solution of biborate of soda. (Moberg.)

BORATE *of sesquioxide* OF CHROMIUM. Insoluble in water. (Hayes.) Soluble in an aqueous solution of biborate of soda. (Berlin.)

BORATE *of sesquioxide* OF CHROMIUM & OF MAGNESIA. $6MgO, 3Cr_3O_3, 2BO_3$ Unacted on by acids. (Ebelmen, *Ann. Ch. et Phys.*, (3.) **33.** 52.)

BORATE OF COBALT. Scarcely at all soluble in water.

BORATE OF COPPER (Cu O). $CuO, 2BO_3$ Permanent. Slightly soluble in water. Soluble in boracic acid and the acids generally. (Tunnermann.) Soluble in a large excess of a solution of chloride of ammonium when boiled therewith for a long time. (H. Rose, *Tr.*)

BORATE OF ETHYL.

I.) *mono.* C_4H_5O, BO_3 Its properties are similar to those of No. 3. (Stædeler.)

II.) *bi.* $C_4H_5O, 2BO_3$ Decomposed by water. Soluble in all proportions in alcohol, and ether. (Ebelmen, *Ann. Ch. et Phys.*, (3.) **16.** 132.)

III.) *tri.* $C_{12}H_{15}BO_6 = 3C_4H_5O, BO_3$ Readily soluble in water, the solution being decomposed in the course of a few moments. Soluble in all proportions in alcohol, and ether. (Ebelmen & Bouquet, *Ann. Ch. et Phys.*, (3.) **17.** 56.)

IV.) ? *sesqui.* $2C_4H_5O, 3BO_3$ Decomposed by absolute alcohol with separation of hydrated boracic acid and formation of No. 3. Not so readily decomposed by water as No. 1. (Stædeler.)

BORATE OF FLUORIDE OF SODIUM. $3NaFl, HO, BO_3$ Permanent. Soluble in water. (Berzelius, *Lehrb.*)

BORATE *of protoxide* OF IRON. $FeO, 2BO_3$ Insoluble in water, but is decomposed by washing with water, boracic acid being gradually abstracted. (Berzelius, *Lehrb.*)

BORATE *of sesquioxide* OF IRON. $Fe_2O_3, 3BO_3 + 3Aq$ Insoluble in water. (Berzelius, *Lehrb.*)

BORATE *of sesquioxide* OF IRON & OF MAGNESIA. $6MgO, 3Fe_2O_3, 2BO_3$ Insoluble in water. Easily soluble in hot concentrated chlorhydric acid. (Ebelmen, *Ann., Ch. et Phys.*, (3.) **33.** 54.)

BORATE OF LEAD.

I.) *normal.* $PbO, BO_3 + Aq$ Insoluble in water or alcohol. Easily soluble in dilute nitric, and hot acetic acids.

"Borate of lead" dissolves after long-continued ebullition in a large quantity of a solution of chloride of ammonium. (H. Rose.) It is soluble in a saturated aqueous solution of chloride of sodium. (Becquerel, *C. R.*, 1845, **20.** 1523.)

II.) *bi.* $PbO, 2BO_3, + 4Aq$ Slightly soluble in pure water, but insoluble in aqueous solutions of soda salts, of borax for example. (Soubeiran.)

III.) *sesqui.* $2PbO, 3BO_3 + 4Aq$ Ppt. Resembles the normal salt.

BORATE OF LEAD with CHLORIDE OF LEAD. $PbO, BO_3; PbCl + Aq$ Unacted upon by cold, slowly decomposed by boiling water. Insoluble in alcohol. (T. J. Herapath.)

BORATE OF LEAD with NITRATE OF LEAD.

$\mathrm{Pb\,O, B\,O_3 ; Pb\,O, N\,O_5 + x\,Aq}$ Insoluble in alcohol. (T. J. Herapath.)

Borate of Lead with **Silicate of Lead.**

Borate of Lime.

I.) *normal.* Difficultly soluble in water. (Bergman.) Soluble to no inconsiderable extent in water, and more readily in hot than in cold water. (Berzelius, *Pogg. Ann.*, **34.** 568.) Decomposed to a certain extent by boiling water.

$\mathrm{Ca\,O, B\,O_3 + 2\,Aq}$

Borate of lime when recently precipitated is soluble, even in the cold, in an aqueous solution of chloride of ammonium (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 315; Brett, *Phil. Mag.*, 1837, (3.) **10.** 96), of nitrate of ammonia (Brett, *Ibid.*), and of chloride of calcium.

II.) *sesqui?* Somewhat soluble, with decomposition, in water.

III.) *bi.* Ppt.

$\mathrm{Ca\,O, 2\,B\,O_3}$

IV.) *sex.* Ppt. (Berzelius, *Lehrb.*, **3.** 420.)

$a = \mathrm{Ca\,O, 6\,B\,O_3}$

$b = \mathrm{2(Ca\,O, 2\,B\,O_3) + 9\,Aq}$ Slightly soluble in cold, more soluble in hot water. Insoluble in alcohol. (Lecanu.)

Borate of Lime & of Magnesia. Very soluble in warm chlorhydric acid.

(*Hydroboracite.*)
$\mathrm{Ca\,O, Mg\,O, 3\,B\,O_3 + 6\,Aq}$

Borate of Lime & of Soda. Scarcely soluble in cold, very sparingly soluble in hot water. (Ulex.)

$\mathrm{2\,Ca\,O, Na\,O, 5\,B\,O_3 + 10\,Aq}$

Borate of Lime with **Silicate of Lime.**

$\mathrm{Ca\,O, B\,O_2 ; Ca\,O, 2\,Si\,O_3 + 2\,Aq}$ Insoluble in water.

Borate of Lime with **Tartrate of Lime.**

Borate of Lithia.

I.) *bi.* Deliquescent. Easily soluble in water.

$\mathrm{Li\,O, 2\,B\,O_3}$

II.) "*acid salt.*" Less readily soluble in water than the preceding. (C. Gmelin.)

Borate of Magnesia.

I.) *tri.* Unacted on by water. Easily soluble in acids. (Ebelmen, *Ann. Ch. et Phys.*, (3.) **33.** 50.) Very sparingly soluble in cold water. A portion of the acid is removed by boiling water. (Rammelsberg.) When aqueous solutions of sulphate of magnesia and biborate of soda are mixed a precipitate is formed which is abundantly soluble in an excess of the former, but much less soluble, or insoluble, in an excess of the latter. (Berzelius, *Lehrb.*)

$\mathrm{3\,Mg\,O, B\,O_3}$

II.) *mono.* Insoluble either in cold or boiling water. Soluble in dilute chlorhydric acid, from which it is reprecipitated unchanged on the addition of ammonia. Concentrated chlorhydric acid decomposes it, magnesia being dissolved and boracic acid deposited. (Wœhler, Berzelius's *Lehrb.*, **3.** 451.)

$\mathrm{Mg\,O, B\,O_3 + 8\,Aq}$

III.) $(\frac{4}{3})$. Insoluble in water. Slowly soluble in acids. (Berzelius.)

(*Boracite.*)
$\mathrm{3\,Mg\,O, 4\,B\,O_3}$

IV.) *ter.* Slowly soluble, but in tolerable quantity, in water. (Wœhler.) Soluble in 75 pts. of water. (Rammelsberg.)

$\mathrm{Mg\,O, 3\,B\,O_3 + 8\,Aq}$

V.) *sex.*

$\mathrm{Mg\,O, 6\,B\,O_3 + 18\,Aq}$

Borate of Magnesia & of Potash. Easily soluble in water. (Rammelsberg.)

Borate of Magnesia & of Soda. Efflorescent. About as soluble as biborate of soda in cold water; the solution becomes turbid when heated, but clears up again on cooling. Decomposed by boiling water. (Rammelsberg.)

$\mathrm{Na\,O, 2\,Mg\,O, 5\,B\,O_3 + 30\,Aq}$

Borate of Manganese. Insoluble in water. (Berzelius, *Lehrb.*) Very difficultly soluble in water. (Ot. Gr.) It is decomposed almost immediately by warm water, even when this is acidulated with boracic acid; in the cold the decomposition is more gradual. (Gorgeu, *Ann. Ch. et Phys.*, (3.) **42.** 77.) Soluble in an aqueous solution of sulphate of magnesia. (Berzelius.)

$\mathrm{Mn\,O, 2\,B\,O_3}$

Borate of Methyl.

I.) *tri.* Miscible with water; but the solution soon decomposes. (Ebelmen & Bouquet, *Ann. Ch. et Phys.*, (3.) **17.** 60.)

$\mathrm{3\,C_2\,H_3\,O, B\,O_3}$

II.) *bi.* Decomposed by water. Soluble in ether. (Ebelmen, *Ann. Ch. et Phys.*, (3.) **16.** 137.)

$\mathrm{C_2\,H_3\,O, 2\,B\,O_3}$

Borate *of protoxide* **of Molybdenum.** Insoluble in water. Very sparingly soluble in boracic acid. (Berzelius, *Lehrb.*)

Borate *of binoxide* **of Molybdenum.** Insoluble in water. Soluble in boracic acid. (Berzelius, *Lehrb.*)

$\mathrm{Mo\,O_2, 2\,B\,O_3}$

Borate of Molybdic Acid. Soluble in hot boracic acid, somewhat less so in cold. Decomposed by alcohol. (Berzelius.)

Borate of Nickel. Insoluble in water. Soluble in sulphuric, chlorhydric, and nitric acids. (Tupputi.) Easily soluble in a solution of chloride of ammonium when this is gently heated. (H. Rose, *Tr.*) Decomposed to a certain extent by washing with water.

$\mathrm{Ni\,O, 2\,B\,O_3 + 2\,Aq}$

Borate of Picolin. Decomposed by boiling with water. (Unverdorben.)

Borate of Potash.

I.) *normal.* Very easily soluble in water. (Arfvedson.) It dissolves in a very small quantity of water, from which it crystallizes with difficulty. (Berzelius, *Pogg. Ann.*, 1835, **34.** 568.)

$\mathrm{K\,O, B\,O_3}$

II.) *bi.* Readily soluble in hot, and in cold water.

$a = \mathrm{K\,O, 2\,B\,O_3}$

$b = \mathrm{K\,O, 2\,B\,O_3 + 5\,Aq}$ Very readily soluble in water. More readily soluble in water than the *ter* or *sex* salt.

III.) *ter.* Permanent.

$\mathrm{K\,O, 3\,B\,O_3 + 8\,Aq}$

IV.) *sex.* Permanent. Sparingly soluble in cold, but readily soluble in boiling water. (Laurent.) Difficultly soluble in boiling water. (Berzelius, *Lehrb.*, **3.** 163.)

$\mathrm{K\,O, 6\,B\,O_3 + 10\,Aq}$

Borate of Potash with **Tartrate of Potash.** *Vid.* Tartrate of Boron & of Potash.

Borate of Quinine. Soluble in hot, less soluble in cold water. (Sérullas, *Ann. Ch. et. Phys.*, 1830, (2.) **45.** 282.)

Borate of Silver.

I.) *normal.* Sparingly soluble in water. (H. Rose.) Readily soluble, with decomposition, in aqueous solutions of the soluble hyposulphites. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 397.) When precipitated in the cold, borate of silver is soluble, even at the ordinary temperature, in an aqueous solution of nitrate of ammonia. (H. Rose, *Tr.*)

$\mathrm{Ag\,O, B\,O_3}$

II.) *sex.* Sparingly soluble in water. (Laurent.)
$AgO, 6BO_3$

Borate of Soda.

I.) *normal.* Soluble in water, with evolution of heat. On slowly cooling the hot aqueous solution the 8 hydrated salt (*c*) crystallizes out; but if the salt be dissolved in a quantity of water sufficient for the water of crystallization of *c* the latter crystallizes much more difficultly. (Berzelius, *Pogg. Ann.*, 1835, **34.** 567.)
a = *anhydrous*, NaO, BO_3

b = $NaO, BO_3 + 6 Aq$ Gradually separates out from the liquor obtained by fusing the 8 Aq salt in its water of crystallization, when this liquor is cooled to 0°. (Berzelius, *Pogg. Ann.*, **34.** pp. 567, 568.)

c = $NaO, BO_3 + 8 Aq$ Superficially efflorescent. Soluble in hot, less soluble in cold water. Melts at 57° in its water of crystallization, but does not solidify again on cooling, until after a long time. A portion of it thus melted was kept for several days in a closed vessel, at 0° before any crystals appeared, after which these increased slowly. (Berzelius, *Pogg. Ann.*, 1835, **34.** 567.)

II.) *bi.* Becomes opaque in moist air, being gradually converted into *b.* When a hot solution of ordinary borax of 30° B. (= 1.263 sp. gr.) is allowed to cool slowly, the octohedral salt begins to crystallize out as soon as the temperature of the solution has fallen to 79° and continues to separate until the temperature reaches 56°, after which only the ordinary prismatic crystals (*b*) are formed. (Payen in his *Précis de Chimie Industrielle*, Paris, 1855, p. 325.) If the solution be boiled for some hours it appears to yield more octohedral borax on cooling, even when cooled below 56°. (Buron, Soubeiran & Pellerin)
a = $NaO, 2BO_3 + 5 Aq$
(*Octohedral Borax.*)

b = $NaO, 2BO_3 + 10 Aq$
(*Prismatic, or ordinary Borax.*)
Effloresces superficially. Soluble in 12 pts. of cold, and in 2 pts. of boiling water; the saturated cold solution containing 9.23% of it, and the saturated hot solution 33.33%. (Gmelin.) Soluble in 20 pts. of cold, and in 6 pts. of boiling water (Wallerius); in 15 pts. of water at 18.75° (Abl, from *Œsterr, Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76)

100 pts. of water at	Dissolve pts. of the anhydrous salt.	of the cryst. salt $NaO,2BO_3 + 10Aq$.

70°	24.22	57.85
80°	31.17	76.19
90°	40.14	116.66
100°	55.16	201.43

(Poggiale, *Ann. Ch. et Phys.*, (3.) **8.** 467.)

100 pts. of water at 15.5° dissolve 5 pts. of it.
" " 65° " 40 "
" " 100° " 166 "
(Ure's *Dict.*)

The aqueous solution saturated at 15° is of 1.019919 sp. gr. and contains dissolved in every 100 pts. of water at least 3.926 pts. of the salt. (Michel & Krafft, *Ann. Ch. et Phys.*, (3.) **41.** pp. 478, 482.) 100 pts. of the saturated aqueous solution at its boiling temperature (105.5°), contain 52.5 pts. of the dry salt; or 100 pts. of water dissolve 110.54 pts. of the dry salt at 105.5°; or, 1 pt. of the dry salt is soluble in 0.9047 pts. of water at 105.5°. (T. Griffiths, *Quar. J. Sci.*, 1825, **18.** 90.) A hot aqueous solution of "borate of soda" is liable to become supersaturated on cooling. (Gay-Lussac.) Insoluble in alcohol. (Wenzel.) Nearly insoluble in alcohol. (P. & F.)

III.) *quadri.* Soluble in 5 or 6 pts. of water at ordinary temperatures. (Bolley, *Ann. Pharm.*, **68.** 122.) Unlike borax, it deposits boracic acid on the addition even of dilute acids.
$NaO, 4BO_3 + 10 Aq$

IV.) *sex.* Known only in solution. (Laurent, *Ann. Ch. et Phys.*, **67.** 218.)
$NaO, 6BO_3$

Borate of Soda with Fluoride of Sodium.

I.) "*neutral.*" Decomposed by cold, soluble in boiling water.
$NaO, BO_3; 3 NaFl + 8 Aq$

II.) "*bi.*" Soluble in water. (Berzelius, *Lehrb.*, **3.** 246.)
$NaO, 2BO_3; 6 NaFl + 22 Aq$

Borate of Soda with Sucrate of Soda.

Borate of Soda with Tartrate of Soda. *Vid.* Tartrate of Boron & of Soda.

Borate of Strontia.

I.) *bi.* Almost insoluble in cold water. (Berzelius's *Lehrb.*) Soluble in 130 pts. of boiling water. (Hope, *Edin. Trans.*, **4.** 17. [T.].) 100 pts. of boiling water dissolve 7.7 pts. of "sub-borate" of strontia. (Ure's *Dict.*) Readily soluble in cold aqueous solutions of chloride of ammonium and nitrate of ammonia. (Brett.)
$SrO, 2BO_3$

II.) *sex.* Very sparingly soluble in water. (Laurent.)
$SrO, 6BO_3$

Borate of Thoria. Insoluble in water or in a solution of boracic acid. (Berzelius.)

Borate *of protoxide* of Tin. Insoluble in water.

Borate *of protoxide* of Uranium. Ppt. Easily decomposed by water.

Borate *of sesquioxide* of Uranium. Sparingly soluble in water. (Richter.)

Borate *of binoxide* of Vanadium. Insoluble in water. Soluble in an aqueous solution of boracic acid.
$VO_2, 4BO_3$

Borate of Yttria. Insoluble in water.

Borate of Zinc. Insoluble in water. Soluble in boracic, and chlorhydric acids. (Wenzel.)
$ZnO, 2BO_3$

Borate of Zirconia. Insoluble in water.

Borax. *Vid. bi*Borate of Soda.

Boride of Iron & of Potassium. Decomposed by water. (H. Davy.)

Boride of Nitrogen. Insoluble in water. Unacted on by nitric or chlorhydric acids, or by concentrated caustic lye.
NB

Boride of Nitrogen & of Potassium. Insoluble in cold or boiling water or in cold caustic lye. Decomposed by boiling aqua-regia. (Balmain, *Phil. Mag.*, **21.** 270.)
$K_3N_3B_2$

Boride of Platinum. Soluble in nitromuriatic acid. (Descotils.)

Borneene. Insoluble, or very sparingly soluble in water. Soluble in alcohol. Unacted upon in the cold by ordinary nitric acid, but is decomposed by boiling therewith. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **7.** 281.) Soluble in ether.
(*Isomeric with oil of Turpentine. "Valerene" (of Pierlot).*)
$C_{20}H_{16}$

Bornenic Acid. *Vid.* Campholic Acid.

Borneol. (From *Dryobalanops camphora.*)
(*Borneol Alcohol. Camphol. Campholic Alcohol. Solid Camphor of Borneo. Oxide of Bornene.*)
I.) *ordinary.*
$C_{20}H_{18}O_2 = \left.\begin{matrix}C_{20}H_{17}\\H\end{matrix}\right\}O_2$
Sparingly soluble in water. (Pelouze.) Insoluble in water. (Berthelot.) Readily soluble in alcohol, and ether. (Pelouze. Berthelot.) From a solution of 2 pts. borneol in 10 pts. absolute alcohol, 100 pts. of water separate, after three days' standing, 1.2 pts. of borneol, and on agitating the liquid with ether, this takes up an additional 0.6 pt. of borneol. (Berthelot.)

II.) *Lævo-rotatory.* Sparingly soluble in water. Readily soluble in alcohol, ether, and acetic acid. (Jeanjean).

BoroFluoride of *X.* *Vid.* FluoBorate of *X.*

Boron.
B
a = pulverulent. When freshly prepared it is somewhat soluble in water, and especially in alkaline water; but is insoluble in saline solutions, as of chloride of ammonium, fluoride of potassium, or borate of potash, or in alcohol. Chloride of ammonium also precipitates it from the aqueous solution. After having been heated, boron is no longer soluble, even in boiling water, and is not acted upon by acids or by alkaline solutions, excepting nitric acid and aqua-regia, which oxidize it. (Berzelius, *Lehrb.*, **1.** 315.) Insoluble in hot or cold alcohol, ether or oils.

Soluble in hot concentrated sulphuric acid. (H. Davy.)

b = crystalline. Unacted upon by any acid, or by boiling concentrated alkaline lyes. (Wœhler.)

BoroSilicate of *X.* *Vid.* Borate & Silicate of *X.*

BoroTartrate of *X.* *Vid.* Borate & Tartrate of *X.*

Brassic Acid.
(*Supposed to be identical with Darby's Erucic Acid.*)
$C_{44}H_{42}O_4 = C_{44}H_{41}O_3, HO$
Insoluble in water. Soluble in 12 pts. of alcohol, of 0.835 sp. gr., at 7°, and in all proportions in the same alcohol at temperatures above 33°. Miscible in all proportions with ether.

The alkaline brassates are soluble, but all the others are insoluble in water.

Brassate of Baryta. Ppt.

Brassate of Lead. Insoluble in water.

Brassate of Silver. Ppt.

Brassate of Soda. Soluble in water, and absolute alcohol.
$C_{44}H_{41}NaO_4$

Brazilin. Soluble in water, alcohol, and ether.
(*Brazilic Acid. Bresilin.*)
$C_{36}H_{14}O_{14}$

Brodracasic Acid. *Vid.* BromAnisic Acid.

*Bi***BromAcetamid.**
$C_4H_3Br_2NO_2 = N\left\{\begin{matrix}C_4HBr_2O_2\\H_2\end{matrix}\right.$

BromAcetic Acid. Very deliquescent. Very readily soluble in water.
$C_4H_3BrO_4$

BromAcetate of Ammonia. Very soluble in water.

BromAcetate of Amyl. Insoluble, or very sparing soluble, in water.
$C_{14}H_{13}BrO_4 = C_4H_2Br(C_{10}H_{11})O_4$

BromAcetate of Baryta. Tolerably soluble in alcohol.

BromAcetate of Copper. Very soluble in water.

BromAcetate of Ethyl.
$C_8H_7BrO_4 = C_4H_2Br(C_4H_5)O_4$

BromAcetate of Lead. Sparingly soluble in cold, tolerably soluble in hot water; but is decomposed when boiled for a long time with water.
$C_4H_2BrPbO_4$

BromAcetate of Lime. Very soluble in water.

BromAcetate of Methyl. Insoluble, or sparingly soluble, in water.
$C_6H_5BrO_4 = C_4H_2Br(C_2H_3)O_4$

BromAcetate of Potash. Very soluble in water and in alcohol.

BromAcetate of Silver. Insoluble, or nearly insoluble, in cold water; decomposed by boiling water.
$C_4H_2BrAgO_4$

BromAcetate of Soda. Very soluble in water. Insoluble, or nearly insoluble, in alcohol. (Perkin & Duppa.)

*Bi***BromAcetic Acid.** Soluble in water.
$C_4H_2Br_2O_4$

*Bi***BromAcetate of Ammonia.** Readily soluble in water, alcohol, and ether.
$C_4HBr_2(NH_4)O_4 + Aq$

*Bi***BromAcetate of Amyl.**

*Bi***BromAcetate of Baryta.** Deliquescent.

*Bi***BromAcetate of Ethyl.** Insoluble, or but sparingly soluble, in water.
$C_4HBr_2(C_4H_5)O_4$

*Bi***BromAcetate of Lead.** Very soluble in water, from which alcohol precipitates it.

*Bi***BromAcetate** *of protoxide* **of Mercury.**

*Bi***BromAcetate of Potash.** Very soluble in water and in alcohol.

*Bi***BromAcetate of Silver.** Decomposed by boiling with water. (Perkin & Dnppa.)
$C_4HBr_2AgO_4$

*Mono***BromAcetone.**
$C_6H_5BrO_2$

*Bi***BromAcetone.**
β = (*neutral oil.*)
$C_6H_3Br_3O_2$
Completely insoluble in water and in alkaline solutions. Soluble in all proportions in alcohol, and ether. (Cahours, *Ann. Ch. et Phys.*, (3.) **19.** 504.)

BromAcetyl. *Vid.* Bromide of Ethylene.

*Ter***BromAcetyl.** Not isolated.
$C_4Br_3O_2$

Bromal. *Vid.* Hydride of *ter*BromAcetyl.

*Di***BromAllylamin.**
$C_{12}H_9Br_2N = N\left\{\begin{matrix}C_6H_4Br\\C_6H_4Br\\H\end{matrix}\right.$
Very sparingly soluble in water. Easily soluble in alcohol. Easily soluble in sulphuric, chlorhydric, nitric, and acetic acids, with semi-combination. (Maxwell Simpson.)

*Di***BromAllylEthylamin.** Insoluble in water.
$C_{16}H_{13}Br_2N = N\left\{\begin{matrix}(C_6H_4Br)_2\\C_4H_5\end{matrix}\right.$

BromAloin. Less soluble than aloin in cold water, and alcohol. Easily soluble in boiling alcohol.
$C_{34}H_{15}Br_3O_{14}$

BromAmyl. *Vid.* Bromide of Amyl.

BromAmylene.
$C_{10}H_9Br$

*Bi***BromAmylene.**
$C_{10}H_8Br_2$

*Ter***BromAnethol.**
(*Bromanisol. Bromanisal.*)
$C_{20}H_9Br_3O_2$
Insoluble in water. Slightly soluble in alcohol; more soluble in ether. (Cahours.)

BromAnil. *Vid. per*BromoKinone.

BromAnilamic Acid. *Vid. bi*BromoKinonamic Acid.

BromAnilamid. *Vid. bi*BromoKinonamid.

BromAnilic Acid. *Vid. bi*BromoKinonic Acid.

BromAnilin. Sparingly soluble in water. Easily soluble in alcohol, ether, wood-spirit, acetone, bisulphide of carbon, and the fatty and essential oils. (Hofmann.)
(*Amabrophenase.*)
$C_{12}H_6BrN = N\left\{\begin{matrix}C_{12}H_4Br\\H_2\end{matrix}\right.$

*Bi*BromAnilin. Sparingly soluble in boiling, and less soluble in cold water. Soluble in alcohol. (Hofmann.)
$C_{12}H_5Br_2N = N\left\{\begin{matrix}C_{12}H_3Br_2\\H_2\end{matrix}\right.$

*Ter*BromAnilin. Insoluble in water. Sparingly soluble in cold, readily soluble in boiling alcohol. Readily soluble in ether. Insoluble in dilute acids or in alkaline solutions. Abundantly soluble in hot concentrated sulphuric acid, from which it separates on cooling and upon addition of water. (Fritzsche.)
(*Bromaniloid. AmaBroPhenise.*)
$C_{12}H_4Br_3N = N\left\{\begin{matrix}C_{12}H_2Br_3\\H_2\end{matrix}\right.$

BromAniloid. *Vid. ter*BromAnilin.

BromAnisic Acid. Very sparingly soluble even in boiling water. Tolerably soluble in alcohol, especially when this is warm. Easily soluble in ether. (Cahours, *Ann. Ch. et Phys.*, (3.) **14.** 496.)
(*Bromanisylic Acid. Bromodraconesic Acid. Bromodraconic Acid. Brodacasic Acid. Bromadracisic Acid. Bromoanisatic Acid. Bromoanisic Acid.*)
$C_{16}H_7BrO_6 = C_{16}H_6BrO_5, HO$

BromAnisate of Ammonia. Very readily soluble in water. (Cahours.)

BromAnisate of Baryta. Difficultly soluble in water.

BromAnisate of Ethyl. Insoluble in water. Easily soluble especially in warm alcohol and ether. (Cahours, *Ann. Ch. et. Phys.*, (3.) **14.** 500.)
$C_{16}H_6(C_4H_5)BrO_6$

BromAnisate of Lead. Insoluble in water.

BromAnisate of Lime. Difficultly soluble in water.

BromAnisate of Magnesia. Appears to be soluble in water.

BromAnisate of Methyl. Insoluble in water. Tolerably readily soluble, especially in warm alcohol and wood-spirit; less easily soluble in ether. (Cahours, *loc. cit.*, p. 503.)
(*BromAnisate of Methylene.*)
$C_{16}H_6(C_2H_3)BrO_6$

BromAnisate of Potash. Very readily soluble in water. (Cahours, *loc. cit.*)

BromAnisate of Silver. Insoluble in water.
$C_{16}H_6AgBrO_6$

BromAnisate of Soda. Very readily soluble in water. (Cahours, *loc. cit.*)

BromAnisate of Strontia. Difficultly soluble in water.

BromAnisol. *Vid.* Phenate of BromoMethyl; also BromAnethol.

BromAnisyl. *Vid.* Bromide of Anisyl.

BromAnisoNitranisic Acid. Insoluble in water. Soluble in alcohol, and ether. (Laurent.)
(*NitroBromoDraconesic Acid.*)
$C_{32}H_{14}BrNO_{16}$

BromAnisoNitranisate of Ammonia. Soluble in water.

Bromic Acid. Soluble in water. Decomposed by alcohol, and ether. Most of the metallic bromates are easily soluble in water, a few are difficultly soluble, but none are insoluble.
BrO_5, HO

Bromate of Alumina. Deliquescent. Soluble in water. (Rammelsberg.)
$Al_2O_3, 3BrO_5$

Bromate of Ammonia. Soluble in water.
NH_4O, BrO_5

Bromate of Argent*bi*amin. Decomposed by water. (Rammelsberg.)
(*AmmonioBromate of Silver.*)
$N_2\{H_6 . AgO, BrO_5$

Bromate of Baryta. Soluble in 130 pts. of cold, and in 24 pts. of boiling water. (Rammelsberg.)
$BaO, BrO_5 + Aq$

Bromate of Bismuth.

I.) $3BiO_3, 2BrO_5 + 6Aq$ Insoluble in bromic acid.

II.) *acid.* Soluble in bromic acid.

Bromate of Cadmium. Soluble in 0.8 pt. of cold water. (Rammelsberg.)
$CdO, BrO_5 + Aq$

Bromate of Cerium. Permanent. Readily soluble in water. (Rammelsberg.)
$CeO, BrO_5 + 6Aq$

Bromate *of sesquioxide* of Chromium. Deliquescent. Soluble in water. (Rammelsberg.)

Bromate of Cobalt. Soluble in 2.2 pts. of cold water. (Rammelsberg.) Soluble in ammonia-water.
$CoO, BrO_5 + 6Aq$

Bromate of Copper.

I.) *normal.* Permanent. Very easily soluble in water.
$CuO, BrO_5 + 5Aq$

II.) *hexa.* Ppt.
$6CuO, BrO_5 + 10Aq$

Bromate of Cupr(*ic*)*bi*amin. Soluble in a small quantity of water, but is decomposed by much water, with separation of hydrate of copper. Insoluble in alcohol. (Rammelsberg.)
(*Ammonio Bromate of Copper.*)
$N_2\{H_6 . CuO, BrO_5$

Bromate *of protoxide* of Iron. Soluble in water, but the solution is exceedingly liable to decomposition, with separation of a basic salt of the sesquioxide. (Berzelius, *Lehrb.*)
FeO, BrO_5

Bromate *of sesquioxide* of Iron.

I.) *normal.* Soluble in water. (Berzelius, *Lehrb.*)
$Fe_2O_3, 3BrO_5$

II.) *basic.* Partially soluble in water, with separation of a portion of a still more basic salt. Soluble in nitric acid. (Rammelsberg.)
$5Fe_2O_3, BrO_5 + 30Aq$

Bromate of Lanthanum. Soluble in water.
$LaO, BrO_5 + 6Aq$

Bromate of Lead. Permanent. Soluble in 75 pts. of cold water. (Rammelsberg.)
$PbO, BrO_5 + Aq$

Bromate of Lead with Carbonate of Lead. Insoluble in water. (Lœwig.)
(*Bromo Carbonate of Lead.*)

Bromate of Lime. Soluble in 1.1 [or 1.5?] pts. of cold water forming a syrup. (Rammelsberg.)
$CaO, BrO_5 + Aq$

Bromate of Lithia. Deliquescent. Very easily soluble in water. (Rammelsberg, *Pogg. Ann.*, **55.** 63.) Efflorescent in dry air. Very soluble in water. (Troost.)
LiO, BrO_5

Bromate of Magnesia. Efflorescent. Soluble in 1.4 pts. of water at 15°, and melts in its water of crystallization when heated. (Rammelsberg.)
$MgO, BrO_5 + 6Aq$

Bromate of Manganese.
MnO, BrO_5

Bromate of ***di*****Mercur(*****ic*****)ammonium with** ***prot*****Oxide of Mercury.**
$N\left\{\begin{matrix}H_2\\Hg_2\end{matrix}\right. O, BrO_5; 2HgO$ Ppt.

Bromate ***of dinoxide*** **of Mercury.**

I.) *normal.* Insoluble in water, but is decomposed when boiled therewith. Easily soluble in chlorhydric, difficultly soluble in nitric acid. (Rammelsberg.)
Hg_2O, BrO_5

II.) *di.* Insoluble in warm water. (Rammelsberg.)
$2Hg_2O, BrO_5$

Bromate ***of protoxide*** **of Mercury.** Soluble in 650 pts. of cold, and in 64 pts. of boiling water. (Rammelsberg.) Easily soluble in chlorhydric, slightly soluble in nitric acid.
$HgO, BrO_5 + 2Aq$

Bromate of Nickel. Soluble in 3.58 pts. of cold water. (Rammelsberg.)
$NiO, BrO_5 + 6Aq$

Bromate of Nickelammonium. Partially soluble in water. Insoluble in alcohol. (Rammelsberg.)
$N\left\{\begin{matrix}H_3\\Ni\end{matrix}\right. O, BrO_5$

Bromate of Palladium. Very sparingly soluble in bromic acid.

Bromate of Platinum(PtO_2). Soluble in water, the solution undergoing decomposition when evaporated. (Rammelsberg.)

Bromate of Potash. Soluble in boiling, much less soluble in cold water. (Balard.) Soluble in 15.2 pts. of water at 15°; or 100 pts. of water dissolve 6.58 pts. of it at 15°. (Rammelsberg.) Soluble in 16.2 pts. of water at 15° (in Otto Graham). Soluble in 17.149 pts. of water at 17.1°; or 100 pts. of water at 17.1° dissolve 5.831 pts. of it. (Pohl, *Wien. Akad. Bericht*, **6.** 595.)

BromHelicin. Properties similar to those of chlorhelicin. (Piria, *Ann. Ch. et Phys.*, (3.) **14.** 298.)

$C_{26} H_{15} Br O_{14} + 2 Aq$

***Hemi*BromHydramid.** Insoluble in water, alcohol, ether, or glacial acetic acid. (Berthelot & De Luca.)

$C_{12} H_{12} Br N O_4$

BromHydranil. *Vid. per*BromHydroKinone.

Bromhydric Acid. The gas is rapidly and abundantly absorbed by water, heat being evolved. The saturated solution boils at a temperature lower than 100°, some of the acid being thereby lost. More dilute solutions boil at temperatures above 100°, and become more concentrated.

(*Bromohydric Acid. Hydrobromic Acid.*)
$H Br$

Bromhydrate of Ammonia. Easily soluble in water. (Lœwig.)

Bromhydrate of Amylamin. Permanent. Very soluble in water, and alcohol. Sparingly soluble in ether, which precipitates it from the alcoholic solution. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 494.)

$N\left\{\begin{matrix}C_{10} H_{11}\\H_2\end{matrix}\right., H Br$

Bromhydrate of AmylAnilin. Rather sparingly soluble in water. Soluble in bromide of amyl.

Bromhydrate of *di*AmylAnilin. Nearly insoluble in water.

“**Bromhydrate of Amylene.**” *Vid.* Bromide of Amyl.

Bromhydrate of Anilin. Soluble in water. Somewhat less readily soluble than the chlorhydrate.

$N\left\{\begin{matrix}C_{12} H_5\\H_2\end{matrix}\right., H Br$

Bromhydrate of Anisamate of Ethyl. Soluble in alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 346.)

Bromhydrate of Benzamic Acid. Easily soluble in water, and alcohol. Sparingly soluble in bromhydric acid. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 325.)

$N\left\{\begin{matrix}C_{14} H_5 O_2\\H_2\end{matrix}\right. \cdot O_2, H Br$

Bromhydrate of Bromide of Acetyl. *Vid.* Bromide of Ethylene.

Bromhydrate of Bromide of Aldehydin. *Vid.* Bromide of Ethylene.

Bromhydrate of Bromide of Silicium. Decomposed by water.

$Si_2 Br_3, 2 H Br$

Bromhydrate of *ter*BromoBenzin. Insoluble in water. (Mitscherlich.) Very sparingly soluble in boiling ether and in alcohol. (Lassaigne.)

(*Ter Bromide of Benzin. BromBenzin. Hydrobromate of terBromoBenzene.*)
$C_{12} H_6 Br_6 = C_{12} H_3 Br_3, 3 H Br$

Bromhydrate of BromoCaprylene. *Vid.* Bromide of Caprylene.

Bromhydrate of BromoCinchonin. Tolerably soluble in boiling alcohol. (Laurent, *Ann. Ch. et Phys.*, (3.) **24.** 307.)

Bromhydrate & Chlorhydrate of *sesqui* BromoCinchonin. Tolerably soluble in water. Very sparingly soluble in boiling alcohol. Easily soluble in a hot alcoholic solution of ammonia. (Laurent, *Ann. Ch. et Phys.*, (3.) **24.** 311.)

$C_{80} H_{45} Br_3 N_4 O_4, 2 (H Br, H Cl)$

Bromhydrate of BromoCodein. Sparingly soluble in cold, readily in boiling water. (Anderson.)

$C_{36} H_{20} Br N O_6, H Br + 2 Aq$

***Sesqui*Bromhydrate of *ter*BromoCodein.** Very sparingly soluble in cold, more soluble in boiling water. (Anderson.)

$2 C_{36} H_{18} Br_3 N O_6, 3 H Br$

Bromhydrate of BromoMelAnilin. Soluble in water.

Bromhydrate of BromoNaphthalin. *Vid.* Bromide of BromoNaphthalin.

Bromhydrate of BromoPapaverin. Insoluble in water. Soluble in boiling, less soluble in cold alcohol.
$C_{40} H_{20} Br N O_8, H Br$

Bromhydrate of BromoStilbene. *Vid.* Bromide of Stilbene.

Bromhydrate of Caoutchin.

***Bi*Bromhydrate of *bi*ChloroCinchonin.** Sparingly soluble in water.
$C_{40} H_{22} Cl_2 N_2 O_2, 2 H Br$

Bromhydrate of Coniin. (?) Very soluble in water, and alcohol; less soluble in ether. (Blyth, *J. Ch. Soc.*, **1.** 353.)

Bromhydrate of Cumidin.

Bromhydrate of Cuminamate of Ethyl. Easily soluble in water, and alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 340.)

Bromhydrate of CyanAnilin. Soluble in water, and alcohol. It undergoes partial decomposition when the solution is evaporated. Insoluble in ether and in concentrated bromhydric acid. (Hofmann, *J. Ch. Soc.*, **1.** 166.)
$N \left\{ \begin{matrix} C_{12} H_5 \\ H_2 \end{matrix} \right. . C_2 N, H Br$

Bromhydrate of EthylAmin.

Bromhydrate of *di*EthylAmin.

Bromhydrate of *tri*EthylAmin.

Bromhydrate of EthylAmylAnilin.

Bromhydrate of EthylAnilin. Extremely soluble in water. Also soluble in alcohol. (Hofmann.)
$C_{16} H_{11} N, H Br$

Bromhydrate of *di*EthylAnilin. Extremely soluble in water. (Hofmann.)
$O_{20} H_{15} N, H Br$

Bromhydrate of EthylConiin.

Bromhydrate of EthylNaphthylamin. Very slightly soluble in cold water; rather soluble in hot water, alcohol, and ether. (Schiff.)
$N \left\{ \begin{matrix} C_{20} H_8'' \\ C_4 H_5 \end{matrix} \right. , H Br$

Bromhydrate of *tri*EthylPhosphin.

Bromhydrate of Glyceramin. Soluble in alcohol. Almost entirely insoluble in ether. (Bethelot & De Luca.)
$C_6 H_9 N O_4, H Br$

Bromhydrate of Guanin. Soluble in bromhydric acid.
$3 (C_{10} H_5 N_5 O_2, Br H) + 7 H O$

Bromhydrate of Harmalin.

Bromhydrate of Harmin.

Bromhydrate of IodAnilin. Slightly soluble in cold, somewhat more soluble in hot water. Soluble in alcohol. Insoluble in ether. (Hofmann, *J. Ch. Soc.*, **1.** 276.)

Bromhydrate of MelAnilin. Very readily soluble in water, though less so than the chlorhydrate. Less easily soluble in strong bromhydric acid than in water. (Hofmann, *J. Ch. Soc.*, **1.** 293.)
$C_{26} H_{13} N_3, H Br$

Bromhydrate of MenaphthalAmin. Very soluble in alcohol.

Bromhydrate of MethylAmin. Very deliquescent. Very soluble in water, and alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 459.)
$C_2 H_5 N, H Br$

Bromhydrate of Methyl Nitro Phenidin.
$C_{14} H_6 (N O_4) N O_2, H Br$

Bromhydrate of Naphthylamin. Readily soluble in alcohol; less soluble in cold water. (Schiff.)
$N \left\{ \begin{matrix} C_{20} H_8'' \\ H \end{matrix} \right. , H Br$

Bromhydrate of NitroHarmalin.

Bromhydrate of NitroHarmin.

Bromhydrate of Phosphuretted Hydrogen. Decomposed by water.
$P H_3, H Br$

Bromhydrate of Quinidin. Soluble in 200 pts. of cold water.

Bromhydrate of Strychnine. Soluble in water.
$C_{42} H_{22} N_2 O_4, H Br$

Bromhydrate of Terebene.

I.) *mono.* Permanent.
(*BiBromhydrate of Terebene* (of Deville).)
$C_{20} H_{16}, H Br$

II.) *basic.*
(*MonoBromhydrate of Terebene* (of Deville).)
$2 C_{20} H_{16}, H Br$

Bromhydrate of Turpentine-Oil. Soluble in alcohol. (Deville.)
(*Bromhydrate of Camphene.*)
$C_{20} H_{16}, H Br$

***Mono*Bromhydrin.** Soluble in ether. (Berthelot & De Luca, *loc. cit.*)
$C_6 H_7 Br O_4 = \left. \begin{matrix} C_6 H_5''' \\ H_2 \end{matrix} \right\} \begin{matrix} O_4 \\ Br \end{matrix}$

***Bi*Bromhydrin.** Insoluble in water. Soluble in absolute alcohol, and in ether. (B. & De L.)
$C_6 H_6 Br_2 O_2 = \left. \begin{matrix} C_6 H_5''' \\ H \end{matrix} \right\} \begin{matrix} O_2 \\ Br_2 \end{matrix}$

***Ter*Bromhydrin.** Slowly decomposed by water. (Berthelot & De Luca, *Ann. Ch. et Phys.*, (3.) **48.** 304.)
(*Bromide of Glyceryl.*)
$C_6 H_5''', Br_3 \& + 2 Aq$
(*Isomeric with Bromide of BromoPropylene.*)

***Iso-Ter*Bromhydrin.**
(*Isomeric with triBromhydrin and with Bromide of BromoProphylene.*)
$C_6 H_5 Br_3$

***Hemi*Bromhydrin.** *Vid.* Propionate of BromAllyl.
$C_{12} H_9 Br O_4$

***Epi*Bromhydrin.** Soluble in water, from which it is dissolved out by ether. (B. & L., *loc. cit.*)
(*Oxide of Bromo Glyceryl.*)
$C_6 H_5 Br O_2 = C_6 H_5''' \left\{ \begin{matrix} O_2 \\ Br \end{matrix} \right.$

Bromhydrinhexaglycerique. Insoluble in cold, sparingly soluble in boiling ether. (B. & L., *loc. cit.*)
$C_{36} H_{27} Br O_{14}$

Bromhydro *bi*Chlorhydrin.
$C_6 H_5 Cl_2 Br = C_6 H_5''' \left\{ \begin{matrix} Cl_2 \\ Br \end{matrix} \right.$

***Quadri*BromHydrokinone.** Almost insoluble in water. Readily soluble in alcohol, and ether. (Stenhouse, *Phil. Mag.*, (4.) **8.** 39.)
(*Hydroquinone perbromée. Brom Hydranil.*)
$C_{12} H_2 Br_4 O_4$

Bromides. Almost all of the metallic bromides are soluble in water, excepting those of mercury, lead, silver, bismuth, and copper ($Cu_2 Br$). (Persoz, *Chim. Moléc.*, p. 463.)

Bromide of Acetyl. Quickly decomposed by water.
$C_4 H_3 O_2, Br$

Bromide of Aldehydin. *Vid.* BromEthylene.

Bromide of Allyl. Soluble in alcohol, from which it separates on the addition of water.
$C_6 H_5, Br$

***Bi*Bromide of Allyl.** Insoluble in water. Readily soluble in ether. (Berthelot & De Luca.)
$C_6 H_5 Br_2$

***Ter*Bromide of Allyl.** Insoluble, or very sparingly soluble, in water. (Wurtz.)
$C_6 H_5 Br_3$

Bromide of Aluminum.

I.) *normal.* Deliquescent. Very soluble in water, with evolution of heat. Very soluble in alcohol. (Berthemot, Lœwig.)
$Al_2 Br_3$

II.) *basic.* Basic bromides of aluminum which contain six equivalents, and less, of base may be obtained soluble in water. Those containing more than six equivalents of base are insoluble. (Ordway, *Am. J. Sci.*, (2.) **26.** 203.)

Bromide of Ammonium. NH_4Br Readily soluble in water. Sparingly soluble in alcohol.

Bromide of Ammonium & of Iron (Fe_2Br_3). Soluble in water. (Lœwig.)

Bromide of Ammonium & of Mercury. Soluble in an aqueous solution of bromide of ammonium. (Lœwig.)

Bromide of Ammonium (*basic*) & of Vanadium. Ppt.

Bromide of Ammonium with FerroCyanide of Ammonium. (*BromoFerroCyanide of Ammonium.*) $NH_4Br; 2NH_4Cy, FeCy$ Permanent. Very soluble in water. The solution is decomposed on boiling. (Himly & Bunsen.)

Bromide of Amyl. $C_{10}H_{11}Br$ Insoluble in water. Easily soluble in alcohol, and ether. (Cahours.)

Bromide of Amylene. $C_{10}H_{10}'', Br_2$

Bromide of Anisyl. (*BromAnisylous Acid. Brom Anisyl.*) $C_{16}H_7O_4Br$ Somewhat soluble in ether. Decomposed by boiling concentrated solutions of caustic potash. (Cahours, *Ann. Ch. et Phys.*, (3.) **14.** 486.)

***Ter*Bromide of Antimony.** $SbBr_3$ Deliquescent. Instantly decomposed by water. (Sérullas.)

Bromide of Argentammonium. $N\left\{\begin{matrix}H_3\\Ag\end{matrix}\right.Br$ Soluble in a strong solution of ammonia; this solution becomes turbid, from deposition of bromide of silver, when water is added to it.

Bromide of Arsen*tri*Ethyl. $(C_4H_5)_3As, Br_2$ Deliquescent. Easily soluble in water, and alcohol. Insoluble in ether.

Bromide of ArsenEthylium. $(C_4H_5)_4As, Br$ Very deliquescent. Very easily soluble in water, and alcohol.

***Ter*Bromide of Arsenic.** $AsBr_3$ Decomposed by water to a soluble, very acid, and an insoluble basic salt. (Sérullas.) Decomposed by a large quantity of water to arsenious acid and bromhydric acid.

Bromide of Arsen*tri*Methyl. $(C_2H_3)_3AsBr_3$

Bromide of ArsenMethylium. $(C_2H_3)_4AsBr$ Very deliquescent.

Bromide of ArsenMethylEthylium.

Bromide of Barium. $BaBr + 2Aq$ Very easily soluble in water. (Balard.)

1 pt of the anhydrous salt

is soluble in	1.02	pts. water at	0°
“	0.96	“	20°
“	0.88	“	40°
“	0.81	“	60°
“	0.74	“	80°
“	0.67	“	100°

(Kremers, *Pogg. Ann.*, **99.** 47.)

The saturated aqueous solution boils at 113°. (Kremers, *Pogg. Ann.*, **99.** 43.)

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of Ba Br dissolved in 100 pts. of water.	An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of Ba Br dissolved in 100 pts. of water.
1.1440	17.81	1.5816	81.97
1.3005	38.83	1.7115	104.68
1.4507	60.92		

(Kremers, *Pogg. Ann.*, **99.** 444.)

Easily soluble in absolute alcohol. (Huenefeld.) Soluble in absolute alcohol. (H. Rose.)

Bromide of Barium & of Mercury ($HgBr$). Deliquescent. Soluble in water. (v. Bonsdorff, *Pogg. Ann.*, 1830, **19.** pp. 340, 342.)

Bromide of Barium with Cyanide of Mercury. $BaBr; 2HgCy + 6Aq$ Soluble in water, and alcohol, especially when these are hot. (Caillot.)

Bromide of Benzamid. $C_{14}H_7NO_2, Br_2$ Slowly decomposed by water; quickly by ammonia-water.

***Ter*Bromide of Benzin.** *Vid.* Bromhydrate of *ter*BromoBenzin.

Bromide of Benzoyl. (*Brombenzaldide. Benzolbiacibromide. OxyBromoBenzoyl.*) $C_{14}H_5O_2, Br$ Very slowly decomposed when in contact with water. Easily soluble, without decomposition, in alcohol, and ether. (Liebig & Wœhler.)

Bromide of Bismuth. $BiBr_3$ Decomposed by water, with separation of an insoluble basic salt.

Bromide of BismuthEthyl. Soluble in alcohol.

Bromide of Boron. BBr_3 Decomposed by water. (Poggiale.)

Bromide of BromAllyl. C_6H_4Br, Br

Bromide of *bi*BromAllyl. $C_6H_3Br_2, Br$

Bromide of BromAmylene. $C_{10}H_9Br'', Br_2$

Bromide of BromEthylene. C_4H_3Br'', Br_2 Insoluble in water. Freely soluble in alcohol, ether, and acetic acid. (M. Simpson, *Phil. Mag.*, **14.** 545.)

***Bi*Bromide of BromoChloroNaphthalin.** (*Bromide of Chlorobronaphtese.*) $C_{20}H_6ClBr, 2Br_2$ Difficultly soluble in boiling, less soluble in cold ether. (Laurent.)

Bromide of *bi*BromoMethyl. (*Bromoform. Bromide of Carbon. Bromide of Methyl bibromé. Per Bromide of Formyl.*) C_2HBr_2, Br Very sparingly soluble in water. Soluble in alcohol, ether, and the essential oils. (Lœwig.)

***Bi*Bromide of *bi*BromoNaphthalin.** (*Bronaptesbromure.*) $C_{20}H_0Br_6 = C_{20}H_6Br_2, 2Br_2$ Very slightly soluble in boiling ether. (Laurent.)

Bromide of *ter*BromoNaphthalin. (*Subbromide of Bronaphtise.*) $C_{20}H_5Br_5 = C_{20}H_5Br_3, Br_2$ Soluble in boiling ether. (Laurent.)

***Bi*Bromide of *ter*BromoNaphthalin.** (*Bromide of Bronaphtise.*) $C_{20}H_5Br_7 = C_{20}H_5Br_3, 2Br_2$ Very sparingly soluble in ether. (Laurent.)

Bromide of *bi*BromoNitroMethyl. (*BromoPicrin. Bromide of NitroMethylperbromé.*) $C_2Br_3NO_4 = C_2(NO_4)Br_2, Br$ Very sparingly soluble in water. Readily soluble in alcohol, and ether. (Stenhouse, *Phil. Mag.*, (4.) **8.** 38.)

Bromide of BromoPropylene. C_6H_5Br'', Br_2 Insoluble, or very sparingly soluble, in water. (A. Wurtz.)

Bromide of *bi*BromoPropylene. $C_6H_4Br_2'', Br_2$

Bromide of *ter*BromoPropylene. $C_0H_3Br_3'', Br_2$

Bromide of Butoyl. C_3H_7Br Soluble in spirit.

Bromide of Butyl. (*Bromide of Tetryl or of Valyl Butyl Bromhydric Ether.*) C_8H_9Br Insoluble in water. (Kolbe's *Lehrb.*, **1.** 290.)

Bromide of Butylene.
(*Bromide of Tetrylene.*)
$C_8\,H_8{}'',\,Br_2$

Bromide of Cacodyl.

I.) *normal.* Resembles the chloride. Is decomposed by water.
$(C_2\,H_3)_2\,As,\,Br$

II.) *basic.* Insoluble in water.
$3\,C_4\,H_6\,As\,Br,\,C_4\,H_6\,As\,O$

Bromide of Cacoplatyl. Sparingly soluble in cold, tolerably soluble in warm water.
$\left.\begin{matrix}C_2\,H_3\\C_2\,H_2\,Pt\end{matrix}\right\}As\,Br + 2\,Aq$

Bromide of Cadmium. Deliquescent. Easily soluble in water. Readily soluble in alcohol, and ether. Also soluble in wood-spirit. Soluble, without decomposition, in chlorhydric, and acetic acids. Decomposed by nitric acid.
$a = Cd\,Br$

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of Cd Br dissolved in 100 pts. of water.
1.2337	29.8 pts.
1.4690	64.3
1.6496	94.1

(Kremers, *Pogg. Ann.*, **104.** 156.)

$b = Cd\,Br + 4\,Aq$ Efflorescent.

Bromide of Cadmium & of Potassium. Much more readily soluble in water than the corresponding chloride (K Cl, Cd Cl). Slightly soluble in alcohol and in wood-spirit, though less so than bromide of cadmium. (Croft.)
$K\,Br,\,Cd\,Br$

Bromide of Cadmium & of Sodium.
$2\,Cd\,Br,\,Na\,Br + 5\,Aq$

Bromide of Cadmium*bi*amin. Decomposed by water. (Rammelsberg.)
(*Ammonio Bromide of Cadmium.*)
$N_2\left\{H_6\,.\,Cd,\,Br\right.$

Bromide of Cadmiumammonium. Decomposed by water. (Rammelsberg.)
$N\left\{\begin{matrix}H_3\\Cd\end{matrix}\right.Br$

Bromide of Cajputene. Soluble in boiling alcohol, and in ether. Is not altered by boiling with an aqueous solution of caustic potash. (Max. Schmidl.)
$C_{20}\,H_{16},\,Br_4$

Bromide of Calcium.

I.) *mono.* Very deliquescent, and soluble in water. (Lœwig.)
$Ca\,Br$

1 pt. of the anhydrous salt is soluble in			
	0.80	pts. water at	0°
"	0.70	"	20°
"	0.47 @ 0.48	"	40°
"	0.36	"	60°
"	0.32	"	105°

(Kremers, *Pogg. Ann.*, **103.** 65.)

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of Ca Br dissolved in 100 pts. of water.
1.1386	17.65
1.2660	35.43
1.3983	55.91
1.5214	77.04
1.6517	102.56

(Kremers, *Pogg. Ann.*, **99.** 445.) Very soluble in alcohol. (O. Henry.)

II.) *basic.* *Vid.* OxyBromide of Calcium.

Bromide of Calcium & of Mercury.

a.) Permanent in dry air. Decomposed by a small quantity of water, but dissolves in warm water.

b.) "*Probably contains less Hg Br.*" Exceedingly deliquescent. Soluble in water. (v. Bonsdorff, *Pogg. Ann.*, **19.** 340, 342.)

Bromide of Calcium with Cyanide of Mercury. Readily soluble in water, and alcohol. (Custer.)
$Ca\,Br,\,2\,Hg\,Cy + 5\,Aq$

Bromide of Calcium*ter*amin. Soluble in water. (Rammelsberg, *Pogg. Ann.*, **55.** 239 [Gm.].)
$N_3\left\{H_9\,.\,Ca\,Br\right.$

Bromide of Camphor. Deliquescent, with decomposition. Soluble in water; but the solution soon decomposes. (Laurent.)
$C_{20}\,H_{16}\,O_2,\,Br_2$

Bromide of Capryl. *Vid.* Bromide of Octyl.

Bromide of Caprylene.
(*Bromhydrate of Bromo Caprylene. Bromide of Octylene.*)
$C_{16}\,H_{10}{}'',\,Br_2$

Bromide of Carbon. *Vid.* *per*BromEthylene.
(*Solid or protoBromide of Carbon.*)

Bromide of Carbon (liquid). *Vid.* Bromide of *bi*BromoMethyl.

Bromide of Carbon. *Vid.* Iodide of *bi*BromoMethyl.

Bromide of Cerium.

I.) *mono.* Very deliquescent. Soluble in water. (Beringer.)
$Ce\,Br$

II.) *basic.* Insoluble in water.

Bromide of Cetyl. Insoluble in water. More soluble in boiling, than in cold alcohol. Readily soluble in ether.
$C_{24}\,H_{33}\,Br$

Bromide of Chlorethose. *Vid.* Bromide of *per*ChlorEthylene.

Bromide of *per*ChlorEthylene. Soluble in alcohol. (Malaguti.)
(*Bromide of Chlorethose. Bromo Chloride of Carbon. Bromure d'Ethylène perchloré.*)
$C_4\,Cl_4{}'',\,Br_2$

Bromide of ChlorOxethose. *Vid.* Oxide of *ter*Chloro*bi*BromEthyl.

***Bi*Bromide of *bi*ChloroNaphthalin.** Sparingly soluble in cold alcohol, or ether. Soluble in ether at 100° (in a sealed tube), from which it crystallizes on cooling, but if heated to 120° @ 130°, crystals can no longer be obtained. (Laurent.)
(*Bromide of Chlonaphtèse.*
$C_{20}\,H_6\,Cl_2\,Br_4 = C_{20}\,H_6\,Cl_2,\,2\,Br_2$

Bromide of ChloroPropylene.
$C_6\,H_5\,Cl'',\,Br_2$

Bromide of *sexi*ChloroPropylene.
$C_6\,Cl_6{}'',\,Br_2$

Bromide of ChloroStilbene. Sparingly soluble in ether, and alcohol. (Laurent.)
$C_{28}\,H_{11}\,Cl,\,Br_2$

***Proto*Bromide of Chromium.** Deliquesces, with decomposition.
$Cr\,Br$

***Sesqui*Bromide of Chromium.**
$Cr_2\,Br_3$

$a =$ *anhydrous.* When prepared in the dry way, and perfectly pure, it is completely insoluble in water, but if it contains any protobromide it dissolves in water. (Wœhler.)

$b =$ *hydrated.* Deliquescent. Soluble in water, the solution being easily decomposed by evaporation. (Berthemot.)

Bromide of Cinnamene (or of Styrol). Insoluble in water. Readily soluble in alcohol, and ether. Miscible in all proportions with ether.
(*Bromo Cinnamene. Bromo Styrol.*)
$C_{16}\,H_8,\,Br_2$

Bromide of Cobalt. Deliquescent. Easily soluble in water. Also soluble in alcohol, and ether.
$Co\,Br$

Bromide of Cobalt*ter*amin.
$N_3 \left\{ H_9 . Co, Br \right.$

Bromide of Coniin. Permanent. Readily soluble in water, and alcohol; less soluble in ether.

*Di*Bromide of Copper. Insoluble in water. $Cu_2 Br$ Soluble in caustic ammonia. (Berthemot.) Soluble, without decomposition, in chlorhydric, and bromhydric acids. Soluble, with decomposition, in dilute nitric acid. (Lœwig.) Insoluble in acetic acid, and in sulphuric acid, even when concentrated and boiling. (Dumas, *Tr.*)

*Proto*Bromide of Copper. Deliquescent. $Cu Br + 5 Aq$ Readily soluble in water. (Lœwig.)

Bromide of Cyan*bi*amin. Permanent. Easily soluble in water, and in chlorhydric acid. (Bineau.)
(*Solid Ammonio Bromide of Cyanogen.*)
$C_2 H_6 N_3 Br = Cy Br ; 2 N H_3 = N_2 \left\{ \begin{matrix} C_2 N \\ H_6 \end{matrix} \right. , Br$

Bromide of Cyan*sex*amin.
(*Liquid Ammonio Bromide of Cyanogen.*)
$C_2 H_{18} N_7 Br = Cy Br ; 6 N H_3 = N_6 \left\{ \begin{matrix} C_2 N \\ H_{18} \end{matrix} \right. , Br$

Bromide of Cyanogen. Easily soluble in $C_2 N Br = Cy Br$ water, and alcohol; more so than iodide of cyanogen. (Sérullas.)

Bromide of Cymene. Insoluble in water. $C_{20} H_{14}'', Br_2$ (Sieveking.)

Bromide of Ethyl. Very sparingly soluble $C_4 H_5 Br$ in water. (Lœwig.) Miscible in all proportions with alcohol, and ether. (Lœwig.) Water precipitates it from the alcoholic solution. (Sérullas.)

Bromide of Ethylene. Insoluble in water. Soluble in alcohol, ether, and strong acetic acid. (Hermann.) Unacted on by concentrated sulphuric acid. (Regnault.)
(*BromElayl. BromAcetyl. BromÆtherin. Bromhydrate of Bromide of Acetyl. Bromhydrate of Bromide of Aldehydin.*)
$C_4 H_4'', Br_2$

Bromide of Ethylene*bromé*. *Vid.* Bromide of BromEthylene.

Bromide of Ethylene*chloré*. *Vid.* Bromide of *per*ChlorEthylene.

Bromide of Ethylidene. Insoluble in water; $C_4 H_4'', Br_2$ but is rapidly decomposed thereby. (Wurtz & Frappoli.)

Bromide of *tetr*Ethylammonium. Deliquescent.

Bromide of *tri*EthylPhosphin.

Bromide of EthylNicotin. Very deliquescent. Very soluble in water. Tolerably soluble in alcohol, even when this is absolute. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **87.** 5.)

*Per*Bromide of Formyl. *Vid.* Bromide of *bi*BromoMethyl.

Bromide of Glucinum. Soluble in water, $Gl_2 Br_3$ with great evolution of heat. (Wœhler.) The basic bromides of glucinum may be obtained dissolved in water so long as they contain less than three equivalents of the base, but those containing three, or more than three, equivalents are insoluble in water. (Ordway, *Am. J. Sci.*, (2.) **26.** 207.)

Bromide of Glyceryl. *Vid.* Bromhydrin.

*Ter*Bromide of Gold. Hygroscopic. Readily soluble in water. (Lampadius.) Soluble in ether. (Wilson.)
(*Bromauric Acid.*)
$Au_2 Br_3$

*Proto*Bromide of Iodine. Soluble in water.

*Quinqui*Bromide of Iodine. Soluble in water, $I Br_5$ with decomposition.

*Proto*Bromide of Iron. Very deliquescent. $Fe Br, \& + 6 Aq$ Soluble in water. (Lœwig.) (Soluble in alcohol?) (Gmelin.)

*Sesqui*Bromide of Iron. Deliquescent. Soluble $Fe_2 Br_3$ in water, alcohol, and ether. (Lœwig.)

Basic sesquibromides of iron containing six equivalents, and less, of base to one of acid may be obtained dissolved in water. (Ordway, *Am. J. Sci.*, (2.) **26.** 202.)

*Proto*Bromide of Iron & of Mercury. Deliquescent. Soluble in water. (v. Bonsdorff, *Pogg. Ann.*, 1830, **19.** pp. 340, 343.)

Bromide of Lead.

I.) *normal.* Sparingly soluble in boiling water; $Pb Br$ more readily soluble in water containing chlorhydric, nitric, or acetic acids. (Lœwig.) Slowly soluble in cold, quickly soluble in warm aqueous solutions of nitrate of ammonia and chloride of ammonium. (Wittstein.) It is not precipitated from solutions containing citrate of soda. (Spiller.)

II.) *basic.* *Vid.* OxyBromide of Lead.

Bromide of Lead & of Potassium. Soluble $K Br, Pb Br$ in a small quantity of water, without decomposition, but is decomposed by much water. (Lœwig.)

Bromide of Lead & of Sodium. Decomposed by water. (Lœwig.)

Bromide of Lead with Carbonate of Lead. $Pb Br ; Pb O, C O_2$ Insoluble in water.

Bromide of Lithium. Very deliquescent and soluble in water. (Troost.)

Soluble in	0.70	pts. of water at	0°
“	0.51	“	34°
“	0.45	“	59°
“	0.41	“	82°
“	0.37	“	103°

(Kremers, *Pogg. Ann.*, **103.** 65.)

An aqueous solution of sp. gr. at 19.5° (sp. gr. of water at 19.5° = 1)	Contains pts. of Li Br dissolved in 100 pts. of water.
1.1173	18.3
1.1414	22.8

(Kremers, *Pogg. Ann.*, **104.** pp. 155, 158.)

Bromide of Lithium with Fluoride of Lithium. Deliquescent. Easily soluble in water.

Bromide of LuteoCobalt. Soluble in water.
$6 N H_3 . Co_2 Br_3$

Bromide of Magnesium. Deliquescent. $Mg Br + 6 Aq$ Very soluble in water, with great evolution of heat. (Lœwig.)

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of anhydrous Mg Br dissolved in 100 pts. of water.	An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of anhydrous Mg Br dissolved in 100 pts. of water.
1.0965	12.2	1.4386	64.2
1.1864	24.5	1.5693	88.6
1.2811	38.3		

(Kremers, *Pogg. Ann.*, **104.** 155.)

On evaporating the aqueous solution, some bromhydric acid is evolved. Soluble in alcohol.

Bromide of Magnesium & of Mercury.

I.) $Mg Br ; Hg Br$ Deliquescent.

II.) $Mg Br ; 2 Hg Br$ Permanent.

Bromide of Magnesium & of Potassium. $Mg Br ; K Br + 6 Aq$ Permanent. Very soluble in water; when the solution is evaporated at the temperature of 75° @ 87° crystals of bromide of potassium are deposited while bromide of magnesium remains in solution. Decomposed by alcohol.

Bromide of Manganese. Deliquescent. $Mn Br$ Soluble in water.

*Proto*Bromide of Manganese & of Mercury. Deliquescent. Soluble in water. (v. Bonsdorff, *Pogg. Ann.*, 1830, **19.** pp. 340, 343.)

Bromide of Mercur(*ous*)*bi*Amin.
$N_2 \left\{ H_6 . Hg_2, Br \right.$

Bromide of *di*Mercur(*ous*)ammonium. $N \left\{ \begin{matrix} H_2 \\ 2 Hg_2 \end{matrix} \right. Br$ Resembles the corresponding chloride.

Bromide of *di*Mercur(*ic*)ammonium. $N \left\{ \begin{matrix} H_2 \\ 2 Hg \end{matrix} \right. Br$ Insoluble in cold water, or in alcohol. Slightly soluble in ammonia-water. (Lœwig.)

Bromide of Mercur(*ic*)ammonium & of Mercury. $N \left\{ \begin{matrix} H_3 \\ Hg \end{matrix} \right. Br ; Hg Br$ Insoluble in water. (H. Rose.)

Bromide of Mercur(*ous*)Ethyl. $C_4 H_5 Hg_2, Br$ Resembles the chloride.

*Di*Bromide of Mercury. $Hg_2 Br$ Insoluble in water and in alcohol. (Parrish's *Pharm.*, p. 561.) Easily soluble in an aqueous solution of protonitrate of mercury. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 317.) Insoluble in cold aqueous solutions of carbonate and succinate of ammonia or chloride of ammonium, but they all dissolve it partially, with separation of mercury, when hot. Insoluble in boiling aqueous solutions of sulphate or nitrate of ammonia. (Wittstein.) Like the dichloride, it is partially decomposed by aqueous solutions of the alkaline chlorides; when out of contact with the air this decomposition is slight and protobromide is formed, while in the air protochloride of mercury ($Hg Cl$) is the result of the action. The decomposition is much more marked in hot solutions than in cold. (Mialhe, *Ann. Ch. et Phys.*, (3.) **5.** 177.)

*Proto*Bromide of Mercury.

I.) *normal.* $Hg Br$ Difficultly soluble in water. Soluble in 250 pts. of water at the ordinary temperature, and in 25 pts. of boiling water; in 12 pts. of cold, and in 3 pts. of hot spirit; still more readily soluble in ether. (Wittstein's *Handw.*) Soluble in 240 pts. of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) Soluble in 94 pts. of water at 9°, and in 4 @ 5 pts. at boiling. Easily soluble in alcohol, and still more soluble in ether. (Balard.) Decomposed by warm nitric, and sulphuric acids.

II.) *basic.* *Vid.* OxyChloride of Mercury.

Bromide of Mercury & of Potassium.

I.) $K Br ; Hg Br$ (?) Permanent. Soluble in water. (v. Bonsdorff, *Pogg. Ann.*, 1830, **19.** pp. 340, 341.)

II.) $K Br ; 2 Hg Br + 2 Aq$ Permanent. Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1830, **19.** 340.)

Bromide of Mercury & of Sodium.

I.) $Na Br ; Hg Br$ (?) Deliquescent. (v. Bonsdorff.)

II.) $Na Br ; 2 Hg Br + 3 Aq$ Soluble in water, and alcohol. (Berthemot.)

*Di*Bromide of Mercury & of Strontium.

I.) $Sr Br, Hg_2 Br$ Soluble in all proportions in water.

II.) $Sr Br, 2 Hg_2 Br$ Decomposed by much water, to the preceding compound and insoluble bromide of mercury. (Lœwig.)

*Proto*Bromide of Mercury & of Zinc. Deliquescent. Soluble in water. (v. Bonsdorff, *Pogg. Ann.*, 1830, **19.** pp. 340, 343.)

*Proto*Bromide of Mercury with Oxide of Cacodyl. $2 Hg Br ; C_4 H_6 As O$ Somewhat soluble in water, the solution undergoing decomposition when boiled. (Bunsen.) About as soluble as the compound with chloride of mercury, *q. v.*

*Proto*Bromide of Mercury with Sulphide of Mercury. (*Sulphobromide of Mercury.*) $Hg Br ; 2 Hg S$ Insoluble in hot nitric or sulphuric acids. (H. Rose.)

Bromide of Methyl. (*Methylic Bromide. Hydrobromic Methyl Ether.*) $C_2 H_3 Br$ Insoluble, or but sparingly soluble in water at 0°. (Pierre.) Easily soluble in alcohol, wood-spirit, and ether.

Bromide of Methyl*bibromé*. *Vid.* Bromide of *bi*BromoMethyl.

Bromide of *tri*MethylBromEthylammonium. $C_{10} H_{13} N Br_2 = N \left\{ \begin{matrix} (C_2 H_3)_3 \\ C_4 H_4 Br \end{matrix} \right. Br$ Very easily soluble in water, and in boiling alcohol. Sparingly soluble in cold alcohol. Insoluble in ether.

Bromide of MethylSelenious Acid.
$C_2 H_4 Br Se_2 O_5 = Se_2 (C_2 H_3) Br O_4 + Aq$

Bromide & *ter*Chloride of Naphthalin. (*Ter Chloro Bromide of Naphthalin.*) $C_{20} H_8'' \left\{ \begin{matrix} Cl_3 \\ Br \end{matrix} \right.$ More soluble than (*α*) bichloride of naphthalin in ether, but less soluble therein than (*β*) bichloride of naphthalin. (Laurent.)

Bromide of Naphthalin *bromé, chloré,* &c. *Vid.* Bromide of Bromo, Chloro, &c., Naphthalin.

Bromide of Nickel.

a = anhydrous. $Ni Br$ Like the chloride, it is only very slowly soluble in water.

b = hydrated. $Ni Br + 3 Aq$ Deliquescent. Easily soluble in water. Soluble in alcohol, ether, chlorhydric acid, and ammonia-water. (Berthemot.)

Bromide of Nickel*ter*amin. (*Ammonio Bromide of Nickel.*) $N_2 \left\{ H_9 . Ni, Br \right.$ Soluble in a small amount of water, but is decomposed when this solution is diluted with much water. (Rammelsberg.)

Bromide of Nitrogen. $N Br_3$ Quickly decomposed by water, even more readily than chloride of nitrogen.

Bromide of NitroMethyl*perbrome*. *Vid.* Bromide of *per*BromoNitroMethyl.

Bromide of Octyl. (*Bromide of Capryl. BromoCapryl. CaprylBromhydricEther.*) $C_{16} H_{17} Br$ Insoluble in water. Soluble in alcohol. (Bouis, *Ann. Ch. et Phys.*, (3.) **44.** 130.)

Bromide of Octylene. *Vid.* Bromide of Caprylene.

*Bi*Bromide of Palladium. $Pd Br_2$ (?) Insoluble in water. Soluble in water acidulated with bromhydric acid. (v. Bonsdorff, *Pogg. Ann.*, 1830, **19.** 347.) Insoluble in alcohol.

*Bi*Bromide of Palladium & of *X.* *Vid.* BromoPalladiate of *X.*

*Proto*Bromide of Palladium & of Potassium. Easily soluble in water, somewhat more difficultly soluble in alcohol.
$K\,Br, Pd\,Br$

*Proto*Bromide of Palladium & of Sodium.

*Ter*Bromide of Phosphorus. Decomposed, with solution, by water.
$P\,Br_3$

*Penta*Bromide of Phosphorus. Decomposed, with solution, by water.
$P\,Br_5$

Bromide of Platin(*ous*)*bi*amin. Soluble in water. (Reiset, *Ann. Ch. et Phys.*, (3.) **11.** pp. 425, 426.)
(*Ammonioprotobromide of Platinum.*)
$N_2 \left\{ H_6 . Pt', Br \right.$

*Bi*Bromide of Platinum. Deliquescent. Soluble in water. (v. Bonsdorff, *Pogg. Ann.*, 1830, **19.** 343.)
(*BromoPlatinic Acid.*)
$Pt\,Br_2$

*Bi*Bromide of Platinum with Bromide of *X*. *Vid.* BromoPlatinate of *X*.

Bromide of $\frac{3}{2}$ PlumbEthyl. Easily soluble in alcohol, and ether.
$(C_4\,H_5)_3\,Pb_2, Br$

Bromide of Potassium. Permanent.
$K\,Br$

Soluble in	1.87	pts. of water at	0°
"	1.55	"	20°
"	1.34	"	40°
"	1.18	"	60°
"	1.07	"	80°
"	0.98	"	100°

The saturated solution boils at 112°. (Kremers, *Pogg. Ann.*, **97.** pp. 15, 20.) Soluble in 4 pts. of water at 18.75° (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76); in 4 pts. of cold, and in 1 pt. of boiling water; in 200 pts. of cold alcohol of 80% and in 16 pts. at boiling.

An aqueous solution of sp. gr., at 19.5° (sp. gr. of water at 19.5°=1)	Contains per cent of K Br	Contains pts. of K Br dissolved in 100 pts. of water.
1.0755	10.088	11.22
1.1505	19.015	23.48
1.2222	26.670	36.37
1.2995	34.080	51.70
1.3618	39.500	65.29

(Kremers, *loc. cit.*, **95.** 119; the second column is from Gerlach's *Sp. Gew. der Salzlœsungen*, p. 33.)

From the observations of Kremers, Schiff calculates the following table by means of the formula: —

$$D = 1 + 0.00725\,p + 0.000022\,p^2 + 0.000000\,p^3;$$

in which D = the sp. gr. of the solution and p the percentage of substance in the solution.

An aqueous solution of sp. gr.	Contains per cent of K Br.	An aqueous solution of sp. gr.	Contains per cent of K Br.
1.037	5	1.201	25
1.075	10	1.248	30
1.115	15	1.298	35
1.157	20	1.351	40

(H. Schiff, *Ann. Ch. u. Pharm.*, 1858, **107.** 306.)

Bromide of Potassium & of Thorium. Soluble in water.

Bromide of Potassium with Cyanide of Mercury. Soluble in 13.34 pts. of water at 18°, and in less than 1 pt. of boiling water. (Brett.) Soluble in alcohol, especially when this is hot. Soluble, without decomposition, even in hot dilute or monohydrated sulphuric, chlorhydric, or nitric acid. (Brett.)
$K\,Br; 2\,Hg\,Cy + 4\,Aq$

Bromide of Propylene. Insoluble in water. Miscible with alcohol, and ether. (Reynolds.)
(*Bromide of Tritylene.*)
$C_6\,H_6'', Br_2$

Bromide of Salicyl. *Vid.* BromoSalicylous Acid.

Bromide of SelenEthyl. Readily soluble in ammonia-water, with formation of oxybromide. (Joy.)
$C_4\,H_5\,Se\,Br$

Bromide of Selenium. Soluble in water, with decomposition.
$Se\,Br$

Bromide of Silicon. Decomposed by water, like the chloride, with evolution of heat.
$Si\,Br_3$

Bromide of Silver. Insoluble in water. It is precipitated before chloride of silver when a solution of a silver salt is added to a mixed solution of chlorhydric and bromhydric acids. (Berthier.) Slightly soluble in concentrated aqueous solutions of bromide of potassium, and bromide of sodium. (Lœwig.) Soluble in a hot aqueous solution of chloride of ammonium; very sparingly soluble in solutions of carbonate, sulphate, or succinate of ammonia, and still less soluble in a solution of nitrate of ammonia. (Wittstein.) Soluble in an aqueous solution of protonitrate of mercury. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 317.) Soluble in concentrated bromhydric, and chlorhydric acids. (Lœwig.) Boiling concentrated sulphuric acid decomposes it (Balard); hardly acts upon it (Dumas, *Tr.*); dissolves a small quantity of it, which is reprecipitated on the addition of water. (Berzelius, *Lehrb.*, **3.** 916.) Boiling concentrated nitric acid does not act upon it at all. (Balard.) Soluble in concentrated caustic ammonia; very sparingly in dilute ammonia-water. (Wackenroder.) Very slightly soluble in ammonia-water, from which it separates out unchanged on evaporating the solution. (Berzelius, *Lehrb.*) Only slowly soluble in concentrated ammonia-water. (Ot. Gr.) When prepared in the moist way, it is completely insoluble in water or nitric acid. Tolerably soluble in ammonia-water. Soluble in a hot aqueous solution of chloride of ammonium. Very sparingly soluble in a solution of nitrate of ammonia. (Fresenius, *Quant.*, p. 164.) Soluble in caustic-ammonia, though somewhat more difficultly than chloride of silver. Insoluble in dilute acids, sparingly soluble in concentrated sulphuric acid, from which it is precipitated on the addition of water. (Wittstein's *Handw.*)
$Ag\,Br$

Bromide of Silver with Chloride of Silver. These salts appear to crystallize together in all proportions. Whether the solubilities of these mixtures vary from those of their components is a point not yet established.

Bromide of Sodium. Readily soluble in water, and in weak alcohol. (O. Henry.) Very sparingly soluble in alcohol. (Gmelin.)
$Na\,Br + 4\,Aq$

1 pt. of the anhydrous salt

is soluble in	1.29	pts. of water at	0°
	1.13		20°
	0.96		40°
	0.90*		60°
	0.89*		80°
	0.87*		100°

The saturated aqueous solution boils at 121°. (Kremers, *Ibid.*)

---

* In these three determinations the solutions remained supersaturated when cooled down, till at about 20° they solidified with development of considerable heat. (Kremers, *Pogg. Ann.*, **97.** pp. 14, 20.)

(H. Schiff, *Ann. Ch. u. Pharm.*, 1858, **107.** 305.)

Bromide of Sodium with Cyanide of Mercury.
$Na\,Br; 2\,Hg\,Cy + 3\,Aq$
Readily soluble in water, and alcohol. Decomposed by acids. (Caillot.)

Bromide of Spiroyl. *Vid.* BromoSalicylous Acid.

Bromide of StannEthyl.
$C_4\,H_5\,Sn, Br$
Soluble in alcohol. Still more soluble in ether. Water precipitates it from both these solutions. (Lœwig.)

Bromide of *bi*StannEthyl.
$C_4\,H_5\,Sn_2, Br$

Bromide of *bi*Stann(*ic*)*tri*Ethyl.
(*Bromide of Methylo-StannEthyl.*)
$Sn_2\,(C_4\,H_5)_3, Br$
Soluble in alcohol, and ether.

Bromide of StannMethyl.

Bromide of Stib*tri*Amyl.
$(C_{10}\,H_{11})_3\,Sb, Br_2$
Soluble in alcohol, especially in absolute alcohol, and in ether.

Bromide of Stib*tri*Ethyl.

I.) $(C_4\,H_5)_3\,Sb, Br_2$ Entirely insoluble in water. Very easily soluble in alcohol, and ether. (Lœwig & Schweitzer.)

II.) *Merck's bromide.* Soluble in water. (Merek.)
$(C_4\,H_5)_3\,Sb, Br$

Bromide of StibEthylium.
$(C_4\,H_5)_4\,Sb, Br + x\,Aq$
Permanent. Very readily soluble in water, and alcohol. (Lœwig.)

Bromide of StibMethylium.
$Sb\left\{(C_2\,H_3)_4\right.\,Br$
Very soluble in water, and alcohol. Insoluble in ether. (Landolt.)

Bromide of Stilbene.
$C_{28}\,H_{12}'', Br_2$
Insoluble in alcohol or ether.

Bromide of Strontium.
$Sr\,Br\,\&\,+ 6\,Aq$
Efflorescent. Easily soluble in water, being more readily soluble than bromate of strontia. Somewhat soluble in absolute alcohol. (Lœwig.) The crystallized salt is soluble in 1 pt., or less, of cold water. When heated, it melts in its water of crystallization. (Berzelius, *Lehrb.*, **3.** 385.)

1 pt. of the anhydrous salt s soluble in	pts. of water at
1.14	0°
1.01	20°

(Kremers, *Pogg. Ann.*, **99.** 444.)

Bromide of Strontium with Cyanide of Mercury.
$Sr\,Br; 2\,Hg\,Cy + 6\,Aq$
Efflorescent. Soluble in water, and alcohol. Decomposed by acids.

Bromide of Sulphur.

I.) $S_2\,Br$

II.) $S\,Br$ Slowly decomposed by cold, quickly decomposed by hot water. (Balard.)

Bromide of TellurEthyl.
$C_4\,H_5\,Te, Br$
Soluble in a solution of ammonia.

*Proto*Bromide of Tellurium.

I.) *normal.* Decomposed by water. (Berzelius.)
$Te\,Br$

II.) *basic.*

*Bi*Bromide of Tellurium.
(*Bromotelluric Acid.*)

I.) *normal.* Slowly deliquescent. Soluble,
a = $Te\,Br_2$ without decomposition, in a very small quantity of water, but a larger quantity of water decomposes it.

b = *hydrated.* $Te\,Br_2 + Aq$ Deliquesces with extraordinary rapidity.

II.) *basic.* Permanent. Decomposed by much water.
(*Tellurite of biBromide of Tellurium.*)

*Bi*Bromide of Tellurium with Bromide of *X*. *Vid.* BromoTellurate of *X*.

Bromide of TellurMethyl.
$C_2\,H_3\,Te, Br$

Bromide of Tetryl. *Vid.* Bromide of Butyl.

Bromide of Tetrylene. *Vid.* Bromide of Butylene.

Bromide of Thorium.
$Th\,Br$
Permanent. Soluble in water. (Berzelius.)

*Proto*Bromide of Tin.
$Sn\,Br$
Soluble in water.

*Bi*Bromide of Tin.
$Sn\,Br_2$
Soluble in water, apparently without decomposition. (Balard.)

Bromide of Titanium.
$Ti\,Br_2$
Deliquesces with decomposition. (Duppa.)

Bromide of Tritylene. *Vid.* Bromide of Propylene.

Bromide of Tungsten.

I.) $W\,Br_2$ Deliquesces, with decomposition, in the air. (Borck.)

II.) $W\,Br_2, W\,Br_3$

III.) $W\,Br_3$ Decomposed immediately by water. (Riche.)

*Proto*Bromide of Uranium.
$Ur\,Br + 4\,Aq$
Deliquescent. Soluble in water. (Rammelsberg.)

*Sesqui*Bromide of Uranium.
$Ur_2\,O_3, H\,Br$
Deliquescent. Soluble in alcohol. (Berthemot.)

Bromide of Valeryl.
$C_{10}\,H_9\,O_2, Br$

*Bi*Bromide of Vanadium.
$V\,Br_2$

a = *blue modif.* Soluble in water. When mixed with alcohol the solution gelatinizes, but on evaporating the alcohol it becomes fluid again.

b = *brown modif.* Soluble in water.

Bromide of Yttrium. $Y\,Br$ Deliquescent. Very soluble in water, with evolution of heat. (Berlin.)

Bromide of Zinc. $Zn\,Br$ Deliquescent. Soluble in water, with evolution of heat. Soluble in alcohol, ether, chlorhydric and acetic acids, and in ammonia. (Berthemot.)

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of the anhydrous salt dissolved in 100 pts. of water.
1.1715	20.6
1.3270	42.6
1.3371	43.9

(Kremers, *Pogg. Ann.*, **104.** 155, & **106.** 587.)

Bromide of Zincammonium. $N\left\{\begin{matrix}H_3\\Zn\end{matrix}\right., Br + Aq$ Decomposed by water. Soluble in warm, less soluble in cold ammonia-water. (Rammelsberg.)

Bromide of Zirconium. $Zr_2\,Br_3$ Easily soluble in water. (Berthemot.)

***Bi*BromImasatin.** (*Imabromisatinèse. Imabibromisatin.*) $C_{32}\,H_7\,Br_4\,N_3\,O_6$ Soluble in a solution of potash. (Laurent.)

BromIndatmit. *Vid. ter*BromAnilin.

***Bi*Bromindin.** $C_{32}\,H_6\,Br_4\,N_2\,O_4$ Sparingly soluble in alcohol, and ether. (Laurent.)

Bromindoptic Acid. *Vid. ter*BromoPhenic Acid.

Bromine. Br Soluble in 33.3 pts. of water at 15°. When exposed to sunlight the solution is gradually converted into bromhydric acid. (Lœwig.) Below + 4° it forms a crystalline hydrate with water. Soluble in 31.0 pts. of water. (Slessor.) No more soluble in hot than in cold water.

An aqueous solution of sp. gr.	Contains in 1000 pts., pts. of Br.	An aqueous solution of sp. gr.	Contains in 1000 pts., pts. of Br.
1.0090	10.7	1.0149	18.7 @ 19
1.0093	12.0	1.0158	19.5 @ 20.1
1.0099	13.0	1.0181	20.9 @ 21.5
1.0122	15.0	1.0237*	31.0 @ 31.7

(Slessor.)

* Saturated solution.

Soluble in 34.29 pts. of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.)

Easily soluble in strong alcohol, and in all proportions in ether, but these solutions soon undergo decomposition. Easily soluble in bisulphide of carbon. Tolerably soluble in glycerin, with combination. (Pelouze.) Soluble in benzin. (Mansfield.) Insoluble in benzin. (Moride, *Ann. Ch. et Phys.*, (3.) **39.** 452.) Soluble in oil of mandarin. (Luca.) Soluble in warm chloral (Liebig); also in bromal and iodal (Lœwig); soluble in chloride of sulphur (Solly); and in bromide of sulphur (Ot. Gr.). Readily soluble in strong acetic acid; decomposition ensuing after a time. (Balard.) Readily soluble in valerianic acid. (Trautwein.) Abundantly soluble, without decomposition, in aqueous solutions of the acetates of potash, soda, and lime. (Cahours.)

Soluble to an enormous extent in very concentrated bromhydric acid, from which solution much of it is precipitated on the addition of water, a solution remaining which contains three times as much bromine as there is acid. The bromine is easily expelled from these solutions on boiling or merely on exposure to the air. (Bineau, *Ann. Ch. et Phys.*, (3.) **7.** pp. 264, 274.) Soluble in concentrated chlorhydric acid. Less soluble in concentrated sulphuric acid than in water.

According to Balard, bromine is no more soluble in an aqueous solution of bromide of potassium than in pure water. Lœwig finds, however, that a solution of 1 pt. bromide of potassium in 6 pts. of water takes up as much bromine as it already contains; when this solution is gently heated the bromine which was dissolved is separated. A solution of 1 pt. of bromide of potassium in 1 pt. of water takes up twice as much bromine as it already contains, much heat being evolved. This solution loses its bromine when heated or exposed to the air. (Gmelin's *Handbook.*)

Most of the metallic bromides are soluble in water. Several of them are soluble in ether. (Gmelin.)

BromIodoform. *Vid.* Iodide of *bi*Bromo-Methyl.

***Mono*BromIsatic Acid.** $C_{16}\,H_6\,Br\,N\,O_6$

***Mono*BromIsatate of Potash.**

***Bi*BromIsatic Acid.** $C_{16}\,H_5\,Br_2\,N\,O_6$ Somewhat sparingly soluble in water. (Laurent.)

***Bi*BromIsatate of Baryta.** Soluble in boiling water, separating out as the solution cools.

***Bi*BromIsatate of Copper.** Ppt.

***Bi*BromIsatate of Lead.** Soluble in water.

***Bi*BromIsatate of Lime.** Soluble in boiling water, separating out as the solution cools.

***Bi*BromIsatate of Potash.** $C_{16}\,H_4\,K\,Br_2\,N\,O_6 + 2\,Aq$ Less soluble in water, and alcohol, than the bichlorisatate of potash.

***Bi*BromIsatate of Silver.** Soluble in boiling, less soluble in cold water. (Laurent.)

BromIsatin. (*Bromisatinase.*) $C_{16}\,H_4\,Br\,N\,O_4$ Soluble in boiling, less soluble in cold water. (Erdmann.) Soluble in boiling, less soluble in cold alcohol. (Hofmann.)

***Bi*BromIsatin.** (*Bromisatinèse.*) $C_{16}\,H_3\,Br_2\,N\,O_4$ More soluble in water than monobromisatin. Readily soluble in alcohol. (Erdmann.) Readily soluble in boiling, less soluble in cold alcohol. (Laurent.) Soluble in a cold aqueous solution of caustic potash; the solution subsequently undergoing decomposition, slowly in the cold, at once when heated. (Erdmann.)

***Bi*BromIsatin with Potash.** $C_{16}\,H_2\,K\,Br_2\,N\,O_4$

BromIsatinase. *Vid.* BromIsatin.

BromIsatinèse. *Vid. bi*BromIsatin.

BromoBenzol.
} *Vid.* Hydride of BromoPhenyl. Also, Bromhydrate of Benzin.

BromoBenzoic Acid. $C_{14} H_5 Br O_4 = C_{14} H_4 Br O_3, HO$ Sparingly soluble in water. Readily soluble in alcohol, ether, and wood-spirit.

Most of its salts are very readily soluble in water.

BromoBenzoate of Baryta. Sparingly soluble in water.

BromoBenzoate of Copper. Sparingly soluble in water.

BromoBenzoate of Lead. Readily soluble in water.

BromoBenzoate of Lime. Sparingly soluble in water.

BromoBenzoate *of dinoxide* of Mercury. Sparingly soluble in water.

BromoBenzoate of Silver. $C_{14} H_4 Br Ag O_4$ Sparingly soluble in cold, tolerably easily soluble in warm water. (Peligot.)

BromoBoracic Acid. Soluble, with decomposition, in water. (Poggiale.)

BromoBrucin. *(Brucine bromé.)* $C_{46} H_{25} Br N_2 O_8$ Soluble in dilute alcohol; less soluble in water. (Laurent, *Ann. Ch. et Phys.*, (3.) **24.** 314.)

BromoButylene.
$C_8 H_7 Br$

*Bi*BromoButyric Acid. *Vid.* BromoTriconic Acid.

*Bi*BromoButyric Ether. *Vid.* BromoTriconate of Ethyl.

BromoCarbolic Acid. *Vid.* BromoPhenic Acid.

BromoCarbonate of *X*. *Vid.* Bromate of *X* with Carbonate of *X*.

*Bi*BromoCarmindin. $C_{64} H_{15} Br_8 N_7 O_{10}$ Insoluble in water, or in aqueous solutions of caustic potash or ammonia. Very freely soluble in ether; less soluble in alcohol. (Laurent.) Sparingly soluble in alcohol.

*Bi*BromoChlorAnilin. $C_{12} H_4 Cl Br_2 N = N \left\{ \begin{matrix} C_{12} H_2 Cl Br_2 \\ H_2 \end{matrix} \right.$ Entirely insoluble in water. Soluble in alcohol, and ether. Soluble, without alteration, in warm solutions of ammonia and of potash. Soluble in hot concentrated chlorhydric acid, from which it separates out on cooling; it is also precipitated by the addition of water. Soluble in concentrated sulphuric acid, from which it is precipitated by water. (Hofmann.)

*Bi*BromoChloride of Cacodyl.
$C_2 H_3 As Cl Br_2$

BromoChloride of Carbon. *Vid.* Bromide of *per*ChlorEthylene.

Bromo*bi*ChloroNaphthalin. *(Naphthaline bromo-bichlorée. Chlorébronaphtise A.)* $C_{20} H_5 Br Cl_2$ Tolerably soluble in alcohol. Very soluble in ether.

*Bi*Bromo*bi*ChloroNaphthalin.
(Naph. bibromo-bichlorée.)
$C_{20} H_4 Br_2 Cl_2$

[There are two modifications.]

I.) *Modification α.* *(Chlorébronaptose b.)* Scarcely at all soluble, even in boiling alcohol or ether.

II.) *Modification β.* *Bromécklonaphtose b.)* Scarcely at all soluble in ether or in boiling alcohol.

Bromo*ter*ChloroNaphthalin.
(Naph bromo-trichlorée.)
$C_{20} H_4 Br Cl_3$

[There are three isomeric modifications.]

I.) *Modification α.* *(Chloribronaphtose a.)* Soluble in ether, and in mixed alcohol and ether. (Laurent.)

II.) *Modification β.* *(Bromachlonaphtose a.)* Scarcely at all soluble in alcohol. Tolerably soluble in ether, though less so than in modification α. Soluble in a mixture of alcohol and ether. (Laurent.)

III.) *Modification γ.* *(Bromachlonaphtose b.)* Very sparingly soluble in boiling alcohol and in ether. (Laurent.)

*Bi*Bromo*ter*ChloroNaphthalin.
(Naph. bibromo-trichlorée.)
$C_{20} H_3 Br_2 Cl_3$

[There are two isomeric modifications.]

I.) *Modification α.* *(Broméchlonaphtuse b.)* Somewhat soluble in boiling ether, better in rock-oil.

II.) *Modification β.* *(Chloribronaphtuse.)* Almost insoluble in ether.

BromoChloroPropylene.
$C_6 H_4 Cl Br$

BromoCinchonin. $C_{40} H_{23} Br N_2 O_2 = N_2 \left\{ C_{40} H_{23} Br O_2^{vi} \right.$ Tolerably easily soluble in boiling, less soluble in cold alcohol.

*Sesqui*BromoCinchonin. $C_{40} H_{22} Br_2 N_2 O_2 ; C_{40} H_{23} Br N_2 O_2$ Insoluble in water. Somewhat soluble in boiling, less soluble in cold alcohol. (Laurent, *Ann. Ch. et Phys.*, (3.) **24.** 309.)

*Bi*BromoCinchonin. $C_{40} H_{22} Br_2 N_2 O_2$ Insoluble in water. Sparingly soluble in boiling alcohol.

BromoCinnamic Acid. $C_{18} H_7 Br O_4$ Soluble in water; the aqueous solution being somewhat decomposed by evaporation. Soluble in alcohol, with partial decomposition. Its salts are easily soluble. (Herzog.)

BromoCinnamate of Silver. Soluble in water, and ether.

BromoCinnamate of Potash. Soluble in water.

BromoCinnamene. *Vid.* Bromide of Cinnamene.

BromoCodein. $C_{36} H_{20} Br N O_6 + 3 Aq$ Scarcely at all soluble in cold, somewhat more soluble in boiling water. Easily soluble, especially in boiling alcohol. Scarcely at all soluble in ether. Soluble in cold concentrated sulphuric acid, also easily soluble in chlorhydric acid.

*Ter*BromoCodein. $C_{36} H_{18} Br_3 N O_6$ Insoluble in water. Readily soluble in alcohol. Insoluble in ether. Sparingly soluble in cold, much more soluble in boiling chlorhydric acid; apparently with partial decomposition.

Its salts are very sparingly soluble in water. (Anderson.)

BromoComenic Acid. $C_{12} H_3 Br O_{10} + 3 Aq$ Sparingly soluble in cold, tolerably soluble in boiling water. Less easily soluble in water than chlorocomenic acid. Soluble in warm alcohol; but less so than chlorocomenic acid. (How.) The normal (*di*) salts of the alkaline earths are insoluble in water, the acid (*mono*) salts of the alkaline earths are, on the contrary, very readily soluble.

BromoComenate of Silver.

I.) *normal* (*di*). Ppt.

II.) *acid* (*mono*). Sparingly soluble in cold, more readily soluble in boiling water. (How.)

$C_{12}H_2AgBrO_{10}$

*Ter*BromoCumidin. Insoluble in water. Soluble in alcohol, and ether.

BromoTriconate of Ethyl. $C_8 H_5 Br_2 (C_4 H_5) O_4$ Sparingly soluble in water. Soluble in all proportions in alcohol. (Cahours, *loc. cit.*, p. 499.)

BromoTriconate of Lead.
I.) *cryst. modif.* Sparingly soluble in water.

BromoTriconate of Potash.
I.) *cryst. modif.* Soluble in water.

BromoTriconate of Silver.
I.) *cryst. modif.* Sparingly soluble in water.
II.) *oily modif.* Slightly soluble in cold water.
$C_8 H_5 Br_2 Ag O_4$

BromoTriconate of Soda.
I) *cryst. modif.* Soluble in water.

***Quadri*BromoTurpentine-Oil.**
$C_{20} H_{12} Br_4$

***Bi*BromoVeratrol.** $C_{18} H_8 Br O_4$ Insoluble in water. Easily soluble in alcohol, and ether. (W. Merck.)

BromOxaform. $C_6 H Br_5 O_4$ Insoluble either in hot or in cold water. Readily soluble in hot alcohol, especially if it be also concentrated; much less soluble in cold alcohol. Soluble in ether, and wood-spirit. Sparingly soluble in concentrated sulphuric acid when this is gently warmed, but at the temperature of ebullition decomposition ensues. Insoluble in cold moderately concentrated nitric acid, but is sparingly soluble without decomposition in the same acid when boiling. Soluble in a cold concentrated solution of potash, being decomposed when this is heated. (Cahours, *Ann. Ch. et Phys.*, (3.) **19.** 490.)

Brucin. (*Vomicin. Caniramin.*) $C_{46} H_{26} N_2 O_8 + 8\,Aq = N_2 \left\{ C_{46} H_{28} O_8^{vi} + 8\,Aq \right.$ Somewhat efflorescent. Soluble in 850 pts. of cold, and in 500 pts. of boiling water (——?); in 320 pts. of cold, and in 150 pts. of boiling water (Duflos); in 768 pts. of water at 18.75° (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 75). Very soluble in alcohol. (Bouchardat, *Ann. Ch. et Phys.*, (3.) **9.** 231.) More soluble than strychnine in alcohol. Soluble in ammonia-water. (Parrish's *Pharm.*, p. 410.) Very soluble at ordinary temperatures in water saturated with carbonic acid. (Langlois.) 100 pts. of chloroform dissolve 14 pts. of it. (Schlimpert, *Kopp & Will's J. B. für* 1859, p. 405.) 100 pts. of chloroform dissolve 56.79 pts. of it. (Michael Pettenkofer, *Kopp & Will's J. B. für* 1858, p. 363.) 100 pts. of olive-oil dissolve 1.78 pts. of it. (M. Pettenkofer, *loc. cit.*) Sparingly soluble in the essential oils. Insoluble in ether and the fatty oils. (Gerhardt's *Tr.*) Most of the brucin salts are difficultly soluble in cold water, or alcohol. They are generally freely soluble in glycerin. (Parrish's *Pharm.*, p. 232.)

Brunolic Acid. Insoluble in water. Soluble in alcohol and in alkaline lyes. Its salts are mostly insoluble. (Runge.)

Brunolate of Lime. Insoluble in alcohol.

Brunolate of Soda. Soluble in water.

Bryonin (from *Bryonia alba*). $C_{96} H_{84} O_{42}$ Soluble in water, and alcohol. Insoluble in ether. Soluble, with decomposition, in concentrated sulphuric, nitric, and chlorhydric acids. Soluble, without decomposition, in alkaline solutions.

Bryonitin. Soluble in water, and ether. Insoluble in alcohol.

Soluble in alcohol, of 95%, and ether. (Parrish's *Pharm.*, p. 422.)

Bryoretin. Soluble in ether. (Walz.)
$C_{42} H_{35} O_{14}$

Butaldid. *Vid.* Hydride of Butyryl.

Butter. See Fats.

Butyl. (*Valyl. Tetryl* (of Gerhardt). *Butylium.*) $C_8 H_9$, or $\left. \begin{matrix} C_8 H_9 \\ C_8 H_9 \end{matrix} \right\}$ Completely insoluble in water. Miscible in all proportions with alcohol, and ether. (Kolbe, *J. Ch. Soc.*, **2.** 161.)

Butyl Alcohol. *Vid.* Hydrate of Butyl.

Butylamin. (*Tetrylamin. Tetryl ammonia. Butyliaque. Butyriaque. Butyramin. Nitride of Tetryl.*) $C_8 H_{11} N = N \left\{ \begin{matrix} C_8 H_9 \\ H_2 \end{matrix} \right.$ Soluble in all proportions in water, alcohol, and ether. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **42.** 166.)

ButylAmyl.
(*Tetryl Amyl.*)
$C_{18} H_{20} = \begin{matrix} C_8 H_9 \\ C_{10} H_{11} \end{matrix}$

Butylate of Ethyl. *Vid.* Oxide of Ethyl and of Butyl.

ButylCaproyl.
(*Tetryl Hexyl.*)
$C_{20} H_{22} = \left. \begin{matrix} C_{12} H_{13} \\ C_8 H_9 \end{matrix} \right\}$

Butylene. (*Butyrene. Tetrylene. Di Tetryl.*) $C_8 H_8$ Very sparingly soluble in cold water. Much more soluble in alcohol, and in oils, both fixed and volatile. Olive-oil absorbs about 6 times its own volume. (Faraday.) It is dissolved by a solution of dichloride of copper in chlorhydric acid, also, quickly, by monohydrated sulphuric acid and by bromine, with combination. Soluble in inflammable liquids generally. It is disengaged from its solutions by ebullition. (Berthelot, *Ann. Ch. et Phys.*, (3.) **51.** 70.)

Butylene *Chloré*. *Vid.* ChloroButylene.

ButylGlycol. *Vid.* Hydrate of Butylene.

Butyliaque. *Vid.* Butylamin.

Butylic Alcohol. *Vid.* Hydrate of Butyl.

Butylic Ether. *Vid.* Oxide of Butyl.

Butylic Mercaptan. *Vid.* Sulphydrate of Butyl.

Butylic Urethan. *Vid.* Carbamate of Butyl.

Butylium. *Vid.* Butyl.

ButylLactic Acid. Soluble in water.
(*Isomeric with Acetonic Acid*)
$C_8 H_8 O_6 = C_8 H_6 O_4, 2\,H\,O$

ButylLactate of Baryta. $C_8 H_7 Ba O_6$ Easily soluble in water, and dilute alcohol. Insoluble in absolute alcohol.

ButylLactate of Lime. $C_8 H_7 Ca O_6$ Very easily soluble in water. Soluble in absolute alcohol. Insoluble in ether.

ButylLactate of Zinc. $C_8 H_7 Zn O_6 + 2\,Aq$ Permanent. Soluble in 160 pts. of water at 15°. Almost insoluble in absolute alcohol.

ButylLeucin. $C_{10} H_{11} N O_4 = N \left\{ \begin{matrix} C_2 H O_2 \\ C_8 H_9 \\ H \end{matrix} \right\} O_2$ Soluble in water; less soluble in alcohol. Insoluble in ether. Soluble, with combination, in chlorhydric acid.

ButylSulphuric Acid.
(*SulphoButylic Acid. TetrylSulphuric Acid.*)
$C_8 H_{10} O_2, S_2 O_6$

ButylSulphate of Baryta. $C_8 H_9 Ba O_2, 2\,S O_3 + 2\,Aq$ Very readily soluble in water.

ButylSulphate of Lime. $C_8 H_9 Ca O_2, 2\,S O_3$ Very soluble in water.

ButylSulphate of Potash. $C_8 H_9 K O_2, 2\,S O_3$ Very soluble in water. Tolerably readily soluble in boiling, but only sparingly soluble in cold alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **42.** 162.)

ButylSulphydric Acid. *Vid.* Sulphydrate of Butyl.

Butyral. *Vid.* Hydride of Butyryl.

Butyral *chloré.* *Vid.* Hydride of ChloroButyryl.

ButyralAmmonia. *Vid.* Butyrylide of Ammonium.

Butyraldehyde. *Vid.* Hydride of Butyryl.

Butyramid. Permanent. Soluble in water,
(*Butyrylamid.*)
$C_8 H_9 N O_2 = N \left\{ \begin{matrix} C_8 H_7 O_2 \\ H_2 \end{matrix} \right.$
especially when this is warm. Also soluble in alcohol, and ether. (Chancel.)

Butyramide mercurique. *Vid.* Mercur(*ic*)Butyramid.

Butyramin. *Vid.* Butylamin.

ButyrAnilid. *Vid.* PhenylButyramid.

Butyric Acid(Anhydrous). It is slowly acid-
(*Butyrate of Butyryl.*)
$C_{18} H_{14} O_8 = \left. \begin{matrix} C_8 H_7 O_2 \\ C_8 H_7 O_2 \end{matrix} \right\} O_2$
ified, by absorbing water, when exposed to the air. Slowly miscible with water. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** 320.)

Butyric Acid. Soluble in all proportions in
$C_8 H_8 O_4 = C_8 H_7 O_3, H O$
water, alcohol, and wood-spirit. Unacted upon by cold concentrated sulphuric acid, but is partially decomposed when heated therewith. (Pelouze & Gélis, *Ann. Ch. et Phys.*, (3.) **10.** 445.) A mixture composed of 2 pts. of the acid with 1 pt. of water is of 1.00287 sp. gr. (Chevreul.) Soluble in all proportions in ether, and oils. Soluble, without decomposition, in cold concentrated sulphuric, and nitric acids, but decomposes when these solutions are boiled. All the butyrates are soluble in water.

Butyrate of Acetosamin.

Butyrate of Allyl. Soluble in ether. (Ber-
$C_{14} H_{12} O_4 = C_8 H_7 (C_6 H_5) O_4$
thelot & De Luca.)

Butyrate of Ammonia. Deliquescent. Soluble in water. (Pelouze & Gélis, *loc. cit.*)

Butyrate of Amyl. Is not miscible with
$C_{18} H_{18} O_4 = C_8 H_7 (C_{10} H_{11}) O_4$
water.

Butyrate of Anilin. Sparingly soluble in water. (Unverdorben.)

Butyrate of Baryta. Permanent. The
$C_8 H_7 Ba O_4 + 2 Aq, \& 4 Aq$
salt with 4 Aq. is soluble in 2.77 pts. of water at 10°. 100 pts. of water at 10° dissolve 36.07 pts. of it. (Chevreul.) Alcohol dissolves it, apparently with partial decomposition. (Chevreul. [T.].) Soluble in 400 pts. of absolute alcohol at 5°.

Insoluble in cold absolute alcohol. (Berthelot.) Very soluble in absolute alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **11.** 254.)

Butyrate of Baryta & of Lime. Soluble in 3.8 pts. of water at 18°. (Chevreul.)

Butyrate of Cetyl. Somewhat soluble in
$C_8 H_7 (C_{32} H_{33}) O_4$
alcohol. Miscible in all proportions with ether.

Butyrate of Cholesterin. Slightly solu-
$C_{60} H_{50} O_4 = C_8 H_7 (C_{52} H_{43}) O_4$
ble in cold, somewhat more easily soluble in boiling alcohol. Rather easily soluble in ether.

Butyrate of Cinchonidin(of Pasteur). Easily soluble in water, and spirit. (Leers, *Ann. Ch. u. Pharm.*, **82.** 161.)

Butyrate of Copper. Very sparingly sol-
$C_8 H_7 Cu O_4 + 2 Aq$
uble in cold, somewhat more soluble in boiling water. (Pelouze & Gélis, *loc. cit.*)

Butyrate of Ethyl. Sparingly soluble in
$C_{12} H_{12} O_4 = C_8 H_7 (C_4 H_5) O_4$
water. Soluble in all proportions in alcohol, and wood-spirit. Very slowly decomposed even by boiling alkaline solutions. (Pelouze & Gélis, *loc. cit.*)

Butyrate of Ethylene. Perfectly insoluble
(*Butyrate of Glycol.*)
$C_{20} H_{18} O_8 = C_4 H_4'', 2 C_8 H_7 O_4$
in water. Soluble in all proportions in alcohol, and ether. (A. Wurtz.)

Butyrate of Glyceryl.

I.) *bibasic.* Insoluble, or exceedingly sparingly
(*MonoButyrin* (artificial).)
$C_{14} H_{14} O_8 = C_6 H_5 O_3, 2 H O, C_8 H_7 O_3$
soluble, in water. Soluble in all proportions in concentrated alcohol, and in ether, from which water readily separates it. (Pelouze & Gélis, *Ann. Ch. et Phys.*, (3.) **10.** 455.) It mixes with water and in certain proportions forms a stable emulsion therewith. When 1, 2, and 3 volumes of water are successively added to 8 vols. of monobutyrin the water dissolves and a limpid solution is formed; if 2 vols. more of water are now added, a slight opalescence is produced; 13 vols. more of water (18 vols. in all) produce a permanent homogeneous emulsion. This emulsion persists when more water, even so much as 220 pts., is added. 900 vols. of water render the liquid almost transparent, still one cannot affirm that a true solution has been produced. Monobutyrin is soluble in ether. (Berthelot, *Ann. Ch. et Phys.*, (3.) **41.** 262.)

II.) *monobasic.* Somewhat soluble in water.
$C_{22} H_{20} O_{10} = C_6 H_5 O_3, H O, 2 C_8 H_7 O_3$
(*DiButyrin.*)
1 volume of dibutyrin mixed with 1 vol. of water forms a limpid mixture; if another vol. of water be added, the dibutyrin will be precipitated, and this precipitation is hastened if 3 vols. more water are added; but with from 150 @ 200 vols. water a transparent emulsion or solution is formed.

Miscible with alcohol, and ether. The alcoholic solution decomposes after a time when it is exposed to the air. Soluble in an aqueous solution of carbonate of soda. (Berthelot, *loc. cit.*)

III.) *normal.* Insoluble in water. Very easily
$C_{30} H_{26} O_{12} = C_6 H_5 O_3, 3 C_8 H_7 O_3$
$= C_{24} H_{21} (C_6 H_5''') O_{12}$
(*TriButyrin.*)
soluble in alcohol, and ether. Sparingly soluble in cold dilute alcohol. (Berthelot, *Ann. Ch. et. Phys.*, (3.) **41.** 267.)

Natural butyrin is extremely sparingly soluble in water; but is soluble in all proportions in boiling alcohol of 0.822 sp. gr., and in ether, from which water separates it. The warm alcoholic solution remains clear on cooling, if it contains 120 pts. of butyrin to 100 pts. of alcohol, but when the proportion of butyrin to alcohol is as 20 to 100 the solution becomes turbid on cooling. (Chevreul.)

Butyrate *of sesquioxide* **of Iron.** Soluble in much water.

Butyrate of Lead.

I.) *normal.* Soluble in alcohol, and in spirit;
$C_8 H_7 Pb O_4$
less soluble in water. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **11.** 253.)

II.) *basic.* Difficultly soluble in water.
$C_8 H_7 Pb O_4, 2 Pb O$

Butyrate of Lime. Soluble in 5.69 pts. of
$C_8 H_7 Ca O_4 + x Aq$
water at 15°; much less soluble in hot water. (Chevreul.) 100 pts. of water at 15.5° dissolve 17.58 pts. of it;

when this solution is heated, the salt separates out so abundantly that the liquid becomes solid, but it again dissolves as the temperature falls to 15.5°. (Chevreul, [T.].)

Tolerably abundantly soluble in cold water: this solubility decreases gradually as the temperature of the solution is elevated, till at the point of ebullition almost all the salt separates out. (Pelouze & Gélis, *Ann. Ch. et Phys.*, (3.) **10.** 451.)

Butyrate of Magnesia. $C_8H_7MgO_4 + 5Aq$ Very soluble in water. (Pelouze & Gélis, *loc. cit.*)

Butyrate *of dinoxide* of Mercury. Ppt.

Butyrate of Methyl. $C_{10}H_{10}O_4 = C_8H_7(C_2H_3)O_4$ Scarcely at all soluble in water. Soluble in all proportions in alcohol, ether, and wood-spirit. (Pelouze & Gélis, *loc. cit.*, p. 454.)

Butyrate of Picolin.

Butyrate of Potash. $C_8H_7KO_4$ Very deliquescent. Soluble in 0.8 pt. of water at 15.5°. (Chevreul.) Much less deliquescent than acetate of potash. (Pelouze & Gélis, *loc. cit.*)

Butyrate of Propyl. $C_{14}H_{14}O_4 = C_8H_7(C_6H_7)O_4$ Decomposed by boiling potash lye.

Butyrate of Silver. $C_8H_7AgO_4$ Very sparingly soluble in water, though more soluble in hot than in cold water. (Pelouze & Gélis, *loc. cit.*) Very sparingly soluble in water; less soluble in alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **11.** 254.)

Butyrate of Soda. $C_8H_7NaO_4$ Less deliquescent than the potash salt. Soluble in water. (Chevreul.)

Butyrate of StibMethylEthylium.

$C_8H_7\left(Sb\left\{\begin{matrix}C_2H_3\\(C_4H_5)_3\end{matrix}\right.\right)O_4$

Permanent. Soluble in water. (Friedlænder.)

Butyrate of Strontia. $C_8H_7SrO_4$ Soluble in 3 pts. of water at 4°. (Chevreul.)

Butyrate of Trehalose. $C_{16}H_{14}(C_{12}H_8O_6'')O_8$ Difficultly soluble in water. Soluble in alcohol, and ether.

Butyrate of Zinc.

I.) *normal.* $C_8H_7ZnO_4$ Sparingly soluble in cold, decomposed by boiling water. Sparingly soluble in alcohol. (Larocque & Hurault.)

II.) *basic.* Insoluble in water. (Larocque.)

Butyrene. *Vid.* Butylene.

Butyrene *chloré*. *Vid.* ChloroButylene.

Butyriaque. *Vid.* Butylamin.

Butyric Aldehyde. *Vid.* Hydride of Butyryl.

Butyric Ether. *Vid.* Butyrate of Ethyl.

Butyrin. *Vid.* Butyrate of Glyceryl.

Butyridin. *Vid.* Butyrate of Glyceryl, II.)

ButyroAcetic Acid. (*PseudoAcetic Acid.*) $C_6H_6O_4 = C_6H_5O_3, HO$ Was at one time thought to be identical with propionic acid, but the experiments of Limpricht & v. Uslar (*Ann. Ch. u. Pharm.*, **94.** 321) appear to disprove this and to establish its individuality.

It is soluble in all proportions in water.

ButyroAcetate of Baryta. $C_6H_5BaO_4 + Aq$ Easily soluble, especially in hot water. Very sparingly soluble in absolute alcohol. Tolerably soluble in hot, less soluble in cold spirit. (Nicklès.)

ButyroAcetate of Copper. Very sparingly soluble in water. more soluble in water acidulated with aeetie acid. Very soluble in alcohol. (Nicklès.)

ButyroAcetate of Ethylene. (*ButyroAcetate of Glycol. Glycolic AcetoButyrin or ButyroAcetin.*) $C_{16}H_{14}O_8 = C_{12}H_{10}(C_4H_4'')O_8$ Insoluble in water. Soluble in alcohol. (Simpson.)

ButyroAcetate of Lead.

I.) *normal.* Deliquescent in moist air. Soluble in water.

II.) *basic.* Efflorescent. Melts at 19° in its water of crystallization. Easily soluble in spirit.

ButyroAcetate of Lime. $C_6H_5CaO_4$ Efflorescent. Easily soluble in hot water.

ButyroAcetate of Potash. Very deliquescent. Exceedingly soluble in water. Easily soluble in absolute alcohol, and in a mixture of alcohol and ether.

ButyroAcetate of Silver. $C_6H_5AgO_4$ Somewhat soluble, with partial decomposition, in hot water.

ButyroAcetate of Soda. Deliquescent. Very soluble in water, and alcohol; less soluble in a mixture of alcohol and ether. (Limpricht & v. Uslar, *Ann. Ch. u. Pharm.*, **94.** 330.)

ButyroAcetate of Zinc. Soluble in water, the solution undergoing decomposition when boiled.

ButyroChlorhydrin. $C_{14}H_{13}ClO_6$ Insoluble in water. (Berthelot, *Ann. Ch. et Phys.*, (3.) **41.** 303.)

Butyro*bi*Chlorhydrin. $C_{14}H_{12}Cl_2O_4$ Insoluble in water. (Berthelot, *Ann. Ch. et Phys.*, (3.) **41.** 303.)

"**Butyroleic Acid.**" Was a mixture.

Butyrone.

$C_{14}H_{14}O_2 = \left.\begin{matrix}C_8H_7\\C_6H_7\end{matrix}\right\}O_2$

Almost entirely insoluble in water. Soluble in all proportions in alcohol. (Chancel, *Ann. Ch. et Phys.*, (3.) **12.** 148.)

"**ButyroNitric Acid.**" *Vid.* NitroPropionic Acid.

Butyronitril. *Vid.* Cyanide of Propyl.

ButyroSulphuric Acid. *Vid.* SulphoButyric Acid.

Butyryl. $C_8H_7O_2$ Not isolated.

Butyrilide of Ammonium. (*Butyralammonia.*)

$\left.\begin{matrix}C_8H_7O_2\\NH_4\end{matrix}\right\} + 10Aq$

Almost insoluble in water, or ammonia-water. Easily soluble in alcohol, and ether. (Guckelberger.)

ButyrylUrea. (*CarbonylButyrylbiamid.*)

$C_{10}H_{10}N_2O_4 = N_2\left\{\begin{matrix}C_2O_2''\\C_8H_7O_2\\H_3\end{matrix}\right.$

Soluble in water, and spirit. (Moldenhauer, *Ann. Ch. u. Pharm.*, **94.** 101.)

Buxin (from *Buxus sempervirens*). Difficultly soluble in cold water; more easily soluble in hot water, and in alcohol. Sparingly soluble in ether. Insoluble in alkaline solutions.

C.

CachouTannic Acid. *Vid.* MimoTannic Acid.

Cacodyl. (*Kakodyl. ArsenbiMethyl.*) $(C_2H_3)_2As$ Sparingly soluble in water. Very soluble in alcohol, and ether. Miscible with chloride of ethyl.

Cacodylic Acid. (*Alkargen.*) $C_4H_7AsO_4 = (C_2H_3)_2AsO_3, HO$ Permanent in dry air; deliquesces in moist air. Miscible with water. Easily soluble in dilute, less readily soluble in cold concentrated alcohol. Insoluble in anhydrous, but is sparingly soluble in ordinary aqueous ether. (Bunsen.)

Its metallic salts are soluble in water, and alcohol.

Cacodylate of *per*Bromide of Cacodyl. (*Basic Perbromide of Cacodyl. Bromhydrate of Cacodylic Acid.*) $C_4 H_6 As Br_3, 3 C_4 H_6 As O_3 + 12 Aq$ Deliquescent. Decomposed by water.

Cacodylate of *bi*Chloride of Cacodyl. $3 C_4 H_6 As Cl_2, 2 C_4 H_6 As O_3$ Insoluble in water. Soluble in alcohol. (Bunsen.)

According to Bæyer (*Ann. Ch. u. Pharm.*, **107.** 279) this body consists of a mixture of bichloride of arsenmethyl and oxide of cacodyl.

Cacodylate of *per*Chloride of Cacodyl. (*Basic Perchloride of Cacodyl. Clorhydrate of Cacodylic Acid.*) $C_4 H_6 As Cl_3, 2 C_4 H_6 As O_3 + 6 Aq$ Deliquescent. Decomposed by water.

Cacodylate of Cacodyl. (*Hydrarsin. Binoxide of Cacodyl.*) $C_8 H_{12} As_2 O_4 = (C_2 H_3)_2 As O, (C_2 H_3)_2 As O_3$ Easily soluble in water; but is decomposed by much water.

Cacodylate of Copper. Soluble in water, and alcohol.

Cacodylate of Copper with *proto*Chloride of Copper. $7 Cu Cl ; 2 (Cu O, 2 C_4 H_6 As O_3)$ Easily soluble in water. Insoluble in absolute alcohol. (Bunsen.)

Cacodylate of Chloride of Mercury. $2 Hg Cl, C_4 H_6 As O_3 + Aq$ Abundantly soluble in water. Difficultly soluble in alcohol. (Bunsen.)

Cacodylate of *per*Fluoride of Cacodyl. (*Basic Perfluoride of Cacodyl. Fluorhydrate of Cacodylic Acid.*) $2 C_4 H_6 As Fl_3, C_4 H_6 As O_3 + 3 Aq$ Deliquescent. Readily soluble in water, and alcohol. (Bunsen.)

Cacodylate *of sesquioxide* of Iron. Soluble in water, and alcohol.

Cacodylate *of protoxide* of Mercury. Partially soluble in water, and alcohol, a basic salt separating out.

Cacodylate of Potash. Deliquescent. Soluble in water, and alcohol.

Cacodylate of Silver.

I.) *normal.* $C_4 H_6 Ag As O_4$ Permanent. Very readily soluble in water. Easily soluble in hot alcohol.

II.) *acid.* Soluble in water.
$C_4 H_6 Ag As O_4 ; 2 C_4 H_7 As O_4$

Cacodylate of Silver with Nitrate of Silver. $C_4 H_6 Ag As O_4 ; Ag O, N O_5$ Easily soluble in water. Sparingly soluble in absolute alcohol.

Cacodylate of Soda. Less deliquescent than the potash salt. Soluble in water and alcohol.

Cacothelin. $C_{40} H_{22} (N O_4)_2 N_2 O_{10}$ Insoluble in water. Sparingly soluble in alcohol. Easily soluble in ammonia-water, but is decomposed when the solution is boiled. Easily soluble in chlorhydric acid. (Laurent, *Ann. Ch. et Phys.*, (3.) **22.** 465.) Very sparingly soluble in boiling water, and still less soluble in boiling alcohol. Insoluble in ether. Soluble in water strongly acidulated with nitric acid, and in acids generally, with combination. Easily soluble in aqueous solutions of caustic potash, ammonia, or baryta. (Strecker, *Ann. Ch. u. Pharm.*, **91.** 89.)

Cacothelin with Baryta. $C_{40} H_{22} (N O_4)_2 N_2 O_{10}, Ba O$ Soluble in water. Insoluble in alcohol. (Strecker.)

Cacothelin with Lead. Ppt.

Cacothelin with Silver. Ppt.

Cadmium. Cd Permanent in dry air, but becomes slightly tarnished in a moist atmosphere.

Decomposes water at 100°. (Regnault.) Soluble in chlorhydric acid, when this is not too dilute, especially on heating. Dilute sulphuric and other acids, even acetic acid, dissolve it slowly. Very easily soluble in nitric acid.

CadmiumEthyl. $C_4 H_5 Cd$ Decomposed by water. (Wanklyn.) Insoluble in water. Soluble in iodide of ethyl. (Sonnenschein.)

Caffein. (*Cafein. Thein. Guaranin.*) $C_{16} H_{16} N_4 O_4, \& + 2 Aq$ Sparingly soluble in cold, easily soluble in hot water. Soluble in 35 @ 40 pts. of cold water (Oudry); in 48 pts. of water at 21° (Zenneck); in 50 pts. of water (Pfaff); in 100 pts. at 15°. (Günther.)

1 pt. of crystallized caffein is soluble in 93 pts. of water at 12.5°; when dried at 120°, 1 pt. of it is soluble in 98 pts. of water at 12.5°; quickly soluble in boiling water. (Mulder, *Pogg. Ann.*, 1838, **43.** 174.) Soluble in 20 pts. of alcohol at 21° (Zenneck); in 25 pts. of alcohol, of 85%, at 20°. (Günther.) Crystallized caffein dissolves in 158 pts. of anhydrous alcohol at 12.5°; when it has been dried at 120° it dissolves in 97 pts. of the same alcohol; quickly soluble in boiling alcohol. (Mulder, *Pogg. Ann.*, **43.** 174.) Insoluble in absolute alcohol. (Pfaff.) Easily soluble in hot alcohol.

Very sparingly soluble in ether. (Robiquet, Martius, Herzog.) Insoluble in ether. (Pfaff.) Readily soluble in hot ether. (Jobst.) Soluble in 300 pts. of ether; being very sparingly soluble therein, and much less soluble than it is in alcohol, and water. (Péligot, *Ann. Ch. et Phys.*, (3.) **11.** pp. 137, 138.) 1 pt. of crystallized caffein is soluble in 298 pts. of ether at 12.5°; after having been dried at 120°, 1 pt. of caffein dissolves in 194 pts. of ether at 12.5°; it is quickly soluble in hot ether. (Mulder, *Pogg. Ann.*, **43.** 174.)

100 pts. of chloroform dissolve 11 pts. of it. (Schlimpert, *Kopp & Will's J. B. für* 1859, p. 405.) Soluble in volatile oils, but insoluble in fatty oils. (Herzog.) Very easily soluble in oil of rosemary. (Günther.) Soluble in oil of almonds.

Insoluble in oil of turpentine. (Pfaff.) Readily soluble in benzin. (Vogel.) Soluble in acids, with combination.

Easily soluble in nitric acid, without decomposition, even by the concentrated acid. Easily soluble in chlorhydric acid, from which a portion of it is precipitated, unchanged, by water and by alcohol. Rapidly soluble in dilute sulphuric acid, without decomposition. (Pfaff.) Easily soluble in acetic acid; slowly soluble in oxalic and in tartaric acid, crystallizing unchanged from these last. (Mulder.) It crystallizes unchanged from its solution in dilute perchloric acid. (Bœdecker.) More easily soluble in aqueous solutions of potash, and ammonia, than in water. (Pfaff.)

Caffein with Chloride of Mercury. $C_{16} H_{10} N_4 O_4 ; 2 Hg Cl$ Easily soluble in water, alcohol, chlorhydric acid, and oxalic acid. Almost insoluble in ether. (Nicholson.)

Caffein with Cyanide of Mercury. Diffi-

$C_{16}H_{10}N_4O_4; 2HgCy$ cultly soluble in cold water, and in alcohol. (Kohl & Swoboda.)

Caffein with Nitrate of Silver. Sparingly soluble in cold water. More soluble in boiling water and in alcohol. (Nicholson.)
$C_{16}H_{10}N_4O_4; AgO, NO_5$

Caffein with Oxide of Lead.
I.) *basic.* Insoluble in boiling water. (Peligot, *loc. cit*)

CaffeoTannic Acid. Readily soluble in water; less soluble in alcohol. Soluble in concentrated sulphuric acid. Soluble in aqueous solutions of potash and soda, with subsequent decomposition.
(*Caffeic Acid. Chloroginic Acid.*)
$C_{70}H_{38}O_{34}$

Very soluble in water. Soluble in absolute alcohol; still more soluble in spirit. (Payen, *Ann. Ch. et Phys.*, (3.) **26**. 114.)

CaffeoTannate of Baryta.

CaffeoTannate of Caffein.
I.) *acid.* Soluble in alcohol.

CaffeoTannate of Caffein & of Potash. Easily soluble in water. Scarcely soluble even in hot absolute alcohol. Tolerably soluble in dilute alcohol; its solubility increasing in proportion to the amount of water present. (Payen, *Ann. Ch. et Phys.*, (3.) **26**. 112.)

CaffeoTannate of Lead. Insoluble in water. Soluble in a solution of caustic potash. (Payen, *loc. cit.*)

CaffeoTannate of Lime.

CaffeoTannate of Potash. Soluble in water. Insoluble in alcohol.

Cahincic Acid. *Vid.* Caincic Acid.

Caincic Acid. Permanent. More than 600 pts. of water are required in order to dissolve one pt. of it. Abundantly soluble in alcohol, especially when this is warm. Ether dissolves about as much as water. Soluble, with decomposition, in concentrated sulphuric, chlorhydric, and nitric acids. Scarcely at all soluble in dilute nitric or chlorhydric acids. Soluble without alteration in cold glacial acetic acid, but the solution undergoes decomposition when boiled or when left to itself. (François, Caventou, & Pelletier, *Ann. Ch. et Phys.*, 1830, (2.) **44**. 292.) Readily soluble, with combination, in aqueous solutions of ammonia, potash, and baryta, but the compounds thus obtained do not crystallize. All of its salts are soluble in alcohol, and most of them in water also. (F., C., & P., *loc. cit.*, pp. 293, 294.)
(*Cainca bitter.*)
$C_{32}H_{26}O_{14} = C_{32}H_{24}O_{12}, 2HO$

Caincate of Lead.
I.) *normal.* Ppt., in spirit.
$C_{32}H_{24}Pb_2O_{14} + 2Aq$
II.) *basic.* Insoluble in boiling water. (F., C., & P., *loc. cit.*, p. 295.)

Caincate of Lime.
I.) *normal?* Soluble in water. (F., C., & P., *loc. cit.*, p. 293.)
II.) *basic.* Ppt., in water. Readily soluble in alcohol. (*Ibid.*)
III.) *acid.* Soluble in water, and spirit, less soluble in strong alcohol.

Cajputene. Permanent. Insoluble in alcohol. Soluble in ether, and oil of turpentine. (Max. Schmidl.)
$C_{20}H_{16}$

Calcium. Slowly oxidized in dry, quickly oxidized in moist air. Decomposes water with violence and evolution of much heat, and dilute acids still more violently.
Ca

Most of the compounds of calcium are soluble in chlorhydric, and nitric acids.

Calcium Amalgam. Decomposed by water.

Calendulin (from *Calendula officinalis*). Almost insoluble in cold, sparingly soluble in boiling water. Easily soluble in alcohol, acetic acid, and aqueous solutions of the caustic alkalies. Insoluble in ether, the fatty or essential oils, and most dilute acids.

CalluTannic Acid (from *Calluna vulgaris*). Hygroscopic. Soluble in water, and alcohol. Decomposed by the mineral acids. (Rochleder.)
$C_{28}H_{14}O_{18} = C_{28}H_{12}O_{16}, 2HO$

CalluTannate of Lead. Ppt.

CalluXanthin. Soluble in hot, but almost entirely insoluble in cold water. Easily soluble in alcohol. (Rochleder.)
$C_{28}H_{10}O_{14}$

Calomel. *Vid. di*Chloride of Mercury.

Camphic Acid. More or less soluble in water. (Berthelot.) Readily soluble in alcohol.
$C_{20}H_{16}O_4$

Camphate of Copper (CuO).
" Iron (FeO).
" Iron (Fe_2O_3).
" Lead.
} Sparingly soluble in water. Soluble in acetic acid. (Berthelot.)

Camphate of Potash. Deliquescent. Easily soluble in pure water, and alcohol. Sparingly soluble in a concentrated aqueous solution of caustic potash. (Berthelot.)

Camphate of Silver. Sparingly soluble in water. Soluble in acetic acid.

Camphate of Soda. Deliquescent. Easily soluble in pure water, and in alcohol. Sparingly soluble in a concentrated aqueous solution of caustic soda.

Camphate of Zinc. Sparingly soluble in water. Soluble in acetic acid.

"Camphene" (of Deville). *Vid.* Oil [essential] of Turpentine.

"Camphene" (of Dumas). *Vid.* Camphilene.

Camphene (of Berthelot).
$C_{20}H_{16}$

Camphilene (of Deville). Soluble in alcohol, ether, and bisulphide of carbon. Insoluble in acetic acid. (Oppermann.) It is not dissolved or altered by fuming nitric acid. (Oppermann.) Alcoholic nitric acid converts it into a crystalline hydrate. (Gerhardt's *Tr.*) Fuming chlorhydric acid combines with it. With iodhydric acid it forms a liquid compound. (Deville.) Decomposed by concentrated sulphuric acid.
(*Dadyl of Blanchet & Sell*). *Camphene* (*of Dumas*). *Terebene* (*of Soubeiran*). *Isomeric with Oil of Turpentine.*)
$C_{20}H_{10}$

Camphin. Insoluble in water, dilute spirit, potash-lye, or dilute acids. Soluble in strong alcohol, in ether, oil of turpentine, and rock-oil. Insoluble in strong chlorhydric acid. (Claus.)
(*Isomeric with Campholene.*)
$C_{18}H_{16}$

CamphoCreosote. *Vid.* Carvacrol.

Camphogene. *Vid.* Cymene.

Camphol. *Vid.* Borneol.

Campholic Acid. Insoluble in water. Very

(Bornenic Acid.)
$C_{20}H_{18}O_4 = C_{20}H_{17}O_3, HO$

abundantly soluble in alcohol, and ether. (Delalande, *Ann. Ch. et Phys.*, 1841, (3.) **1.** 121.)

Campholate of Ammonia. Soluble in water. (Delalande, *loc. cit.*)

Campholate of Lime. Soluble in water; much more soluble in *cold* than in hot water. (Delalande, *loc. cit.*, p. 123.)
$C_{20}H_{17}CaO_4$

Campholate of Potash. Soluble in water. (Delalande, *loc. cit.*)

Campholate of Silver. Ppt. Insoluble in water. (Delalande, *loc. cit.*)
$C_{20}H_{17}AgO_4$

Campholene.
(Isomeric with Camphin.)
$C_{18}H_{16}$

Campholone.
$C_{88}H_{34}O_2$

CamphoMethylic Acid. *Vid.* MethylCamphoric Acid.

(Oxide of Camphene. Campholic Aldehyde. Isomeric with Caryophylin and Ursone.)

$C_{20}H_{16}O_2 = \left.\begin{matrix}C_{20}H_{15}\\H\end{matrix}\right\}O_2$

Camphor (from *Laurus Camphora*). Soluble in 1000 pts. of water. (Giese.) Heated with water in a Papin's digester, it dissolves more abundantly, apparently without decomposition, without separating out again on cooling. (Pfaff.) Its solubility in water is increased by the presence of the stronger acids, but not by carbonic acid. (Giese, Brandes.) By the aid of magnesia it dissolves in 150 pts. of cold water. (M., R., & P.) From an intimate mixture of camphor with carbonate of lime or carbonate of magnesia, water is said to take up three times as much camphor as it dissolves when shaken with camphor alone. (Gm., **14.** 346.) But camphor is insoluble in aqueous solutions of the caustic alkalies, and does not combine with the other metallic oxides.

Soluble in 0.8333 pt. of alcohol, of 0.806 sp. gr., at 12° (Saussure); or 100 pts. of this alcohol dissolve 120 pts. of it. Much more soluble in hot than in cold alcohol. Water precipitates it from the alcoholic solution. Soluble in much less than its own weight of wood-spirit. (Gmelin.) Abundantly soluble in acetone. (Trommsdorff.) Soluble in 0.3333 pt. of chloroform. (Smith.) Abundantly soluble in ether, and the compound ethers. Soluble in fusel-oil (hydrate of amyl). Readily soluble in lignone. Largely soluble in benzin. (Mansfield, *J. Ch. Soc.*, **1.** 261.) Soluble in bisulphide of carbon, and the solution thus obtained is miscible with alcohol, but not with water, although it is not precipitated by water. (Lampadius.) Soluble in oil of ocotea (Hancock); in creosote (Reichenbach); in anilin, and in leucol (quinolein). (Hofmann, *Ann. Ch. et Phys.*, (3.) **9.** pp. 143, 169.) Readily soluble in the volatile oils, crystallizing out from hot solutions as they cool. Also soluble in the fixed oils, and fats, and in some resins.

Only sparingly soluble in vinegar, but dissolves in 0.0833 pt. of concentrated acetic acid. (Pfaff.) When camphor dissolves in moderately strong acetic acid, the solution is effected only by the more concentrated portion of the acid, and a watery liquid separates containing a little acetic acid and a trace of camphor. (Vauquelin.) Slowly, but abundantly, soluble in cold valerianic acid; this solution may be distilled without decomposition, but deposits camphor when mixed with 30 pts. of water. (Trommsdorff.) Soluble in 2 6 pts. of concentrated chlorhydric acid, and is precipitated therefrom on the addition of water. (Wenzel.) Soluble in 0.1667 pt. of cold fuming nitric acid. (Wenzel.) Soluble in cold concentrated nitric acid, from which a portion of it is precipitated on the addition of water. Decomposed by prolonged boiling with nitric acid. Abundantly soluble, without decomposition, in bromine. (Claus.) Soluble in 0.36 pt. of cold, and in a smaller quantity of warm concentrated sulphuric acid. (Wenzel.) Soluble in 4 pts. of concentrated sulphuric acid at 100°; from this solution, when recently prepared, water precipitates camphor, but on continuing to heat it, at 100°, during 12 @ 13 hours, the camphor is decomposed. (Chautard.)

For the solubility of the indefinite compounds of camphor with sulphurous, hyponitric, and chlorhydric acids, see Bineau's paper in *Ann. Ch. et Phys.*, (3.) **24.** 326.

Camphors. Most "Camphors" are sparingly soluble, or insoluble, in water. Soluble in alcohol, and ether. Many of them are soluble in acetone and in concentrated acetic acid.
(Stearoptenes. Solid essential oils.)

Alyxia-Camphor (from *Alyxia Reinwardii*). Very sparingly soluble in cold, more easily soluble in warm water, and does not separate out again as the solution cools. Readily soluble in alcohol, of 0.85 sp. gr., ether, oil of turpentine, and acetic acid. Also readily soluble in aqueous solutions of caustic and carbonated potash, in ammonia-water, &c., without neutralizing them. Insoluble in nitric acid of 1.2 sp. gr. (Nees v. Esenbeck.)

Amber-Camphor.
$C_{20}H_{18}O_2$

Camphor of *Buphthalmum maritimum*. Soluble in alcohol; the solution becomes turbid when mixed with water. (Landerer.)

(Stearoptene of Oil of Cassia. Improperly Benzhydrol.)
$C_{56}H_{29}O_{10}$

Cassia Camphor. Soluble in absolute alcohol. Soluble in concentrated sulphuric acid, from which it is precipitated on the addition of water. (Rochleder & Schwarz.)

$C_{30}H_{26}O_2 = \left.\begin{matrix}C_{30}H_{25}\\H\end{matrix}\right\}O_2$

Camphor of Cubebs. Insoluble in water. Easily soluble in alcohol, ether, and the essential oils. (Blanchet & Sell.)

Camphor of *Iris florentia*. Insoluble in water. (Dumas.) Readily soluble in alcohol.
$C_{16}H_{16}O_4$

Jasmine Camphor. Sparingly soluble in water. Tolerably readily soluble in alcohol, ether, and the fixed and volatile oils. Insoluble in acetic acid, and but partially soluble in concentrated chlorhydric or sulphuric acids. (Herberger.)

Juniper Camphor. With 200 pts. of cold water it forms an incomplete solution, which becomes clear when heated, and remains clear on cooling. From the solution in hot alcohol, of 0.83 sp. gr., it crystallizes on cooling. More readily soluble in ether than in alcohol. More readily soluble in acetic acid than in water. Only slightly soluble in ammonia-water. (Zaubzer.)

Ledum Camphor (from *Ledum palustre*). Nearly insoluble in water. (Grassmann, Buchner.) Readily soluble in alcohol, and ether. Sparingly soluble in chlorhydric acid, still less soluble in acetic acid. Insoluble in ammonia-water. (Buchner.)
$C_{50}H_{48}O_3$

Lemon-Camphor. Insoluble in cold, abundantly soluble in boiling water. The solution solidifies on cooling. (Boissenot.) Soluble in chlorhydric acid, the solution becoming turbid when heated above 100°, but clear again on cooling. (Boissenot.) Soluble in alcohol, ether, and acetic acid. Insoluble in pure oil of lemon, but soluble in this oil when it contains acetic acid. (Boissenot.)

Marjoram-Camphor (from *Origanum marjorana*). Soluble in boiling water. (Guenther, Mulder.) Soluble in alcohol, and ether (Mulder); in 10 pts. of alcohol forming a solution which is not rendered turbid by water; in 10 pts. of oil of turpentine; in 10 pts. of boiling oil of almonds, from which it crystallizes out on cooling, after a while. (Guenther.) Soluble in 10 pts. of concentrated nitric acid. (Guenther.)

Massoy-Camphor. Soluble in hot alcohol and in ether. (Bonastre.)

Neroli-Camphor (from the flowers of *Citrus aurantium*). Insoluble in water. (Plisson, Boullay.) Sparingly soluble in cold, readily soluble in hot alcohol (Boullay, Landerer); in 60 pts. of alcohol of 0.9 sp. gr., separating out on cooling. Abundantly soluble in ether, from which it is precipitated on the addition of water or alcohol. (Boullay, Plisson.) Very easily soluble in hot oil of turpentine, from which it separates completely as the solution cools. (Plisson.) Soluble in hot acetic acid. (Landerer.)

Nutmeg-Camphor. Soluble in 19 pts. of boiling, sparingly soluble in cold water. (John.) Easily soluble in alcohol, and ether (John, Mulder), and in warm fixed and volatile oils. (Bley.) Soluble in cold nitric acid, and in an aqueous solution of caustic potash. (Mulder.)

(*Myristicin. Muscat-Camphor.*) $C_{16}H_{16}O_5$, or $C_{20}H_{20}O_6$

Peppermint-Camphor (from *Mentha piperita*). Sparingly soluble in water, the solution in boiling water becoming turbid on cooling. (Gmelin.) Readily soluble in alcohol, and ether (Dumas, Walter), and in volatile oils (Dumas); less easily in oil of turpentine (Walter), in wood-spirit, and bisulphide of carbon. (Walter.)

(*Menthene Camphor. Hydrated Oxide of Menthene.*) $C_{20}H_{20}O_2$

Raspberry-Camphor. Soluble in water, alcohol, ether, and aqueous solutions of caustic potash and ammonia. (Bley.)

Rose-Camphor. Very sparingly soluble in water. (Herberger.) Sparingly soluble in alcohol. Readily soluble in ether. (Blanchet.) Soluble in 500 pts. of alcohol, of 0.85 sp. gr., at 14° (Saussure); in 490 pts. of alcohol, of 0.85 sp. gr., at 15°, more easily in absolute alcohol, the alcoholic solution becomes cloudy when mixed with water. (Herberger.) Soluble in volatile oils, and acetic acid. (Herberger.) Very sparingly soluble in chlorhydric acid; with difficulty in an aqueous solution of caustic potash; more easily in ammonia-water. Also soluble in aqueous solutions of the alkaline carbonates. (Herberger.)

(*Solid Rose-oil.*) $C_{16}H_{16}$

Sage-Camphor. Soluble in 450 pts. of cold, and in 300 pts. of hot water. Soluble in 5 pts. of alcohol of 0.82 sp. gr.; in all proportions in ether; easily in oil of turpentine; less easily in rock-oil; easily in fixed oils; without alteration in dilute sulphuric acid. (Herberger.)

Camphoramic Acid. Tolerably soluble in warm, much less soluble in cold water. More soluble in alcohol than in water. Its salts are all soluble in water. (Laurent.)

(*Camphorylaminic Acid.*) $C_{20}H_{17}NO_6 = N\left\{\begin{matrix}C_{20}H_{14}O_4''\\H_2\end{matrix}\right. .\,O,\,HO$

Camphoramate of Ammonia. Soluble in water. Somewhat soluble in alcohol, but not readily in absolute alcohol. (Laurent.)

$C_{20}H_{16}(NH_4)NO_6 + 2\,Aq$

Camphoramate of Baryta. Soluble in water. (Laurent, in his *Chemical Method*, p. 250.)

Camphoramate of Lead. Soluble in water. (Laurent, in his *Chemical Method*, p. 250.) Moderately easily soluble in alcohol, though less so than in water.

$C_{20}H_{16}PbNO_6$

Camphoramate of Silver. Soluble in water. (Laurent, in his *Chemical Method*, p. 250.) Soluble in hot alcohol. May be washed with cold absolute alcohol.

$C_{20}H_{16}AgNO_6$

Camphoramid. Insoluble in water. Soluble in alcohol. (Laurent.)

(*Camphorylbiamid.*) $C_{20}H_{16}N_2O_4 = N_2\left\{\begin{matrix}C_{20}H_{14}O_4''\\H_4\end{matrix}\right.$

Camphoranil. *Vid.* PhenylCamphorimid.

CamphorAnilic Acid. *Vid.* PhenylCamphoric Acid.

Camphoric Acid (Anhydrous). Very sparingly soluble in cold, somewhat more soluble in boiling water. Readily soluble in boiling alcohol; still more soluble in ether. Very slowly acidified by boiling with water. (Malaguti.) Less easily soluble in alcohol than camphoric acid. (Laurent.) Very sparingly soluble in water. Soluble in cold concentrated sulphuric acid, from which water precipitates it. It combines with hot sulphuric acid. (Walter, *Ann. Ch. et Phys.*, (3.) **9.** 179.)

(*Oxide of Camphèse. Camphoric Anhydride.*) $C_{20}H_{14}O_6$

Camphoric Acid. Sparingly soluble in cold, more soluble in boiling water. Readily soluble in alcohol, ether, and the essential and fatty oils.

$C_{20}H_{16}O_6 = C_{20}H_{14}O_6, 2\,HO$

Soluble in	88.87	pts. of water at	12.5°

(R. Brandes, *Schweigger's Journ. für Ch. u. Phys.*, 1823, **38.** 278.)

Soluble in 1.52 pts. of ether at 8.75°; or, 100 pts. of ether at 8.75° dissolve 65 pts. of it; or, the ethereal solution saturated at 8.75° contains 39.66% of it. (Brandes, *loc. cit.*, p. 279.) Soluble in 3 pts. of ether at 8.3°.

Only sparingly soluble in cold oil of turpentine, but dissolves in the hot oil; on cooling the hot solution a considerable quantity of the acid crystallizes out, while a smaller quantity remains dissolved. (Brandes, *loc. cit.*, p. 279.) Soluble, without alteration, in concentrated sulphuric, and nitric acids.

The camphorates of the alkalies and alkaline earths are readily soluble in water, but most of the others are difficultly soluble therein.

Camphorate of Alumina. Permanent. Soluble in 200 pts. of cold, and in a smaller quantity of hot water. Sparingly soluble in cold, easily soluble in hot alcohol. (Bouillon.) 100 pts. of water at 15.5° dissolve 5 pts. of it. (Ure's *Dict.*)

Camphorate of Ammonia.

I.) *normal.* $C_{20}H_{14}(NH_4)_2O_8$ Deliquescent. Readily soluble in water. (Malaguti.) According to Brandes (*Schweigger's Journ. für Ch. u. Phys.*, 1823, **38.** 288), the statement of Bouillon-Lagrange, that this salt is soluble in 100 pts. of cold, and 3 pts. of boiling water, is unquestionably erroneous, the salt being really very much more readily soluble than this. When heated, it first begins to melt in its water of crystallization, and then gives off ammonia. Soluble in absolute alcohol. (Brandes, *loc. cit.*) Easily soluble in alcohol. (Bouillon.)

II.) *acid.* ("*Four thirds basic.*") $C_{20}H_{15}(NH_4)O_8 + 6\,Aq$ Easily soluble in cold water. (Malaguti.)

Camphorate of Ammonia & of Copper. (Brandes, *loc. cit.*, p. 298.)

Camphorate of Baryta. $C_{20}H_{14}Ba_2O_8 + 7\,Aq$ Soluble in 1.79 pts. of water at 18.75°; or, 100 pts. of water at 18.75° dissolve 55.77 pts. of it; or the aqueous solution saturated at 18.75° contains 35.82% of it. (Brandes, *Schweigger's Journ. für Ch. u. Phys.*, 1823, **38.** 294.) 100 pts. of water at 15.5° dissolve 0.16 pt. of it. (Ure's *Dict.*) Soluble in 600 pts. of boiling water. (Bouillon.)

Camphorate of *bi*ChlorEthyl. $C_{28}H_{20}Cl_4O_8 = C_{20}H_{14}(C_4H_3Cl_2)_2O_8$ Soluble in 8 pts. of alcohol and in an equal quantity of ether. (Malaguti.)

Camphorate of Cobalt. Appears to be soluble in water. (Kemper.)

Camphorate of Copper(CuO). $C_{20}H_{14}Cu_2O_8$ Almost insoluble in water. (Brandes, *Schweigger's Journ.*, **38.** 297.)

Camphorate of Ethyl.

I.) *normal.* $C_{28}H_{24}O_8 = C_{20}H_{14}(C_4H_5)_2O_8$ Insoluble in water. Easily soluble in alcohol, and ether. Soluble, without decomposition, in cold concentrated sulphuric acid. Unacted upon by chlorhydric or nitric acids even when these are boiling. (Malaguti.)

II.) *mono.* *Vid.* EthylCamphoric Acid.

Camphorate of Iron(Fe_2O_3). Insoluble in water. (Brandes, *Schweigger's Journ.*, **38.** 300.)

Camphorate of Lead.

I.) *normal.* $C_{20}H_{14}Pb_2O_8$ Insoluble in water. (Brandes, *Schweigger's Journ.*, **38.** 295.)

Camphorate of Lime.

I.) *normal.* $C_{20}H_{14}Ca_2O_8 + 2\,Aq$ Efflorescent. Scarcely soluble in cold water. Soluble in 200 pts. of boiling water. Insoluble in alcohol. (Bouillon.) 100 pts. of water at 15.5° dissolve 0.5 pt. of it, and at 100°, 0.8 pt. (Ure's *Dict.*)

II.) *acid.* $C_{20}H_{15}CaO_8 + 15\,Aq$ Soluble in 4.61 pts. of water at 18.75°; or, 100 pts. of water at 18.75° dissolve 21.67 pts. of it; or the aqueous solution saturated at 18.75° contains 17.8% of it. (Bucholz, *Gehlen's Journ. für Ch. Phys. u. Min.*, 1810, **9.** pp. 352, 357.) Soluble in 5 pts. of cold, and very soluble in hot water. (R. Brandes, *Schweigger's Journ. für Ch. u. Phys.*, 1823, **38.** 290.)

Camphorate of Magnesia.

I.) *normal.* $a = C_{20}H_{14}Mg_2O_8$ Hygroscopic. Soluble in 6.5 pts. of water at 2.5°. Soluble in 54.19 pts. of absolute alcohol at 3 75°; or, 100 pts. of absolute alcohol at 3.75° dissolve 1.841 pts. of it; or the alcoholic solution saturated at 3.75° contains 1.812% of it. (R. Brandes, *Schweigger's Journ. für Ch. u. Phys.*, 1823, **38.** 292.)

$b = C_{20}H_{14}Mg_2O_8 + 15\,Aq$ Efflorescent. Soluble in 2.5 pts. of water at 20°. (Kemper.) Camphorate of magnesia is insoluble in cold, but dissolves, with decomposition, in hot alcohol. (Bouillon.)

Camphorate of Manganese. Very soluble in water. (Brandes, *Schweigger's Journ.*, **38.** 299.)

Camphorate of Mercur(*ic*)amin.

I.) *basic.* Insoluble in water or alcohol. Soluble in 1000 pts. of ether. (Harff.)

Camphorate of Mercur(*ous*)amin.

I.) *basic.* Insoluble in water, alcohol, or ether. (Harff.)

---

* This solution was obtained by cooling down a hotter solution, as were all the others, excepting only that marked with a †, which was prepared by digestion, at the temperature indicated (8.75°).

CAMPHORATE *of dinoxide* OF MERCURY. $C_{20}H_{14}Hg_4O_8$ Insoluble in cold water. (Harff); nearly insoluble in water. (Brandes, *Schweigger's Journ. für Ch. u. Phys.*, 1823, **38.** 299.) Partially decomposed by boiling water, or cold alcohol. Soluble in 1666 pts. of ether. (Harff.)

CAMPHORATE *of protoxide* OF MERCURY. $C_{20}H_{14}Hg_2O_8$ Nearly insoluble in cold, more soluble in boiling water. Insoluble in alcohol. Soluble in 1666 pts. of ether. Soluble in nitric, and chlorhydric acids. (Harff.)

CAMPHORATE OF METHYL.

I.) *mono.* *Vid.* MethylCamphoric Acid.

CAMPHORATE OF NICKEL. Rather sparingly soluble in water. (Brandes, *Schweigger's Journ.*, **38.** 300.)

CAMPHORATE *of binoxide* OF PLATINUM. Not very difficultly soluble in water. (Brandes, *loc. cit.*, p. 299.) A solution of camphorate of magnesia produces no precipitate in a solution of bichloride of platinum. (Kemper.)

CAMPHORATE OF POTASH.

I.) *normal.* $C_{20}H_{14}K_2O_8$ Very deliquescent. Extremely easily soluble in water. (Brandes, *Schweigger's Journ. für Ch. u. Phys.*, 1823, **38.** 282.) Very soluble in water. (Bucholz, *Gehlen's Journ. für Ch. Phys. u. Min.*, 1810, **9.** 353.)

II.) *acid?* Soluble in 100 pts. of cold, and in 4 pts. of boiling water. Also soluble in alcohol. (Bouillon-Lagrange.) [Brandes regards Bouillon's salt as nothing but camphoric acid.]

CAMPHORATE OF SILVER. Ppt.
$C_{20}H_{14}Ag_2O_8$

CAMPHORATE OF SODA.

I.) *normal.* Deliquescent. (Brandes, Kemper.) $C_{20}H_{14}Na_2O_8$ Very soluble in water. Somewhat soluble in absolute alcohol; 100 pts. of [this] alcohol at 7.5° dissolve 1.25 pts. of it. (Brandes, *Schweigger's Journ. für Ch. u. Phys.*, 1823, **38.** 286.)

II.) *acid?* Soluble in 100 pts. of cold, and in 8 pts. of boiling water. (Bouillon-Lagrange.) [Brandes thinks that Bouillon's salt is nothing but camphoric acid.]

CAMPHORATE OF STRONTIA. Much more soluble than the baryta salt. (Brandes, *Schweigger's Journ.*, **38.** 295.)

CAMPHORATE *of protoxide* OF TIN. Ppt.

CAMPHORATE *of sesquioxide* OF URANIUM. Ppt.

CAMPHORATE OF ZINC. Ppt.

CAMPHORESIN. $C_{20}H_{12}$ Insoluble in water or spirit. Soluble in strong alcohol, ether, oil of turpentine, and naphtha. (Claus.)

CAMPHORIMID. (*Camphorylamid.*)

$C_{20}H_{15}NO_4 = N\left\{\begin{matrix}C_{20}H_{14}O_4'' \\ H\end{matrix}\right.$

Easily soluble in boiling, less soluble in cold alcohol. Soluble in gently heated concentrated sulphuric acid, in which solution water produces a precipitate. (Laurent.)

CAMPHORIN. (*Camphorate of Glyceryl.*) Soluble in ether. (Berthelot, *Ann. Ch. et Phys.*, (3.) **41.** 294.)

"CAMPHORYL." *Vid.* Phorone.

CAMPHORYL. $C_{20}H_{14}O_4''$ Hypothetical radical of Camphoric Acid, &c.

CAMPHRENE. $C_{16}H_{12}O_2$ Insoluble, or but sparingly soluble in water. (Chautard.)

CAMPHIRONE.
$C_{80}H_{22}O$

CANELLIN (from *Canella alba*). Appears to be identical with Mannit.

CANIRAMIN. *Vid.* Brucin.

CANNABIN. Insoluble in water, or in aqueous solutions of potash or ammonia, and but sparingly soluble in acids. Easily soluble in alcohol, and ether. Soluble in cold essential oils, and warm fatty oils. (Smith.)

CANTHARIDIN. (*Isomeric with Picrotoxin and Xanthoxylin.*)

$C_{10}H_6O_4 = \left.\begin{matrix}C_{10}H_5O_2 \\ H\end{matrix}\right\}O_2$

Insoluble in water, whether cold or boiling. It is, however, rendered soluble by the yellow matter in cantharides, so that hot water can extract from these the whole of the cantharidin. (Robiquet, and others.) Slightly soluble in cold, more soluble in hot alcohol, and acetate of ethyl, less soluble in wood-spirit, more soluble in ether (in 34 pts. of cold ether according to Warner); its best solvents are acetone and chloroform, the latter abstracting it from the aqueous solution. (W. Procter.) Soluble in hot oil of turpentine, in the oils of cinnamon, cloves, and sassafras, also in almond-oil, olive-oil, and lard, crystallizing out on cooling. (Thierry, and others.) According to Procter, cantharidin is extracted from cantharides by glacial acetic acid, oil of turpentine, and olive-oil, but only the last-mentioned retains any considerable quantity of it in solution after cooling.

Easily soluble in benzin. Soluble in 70 pts. (Procter), in 63 pts. (Warner), of boiling oil of turpentine. Soluble in 20 pts. of olive-oil at 121°. Slightly soluble in cold, more easily soluble in hot acetic acid of 1.041 sp. gr.; completely soluble in 40 pts. of hot glacial acetic acid. According to Robiquet it is insoluble in acetic acid. Scarcely at all soluble in hot formic acid. Abundantly soluble in boiling nitric acid. Soluble without color in hot concentrated sulphuric acid, from which it is precipitated on the addition of water. Nearly insoluble in cold chlorhydric acid of 1.18 sp. gr., and in cold phosphoric acid; a little more soluble in these acids when hot. From all these acid solutions cantharidin crystallizes on cooling. (Procter, and others.) Insoluble in ammonia-water. (Thierry.) Slightly soluble in hot ammonia-water. (Procter.) Soluble in aqueous solutions of caustic potash and soda, from which it is precipitated on neutralizing with acetic acid. (Thierry.)

CAOUTCHENE. C_8H_6'' Insoluble in water. Very readily soluble in alcohol, and ether. Insoluble in alkaline solutions. (Bouchardat.)

CAOUTCHICENE. *Vid.* Caoutchin.

CAOUTCHIN. (*Caoutchicene.*) $C_{20}H_{16}$ Soluble in 2000 pts. of water. It takes up a small quantity of water in the cold, and at higher temperatures a larger quantity, which separates on cooling. Soluble in all proportions in absolute alcohol, ether, and acetate of ethyl. It is partially precipitated from the alcoholic solution on the addition of weak alcohol, and totally on mixing with water. Water does not precipitate it from the ethereal solution unless alcohol is likewise added. Soluble in the fixed and volatile oils. Slightly soluble in concentrated formic, and acetic acids. Insoluble in chloride of ethyl. Miscible in all proportions with xanthic acid. Soluble in benzin, bisulphide of carbon, and colza-oil.

CAOUTCHOUC. C_8H_7 Insoluble in water or alcohol. One portion of it is soluble in ether, benzin, bisulphide of carbon, oil of turpentine, and the other essential oils; another portion of it is insoluble in these liquids. Anhydrous ether dissolves 66% of translucid caoutchouc; anhydrous oil of turpentine dissolves 49% of it. The best solvent of caoutchouc is a mixture of 6 @ 8 pts. of absolute alcohol and 100 pts. of bisulphide of carbon. Concentrated sulphuric, and nitric acids slowly attack caoutchouc, but most acids have no action upon it at ordinary temperatures. It is not acted upon by alkalies. (Payen.)

Insoluble in water or alcohol. Soluble in coal-naphtha, caoutchin, and ether. (Page, *Am. J. Sci.*, (2.) **4.** 342.)

No portion of caoutchouc is dissolved by water or by cold alcohol; but hot alcohol dissolves out 4.712% of a soft resinous matter. Pure caoutchouc may be easily obtained by dissolving the ordinary gum in chloroform and precipitating this solution with alcohol. (Adriani.) Soluble in benzin. (Mansfield.) Chloroform is a powerful solvent of caoutchouc (Parrish's *Pharm.*, p. 318); but vulcanized rubber is insoluble in chloroform. (Wittstein's *Handw.*) Sparingly soluble in hot fusel-oil (hydrate of amyl). (Pelletan.) Largely soluble in hot oil of amber ("ambereupion"). (Dœpping.) Soluble in rosin-oil-naphtha. Soluble in oil of turpentine, especially if this has been several times redistilled, in oil of sassafras, and oil of lavender. In oil of ocotea. (Hancock.) Abundantly soluble in oil of rosemary. Swells up in naphtha, but does not dissolve [?] therein. (Laurent.) Swells up in heated styrol, but dissolves in it only to a very slight extent. (Blyth & Hofmann.) Soluble in mercuric methyl.

Very slightly acted upon by anilin, or by leukol (quinolein), even when these liquids are boiling. (Hofmann, *Ann. Ch. et Phys.*, (3.) **9.** pp. 143, 169.) Readily soluble at a gentle heat in melted hog's-lard, but in whale-oil it dissolves only at very high temperatures. After having been swollen in oil of turpentine or in naphtha it is soluble in hot linseed-oil, and the solution thus obtained is miscible with oil of turpentine. (E. Merck, *Ann. der Pharm.*, 1837, **21.** 342.) Soluble in the oil obtained by the destructive distillation of caoutchouc, but no more readily than in oil of turpentine, naphtha, &c. (Trommsdorff.)

Capnomor. Insoluble in water. Easily soluble in alcohol, ether, and oils. When pure, it is insoluble in potash-lye, but when contaminated with creosote it dissolves in potash. Soluble in concentrated sulphuric acid. (Vœlckel.)
$C_{40}H_{22}O_4$

Capral. *Vid.* Hydride of Capronyl.

Capramid. *Vid.* Rutylamid.

Capric Acid. *Vid.* Rutylic Acid.

Capric Aldehyde. *Vid.* Hydride of Rutyl.

Caprinamid. *Vid.* Rutylamid.

Caprinic Acid. *Vid.* Rutylic acid.

Caproic Acid (Anhydrous). Readily acidified by water and by alkaline solutions. Soluble in ether. (Chiozza, *Ann. Ch. et Phys.*, (3.) **39.** 207.)
(*Caproic Anhydride. Caproic Caproate.*)
$C_{24}H_{22}O_6 = \left.\begin{matrix} C_{12}H_{11}O_2 \\ C_{12}H_{11}O_2 \end{matrix}\right\} O_2$

Caproic Acid. Soluble in 96 pts. of water at 7°. Soluble in all proportions in absolute alcohol. Easily soluble in ether. Soluble in cold concentrated sulphuric acid, from which it is precipitated by water. Slowly soluble, without alteration, in cold nitric acid. (Chevreul.)
(*Capronic Acid.*)
$C_{12}H_{12}O_4 = C_{12}H_{11}O_3, HO$

Caproate of Ammonia.

Caproate of Amyl. Insoluble in water. Soluble in all proportions in alcohol, and ether. Partially soluble in alkaline solutions. Insoluble in acid liquors. (Brazier & Gossleth, *J. Ch. Soc.*, **3.** 214.)
$C_{22}H_{22}O_4 = C_{12}H_{11}(C_{10}H_{11})O_4$

Caproate of Baryta. Soluble in 12.46 pts. of water at 10.5°, and in 12.50 pts. at 20°. (Chevreul.) 100 pts. of water at 10° dissolve 8.02 pts. of it. (Chevreul [T.].) Very soluble in water; the aqueous solution undergoing partial decomposition when boiled. (Brazier & Gossleth, *J. Ch. Soc.*, **3.** 215.) More soluble than the caprylate in cold water. Easily soluble in alcohol. (Chiozza, *Ann. Ch. et Phys.*, (3.) **39.** 206.)
$C_{12}H_{11}BaO_4$

Caproate of Ethyl. Insoluble, or very sparingly soluble, in water.
$C_{16}H_{16}O_4 = C_{12}H_{11}(C_4H_5)O_4$

Caproate of Lead.

Caproate of Lime. Soluble in 49.4 pts. of water at 14°. (Chevreul.)

Caproate of Magnesia. Soluble in water.
$C_{12}H_{11}MgO_4 + Aq$

Caproate of Methyl. Insoluble, or sparingly soluble, in water.
$C_{14}H_{14}O_4 = C_{12}H_{11}(C_2H_3)O_4$

Caproate of Potash. Soluble in water. (Chevreul.)
$C_{12}H_{11}KO_4$

Caproate of Silver. Sparingly soluble in boiling water. Less soluble in water than the butyrate. (Frankland & Kolbe.)
$C_{12}H_{11}AgO_4$

Caproate of Soda. Soluble in water. (Chevreul.)
$C_{12}H_{11}NaO_4$

Caproate of Strontia. Efflorescent. Soluble in 11.05 pts. of water at 10°. (Chevreul.)
$C_{12}H_{11}SrO_4$

Caproene. *Vid.* Caproylene.

Caproic Alcohol. *Vid.* Hydrate of Caproyl.

Caproile. *Vid.* Caproyl.

Caproilene. *Vid.* Caproylene.

Caprone. Insoluble in water. Readily soluble in alcohol, and ether. (Brazier & Gossleth, *J. Ch. Soc.*, **3.** 217.)
(*Caproylide of Amyl.*)
$C_{22}H_{22}O_2 = \left.\begin{matrix} C_{10}H_{11} \\ C_{12}H_{11}O_2 \end{matrix}\right\}$

Capronic Acid. *Vid.* Caproic Acid.

Capronoyl. Not isolated.
$C_{12}H_{11}$

Capronyl. Not isolated.
(*Caproyl of Gerhardt.*)
$C_{12}H_{11}O_2$

"Caproyl" (of Gerhardt). *Vid.* Capronyl.

Caproyl. Insoluble in water. Miscible in all proportions with alcohol, and ether. (Brazier & Gossleth, *J. Ch. Soc.*, **3.** 226.)
(*Caproil. Hexyl.*)
$C_{12}H_{13}$, or $\left.\begin{matrix} C_{12}H_{13} \\ C_{12}H_{13} \end{matrix}\right\}$

*Tri*Caproylamin. Almost insoluble in water. Easily soluble in alcohol, and ether. Soluble in acids, forming deliquescent salts. (Petersen & Gœssmann, *Ann. Ch. u. Pharm.*, **101.** 311.)
(*Tri Capronylamin. Tri Hexylamin.*)
$N\left\{(C_{12}H_{13})_3\right.$

Caproylene. Scarcely at all soluble in water. Readily soluble in alcohol, and ether. (Fremy.)
(*Caproilene. Oléène. Hexylene. Caproene.*)
$C_{12}H_{12}$

"Capryl." *Vid.* Octyl.
$C_{16}H_{17}$

Capryl (of Gerhardt). Not isolated.
$C_{16}H_{15}O_2$

CaprylAldehyde. *Vid.* Hydrate of Capricyl.

Caprylamid. Unknown.
$N \left\{ \begin{matrix} C_{16}H_{15}O_2 \\ H_2 \end{matrix} \right.$

"**Caprylamin.**" *Vid.* Octylamin.

Caprylic Acid(Anhydrous). Unacted upon
(*Caprylic Anhydride. Caprylic Caprylate.*)
$C_{32}H_{30}O_6 = \left. \begin{matrix} C_{16}H_{15}O_2 \\ C_{16}H_{15}O_2 \end{matrix} \right\} O_2$
by boiling water. It becomes partially hydrated, however, by prolonged contact with moist air. Decomposed by alcohol. Soluble in ether. (Chiozza, *Ann. Ch. et Phys.*, (3.) **39.** 204.)

Caprylic Acid. Very sparingly soluble in
(*Capranic Acid.*)
$C_{16}H_{16}O_4 = C_{18}H_{15}O_3, HO$
water. (Lerch.) Soluble in 400 pts. of water at 100°, but at 110° it separates out again almost completely, in crystals.

Soluble in all proportions in alcohol, and ether. (Fehling.) Its alkaline salts are very soluble in water; the other salts are sparingly soluble or insoluble.

Caprylate of Baryta. Permanent. Difficultly soluble in water. (Lerch.)
$C_{16}H_{15}BaO_4$
Soluble in 1066 pts. of water at 10°, and in 50 pts. at 100°; or, 100 pts. of water at 10° dissolve 0.79 pt. of the salt, and at 100°, 2 pts. Perfectly insoluble in alcohol, and ether. (Fehling.) Less soluble in cold water than the caproate. Almost completely insoluble in alcohol. (Chiozza, *Ann. Ch. et Phys.*, (3.) **39.** 206.)

Caprylate of Ethyl. Nearly insoluble in
$C_{20}H_{20}O_4 = C_{16}H_{15}(C_4H_5)O_4$
water. Readily soluble in alcohol, and ether. (Fehling.)

Caprylate of Lead. Permanent. Sparing-
$C_{18}H_{15}PbO_4$
ly soluble in water. (Lerch.)

Caprylate of Methyl. Scarcely at all sol-
$C_{18}H_{18}O_4 = C_{18}H_{15}(C_2H_3)O_4$
uble in water. Easily miscible with alcohol, and ether. (Fehling.)

Caprylate of Phenyl.
$C_{28}H_{20}O_4 = C_{18}H_{15}(C_{12}H_5)O_4$

Caprylate of Potash.

Caprylate of Silver. Almost insoluble in
$C_{16}H_{15}AgO_4$
water. (Schneider.) Slightly soluble in water. (Redtenbacher.) Soluble in hot alcohol. (Schneider.) Soluble in acids and in ammonia.

Caprylate of Soda.

Caprylene. Insoluble in water. Soluble in
(*Octylene.*)
$C_{16}H_{16}''$
alcohol, and ether. (Bouis, *Ann. Ch. et Phys.*, (3.) **44.** 114.)

Capryliaque. *Vid.* Octylamin.

Caprylic Alcohol. *Vid.* Hydrate of Octyl.

Caprylic Aldehyde. *Vid.* Hydrate of Capricyl.

Caprylic Ether. *Vid.* Oxide of Octyl.

Caprylone. Insoluble in water. Readily sol-
(*Caprylide of Heptyl.*)
$C_{30}H_{30}O_2$
uble in cold alcohol, ether, and the fatty and volatile oils. Very abundantly soluble in hot alcohol, and wood-spirit. This solution becomes pasty upon cooling, as does that in 80% alcohol.

CaprylPhosphoric Acid. *Vid.* OctylPhosphoric Acid.

CaprylSulphuric Acid. *Vid.* OctylSulphuric Acid.

Capsicin(from *Capsicum annuum*). Sparingly soluble in water. Easily soluble in alcohol, ether, oil of turpentine, and an aqueous solution of caustic potash. (Bucholz, Braconnot.) Witting describes it as a crystalline resin, insoluble in cold water, or in ether, and but sparingly soluble in hot water or alcohol.

Soluble in alcohol, and ether. (H. B. Taylor, *Parrish's Pharm.*, pp. 423, 427.)

Caramel. Soluble in water. Insoluble in
(*Caramelic Acid. Normal Caramel.*)
$C_{12}H_9O_9$, or rather $C_{24}H_{18}O_{18}$
alcohol. (Péligot.)

The *Caramel* of commerce is a mixture, according to Gélis, of *caramelan*, *caramelene*, and *caramelin*. It is very deliquescent, and mostly soluble in water if the sugar has not been very strongly heated in preparing it, but those samples which have been exposed to a high heat contain much that is insoluble in water. Sometimes it is almost entirely insoluble in alcohol. A portion of it is, nevertheless, always soluble in alcohol. (Gélis, *Ann. Ch. et Phys.*, (3.) **52.** 352.)

Caramel(from *Glucose*). Is a mixture of 3 substances analogous to those in cane-sugar-caramel. Their solubility in water is, however, greater and that in alcohol less than that of the compounds in cane-sugar-caramel. Hence glucose-caramel is almost entirely insoluble in strong alcohol, while it is nearly all soluble in water. (Gélis, *Ann. Ch. et Phys.*, (3.) **52.** 387.)

Caramelate of Baryta. Insoluble in wa-
$C_{24}H_{17}BaO_{18}$
ter. (Péligot.)

Caramelan(of Vœlckel). Insoluble in water
$C_{24}H_{13}O_{13}$
or alcohol. Sparingly soluble in an aqueous solution of caustic potash. (Vœlckel.)

Caramelan(of Gélis). Very deliquescent.
$C_{12}H_9O_9 = C_{12}H_8O_8, HO$
Exceedingly soluble in water. Readily soluble in alcohol of 84%. Sparingly soluble in absolute alcohol. Insoluble in ether.

Its compounds with metallic oxides are more soluble in water than those of caramelene. (Gélis, *Ann. Ch. et Phys.*, (3.) **52.** 360.)

Caramelan with Baryta.
$C_{12}H_8O_8; 2BaO$

Caramelan with Lead. Insoluble in alcohol.
$a = C_{12}H_8PbO_9$ Somewhat soluble in acetic acid.
$b = C_{12}H_8O_8, 2PbO$ Ppt. (Gélis, *loc. cit.*)

Caramelene. Permanent. Soluble in water,
$C_{36}H_{25}O_{25} = C_{36}H_{24}O_{24}, HO$
and dilute alcohol. Very sparingly soluble in strong alcohol. Insoluble in ether.

Its compounds with metallic oxides are less soluble in water than those of caramelan. (Gélis, *loc. cit.*)

Caramelene with Baryta. Sparingly soluble
$C_{36}H_{24}BaO_{25}$
in water. Insoluble in spirit.

Caramelene with Lead. Sparingly soluble
$a = C_{36}H_{24}PbO_{25}$ in water. Insoluble in spirit.
$b = C_{36}H_{24}O_{24}, 4PbO$
$c = C_{36}H_{24}O_{24}, 6PbO$ (Gélis, *loc. cit.*)

Caramelin. Occurs in different modifications:
$C_{96}H_{50}O_{50}, HO$

Modif. A. Soluble in water.

Modif. B. Insoluble in cold, but soluble in boiling water, being thereby transformed into *A*. Insoluble in alcohol of 90%, but very soluble in alcohol of 60%. Soluble in alkaline liquors. Insoluble in chlorhydric, sulphuric, or tartaric acids.

Modif. C. Insoluble in all ordinary solvents.

Caramelin (*B*) with **Baryta.** Ppt.
$a = C_{96}H_{50}BaO_{51}$
$b = C_{96}H_{30}O_{50}, 2BaO$ Ppt.

Caramelin with Lead. Ppt. (Gélis, *loc. cit.*)
$C_{96}\,H_{50}\,Pb\,O_{51}$

Under the name *caramelin* Maumené has described a substance, of composition $C_{12}\,H_4\,O_4$, which is insoluble in water, acids, or alkaline solutions.

Carapin(from *Carapa guianensis*). Easily soluble in water, and alcohol. Insoluble in ether. (Petroz & Robinet.)

Carbamic Acid. Not isolated.
$C_2\,H_3\,N\,O_4 = N \left\{ \begin{matrix} C_2\,O_2'' \\ H_2 \end{matrix} \right. .\,O, H\,O$

Carbamate of Ammonia. In the air a part of it evaporates, while the rest absorbs moisture and is converted into carbonate of ammonia. Easily soluble in water, but the solution soon undergoes decomposition to carbonate of ammonia. (H. Rose.) Also soluble in alcohol. (J. Davy.)
(Anhydrous Carbonate of Ammonia.)
$C_2\,H_2\,(N\,H_4)\,N\,O_4$

Carbamate of Ammonia with Carbonate of Ammonia. Decomposed by water.
$C_2\,H_2\,(N\,H_4)\,N\,O_4\,;\,2\,(N\,H_4\,O,\,C\,O_2)$

Carbamate of Amyl. Soluble in boiling, less soluble in cold water. Soluble in alcohol, and ether. Soluble, without decomposition, in cold concentrated sulphuric acid, from which solution it is precipitated by water. The sulphuric acid solution is decomposed on heating. (Medlock, *J. Ch. Soc.*, **2.** 213.)
(Amyl (or Amylo) Urethan.)
$C_2\,H_2\,(C_{10}\,H_{11})\,N\,O_4$

Carbamate of Butyl. Insoluble in water. Soluble in alcohol, and ether. (Humann, *Ann. Ch. et Phys.*, (3.) **44.** 341.)
(Carbamate of Tetryl. Butylic (or Tetrylic) Urethan.)
$C_{10}\,H_{11}\,N\,O_4 = C_2\,H_2\,(C_8\,H_9)\,N\,O_4$

Carbamate of Ethyl. Very soluble both in warm and in cold water. Very soluble in alcohol, spirit, and ether. (Dumas, Liebig & Wœhler.)
(Ethyl Urethan. Urethan.)
$C_6\,H_7\,N\,O_4 = C_2\,H_2\,(C_4\,H_5)\,N\,O_4$

Carbamate of Methyl. Permanent. Soluble in 0.46 pt. of water at 11°; or 100 pts. of water at 11° dissolve 217 pts. of it. Soluble in 1.37 pts. of alcohol at 15°; or, 100 pts. of alcohol at 15° dissolve 73 pts. of it. In ether it is less soluble. (Echevarria.) Decomposed by a solution of caustic potash, and by warm sulphuric acid.
(Urethylan. Methyl Uretane.)
$C_4\,H_5\,N\,O_4 = C_2\,H_2\,(C_2\,H_3)\,N\,O_4$

Carbamate of Tetryl. *Vid.* Carbamate of Butyl.

Carbamic Ether. *Vid.* Carbamate of Ethyl.

Carbamid. Identical with Urea, *q. v.*

Carbamid(or ido)Carbanilid. *Vid.* PhenylCarbamid.

CarbamidNitroCarbanilid. *Vid.* NitroPhenylCarbamid.

CarbAnil. *Vid.* Cyanate of Phenyl.

CarbAnilid. *Vid.* *di*PhenylCarbamid.

CarbanilMethylan. *Vid.* Benzamate of Methyl; and also PhenylCarbamate of Methyl.

CarbAzotic Acid. *Vid.* Picric Acid.

Carbide of Iridium.
$Ir\,C_4$

Carbide of Iron.

Carbide of Iron of Platinum. Much more soluble in dilute sulphuric acid than pure steel. Soluble in aqua-regia, forming a solution containing much platinum with but little iron. (Faraday & Stodart.)

Carbide of Palladium.

Carbide of Platinum. Most of the platinum may be dissolved out by hot aqua-regia. (Zeise, *Ann. Ch. u. Pharm.*, 1840, **33.** 53.)
$Pt\,C_2$

Carbide of Silver. Soluble in nitric acid, with separation of carbon.
$Ag_2\,C$

CarboBenzid. *Vid.* BenzoPhenone.

CarboBenzoic Acid(of Plantamour). "Probably impure benzoic acid." (Gmelin, Gerhardt.) Soluble in hot, less soluble in cold water. It is more soluble than benzoic acid, in water. Readily soluble in alcohol, and ether.
(Myroxylic Acid.)
$C_{15}\,H_6\,O_4$

CarboBenzoate of Baryta. Soluble in water.
$C_{15}\,H_5\,Ba\,O_4$

CarboBenzoate of Lead.
$C_{15}\,H_5\,Pb\,O_4$

CarboBenzoate of Lime. Soluble in water.
$C_{15}\,H_5\,Ca\,O_4$

CarboBenzoate of Silver. Ppt.
$C_{15}\,H_5\,Ag\,O_6$

Carbolate of *X*. *Vid.* Phenate of *X*.

Carbolic Acid. *Vid.* Phenic Acid.

CarboMethylic Acid. *Vid.* MethylCarbonic Acid.
$C_4\,H_4\,O_6$

Carbon. Insoluble in water, alcohol, ether, or in dilute acids or alkaline solutions.
Modif. α (Diamond.)

Modif. β (Graphite.) Insoluble in water, alcohol, ether, or in dilute acids or alkaline solutions.

Modif. γ (Lampblack.) Insoluble in water, alcohol, ether, or in dilute acids or alkaline solutions.

CarboNaphthalid. *Vid.* *di*NaphthylCarbamid.

Carbonic Acid(Gas). Water dissolves about its own volume of the gas at the ordinary temperature (the solution obtained being of 1.0018 sp. gr.) and pressure; and an additional volume for the pressure of each additional atmosphere to which it is subjected. According to Soubeiran the power of water to absorb carbonic acid does not increase in precisely the same ratio as the pressure. Courbe (*Journ. de Pharm.*, **26.** 121) also finds that a volume of water under a pressure of 7 atmospheres contains only 5 volumes of carbonic acid, and that a much greater pressure is necessary in order to increase the amount of the gas dissolved; but up to 4 or 5 volumes the amount of gas dissolved by water is very nearly proportional to the pressure. On removing the pressure from these solutions the excess of carbonic acid gas escapes, leaving only a single volume in solution; but under the same circumstances Champagne wine loses of 4 vols. only ½ a vol. (In *Berzelius's J. B.*, **21.** 77.)

(Bunsen's *Gasometry*, pp. 287, 128, 152.)

At about 5° one vol. of water absorbs somewhat more than 1 vol. of CO_2; at 10° scarcely 1 vol., and still less at higher temperatures. The solution saturated at 2° is of 1.0015 sp. gr. A great part of the carbonic acid escapes when the solution is exposed to the air, and the quicker in proportion as the solution is hotter. But as the amount of CO_2 diminishes the remainder is retained more obstinately, so that boiling for half an hour is necessary to discharge the whole of it. On freezing the water, however, the carbonic acid is all evolved. (Bergman, *Essays*, **1.** pp. 12, 75.)

(Th. de Saussure, *Gilbert's Ann. Phys.*, 1814, **47.** pp. 167 – 172.

From these experiments, it appears that the fatty oils can absorb a much larger quantity of carbonic acid gas than the much more mobile water; that the solubility of this gas in gum or sugar-water is greater than in the far more fluid solutions of sulphate of soda and chloride of potassium; while in solutions of the chlorides of potassium, and of ammonium, and of nitrate of potash, which are as fluid as pure water, it is much less soluble than in the latter: hence, although there are some liquids, like ether and alcohol, more fluid than water, which absorb more of the gas than this is capable of doing, De Saussure argues that, as a general rule, viscosity has but little influence upon the amount of any gas which is absorbed by a liquid, although he admits that a much longer time is required in order that a viscid liquid shall become saturated with the gas,—viscous liquids, like the fatty oils, gum-arabic water, or a solution of chloride of calcium, requiring a considerably longer time to become saturated with a gas than the more mobile liquids, like water, naphtha, alcohol, ether, and the essential oils, which are capable of absorbing similar quantities.* In general, liquids of low specific gravity can absorb more of any gas than those which are heavier. Solutions of the metallic salts, which are of high specific gravity, must consequently have still less power of absorbing gases than those employed in the foregoing experiments. It follows, that in pneumatic operations, as in collecting carbonic acid or any other somewhat soluble gas, it is better to fill the trough with some saline solution instead of water. A solution of common salt is peculiarly well fitted to serve this purpose, and ordinary impure commercial salt is better than purified chloride of sodium, a saturated solution of the former having absorbed at the ordinary temperature not quite ⅓ of its volume of carbonic acid gas, and having required a much longer time to do this than is required by pure water in absorbing its own volume of the gas. (Th. de Saussure, *Gilbert's Ann. Phys.*, 1814, **47**. pp. 172–175.) 1 vol. of oil of turpentine absorbs from 1.7 @ 1.9 vols. of it. (Saussure, in *Gm.*, **14**. 270.) 1 vol. of spirit at 10° absorbs 2 vols. of CO_2; 1 vol. of olive-oil at 10° absorbs 1 (or more) of CO_2; 1 vol. of oil of turpentine at 10° absorbs nearly 2 vols. of CO_2 (with great rapidity at first). (Bergman, *Essays*, **1**. 56.) 1 vol. of caoutchin absorbs 11 vols. of it. Slightly soluble in chlorhydric acid.

Sulphuric acid of ordinary density, at 15.56° and the common pressure, absorbs about 94% of its volume of CO_2; and Nordhausen acid 125% of its volume. The absorption by pure water under the same temperature and pressure being 98%. (W. B. & R. E. Rogers, *Am. J. Sci.*, (2.) **5**. 115.) Monohydrated sulphuric acid absorbs from 7 @ 10% of CO_2. (Hlasiwetz, *Wien. Akad. Bericht*, **20**. 193.) Tolerably soluble in water and in concentrated sulphuric acid. (Berthelot, *Ann. Ch. et Phys.*, (3.) **51**. 72.) About half as soluble in an aqueous solution of chloride of sodium (containing about 15% of NaCl) as in pure water. Much more soluble in an aqueous solution of ordinary diphosphate of soda than in pure water, the quantity dissolved being larger in proportion to the amount of phosphate of soda in the solution. A similar remark is true for solutions of carbonate of soda. The solubility of carbonic acid gas in solutions of these two salts seems to depend upon its coefficient of solubility in pure water plus the product of a constant coefficient (0.069 for $2NaO, HO, PO_5$, and 0.088 for NaO, CO_2) by the amount of salt in solution. (Fernet, *Ann. Ch. et Phys.*, (3.) **47**. 367.)

Carbonic acid is not disengaged at ordinary temperatures from water in which $\frac{1}{1000}$ of carbonate of lime is held in solution by it. Carbonate of magnesia also acts in an analogous manner. Not only does the presence of carbonate of lime or of magnesia in water tend to *retain* carbonic acid very forcibly, even at the temperature of boiling, and when the solution is placed in an exhausted receiver,—a phenomenon which is most strongly marked in dilute solutions,—but such solutions are also capable of absorbing the gas from the atmosphere and of dissolving it in much larger quantity than can be done by pure water. (Bineau.) [The above observation of Bineau is in accordance with facts observed, but incorrectly explained, by myself. (Storer, *Am. J. Sci.*, 1858, (2.) **25**. 41.) From my own observations it appears that carbonate of baryta, as well as carbonate of lime, can most forcibly retain carbonic acid in solution even after long-continued ebullition.] Carbonic acid is also absorbed from the air by aqueous solutions of carbonate of soda and carbonate of potash, especially when these are dilute. (Bineau.) Carbonic acid gas seems to be more soluble than sulphuretted hydrogen in water at high temperatures, as when heated under pressure in sealed tubes. (De Senarmont, *Ann. Ch. et Phys.*, (3.) **32**. 169.)

II.) *Liquid Carbonic Acid.* Not miscible with water, though slightly soluble therein, or with the fatty oils; but miscible in all proportions with alcohol, ether, bisulphide of carbon, and the essential oils. (Thilorier, Mitchell.) Unacted upon by water. Soluble in alcohol, ether, rock-oil, oil of turpentine, and bisulphide of carbon. (Mareska & Donny, *Mem. Brussels Acad.* (Savants étrangers), 1845, vol. **18**. p. 26 of the memoir.)

III.) *Solid Carbonic Acid.* When immersed in water it rapidly assumes the gaseous state and dissolves. With alcohol or ether it forms a semifluid mixture, with apparent chemical combination. (Channing, *Am. J. Sci.*, (2.) **5**. 186.) Only slightly soluble in anhydrous ether, but may be mixed therewith to a paste. (Thilorier.)

All basic and normal carbonates of the metallic oxides are insoluble in water, excepting those of the alkalies and ammonia, but they all dissolve in carbonic acid water, hence it may be said that all acid carbonates are soluble in water.

Carbonates of the metallic oxides are insoluble, or very sparingly soluble, in alcohol. (Saussure.)

Carbonate of Allyl. Insoluble in water.
$C_6H_5O, HO, 2CO_2$ Soluble in alcohol.

Carbonate of Alumina. Insoluble in water.
$3Al_2O_3, 2CO_2 + 16Aq$ (Muspratt.)

Carbonate of Ammonia.

I.) "*Anhydrous.*" *Vid.* Carbamate of Ammonia.
NH_3CO_2 or $N_2H_6C_2O_4$

II.) *mono.* Known only in solution in water, and alcohol. (See Berzelius's *Lehrb.*, **3**. 310.)
NH_4O, CO_2

III.) *sesqui.* Loses water when exposed to the air. Soluble in water; less soluble in alcohol. (H. Deville, *Ann. Ch. et Phys.*, (3.) **40**. 90.) Soluble in 1.667 pts. of cold, and in 0.833 pt. of hot water. (Fourcroy.)
(Common Commercial Carbonate of Ammonia.)
$2NH_4O, 3CO_2 + 3Aq$

100 pts. of water	dissolve	25	pts. of it at	13°
"	"	"	30	17°

(Berzelius, *Lehrb.*, **3**. 313.)

---

* Compare, in this connection, the experiments of Prof. Joseph Henry (*Proc. Amer. Phil. Soc.*, 1844, **4**. pp. 56, 84), who finds that viscous liquids, like soap-water, have less cohesion than pure water.

1 vol. conct'd H_2SO_4 at 11° and a pressure of 0m,757 absorbs exactly

When the aqueous solution is heated to 49° carbonic acid escapes with effervescence. (*Ibid.*) It evaporates in the air.

100 pts. of water at 15.5° dissolve 33 pts. of it. 100 pts. of water at 100° dissolve 100 pts. of it. (Ure's *Dict.*) Soluble in 2 pts. of water at 15.5°, and in less than 1 pt. of boiling water; the solution saturated at 15.5° containing 33.33% of it and the saturated boiling solution 50%. Insoluble in spirit. Soluble in 2.4 @ 3 pts. of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.)

The aqueous solution saturated
at 10° contains 15.7% of it. (Eller.)
?° " 6.1% " (Mussembrock.)
in the cold, " 37.5% " (Fourcroy.)
(All cited by Hassenfratz, *Ann. de Chim.*, **28.** 291.)

Decomposed by water and by alcohol. A small quantity of water dissolves out the compound ($NH_4O, CO_2; NH_3CO_2$), while the bicarbonate ($NH_4O, HO, 2CO_2$) remains undissolved. (H. Rose.) Ordinary commercial carbonate of ammonia does not dissolve as such in water. The first portions of water added to it dissolve principally neutral [mono] carbonate of ammonia, while bicarbonate of ammonia remains undissolved. (Scanlan, *Rep. Br. Assoc.*, 1838, p. 63.) When a solution of carbonate of ammonia is heated, it seems to boil at 82.22°, and if the temperature be increased, the salt evaporates so that by the time the water reaches the boiling-point it is perfectly free from all traces of the substance. (T. Griffiths, *Quar. J. Sci.*, 1825, **18.** 91.) When alcohol is added to the concentrated aqueous solution, bicarbonate of ammonia (No. 4) is precipitated while the mono salt (No. 2) remains dissolved. (Berzelius, *Lehrb.*, **3.** 311.)

IV.) *bi.* Permanent, except that it very slowly
$a = NH_4O, HO, 2CO_2$ evaporates when exposed to the air. Soluble in 8 pts. of cold water. (Wittstein's *Handw.*) In about 6 pts. of water at the ordinary temperature. (Berzelius's *Lehrb.*) When the aqueous solution is slightly heated the salt loses a portion of its acid. (Berthollet, *Gehlen's N. All. J.*, **3.** 255 [T.].) When the solution is heated above 36°, carbonic acid escapes with effervescence and the salt ultimately becomes neutral. Very slightly soluble in alcohol. (Berzelius, *Lehrb.*, **3.** 311.)

$b = 2(NH_4O, HO, 2CO_2) + Aq$

$c = NH_4O, HO, 2CO_2 + Aq$

CARBONATE OF AMMONIA & OF COBALT.
I.) $NH_4O, CO_2; CoO, CO_2 + 4Aq$ Permanent. Ppt. (Deville). Soluble in water. (Berzelius, *Lehrb.*, **3.** 648.)

II.) $NH_4O, 2CO_2; CoO, CO_2 + 9Aq$ & $+ 2Aq$ Quickly decomposes in the air. (H. Deville, *Ann. Ch. et Phys.*, (3.) **35.** 450.)

CARBONATE OF AMMONIA & OF COPPER.
I.) Soluble in water.

II.) Insoluble in water.

CARBONATE OF AMMONIA & OF GLUCINA.
$NH_4O, 3CO_2; Gl_2O_3, 3CO_2 + Aq$ Very soluble in cold, readily decomposed by hot water; much less soluble in spirit, and almost insoluble in absolute alcohol. (Debray, *Ann. Ch. et Phys.*, (3.) **44.** 30.)

CARBONATE OF AMMONIA & OF MAGNESIA.
I.) $MgO, CO_2; NH_4O, CO_2 + 4Aq$ Soluble in water, without decomposition. Insoluble in an aqueous solution of carbonate of ammonia. (Guibourt.) Slowly decomposed by cold, more readily decomposed by boiling water.

"Insoluble in pure water. Contrary to the statement of Guibourt it is decomposed by water, as Bucholz has already said." (Favre, *loc. cit.*, p. 478.) Very sparingly soluble in a solution of carbonate of ammonia. (Favre, *Ann. Ch. et Phys.*, (3.) **10.** pp. 475–478.) Scarcely soluble in a solution of carbonate of ammonia. (Bucholz.) Soluble in a solution of sesquicarbonate of ammonia. (H. Deville, *Ann. Ch. et Phys.*, (3.) **35.** 464.)

II.) $NH_4O, 2CO_2; 2(MgO, CO_2) + 9Aq$ & $+ 12Aq$ Very rapidly altered when exposed to the air. (Deville.)

CARBONATE OF AMMONIA & OF NICKEL.
I.) $NH_4O, 2CO_2; 2(NiO, CO_2) + 9Aq$

II.) ? Soluble in water. (Berzelius, *Lehrb.*)

CARBONATE OF AMMONIA & *of protoxide* OF TIN.
$NH_4O, 2CO_2; 2SnO, CO_2 + 3Aq$ Decomposed by cold water. (H. Deville, *Ann. Ch. et Phys.*, (3.) **35.** 457.)

CARBONATE OF AMMONIA & *of protoxide* OF URANIUM. Soluble in a solution of carbonate of ammonia. (Rammelsberg.)

CARBONATE OF AMMONIA & *of sesquioxide* OF URANIUM.
$2(NH_4O, CO_2); Ur_2O_3, CO_2 + 2Aq$ Slowly decomposes in the air. Sparingly soluble in water, 1 pt. of it being soluble in 20 pts. of water at 15°; or, 100 pts. of water at 15° dissolve 5 pts. of it. More soluble in water containing carbonate of ammonia. The aqueous solution is decomposed by boiling. (Ebelmen, *Ann. Ch. et Phys.*, (3.) **5.** 207.)

Permanent. Soluble in water, at least in that containing carbonate of ammonia, the solution undergoing decomposition when boiled. (Péligot, *Ann. Ch. et Phys.*, (3.) **5.** 45.) Insoluble in pure water. Soluble in an aqueous solution of carbonate of ammonia, but this solution is decomposed when boiled. (Berzelius.) Easily soluble in sulphurous acid; on boiling the solution subsulphite of uranium separates out. (Berthier, *Ann. Ch. et Phys.*, (3.) **7.** 76.)

CARBONATE OF AMMONIA & OF YTTRIA. Insoluble in an aqueous solution of carbonate of ammonia, but is decomposed when boiled. (Berzelius, *Lehrb.*, **2.** 176; **3.** 501.)

CARBONATE OF AMMONIA & OF ZINC. Insoluble in water. (Deville.)
$NH_4O, CO_2; ZnO, CO_2$ Tolerably permanent in the air. Slowly decomposed by cold, rapidly by boiling water. Somewhat soluble in cold water, being much more soluble than the corresponding magnesia salt. Very soluble in water containing carbonate of ammonia. Unacted upon by alcohol. (Favre, *Ann. Ch. et Phys.*, (3.) **10.** 481.)

CARBONATE OF AMMONIA & OF ZIRCONIA. Soluble in water, or at least in an aqueous solution of carbonate of ammonia, the solution undergoing decomposition when boiled. [T.]

CARBONATE OF AMMONIOCHLORIDE OF SULPHUR. Soluble in water, with decomposition.

CARBONATE OF AMMONIUMCHLOROPLATIN(*ous*)AMMONIUM. Insoluble in water. Soluble in
(*Gros's Carbonate.*) acids, with decomposition. (Gros, *Ann. der Pharm.*, 1838, **27.** 256.)

Carbonate of AmmoniumChloroPlatin(*ous*)ammonium & of AmmoniumOxyPlatin(*ous*)ammonium. Sparingly soluble in water. (Raewsky.)
(*Raewsky's Carbonate. Sesquichlorhydrocarbonate de diplatinamine(of Gerhardt).*)

$$C_2\,H_{13}\,Cl\,Pt_2\,N_4\,O_8 = N\left\{\begin{matrix}H_2\\ Pt\,Cl\,.\,O, C\,O_2\,;\,-\\ N\,H_4\end{matrix}\right.$$

$$N\left\{\begin{matrix}H_2\\ Pt\,O\\ N\,H_4\end{matrix}\right. .\,O; C\,O_2 + H\,O$$

Carbonate of AmmonioIridium. Soluble in water. (Claus, *Beiträge*, p. 91.)
$5\,N\,H_3\,.\,Ir_2O_3, 3\,C\,O_2 + 3\,Aq$

Carbonate of AmmonioRhodium. Permanent. Very easily soluble in water. Insoluble in alcohol. (Claus, *Beiträge*, **2.** 88.)
$5\,N\,H_3\,.\,Rh_2O_3, 3\,C\,O_2 + 3\,Aq$

"**Carbonate of Amyl.**" *Vid.* Carbamate of Amyl.

Carbonate of Amyl. Insoluble in water.
$C_{10}\,H_{11}\,O, C\,O_2$, or $(C_{10}\,H_{11}\,O)_2\left\{2\,C\,O_2\right.$

Carbonate of Amylamin.

Carbonate of Baryta. Permanent. Soluble in 12027 pts. of water at 15° (Kremers, *Pogg. Ann.*, **85.** 247); in 14137 pts. of water at 16° @ 20°, and in 15421 pts. at the temperature of boiling. (Fresenius, *Ann. Ch. u. Pharm.*, 1846, **59.** 119.) Soluble in about 25000 pts. of water. (Bineau, *C. R.*, **41.** 511.) Subsequently Bineau states that the numbers resulting from his earlier experiments upon the solubility of carbonate of baryta are too high, as he was ignorant of the necessity of taking special precautions to avoid the influence of the carbonic acid of the air, and that in his recent experiments he found 0.021 grm. of carbonate of baryta to the litre of water at the ordinary temperature, i. e. 1 pt. of it is soluble in 47620 pts. of water. (*Ann. Ch. et Phys.*, 1857, (3.) **51.** 299.) Malaguti appears to be in error in citing the solubility of carbonate of baryta as $\frac{1}{400000}$ after Bineau. (*Ibid.*, p. 346.) Soluble in 4304 pts. of cold, and in 2304 pts. of boiling water. (Fourcroy.) Soluble in 588 pts. of water saturated with carbonic acid, at 10°. (Lassaigne, *J. Ch. Méd.*, **4.** 312; in *Berzelius's Jahresbericht*, **29.** 132.) Soluble in 833 pts. of water saturated with carbonic acid (Dumas); in 380 [830 [T.]] pts. (Fourcroy.)
$Ba\,O, C\,O_2$

Insoluble in water. Soluble in 1550 pts. of water saturated with carbonic acid; when reduced to a fine powder it is much more readily soluble than this in carbonic acid water. (Bergman, *Essays*, **1.** 30.) [Carbonic acid gas produces no precipitate at ordinary temperatures in baryta-water which has been largely diluted with water; nor is any precipitate produced when such dilute solution is boiled.] (Compare Bineau, *Art.* Carbonic Acid.) Almost absolutely insoluble in water containing free ammonia and carbonate of ammonia; thus, when digested in a solution of ammonia and carbonate of ammonia, in excess, the mixture being gently heated and allowed to stand during 12 hours, 1 pt. of the carbonate dissolves in 141000 pts. of the liquid: the addition of chloride of ammonium in this experiment does not increase the solubility of the carbonate. (Fresenius, *Ann. Ch. u. Pharm.*, 1846, **59.** 119.) When caustic ammonia, which has been partially neutralized with carbonic acid, is mixed with baryta-water, or when a mixture of caustic ammonia and of baryta-water is treated with a small amount of carbonic acid gas, no precipitate is produced except on boiling. Yet it does not appear that caustic ammonia can redissolve carbonate of baryta which has once been precipitated. (Vogel, *Ann. de Chim.*, 1814, **89.** 131; also *Schweigger's Journ. für Ch. u. Phys.*, 1821, **33.** 208.)

Soluble in a boiling aqueous solution of chloride of ammonium, with evolution of ammonia. (Fuchs; Demarçay, *Ann. der Pharm.*, 1834, **11.** 251.) When recently precipitated it is soluble in a cold aqueous solution of chloride of ammonium, and even the compact native carbonate (*Witherite*), when finely powdered, is also soluble. (Vogel, *J. pr. Ch.*, 1836, **7.** 455.) Soluble in a cold saturated aqueous solution of chloride of ammonium, and in the solution thus obtained ammonia in excess causes no precipitate. (Brett, *Phil. Mag.*, 1837, (3.) **10.** pp. 96, 334.) Much more soluble in solutions of chloride of ammonium or of nitrate of ammonia than in pure water. From solutions in these salts it is partially reprecipitated by caustic ammonia. (Fresenius, *Quant.*, p. 126.) Soluble in aqueous solutions of various salts: as, chloride of ammonium, nitrate of ammonia, and succinate of ammonia (Wittstein); also soluble in solutions of ammonia, and carbonate of ammonia (Vogel), and of carbonate of potash (Wackenroder). When a solution of ammonia incompletely saturated with carbonic acid is mixed with a solution of chloride of barium no precipitate ensues immediately at the ordinary temperature of the air, but after standing for some time exposed to the air a portion of the carbonate of baryta separates out. On boiling the mixture a precipitate is produced at once. Solutions of ammonia saturated or nearly saturated with carbonic acid generally produce precipitates when mixed with chloride of barium, but the precipitation is incomplete unless the mixture is heated. (Vogel, *Ann. de Chim.*, 1814, **89.** 130; also *Schweigger's J. für Ch. u. Phys.*, 1821, **33.** pp. 205, 206.) When a mixture of a solution of chloride of barium and of caustic ammonia is exposed to an atmosphere of pure carbonic acid no precipitate is produced until a great deal of the acid has been absorbed, and the baryta is completely precipitated only after the lapse of several days. (Vogel, *Schweigger's J.*, **33.** pp. 205, 206.) Aqueous solutions of several of the soluble salts of ammonia, potash, and soda dissolve a portion of recently precipitated carbonate of baryta when digested in great excess therewith; this solvent action is more distinctly observed, however, in the tendency to prevent the precipitation of carbonate of baryta from solutions of baryta salts when these are mixed with other saline solutions. Chloride of ammonium retards in a marked manner the precipitation of carbonate of baryta from dilute baryta-water, a portion of baryta remaining in solution even after boiling with carbonate of soda. The chlorides of sodium and potassium also retard in a measure the precipitation of carbonate of baryta, but their action is not well marked. A solution of chloride of barium produces no precipitate, except on boiling, when added to a mixed solution of carbonate of soda and chloride of ammonium, and if the latter be present in considerable quantity there will be no precipitate even on boiling. When the chloride of ammonium is present in smaller quantity there is a point where the addition of a drop of carbonate of soda produces a cloudiness which clears up on heating. If in the last experiment chloride of sodium be substituted for chloride of ammonium, a similar action may be observed, although it is much less in degree. In one experiment, in which an excess of carbonate of soda was used and a partial precipitate produced in the cold, the liquid was left in repose during twenty-four hours, but on being filtered and the clear filtrate boiled, an additional amount of carbonate of baryta separated. When a mixed solution of carbonate of soda and nitrate of potash is quickly added, in large excess, to a small quantity of a solution of chloride of barium or of hydrate of baryta, no immediate precipitate is produced except on boiling. But in general, carbonate of baryta appears to be affected in much less degree than carbonate of lime by the solvent action of the alkaline salts, and seems to be capable of separating entirely, even in the cold, from such solution after a time. Even solutions of the alkaline carbonates fail to precipitate baryta when they are suddenly added in great excess to dilute solutions of the latter; on boiling the mixture, however, a precipitate is produced, unless the solutions employed were exceedingly dilute. (Storer, *Am. J. Sci.*, 1858, (2.) **25.** 43.) Insoluble in aqueous solutions of potash or soda salts. (In Gmelin.) Soluble in a solution of normal citrate of soda. (Spiller.) In presence of much water carbonate of baryta is no longer precipitated when solutions of carbonate of soda and chloride of barium are mixed together. If the solutions contain 1 pt. of salt to every 1000 pts. of water a very slight precipitate will separate after the lapse of some time, but if the dilution be increased to 2000 pts. of water for every pt. of salt no precipitation will occur. (R. Brandes, *Schweigger's J. für Ch. u. Phys.*, 1825, **43.** 159.) Baryta-water is rendered slightly turbid by a solution of carbonate of soda containing 1 pt. of carbonic acid in between 40000 to 80000 pts. of water. (Lassaigne.) Carbonate of baryta is insoluble in, and is unacted upon by, concentrated nitric acid (Braconnot); but is easily soluble in dilute nitric, and other acids. It is not decomposed by a mixture of 1 pt. oil of vitriol and 6 pts. absolute alcohol, but is slowly decomposed by a mixture of nitric acid and absolute alcohol. It is also acted upon by a solution of oxalic acid in absolute alcohol, although the resulting oxalate is insoluble in the alcoholic mixture. But is not decomposed by alcoholic solutions of racemic, tartaric, citric, or glacial acetic acids. It is partially decomposed when boiled with an aqueous solution of sulphate of potash. (Babington & Richard Phillips, *Journ. of Royal Inst. of Gt Br.*, 1816, **1.** 81.) [See under Sulphate of Baryta.] 1 pt. of carbonate of baryta is decomposed, even in the cold, by an aqueous solution of 1 pt. sulphate of potash or 2 pts. sulphate of soda, but if these solutions be boiled down to a syrup, carbonate of baryta and sulphate of potash or of soda will again be formed. (Kœlreuter, cited by H. Rose, *Pogg. Ann.*, **94.** 484.) When carbonate of baryta is treated, at ordinary temperatures, with a solution of sulphate of potash, or of soda, partial decomposition soon ensues, the carbonate of baryta being converted into sulphate of baryta; and this decomposition may be complete even at the ordinary temperature. (H. Rose, *Ibid*, p. 491.) When one equivalent of BaO, CO_2 is boiled with one equivalent of KO, SO_3. in aqueous solution, 0.60 of it may be decomposed; when boiled with an equivalent of NaO, SO_3, 0.7182 of it may be decomposed; when boiled with an equivalent of KO, CrO_3, 0.79 of it may be decomposed; when boiled with an equivalent of NaO, CrO_3, 0.76 of it may be decomposed; and when boiled with an equivalent of $2\,NaO, HO, PO_5$, 0.50 of it may be decomposed. (p. 335.) On the other hand, when an equivalent of BaO, SO_3 is boiled with one of KO, CO_2, 0.2217 of it may be decomposed; with an equivalent of NaO, CO_2, 0.1873 of it may be decomposed; and when an equivalent of BaO, CrO_3 is boiled with one of KO, CO_2, 0.2072 of it may be decomposed, or with an equivalent of NaO, CO_2, 0.24 of it may be decomposed. For a discussion of the influences which tend to interfere with these reactions, see Malaguti's original memoir, also under sulphate of baryta; in a set of experiments, made under identical conditions, with the exception of the length of time during which the mixture was boiled, the following results were obtained: —

Number of hours during which the mixture of BaO, CO_2 and NaO, SO_3 was boiled.		Per cent of the equivalent of BaO, CO_2 decomposed.

(Malaguti, *Ann. Ch. et Phys.*, (3.) **51.** pp. 344, 348, *et seq.* Compare Sulphate of Baryta.)

It is not decomposed by a solution of carbonate of ammonia at the ordinary temperature, but on boiling the decomposition rapidly ensues. (H. Rose, *Pogg. Ann.*, **95.** 105.) Carbonate of baryta is partially decomposed when boiled with aqueous solutions of the sulphates of potash, soda, lime, ammonia, or magnesia; the phosphates of soda and ammonia; the sulphites of potash, soda, and ammonia; the phosphites of potash, soda, and ammonia; borate of soda; the arseniates of potash and soda; the oxalates of potash and ammonia; fluoride of sodium; and chromate of potash. With the ammonia salts the decomposition is complete. (Dulong, *Ann. de Chim.*, **82.** 286.) Rapidly decomposed, with evolution of carbonate of ammonia, when boiled with solutions of ammoniacal salts. (Denham Smith, *Phil. Mag.*, **9.** 542.)

Soluble in aqueous solutions of the chlorhydrate or nitrate [or any other salt (Demarçay)] of the sesquioxide of iron, with evolution of carbonic acid and precipitation of sesquioxide of iron [as a basic salt (Demarçay, p. 245)]. (Fuchs, *Schweigger's Journ. für Ch. u. Phys.*, 1831, **62.** 193; compare Demarçay, *Ann. der Pharm.*, 1834, **11.** 242, *et seq.*) Solutions of the salts of sesquioxide of chromium, of bismuth, of both the oxides of mercury, and of the perchlorides of tin and antimony, behave like those of the sesquisalts of iron; but, in the cold, carbonate of baryta does not precipitate solutions of alumina, magnesia, manganous oxide, lead, copper, cobalt, nickel, protoxide of tin, protoxide of iron, &c., though at higher temperatures some of these salts decompose it; thus, when boiled with solutions of the chlorides or nitrates of cobalt, nickel, zinc, manganese, or copper, it dissolves, while the oxides of these salts are precipitated. (Demarçay, *loc. cit.*, pp. 246 – 251.)

At the ordinary temperature carbonate of baryta dissolves in aqueous solutions of salts of the sesquioxides of alumina, manganese, chromium, iron, uranium, and bismuth, of the protoxides of cadminum, copper, mercury, palladium, and tin, of dinoxide of mercury, of the oxides of rhodium, iridium, and gold, of binoxide of tin, and of titanic, arsenic, antimonic, phosphoric, selenic, and sulphuric acids; the oxides in question being meanwhile completely precipitated if an excess of the carbonate be present. The five acids last mentioned are precipitated only when their solutions are slightly acidulated with chlorhydric, or nitric, acid. From the above general rule several *chlorides* must be excepted; thus, carbonate of baryta occasions no precipitate in solutions of sesquichloride of gold, or of the protochlorides of mercury, even on heating, or of palladium; or in those of the bichlorides of iridium or rhodium, unless these be boiled; with bichloride of platinum it gives no precipitate, even on boiling. Solutions of the other salts of platinum, and gold, are, however, only partially precipitated by carbonate of baryta, except on heating. Oxide of tin is completely precipitated even in the cold from both the, α and β, bichlorides. But carbonate of baryta does not precipitate, at the ordinary temperature, the oxides of potassium, sodium, lithium, ammonium, barium, strontium, calcium, magnesium, glucinum, yttrium, or zirconium, or the protoxides of manganese, iron, lead, or silver. Magnesia is completely precipitated by it from a solution of the sulphate after long-continued boiling; but under the same conditions it is only incompletely precipitated from the chloride or nitrate. Lime is partially precipitated from solutions of its salts after long-continued boiling. Glucina is not precipitated by carbonate of baryta except on boiling; nor does this completely precipitate zirconia either in the cold or on boiling. It does not precipitate yttria either in the cold or on heating; nor does it immediately precipitate protoxide of cerium, though at the end of 24 hours the precipitation is complete; after some hours it precipitates completely sesquioxide of cerium. Oxide of lanthanum is completely precipitated, after some time, at the ordinary temperature, the reaction being more rapid at the temperature of boiling. When left in contact, at the ordinary temperature, with a solution of nitrate of didymium during an hour or so, scarcely a trace of the oxide of didymium is precipitated, but on allowing the mixture to stand for a longer time, the oxide gradually separates out, but the precipitation is not completed even after several days, nor can it be completely precipitated on boiling. In any event, oxide of didymium is precipitated by carbonate of baryta more slowly than the protoxides of cerium or lanthanum. The protoxides of manganese and iron are precipitated only on boiling, but the precipitation is then complete. Oxide of zinc is not immediately precipitated in the cold, but by long-continued ebullition with an excess of carbonate of baryta the oxide of zinc may all be thrown down. As a rule it does not precipitate the protoxides of cobalt or nickel from their solutions at the ordinary temperature, though after a very long time the greater part of these oxides may be precipitated from solutions of their sulphates; this does not occur with the chlorides, however, though by long-continued boiling the oxides may be almost completely precipitated from them. Sesquioxide of nickel is not precipitated by it from dilute solutions at the ordinary temperature; but sesquioxide of cobalt may be precipitated from the acetate both in the cold and on boiling. Oxide of lead is not precipitated in the cold, but is precipitated completely by long-continued ebullition. (H. Rose, *Tr.*, *passim*, & p. 943.)

*Sesqui*Carbonate of Baryta. Much more soluble than the mono-carbonate in water. (Boussin.)
$2\,BaO, 3\,CO_2$

Carbonate of Bismuth. Insoluble in water, or in carbonic acid water. (Lefort; Bergman, *Essays*, **1.** 55.)
$BiO_3, CO_2 + Aq$

As good as insoluble in water. Easily soluble in chlorhydric, and nitric acids. (Fresenius, *Quant.*, p. 150.) Completely soluble in an aqueous solution of carbonate of ammonia; slightly soluble in a solution of carbonate of potash; insoluble in a solution of carbonate of soda. (Laugier.) Perfectly insoluble in a solution of carbonate of ammonia unless phosphoric or arsenic acid be also present. (Berzelius.) Somewhat soluble in solutions of the alkaline carbonates, but is precipitated by caustic alkali. (Stromeyer.) Insoluble in aqueous solutions of the carbonates of potash, soda, or ammonia. (H. Rose, *Tr.*) Soluble, when recently precipitated, in an aqueous solution of chloride of ammonium. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 315; Brett, *Phil. Mag.*, 1837, (3.) **10.** 98.) But insoluble in a solution of nitrate of ammonia. (Brett, *Ibid.*) Soluble in a solution of chloride of calcium. (Pearson.)

Carbonate of Butyl. Insoluble, or but sparingly soluble in water. Decomposed by ammonia-water.
(*Carbonate of Tetryl.*)
C_8H_9O, CO_2

Carbonate of Cadmium. Insoluble in water. (Stromeyer.) Insoluble in solutions of the alkaline carbonates.
CdO, CO_2

Exceedingly sparingly soluble in a solution of carbonate of ammonia. (Fresenius, *Quant.*, p. 151.) Readily soluble in aqueous solutions of sulphate, nitrate, and succinate of ammonia and of chloride of ammonium. (Wittstein.) Soluble in a solution of cyanide of potassium. Soluble in a cold aqueous solution of chloride of ammonium, and less perfectly in a solution of nitrate of ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** pp. 99, 334.) Readily soluble in a warm aqueous solution of chloride of ammonium, yet carbonate of ammonia precipitates cadmium from solutions which contain much chloride of ammonium. (H. Rose, *Tr.*) The presence of non-volatile organic substances does not prevent the alkaline carbonates from precipitating cadmium from its solutions. (H. Rose, *Tr.*) It is not precipitated from solutions which contain citrate of soda. (Spiller.) Easily soluble in acids.

Carbonate *of protoxide* of Cerium. Insoluble in water, or in carbonic acid water. (Vauquelin.)
I.) $CeO, CO_2 + 3\,Aq$

Slightly soluble in aqueous solutions of the alkaline carbonates, and bicarbonates.

Easily soluble in sulphurous acid. (Berthier, *Ann. Ch. et Phys.*, (3.) **7.** 77.)

II.) $2\,CeO, CO_2 + 2\,Aq$ Easily soluble, with decomposition, in acids.

Carbonate *of sesquioxide* of Cerium. Insoluble in water. (Hisinger, in *Berzelius's Lehrb.*) A solution of carbonate of soda only dissolves a trace of it; somewhat more soluble in bicarbonate of soda and in carbonate of ammonia, the solutions thus obtained being precipitated on boiling. (H. Rose, *Tr.*)

Carbonate of *bi*ChlorEthyl. Insoluble in water. Soluble in alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **9.** 203.)
(*Bichlorocarbonic ether.*
Carbonate of Ethyl bichloré.)
$C_5H_3Cl_2O_3 = C_4H_3Cl_2O, CO_2$

Carbonate of *per*ChlorEthyl.
(*PerChloro Carbonic Ether. Carbonate d'ethyle perchloré.*)
$C_5 Cl_5 O_3 = C_4 Cl_5 O, C O_2$
Soluble in alcohol and in ether, with partial decomposition. (Cahours, *Ann. Ch. et Phys.*, (3.) **9.** 204.) Soluble in alcohol, with slight elevation of temperature, and partial decomposition; from this solution it is precipitated on the addition of water. (Malaguti.)

Carbonate of Chloride of Sulphur. *Vid.* Sulphite of Chloride of ChloroMethyl.

Carbonate *of protoxide* of Chromium. Somewhat soluble in an aqueous solution of bicarbonate of potash. (Moberg.)

Carbonate *of sesquioxide* of Chromium.
$Cr_2 O_3, C O_2 + 4 Aq$
Insoluble in water. Soluble in acids. (T. Thomson, *Phil. Trans.*, 1827, Part I. p. 208.) Insoluble in water. When recently precipitated it is soluble in aqueous solutions of the carbonates of potash and ammonia, and still more soluble in a solution of caustic potash. (Meissner.) According to Lefort it is only the salts of the violet modification of chrome-oxide which afford a carbonate when treated with a solution of an alkaline carbonate.

Carbonate of Cinchonin. Cinchonin is more soluble in carbonic acid water than in pure water. (Langlois.)

Carbonate of Cobalt.

I.) *normal.*
a = anhydrous.
$Co O, C O_2$
Unacted upon by cold chlorhydric or nitric acids, even when these are concentrated. (De Senarmont, *Ann. Ch. et Phys.*, (3.) **30.** 138.)

b = $Co O, C O_2 + 6 Aq$ Permanent. (H. Deville.) Normal carbonate of cobalt is decomposed by water, a basic insoluble salt being formed. (Berzelius, *Lehrb.*, **3.** 647.)

II.) $3 (Co O, C O_2) + 2 Aq$

III.) $4 Co O, 2 C O_2 + 7 Aq$ Ppt. Converted into No. 5 by washing or boiling with water. (Beetz.)

IV.) $4 Co O, C O_2 + 4 Aq$ Ppt.

V.) $5 Co O, 2 C O_2 + 4 Aq$ Insoluble in water. Soluble in aqueous solutions of carbonate, sulphate, nitrate, and succinate of ammonia, and of chloride of ammonium.

Soluble, even in the cold, in aqueous solutions of chloride of ammonium, and nitrate of ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** pp. 98, 99, 334.) Soluble in carbonic acid water, and in aqueous solutions of the alkaline bicarbonates, from which it is again precipitated on boiling. (Berzelius, *Lehrb.*, **3.** 648.) Very sparingly soluble in strong aqueous solutions of carbonate of soda and carbonate of potash; from the last-named solution it is precipitated when much water is added. (Proust, Gmelin.) Largely soluble, with combination, in an aqueous solution of carbonate of ammonia, also soluble in part in ammonia-water. (Berzelius, *Lehrb.*, **3.** 648.) It is not precipitated from solutions which contain citrate of soda. (Spiller.)

Carbonate of Cobalt & of Potash.

I.) $Co O, C O_2 ; K O, C O_2 + 4 Aq$

II.) $2 Co O, 3 C O_2 ; K O, 2 C O_2 + 9 Aq$ Permanent. Very rapidly decomposed by water. (Deville, *Ann. Ch. et Phys.*, (3.) **33.** 90.)

Carbonate of Cobalt & of Soda. Decomposed by water.

I.) $Co O, C O_2 ; Na O, C O_2 + 4 Aq$

II.) $Co O, C O_2 ; Na O, C O_2 + 10 Aq$ Very easily decomposed by water. (H. Deville, *Ann. Ch. et Phys.*, (3.) **33.** 94.)

Carbonate *of dinoxide* of Copper. Ppt.
$Cu_2 O, C O_2$

Carbonate *of protoxide* of Copper.

I.) $2 Cu O, C O_2$ Decomposed by boiling with water. (Gay-Lussac.)

II.) $2 Cu O, C O_2 + Aq$
(*Malachite.*)
Insoluble in water. Sparingly soluble in carbonic acid water; 30720 pts. of this solution contain 1 pt. of oxide of copper. (Fr. Jahn.) Soluble in 3833 pts. of a saturated aqueous solution of carbonic acid. (Lassaigne, *J. Ch. Méd.*, **4.** 312; in *Berzelius's Jahresbericht*, **29.** 132.) Carbonate of copper is insoluble in carbonic acid water unless it be precipitated in presence of an excess of this, in which event a small portion of it is taken up. (Bergman, *Essays*, **1.** 55.) Soluble in aqueous solutions of ammoniacal salts. Partially soluble in solutions of the fixed alkaline carbonates and still more soluble in solutions of the alkaline bicarbonates. Soluble in a solution of sesquicarbonate of ammonia. (Favre, *Ann. Ch. et Phys.*, (3.) **10.** 118.) Less soluble in a solution of carbonate of ammonia than oxide of copper is in caustic ammonia. (Thomson's *System of Chem.*, London, 1831, **2.** 777.) Soluble in aqueous solutions of the alkaline cyanides. (Berzelius, *Lehrb.*, **3.** 795.) Soluble in aqueous solutions of chloride of ammonium, and nitrate of ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** pp. 98, 335.) Slowly but completely soluble in a hot aqueous solution of chloride of ammonium. (H. Rose, *Tr.*) It is not precipitated from solutions which contain citrate of soda. (Spiller.) Soluble in an aqueous solution of carbonate of ethylamin. (Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 483.) Soluble in aqueous solutions of the salts of sesquioxide of iron with evolution of carbonic acid and precipitation of hydrated sesquioxide of iron. [Compare Carbonate of Lime.] (Fuchs, *Schweigger's Journ. für Ch. u. Phys.*, 1831, **62.** 193.) Carbonate of copper, either natural or artificial, is soluble, with effervescence, in sulphurous acid (Berthier, *Ann. Ch. et Phys.*, (3.) **7.** 80); and easily in the acids generally.

III.) *sesqui.*
$3 Cu O, 2 C O_2 + Aq$

Carbonate of Copper & of Potash.
$5 Cu O, 4 C O_2 ; K O, C O_2 + 10 Aq$

Carbonate of Copper & of Soda.
$Cu O, C O_2 ; Na O, C O_2 + 3 Aq$

Carbonate of Copper & of Zinc.
$5 (Zn O, Cu O), 2 C O_2 + 3 Aq$
Readily soluble in chlorhydric acid. (Bœttger.)

Carbonate of Cuprammonium.
$N \left\{ \begin{matrix} H_3 \\ Cu \end{matrix} \right. O, C O_2$
Decomposed by water. Insoluble in alcohol or ether. Soluble in an aqueous solution of sesquicarbonate of ammonia. (Favre, *Ann. Ch. et Phys.*, (3.) **10.** 116.)

Carbonate of Didymium.
$Di O, CO_2 + 2 Aq$
Insoluble in water, or in aqueous solutions of the alkaline carbonates or bicarbonates. (Marignac, *Ann. Ch. et Phys.*, (3.) **38.** 166.) Not completely insoluble in a concentrated solution of chloride of ammonium. (H. Rose, *Tr.*)

Carbonate of Ethyl.

I. *normal.*
$C_4 H_5 O, C O_2$ or $(C_4 H_5 O)_2 \} 2 C O_2$
(*Carbonic ether.*)
Insoluble in water. Very readily soluble in alcohol, and ether. (Cahours, *Ann. Ch. et Phys.*, (3.) **9.** 202.)

II.) *bi.* Not isolated.
$C_6 H_6 O_6 = C_4 H_5 O, H O, 2 C O_2$
(*Ethyl Carbonic Acid.*)

Carbonate of Ethyl & of Methyl. $C_8H_8O_6 = C_4H_5O, C_2H_3O, 2CO_2$ Its properties are for the most part similar to those of carbonate of ethyl. (Chancel, *Ann. Ch. et Phys.*, (3.) **35.** 467.)

Carbonate of Ethyl & of Potash. (*Ethyl Carbonate of Potash.*) $C_6H_5KO_6 = C_4H_5O, KO, 2CO_2$ Decomposed by water. Soluble in absolute alcohol. Insoluble in anhydrous ether. (Dumas & Peligot.)

Carbonate of Ethylamin. C_4H_7N, CO_2

a = anhydrous. Soluble in water. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 483.)

b = hydrated. Very deliquescent.

Carbonate of *tetra*EthylAmmonium. Not deliquescent. Very soluble in water. Soluble in water, and alcohol. (Bruening.)

Carbonate of Ethyl *chloré*. *Vid.* Carbonate of ChlorEthyl.

Carbonate of EthylMethylConiin. Deliquescent. Readily soluble in water. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **89.** 139.)

Carbonate of EthylStrychnine. Partially soluble, and partially insoluble in water.

***Bi*Carbonate of EthylStrychnine.** $C_{42}H_{21}(C_4H_5)N_2O_4, 2HO, 2CO_2$ Permanent. Readily soluble in water. Easily soluble in absolute alcohol; less soluble in ether.

Carbonate of Glucina. $Gl_2O_3, CO_2 + 5Aq$ Not perceptibly soluble in water, or in carbonic acid water. Soluble in aqueous solutions of ammoniacal salts and of the caustic alkalies. Readily soluble in aqueous solutions of the alkaline carbonates, and especially of carbonate of ammonia. (Vauquelin.) Sparingly soluble in an aqueous solution of carbonate of potash; if the latter be concentrated, but little glucina will be precipitated from it on boiling; a larger portion will be thrown down if the solution is diluted with water, and then boiled. A solution of bicarbonate of potash behaves in a similar manner, as does also a solution of carbonate of ammonia, excepting that the latter dissolves the carbonate of glucina more readily than the others. On boiling the solution in carbonate of ammonia a basic carbonate of glucina is precipitated. Easily soluble in acids. (H. Rose, *Tr.*)

Carbonate of Glucina & of Potash. $Gl_2O_3, CO_2; KO, CO_2$ Hygroscopic. Very soluble in cold water. Less easily soluble in spirit. The aqueous solution is decomposed by boiling. (Debray, *Ann. Ch. et Phys.*, (3.) **44.** 32.)

***Bi*Carbonate of Harmalin.**

Carbonate *of protoxide* of Iron.

a = anhydrous. FeO, CO_2 As it occurs in nature it is but slowly soluble in chlorhydric acid. It appears to be insoluble in aqueous solutions of chloride of ammonium and nitrate of ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 97.)

b = hydrated. $FeO, CO_2 + Aq$ Slightly soluble in water. (Berzelius, *Lehrb.*) Easily soluble, with decomposition, in acids. Soluble in carbonic acid water. Also soluble in an aqueous solution of cane-sugar.

Readily soluble in an aqueous solution of chloride of ammonium. (H. Rose, *Tr.*) From a weak solution in carbonic acid water it is precipitated by caustic, but not by carbonated, alkalies. (Bergman, *Essays*, **1.** 49.) Soluble in aqueous solutions of the salts of sesquioxide of iron, with evolution of carbonic acid and precipitation of sesquioxide of iron. [Compare Carbonate of Lime.] (Fuchs, *Schweigger's Journ. für Ch. u. Phys.*, 1831, **62.** 194.)

Carbonate *of sesquioxide* of Iron. $Fe_2O_3, 3CO_2$ Has but a momentary existence as a precipitate, which falls, and then decomposes, when solutions of the salts of sesquioxide of iron are mixed with those of the alkaline carbonates. (Berzelius, *Lehrb.*)

On adding a solution of carbonate of potash or of soda to a solution of a salt of sesquioxide of iron a mixture of hydrate and carbonate of the sesquioxide is precipitated, but a portion of iron always remains in solution, and tends to separate out from the clear filtrate when this is left to itself. In some cases, especially when the solution of the iron salt contains much free acid, the whole of it may remain dissolved in an excess of the alkaline carbonate. With the alkaline bicarbonates the action is much the same though the iron is more easily retained in solution by them than by the former; and after having once been precipitated the sesquioxide of iron may be redissolved in a very large excess of a solution of the alkaline bicarbonate. The best way of obtaining such a solution is to add, drop by drop, a dilute solution of the iron salt to the solution of the alkaline bicarbonate which is kept constantly agitated. After some time the solution thus obtained deposits almost all of its iron as hydrated sesquioxide. A solution of carbonate of ammonia behaves like that of carbonate of potash; in proportion as it contains more carbonic acid so much the more iron remains dissolved in it.. (H. Rose, *Tr.*)

Carbonate *of protoxide* of Iron & of Magnesia. $FeO, CO_2; MgO, CO_2$

Carbonate of Lanthanum. Insoluble in in water.

Carbonate of Lead.

I.) *mono.* Very sparingly soluble in water.

PbO, CO_2 When recently precipitated, 1 pt. of it is soluble in 50551 pts. of water at ordinary temperatures, and in 23450 pts. of water containing a small quantity of acetate of ammonia plus carbonate of ammonia and caustic ammonia; and in a smaller quantity of water containing much nitrate of ammonia plus carbonate of ammonia and caustic ammonia. (Fresenius, *Ann. Ch. u. Pharm.*, 1846, **59.** 125.) Soluble in 7144 pts of a saturated aqueous solution of carbonic acid. (Lassaigne, *J. Ch. Méd.*, **4.** 312; in *Berzelius's Jahresbericht*, **29.** 132.) Carbonic acid water can dissolve $\frac{1}{60000}$ @ $\frac{1}{50000}$ of oxide of lead. (Yorke.) Insoluble in carbonic acid water. (Bergman, *Essays*, **1.** 55; Fr. Jahn, *Ann. Pharm.*, **28.** 117.) Very slightly soluble in carbonic acid water, but the presence of traces of various salts prevents this solution. (Tünnermann) Soluble in carbonic acid water. (Wetzlar.) Easily soluble in acetic acid.

Soluble in aqueous solutions of acetate of ammonia at 18.8° @ 25°; and chloride of ammonium at 12.5° @ 25°. (Weppen, *Arch. d. Pharm.*, (2.) **9.** 236; in *J. pr. Ch.*, 1837, **11.** pp. 181, 183.) Soluble in an aqueous solution of caustic potash. Not absolutely insoluble at the ordinary temperature in an excess of a solution of carbonate of potash or of soda, and at the temperature of ebullition still more of it is dissolved; but an excess of carbonate of ammonia or of the alkaline bicarbonates does not dissolve the least trace of it.

(H. Rose, *Tr.*) It is not decomposed by ammonia-water, but dissolves in aqueous solutions of caustic potash, and soda. Decomposed by a boiling aqueous solution of nitrate of lime. (Berzelius's *Lehrb.*) Soluble in aqueous solutions of the acetates. (Mercer, *Rep. Br. Assoc.*, 1844, p. 32.) It is not precipitated from solutions which contain citrate of soda. (Spiller.) About equally soluble with sulphate of lead in water; but is much less soluble in alkaline solutions than the sulphate. (Dulong, *Ann. de Chim.*, **82.** 290.) Normal carbonate of lead, as thrown down by an alkaline bicarbonate, is not decomposed by an aqueous solution of sulphate of potash. (H. Rose, *Tr.*) Only slightly decomposed by aqueous solutions of the sulphates of potash and soda. (Persoz, *Chim. Moléc.*, p. 385.) Not at all decomposed by aqueous solutions of the alkaline sulphates. (Malaguti, *Ann. Ch. et Phys.*, (3.) **51.** 347.) Carbonate of lead is partially decomposed when boiled with aqueous solutions of the sulphates of potash, soda, lime, ammonia, and magnesia; the phosphates of soda and ammonia; the sulphites of potash, soda, and ammonia; the phosphites of potash, soda, and ammonia; borate of soda; the arseniates of potash and soda; the oxalates of potash and ammonia; fluoride of sodium; and chromate of potash (even at a temperature of 10° @ 15°). With the ammonia salts the decomposition is complete. (Dulong, *loc. cit.*, p. 286.) Soluble in an aqueous solution of chloride of ammonium, especially when this is heated (Brett, *Phil. Mag.*, 1837, (3.) **10.** 96), a free evolution of ammonia occurring when the mixture is boiled. (L. Thompson, *Ibid.*, p. 179.) An excess of caustic ammonia precipitates all the lead from this solution. (Brett, *Ibid.*, p. 99.) Slowly soluble in a boiling aqueous solution of chloride of ammonium; on diluting with water the solution thus obtained, it becomes cloudy, but clears up again when reheated. (H. Rose, *Tr.*) When an equivalent of carbonate of lead is boiled with an equivalent of oxalate of potash, in aqueous solution, 0.15 of it may be decomposed. While, on the other hand, when an equivalent of oxalate of lead is boiled with one of carbonate of potash, 0.9328 of it may be decomposed. (Malaguti, *Ann. Ch. et Phys.*, (3.) **51.** pp. 348 – 353.) Carbonate of lead is not decomposed by concentrated nitric acid, most probably because nitrate of lead is insoluble in nitric acid; nor by a mixture of 1 pt. of oil of vitriol and 6 pts. of absolute alcohol, nor by alcoholic solutions of racemic or tartaric acids.

II.) *sesquicarbonate.* (*White Lead.*) $3\,PbO, 2\,CO_2, + HO$ Soluble in carbonic acid-water, and in alkaline solutions. (Schubarth's *Tech. Chem.*) Soluble in dilute, insoluble in concentrated, potash-lye. Insoluble in solutions of the alkaline carbonates, and bicarbonates. (Bœttger.) Soluble in a cold dilute solution of chloride of ammonium. (Brett.)

III.) *dicarbonate.* $2\,PbO, CO_2 + Aq$ Water dissolves only a trace of it. (Yorke.)

CARBONATE OF LEAD & OF LIME.

CARBONATE OF LEAD & OF SODA. $NaO, CO_2; 4\,(PbO, CO_2)$ Insoluble in water. (Svanberg.)

CARBONATE OF LEAD with CHLORIDE OF LEAD. $PbO, CO_2; PbCl$ Insoluble in water.

CARBONATE OF LEAD with IODIDE OF LEAD. $PbO, CO_2; PbI$ Insoluble in water. (Poggiale.)

CARBONATE OF LEAD with SULPHATE OF LEAD.

I.) (*Leadhillite.*) $3\,(PbO, CO_2); PbO, SO_3$

II.) (*Lanarkite.*) $PbO, CO_2; PbO, SO_3$

CARBONATE OF LIME. $a = CaO, CO_2$ Permanent. More readily soluble in cold than in hot water. (In *Gm.*) When recently precipitated it is soluble in 8834 pts. of boiling, and in 10601 pts. of cold water; it is much less soluble in water containing ammonia and carbonate of ammonia, 65246 pts. of such a solution having been required to dissolve 1 pt. of carbonate of lime. (Fresenius, *Ann. Ch. u. Pharm.*, 1846, **59.** 122.) Soluble in 16000 pts. of pure water. (Brandes, *Schweigger's Journ. für Ch. u. Phys.*, 1825, **43.** 156; Marguerite, *C. R.*, **38.** 308); in 12858 pts. of water at 15° (Kremers, *Pogg. Ann.*, **85.** 247); in 16000 @ 24000 pts. of water. (Bucholz, cited by Cousté.)

A litre of pure water may contain about 0.016 grm. of carbonate of lime, i. e. 1 pt. of it is soluble in 62500 pts. of water. This result Bineau esteems as being most trustworthy, though admitting that the results of his experiments have afforded extremely discordant numbers, owing to the action of the glass of his vessels and to the carbonic acid of the air (the latter having vitiated his earlier published results, as "carbonate of lime is soluble in from 35000 to 50000 pts. of water, the solubility not differing much whether the water be hot or cold"). (Bineau, *C. R.*, **41.** 510.) According to Bineau, Péligot's determinations give 0.02 grm. of carbonate of lime to the litre of water, i. e. 1 pt. of it is soluble in 50000 pts. of water. The solubility of carbonate of lime experiences no marked increase when the temperature is elevated to 100°. (Bineau, *Ann. Ch. et Phys.*, (3.) **51.** pp. 291, 292.) Malaguti appears to be in error in citing "the solubility of carbonate of lime as $\frac{1}{300000}$, after Bineau." (*Ibid.*, p. 346.)

Alcohol dissolves a trace of it. (Grischow.)

Like sulphate of lime, the carbonate is less soluble in hot than in cold water: it is, however, much less soluble than the sulphate at temperatures but little above 100°, and its solubility decreases less rapidly than that of the sulphate as the temperature increases, a point being finally reached at which the sulphate is less soluble than the carbonate. But, like the sulphate, it becomes less and less soluble as the temperature is elevated, and at 150° may be regarded as completely insoluble, or at least as insoluble as the oxalate. The precipitate thus formed at 150° does not redissolve in the water after it has become cold (when protected from carbonic acid), or only dissolves very slowly. On mixing recently precipitated carbonate of lime with an aqueous solution of sulphate of ammonia, or of the sulphates of soda, potash, or magnesia, and heating the mixture to 130° @ 140° in a sealed tube, crystals of sulphate of lime separate out, and the liquid becomes alkaline. (Cousté, *Ann. des Mines*, 1854, (5.) **5.** pp. 144, 140, 81, 139.)

Carbonate of lime, especially when recently precipitated, is soluble in a cold aqueous solution of chloride of ammonium; the clear solution obtained by thus dissolving precipitated carbonate of lime soon becomes cloudy on exposure to the air, a portion of the carbonate of lime being reprecipitated, but a portion of the carbonate still remains dissolved, and cannot be separated from the filtrate even on boiling. If precipitated carbonate of lime be thoroughly washed, and then left to itself for 24 hours, it is no longer so easily soluble in the chloride of ammonium as was the case at the first moment of its production, and even when the precipitate is not washed, but merely allowed to stand beneath the liquid in which it was produced, its solubility in chloride of ammonium, though not destroyed, is still much less than at first. Even the compact carbonate of lime which occurs in nature is not entirely insoluble in an aqueous solution of chloride of ammonium; it is much less soluble, however, than carbonate of magnesia. This solubility appears to depend upon a partial decomposition of the carbonate of lime by the ammonia-salt [i. e. it is a case of reciprocal affinity]. (Vogel, *J. pr. Ch.*, 1836, **7.** 453.) Soluble in a boiling aqueous solution of chloride of ammonium, ammonia being evolved meanwhile. (Fuchs; Demarçay, *Ann. der Pharm.*, 1834, **11.** 251.)

When a solution of ammonia incompletely saturated with carbonic acid is mixed with a solution of chloride of calcium no precipitate ensues even after the lapse of several days when the mixture is kept in a closed vessel and frequently agitated, and only a slight precipitate occurs during this time when the mixture is exposed to the air, but as soon as the mixture is boiled a considerable precipitate of carbonate of lime separates out. Solutions of ammonia saturated or nearly saturated with carbonic acid generally produce precipitates when mixed with the chloride of calcium, but the precipitation is never complete unless the solutions are heated. Moreover, when an excess of the solution of chloride of calcium is added to a solution of crystallized carbonate of ammonia only a portion of the carbonate of lime is precipitated unless the mixture is boiled. (Vogel, *Ann. de Chim.*, 1814, **89.** pp. 122, 128 – 130; also *Schweigger's Journ. für Ch. u. Phys.*, 1821, **33.** 205.) When a mixed solution of chloride of calcium and of caustic ammonia is exposed to an atmosphere of pure carbonic acid, no precipitate appears until after the lapse of several hours and the absorption of much carbonic acid; and the lime is completely precipitated only after the lapse of several days. (Vogel, *Schweigger's Journ. für Ch. u. Phys.*, **33.** 206.) When recently precipitated it is readily soluble in cold aqueous solutions of chloride of ammonium and nitrate of ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 95.) Soluble, when recently precipitated, in an aqueous solution of chloride of ammonium. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 315.) When recently precipitated it is readily soluble in aqueous solutions of carbonate, sulphate, nitrate, or succinate of ammonia and of chloride of ammonium. (Wittstein, *Rept.*, **57.** 18 [Gm.].) Soluble in an aqueous solution of acetate of ammonia. (T. Thomson, in his *System of Chem.*, London, 1831, **2.** 395.) Rapidly decomposed and dissolved when boiled with solutions of ammoniacal salts. (Denham Smith, *Phil. Mag.*, **9.** 542.) An aqueous solution of sulphate of potash, or of chloride of potassium, etc., on being poured into lime-water which has been rendered milky by the addition of carbonic acid water, causes the immediate disappearance of the precipitate. In like manner there will be no precipitate produced when carbonic acid water is poured into a mixture of lime-water and a solution of these neutral salts. (Guyton de Morveau, *Mém. de Scheele*, part II., p. 18 (note), cited by Berthollet, *Ann. de Chim.*, **37.** 178 (note).) More soluble in solutions of chloride of ammonium or nitrate of ammonia than in water, but is reprecipitated, even more completely than carbonate of baryta, when ammonia and carbonate of ammonia are added. It is also more readily soluble in solutions of neutral potash and soda salts than in water. (Fresenius, *Quant.*, p. 128.) When caustic ammonia which has been partially neutralized with carbonic acid is mixed with lime-water, no cloudiness appears unless the mixture is boiled; with ammonia which has been more nearly neutralized with carbonic acid, a precipitate is formed at first, but disappears again immediately, and a great deal of lime-water must be added before a persistent precipitate is obtained. Yet it does not appear that caustic ammonia can itself dissolve carbonate of lime which has once been precipitated, at least no such action could be perceived on making the experiment. Again, no precipitate was formed when a current of carbonic acid gas was passed into caustic ammonia which had been mixed with three times its volume of lime-water, until the mixture was heated. Potash cannot be substituted for ammonia in these experiments. (Vogel, *Ann. de Chim.*, 1814, **89.** pp. 130 – 132; also *Schweigger's Journ. für Ch. u. Phys.*, 1821, **33.** pp. 208, 209.) It is not precipitated when solutions of carbonate of soda and of chloride of calcium containing no more than 1 pt. of either of these salts in 6000 @ 7000 pts. of water are mixed, not even when these solutions are boiled. (R. Brandes, *Schweigger's Journ. für Ch. u. Phys.*, 1825, **43.** 156.)

"Lime-water has the property of dissolving a little carbonate of lime, of which one can assure himself by blowing into it with a tube; the air expired produces a cloud which redissolves entirely, until the lime-water is saturated with the carbonate of lime which has been formed." (Welter & Berthollet, *Ann. de Chim.*, 1789, **3.** 68.) Lime-water from which a portion of the lime has been precipitated by carbonic acid, but which still exhibits an alkaline reaction, is capable of retaining a certain amount of carbonate of lime in solution at the ordinary temperature; this is precipitated on boiling. (Vogel, *Schweigger's Journ. für Ch. u. Phys.*, **33.** 207, (1821); also *Ann. de Chim.*, 1814, **89.** 132.) When diluted with several times its volume of water, lime-water ceases to afford an immediate precipitate when carbonic acid gas is passed through it. A precipitate generally forms on boiling, but if the lime-water be much diluted no precipitate will occur, even on actual ebullition, although solutions of the alkaline carbonates produce at once precipitates. If to the lime-water in which carbonic acid gas produced no precipitate even after boiling, a dilute solution of caustic soda, ammonia, or lime be added, and the mixture heated, a precipitate of carbonate of lime will be formed. Even saturated lime-water is capable of retaining a portion of carbonic acid in solution for a considerable time if the solution is not heated, as is easily proved by passing carbonic acid into lime-water until it is partially saturated, when on filtering and boiling the clear filtrate an abundant precipitate of carbonate of lime is formed. I have noticed that lime-water which has been exposed to the air, as when kept in bottles with loosely fitting stoppers, affords an abundant precipitate of carbonate of lime on boiling, but if that which has been thus exposed be afterwards placed in a securely closed bottle it will deposit after a few days all the carbonate of lime which it had previously retained in solution, and will no longer afford any precipitate of it on boiling. (Storer, *Am. J. Sci.*, (2.) **25.** 42; Eliot & Storer, *Proc. Amer. Acad.*, 1860, **5.** 63.) Lime-water mixed with a *dilute* solution of caustic soda, potash, or ammonia gives no immediate precipitate when carbonic acid gas is passed into it, unless the solution is boiled. [Compare Bineau's observations on the stability of dilute solutions of the carbonates of the alkaline earths in carbonic acid-water, *Art.* Carbonic Acid.]

Besides solutions of ammonia and potash salts, solutions of soda salts are capable of dissolving carbonate of lime. (Berthollet, *Ann. de Chim.*, **37.** pp. 178, 179.) They appear to stand midway in this respect between those of ammonia and of potash. Even a solution of chloride of calcium exerts a certain solvent power upon recently precipitated carbonate of lime. This solvent action may be seen by treating the recently precipitated carbonate with a great excess of a solution of almost any alkaline salt, but is observed more distinctly in the great tendency of the alkaline salts to prevent the precipitation of the carbonate. Thus, if lime-water be mixed with an aqueous solution of chloride of ammonium, chloride of sodium or chloride of potassium, and a current of carbonic acid gas be passed into the mixture no precipitate is produced, even on boiling, if the alkaline chloride be present in sufficient quantity. If less of the alkaline chloride has been used, there will be a precipitate formed on boiling, although none has occurred in the cold. Chloride of calcium exerts an action entirely analogous to that of the alkaline chlorides, though, so far as I have observed, a precipitate always forms on boiling. A solution of sulphate of ammonia or of sulphate of soda, when mixed with lime-water, exerts an influence almost precisely like that of the alkaline chlorides, carbonate of lime not being precipitated, even on boiling, if they are present in sufficient quantity. A solution of sulphate or nitrate of potash behaves much like that of sulphate of soda, but its influence is less strongly marked. The solvent influence of the alkaline salts can be observed with equal facility by mixing their solution with that of an alkaline carbonate and adding a solution of a lime salt to the mixture. Thus, a solution of chloride of calcium produces no precipitate, except on boiling, when added to a mixed solution of carbonate of soda and sulphate of soda, excepting when the carbonate is in excess. In this experiment the sulphate of soda may be replaced by any of the alkaline sulphates or chlorides. The most remarkable solvent action which I have noticed is seen in the inability of the alkaline carbonates to precipitate lime from its solutions, when they are added in great excess. That such solvent power exists may be proved by precipitating a small quantity of a salt of lime with carbonate of ammonia and then redissolving the precipitate in a very great excess of the precipitant. But a much more satisfactory proof may be obtained by adding quickly a large excess of the solution of the alkaline carbonate to a small portion of a dilute solution of a lime or baryta salt; so quickly that the precipitate may not have sufficient time to form. This is readily accomplished by swinging rapidly the vessel containing the solution of the lime or baryta salt and suddenly turning into it the solution of the alkaline carbonate. If the solutions have been used in proper proportion, no trace of a precipitate will appear, owing to the complete mixture obtained by this method of experimenting, although a fractional amount of the lime salt used would have produced a persistent precipitate had it been slowly added. By using the same portion of the solution of the alkaline carbonate upon successive small portions of that of the lime salt no inconsiderable amount of the latter may be finally obtained in solution. As a rule, this solution is precipitated at once on boiling, but if it be diluted with a large quantity of water, ebullition no longer produces any precipitate. In one instance, such a solution left in repose during twenty-four hours afforded no precipitate, although oxalate of ammonia when added to it produced a copious precipitate of oxalate of lime. As would follow from the facts given above, carbonic acid gas frequently affords no immediate precipitate in the cold in solutions of lime salts which have been neutralized by ammonia, as has been repeatedly observed. I find that a weak solution of caustic soda, potash, or even lime, may be substituted for caustic ammonia in the above mixture with like result, no precipitate appearing until after the lapse of considerable time unless the solution be heated. The action of the fixed alkali being, to all appearance, entirely analogous, in kind, to that of ammonia, although less in degree.*

To demonstrate this it is only necessary to employ sufficiently dilute solutions of the caustic alkalies and to pass through the mixture a stream of carbonic acid gas diluted with air, — air expired from the lungs, for example, — when no immediate precipitate will be produced unless the solution be heated. Even if the solution of caustic alkali be used in so concentrated a form (not sufficiently so, however, to precipitate a hydrate of the alkaline earth) that a precipitate of carbonate of lime is produced, in the cold, by a current of carbonic acid, it can readily be proved that a portion of the carbonic acid has not been precipitated, by filtering and boiling the clear filtrate, when a copious precipitate of carbonate of lime will be produced at once. This behavior is more marked with lime salts than with those of baryta, and soda evidently exerts a greater influence than potash. If a solution of chloride of sodium, of chloride of potassium, or of chloride of ammonium be added to the mixed solution before passing carbonic acid gas, the precipitation of the carbonate of lime or baryta is attended with still greater difficulty. As a rule, carbonate of lime appears to be more easily dissolved by solutions of the alkaline salts than carbonate of baryta. (Storer, *Am. J. Sci.*, 1858, (2.) **25.** 41.) Soluble in a boiling aqueous solution of chloride of magnesium, even when this is very dilute, much carbonic acid being meanwhile evolved, and some flocks of magnesia separating out. (Cousté, *Ann. des Mines*, 1854, (5.) **5.** 137.) In sea-water, near limestone coasts, it is found dissolved in about 10000 pts. water. (J. Davy.) Soluble in a solution of normal citrate of soda. (Spiller.) Soluble in a solution of sucrate of lime. (Barreswil.) Soluble in carbonic acid water. (Bergman, *Essays*, **1.** 34.) Soluble at 0° in 1428 pts. of water saturated with carbonic acid; at 10° in 1136 pts. (Lassaigne, *J. Ch. Méd.*, **4.** 312; in *Berzelius's J. B.*, **29.** 132.) The intensity of the power by which CO_2 dissolves carbonate of lime is far from being in

---

* Kolbe (*Handwœrterbuch der Chem.*, I., Supplem., p. 157) explains this behavior of the solution of chloride of calcium or barium neutralized with ammonia, by supposing that carbamate of ammonia, $NH_4O, C\left\{\begin{matrix} O \\ NH_2\,CO_2 \end{matrix}\right.$, is formed, capable of existing for some time in cold aqueous solution, but not of supporting heat, on application of which it is transformed into ordinary carbonate of ammonia, which reacts at once on the lime or baryta salt present. The insufficiency of this view to explain all the facts in the case is evident: (1.) In presence of an excess of chloride of ammonium, carbonic acid produces no precipitate in the mixed solution of chloride of calcium and ammonia, *even when the mixture is boiled.* (2.) When a large excess of any alkaline carbonate is added to a small amount of a solution of a salt of lime or of baryta, no immediate precipitate is produced unless the solution be heated. (3.) A current of carbonic acid gas produces no immediate precipitate in a solution of chloride of calcium or chloride of barium which has been neutralized with a dilute solution of caustic soda or potash instead of ammonia.

direct proportion with the quantity of gas dissolved, and if the amount of the latter is progressively elevated the increased solubility of the salt will become less and less manifest until at last it may be no longer perceived. Carbonic acid waters containing $\frac{1}{1000}$ of carbonate of lime will not deposit any of it at ordinary temperatures when exposed to the air. (Bineau, *Ann. Ch. et Phys.*, (3.) **51.** 290.) Bineau, by operating in presence of large quantities of water, was not able to retain dissolved by carbonic acid more than $\frac{4}{5}$ the quantity of carbonate of lime necessary to make a bicarbonate.

In order that a solution of carbonate of soda shall produce a sensible precipitate in lime-water, the proportion of lime-water must not exceed 20000 pts. to 1 pt. of carbonic acid. (Lassaigne.) Carbonate of lime is not decomposed when boiled with aqueous solutions of the sulphates of potash, soda, lime, or magnesia, or of borate of soda; but it is partially decomposed when boiled with solutions of sulphate of ammonia; the phosphates of soda and ammonia; the sulphites of potash, soda, and ammonia; the phosphites of potash, soda, and ammonia; arseniate of potash, and of soda; oxalate of potash, and of ammonia; fluoride of sodium, and chromate of potash. With the ammonia salts the decomposition is complete. (Dulong, *Ann. de Chim.*, **82.** 286.) Not at all decomposed by aqueous solutions of the alkaline sulphates. (Malaguti, *Ann. Ch. et Phys.*, (3.) **51.** 348.) When one equivalent of carbonate of lime is boiled with an equivalent of oxalate of potash, in aqueous solution, 0.23 of it may be decomposed; when boiled with an equivalent of oxalate of soda 0.18 of it may be decomposed. While, on the other hand, when an equivalent of oxalate of lime is boiled with one of carbonate of potash, 0.7944 may be decomposed, and with an equivalent of carbonate of soda 0.85 of it may be decomposed. (Malaguti, *Ann. Ch. et Phys.*, (3.) **51.** 348.) One equivalent of CaO, CO_2 boiled with an equivalent of $2 NaO, HO, PO_5$ may be decomposed to the extent of 0 3921. (Malaguti, *Ann. Ch. et Phys.*, (3.) **51.** 335.) Soluble in an aqueous solution of the chlorhydrate or nitrate [or any salt (Demarçay)] of sesquioxide of iron, slowly at the ordinary temperature, more rapidly when the solution is heated, with evolution of carbonic acid, and, after a considerable amount of the carbonate has been dissolved, precipitation of sesquioxide of iron [as a basic salt (Demarçay)]. (Fuchs, *Schweigger's Journ. für Ch. u. Phys.*, 1831, **62.** pp. 184, 187, 188, 191; compare Demarçay, *Ann. der Pharm.*, 1834, **11.** 242.) Also soluble in the chlorhydrates and nitrates of the sesquioxides of alumina, manganese, chromium, and uranium, with separation of the several oxides. [As basic salts.] (Fuchs, *Ibid.*, pp. 190, 191.) A solution of protochloride of iron, on the other hand, is not thus precipitated by carbonate of lime, except at a boiling heat, and even then only slowly (Fuchs, *Ibid.*, pp. 185, 188); and in general the protoxides, as MgO, NiO, MnO, ZnO, &c., are not precipitated by it. (Fuchs, *Ibid.*, pp. 190-192.) But much depends upon the temperature at which one operates and upon the acid with which the metallic oxide is combined. Thus at a boiling heat carbonate of lime is dissolved by aqueous solutions of the chlorides and nitrates of cobalt, nickel, zinc, manganese, and copper, these salts being completely decomposed with precipitation of their oxides. The precipitation of the oxides of nickel, cobalt, manganese, and copper, may even be effected at any temperature above 60°. (Demarçay, *loc. cit.*, pp. 249-251.) It is soluble to a certain extent in the salts of those bases which tend to form insoluble basic salts: thus chloride of copper is decomposed by it with separation of a basic salt. (Fuchs, *loc. cit.*, p. 191.) Soluble even in the cold in a solution of bichloride of tin, with effervescence and precipitation of binoxide of tin. (H. Rose, *Tr.*)

Carbonate of lime, even the native mineral, is easily soluble in sulphurous acid. (Berthier, *Ann. Ch. et Phys.*, (3.) **7.** 75.) Soluble in acids generally. When treated with an acid in a closed vessel, effervescence soon ceases as the pressure increases, but the action of the acid is at once renewed on opening the vessel. (Bergman, *Essays*, **1.** 9; Link, *Gilbert's Ann. der Phys.*, 1814, **47.** 34.) Unacted upon by concentrated nitric acid, even when this is boiling, most probably because nitrate of lime is insoluble in strong nitric acid; nor is it decomposed by a mixture of 1 pt. oil of vitriol and 6 pts. of absolute alcohol, but is immediately decomposed by a mixture of nitric acid and absolute alcohol. It is not decomposed by absolute alcoholic solutions of oxalic, racemic, tartaric, citric, or glacial acetic acids. Unacted upon by glacial acetic acid, even when this is boiling.

$b = CaO, CO_2 + 5 Aq$ Permanent at temperatures below 20°, both in the air and under water. Insoluble in water. When heated to 30° either in the air, in water, or in ether, it loses its water completely, but in alcohol it behaves quite differently. In boiling anhydrous alcohol the salt becomes cloudy and parts with 2 equivalents of its water, and the milk-white crystals ($CaO, CO_2 + 3 Aq$) on being removed from the alcohol and exposed to the air lose their water more readily than the original 5 hydrated salt, so that they cannot be heated with safety above 10°. (Pelouze, in *Berzelius's Lehrb.*)

When one equivalent of $CaO, 2 CO_2$ is boiled with an equivalent of $2 KO, HO, PO_5$, in aqueous solution, 0.41 of it may be decomposed; when boiled with an equivalent of $2 NaO, HO, PO_5$, 0.39 of it may be decomposed. While, on the other hand, when an equivalent of $2 CaO, HO, PO_5$ is boiled with an equivalent of $KO, 2 CO_2$, 0.3323 of it may be decomposed, or with an equivalent of $NaO, 2 CO_2$, 0.2536 of it may be decomposed. (Malaguti, *Ann. Ch. et Phys.*, (3.) **51.** pp. 348-354.)

CARBONATE OF LIME & OF MAGNESIA. *(Bitter spar. Dolomite.)* Not so readily soluble in carbonic acid water as carbonate of lime. Unacted upon by cold, decomposed by boiling acetic acid.

CARBONATE OF LIME & OF SODA.

I.) *anhydrous.* $CaO, CO_2; NaO, CO_2$ Decomposed by water.

II.) $CaO, CO_2; NaO, CO_2 + 5 Aq$ Sparingly soluble, without decomposition, in water.

CARBONATE OF LIME & *of sesquioxide* OF URANIUM. $CaO, CO_2; Ur_2O_3, CO_2 + 2 Aq$ Soluble, with decomposition, in chlorhydric acid. (J. L. Smith.)

CARBONATE OF LIME with CHLORIDE OF CALCIUM. $CaO, CO_2; CaCl$ Decomposed by water. (*Ann. der Pharm.*, **12.** 221, note.)

CARBONATE OF LIME with HYDRATE OF LIME. $CaO, CO_2; CaO, HO$

CARBONATE OF LITHIA. LiO, CO_2 Very difficultly soluble in water; but more readily in hot than in cold.

Soluble in about 100 pts. of cold, more soluble in hot water. (Mitscherlich.) Soluble in 120 pts. of cold water. (Wittstein's *Handw.*) 1 pt. of the anhydrous salt is soluble in 150.24 pts. of water at 100°. The saturated aqueous solution boils at 100°. (Kremers, *Pogg. Ann.*, **92.** 499.) 1 pt. of the anhydrous salt is soluble in 130 pts. of water at 13°, and in 128.5 pts. of water at 102°. The saturated solution boils at 102°. "This statement is preferable to the previous one." (Kremers, *Pogg. Ann.*, **99.** pp. 43, 48.) 100 pts. of water dissolve 1.2 pts. of carbonate of lithia. This solubility is nearly the same at all temperatures. It is much more soluble in a solution of carbonic acid water: 100 pts. of water saturated with carbonic acid dissolve 5.25 pts. of carbonate of lithia. It is also soluble in solutions of ammoniacal salts. (Troost, *Ann. Ch. et Phys.*, (3.) **51.** 129.)

Insoluble in alcohol. (C. Gmelin.)

Carbonate of LuteoCobalt.

I.) *normal.* Easily soluble in hot water. Also soluble in cold water.
$6NH_3 . Co_2O_3, 3CO_2 + 7Aq$

II.) *acid.* Less soluble than the normal salt in water. (Gibbs & Genth, *Smithson. Contrib.*, vol. **9.**)
$6NH_3 . Co_2O_3, 3CO_2 ; HO, CO_2 + 5Aq$

Carbonate of Magnesia.

I.) *normal.*

$a = MgO . CO_2$ (*anhydrous.*) (*Magnesite.*) When in the crystalline state it is but feebly acted upon by weak acids. (Senarmont.) Powdered magnesite may even be treated with warm concentrated chlorhydric acid without any noticeable evolution of carbonic acid. In order to dissolve the powder it must be boiled for a long time with chlorhydric acid or with dilute sulphuric acid. (Berzelius, *Lehrb.*, **3.** 444.) Soluble in 5071 pts. of water at 15°. (Kremers, *Pogg. Ann.*, **85.** 247.) "Carbonate of magnesia" is soluble in 2504 pts. of cold water. (Fourcroy, cited in *Ann. de Chim.*, **28.** 290.)

$b = MgO, CO_2 + 3Aq$ Permanent. Soluble in 48 pts. of water, but is decomposed by a larger quantity of water. (Fourcroy.) 100 pts. of water at 15.5° dissolve 2 pts. of carbonate of magnesia. (Ure's *Dict.*) In another place Ure speaks of it as being "very slightly soluble" in water, and of the native carbonate as "insoluble." When treated with cold water it is decomposed to an insoluble basic and a soluble acid salt. (Berzelius.) Water does not decompose it. (Fritzsche.) It is not decomposed by water, even when this is boiling. (Deville, *Ann. Ch. et Phys.*, (3.) **33.** 89.) Cold water has a tendency to decompose it into an insoluble subsalt and a soluble acid salt. It is only when a large amount of liquid, in proportion to the carbonate of magnesia, is present that the salt can dissolve integrally. It is no longer precipitated from mixed solutions of carbonate of soda and sulphate of magnesia when the liquid contains 0.4 @ 0.5 pt. of the elements of carbonate of magnesia in every thousand parts. (Bineau, *Ann. Ch. et Phys.*, 1857, (3.) **51.** 301.)

More stable in sea-water than in pure water, but when the solution is heated to boiling, carbonic acid is evolved and a basic carbonate precipitated. (Cousté, *Ann. des Mines*, 1854, (5.) **5.** 137.) A Swedish *Kanne* of water dissolves 47 grains of it at a moderate heat. Water saturated with carbonic acid dissolves a far greater quantity, even so much as an ounce and a quarter, provided it be precipitated in presence of the solvent. (Bergman, *Essays*, **1.** 434.) Carbonate of magnesia is not precipitated when dilute solutions of carbonate of soda and sulphate of magnesia are mixed. Precipitation in the cold first occurs, and then only after the lapse of nearly an hour, in solutions containing 7 @ 8 grains of either salt per ounce. When the solutions are heated precipitation takes place more readily. (R. Brandes, *Schweigger's Journ. für Ch. u. Phys.*, 1825, **43.** 153, *et seq.*; compare Bergman, *Essays*, **1.** 45.) If a solution containing 1% of carbonate of soda be mixed with another containing 1% of sulphate of magnesia no precipitate will be formed. A precipitate occurs, however, when solutions containing 1.5 @ 2% of the above-mentioned salts are mixed. (Brandes, cited by Mulder, in his *Die Silberprobirmethode*, p. 14.)

More soluble than carbonate of lime in a cold aqueous solution of chloride of ammonium. When recently precipitated, it is readily soluble in an aqueous solution of chloride of ammonium, but if the carbonate has been dried at the temperature of 100° it dissolves much more difficultly and slowly. A concentrated solution of carbonate of magnesia in chloride of ammonium becomes cloudy when exposed to the air, but deposits no carbonate of magnesia on boiling. (Vogel, *J. pr. Ch.*, 1836, **7.** 455.) Soluble in an aqueous solution of nitrate of ammonia and somewhat more readily in a solution of chloride of ammonium. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 96.) Carbonate of magnesia is not precipitated from solutions which contain citrate of soda. (Spiller.)

The carbonates of magnesia are soluble in carbonic acid water; an amount of magnesia very nearly equal to 1 equivalent existing in solution for every 2 equivalents of carbonic acid. (Bineau, *loc. cit.*)

Dry carbonate of magnesia is not decomposed by a mixture of 1 pt. oil of vitriol and 6 pts. of absolute alcohol, nor by alcoholic solutions of racemic, tartaric, or glacial acetic acids; but is slowly decomposed by an alcoholic solution of citric acid and by a mixture of nitric acid and absolute alcohol. Carbonate of magnesia is more soluble in cold than in hot water impregnated with carbonic acid. (Butini, *Sur le Magnesie*; cited by Graham, *Phil. Mag.*, 1827, (2.) **2.** 26.) Unlike the anhydrous salt, this compound, as well as the other hydrates of carbonate of magnesia, is readily soluble in acids, even dilute. (Berzelius, *Lehrb.*, **3.** 444.)

$c = MgO, CO_2 + 5Aq$ Slowly efflorescent. Partially dissolved by cold water, with decomposition to soluble bicarbonate and insoluble basic carbonate. Boiling water converts it into the latter, with evolution of carbonic acid, without dissolving anything. (Fritzsche, *Berzelius's Lehrb.*, **3.** 446.)

II. $\frac{4}{3}$ *basic.* (*Hydromagnesite. Magnesia alba. Subcarbonate of Magnesia.*) $4MgO, 3CO_2 + 4Aq$ After thorough washing it becomes very difficultly soluble in water: — 1 pt. of it then requiring 10000 pts. of water, either hot or cold, for its solution. The more ready solubility ordinarily attributed to it is unquestionably due to the presence of carbonic acid. (Bineau, *C. R.*, **41.** 510.)

After long washing it only dissolves in the proportion of 1 pt. in 10000 pts. of water. Ordinarily, 1000 pts. dissolve 0.08 pt., either when cold or at the temperature of boiling. In solutions from which it had been precipitated by an excess of sulphate of magnesia, 1000 pts. of the liquor contained 0.06 pt. of $\frac{4}{3}$carbonate of magnesia = 1 pt. in

17000 pts. of water. (Bineau, *Ann. Ch. et Phys.*, 1857, (3.) **51.** 300.) Commercial "magnesia" (of composition about $2\,MgO, CO_2 + 3\,Aq$) is soluble in 850 pts. of water at a moderate heat. Water saturated with carbonic acid dissolves $\frac{1}{300}$ of its own weight of common "magnesia" at a moderate heat, and double that quantity if it be in as fine powder as a precipitate. (Bergman, *Essays*, **1.** pp. 43, 45.). Soluble in carbonic acid water. Soluble in 2493 pts. of cold, and in 9000 of boiling water. (Fyfe, *Edin. Journ.*, **5.** 305 [T.].) [Compare Bineau, above.] Soluble in aqueous solutions of carbonate of potash or soda, and of sulphate and nitrate of potash.

Easily soluble in aqueous solutions of chloride of ammonium and of sulphate, nitrate, and succinate of ammonia. (Wittstein.) Soluble in cold aqueous solutions of carbonate of potash, carbonate of soda, sulphate of potash, chloride of potassium, nitrate of potash, and probably of other salts. On heating these solutions it separates out in part, but dissolves again as the solution cools. (Longchamps.) Soluble in an aqueous solution of sulphate of magnesia. (Dulong, *Ann. de Chim.*, **82.** 289 (note).) Very easily soluble in acids. Soluble in aqueous solutions of the salts of sesquioxide of iron, with evolution of carbonic acid and separation of hydrate of sesquioxide of iron. (Fuchs, *Schweigger's Journ. für Ch. u. Phys.*, 1831, **62.** 193; compare Demarçay, *Ann. der Pharm.*, 1834, **11.** 242.) In the cold it does not precipitate solutions of most of the R O oxides, but at higher temperatures such precipitation may occur in some cases; thus carbonate of magnesia is completely dissolved when boiled with solutions of the chlorides or nitrates of cobalt, nickel, zinc, manganese, or copper. (Demarçay, *loc. cit.*, pp. 250, 251.)

III.) $3\,MgO, CO_2 + 3\,Aq$

IV.) $5\,MgO, 4\,CO_2 + 5\,Aq$ Insoluble, or very sparingly soluble, in water. (Fritzsche.)

V.) *bi.* Soluble in water. When the aqueous $MgO, 2\,CO_2$ solution is heated, either in the open air or in a closed vessel, it deposits a precipitate; in the closed vessel this redissolves as the liquid cools, but from the open vessel no such resolution occurs on cooling, since carbonic acid has been expelled. (Osann, *Kastner's Archiv.*, 1824, **3.** 213.)

CARBONATE OF MAGNESIA & OF POTASH.

I.) $KO, CO_2; MgO, CO_2 + 4\,Aq$ Very easily decomposed by cold water. (Deville, *Ann. Ch. et Phys.*, (3.) **33.** 87.)

II.) $KO, 2\,CO_2; 2\,(MgO, CO_2) + 9\,Aq$ Insoluble, as such, in water; but is decomposed by water to bicarbonate of magnesia and bicarbonate of potash, which dissolve, and insoluble subcarbonate of magnesia. (Berzelius, *Lehrb.*, **3.** 448.)

III.) ? Very sparingly soluble in cold water; decomposed by boiling water. (Bonsdorff.)

CARBONATE OF MAGNESIA & OF SODA. Very $MgO, CO_2; NaO, CO_2$ rapidly decomposed by water. (Deville, *Ann. Ch. et Phys.*, (3.) **33.** 89.) The existence of the compound mentioned by Berzelius has been doubted. According to B., this was less easily decomposed by water than the potash salt.

CARBONATE *of protoxide* OF MANGANESE.

I.) MnO, CO_2 Permanent. As good as insoluble in water. (Fresenius, *Quant.*, p. 134.) Soluble in 2500 pts. of a saturated aqueous solution of carbonic acid. (Lassaigne, *J. Ch. Méd.*, **4.** 312; in *Berzelius's J. B.*, **29.** 132.) Soluble in 3840 pts. of an aqueous solution of carbonic acid, and in 7680 pts. of water. (John.)

When recently precipitated it is tolerably easily soluble in a solution of chloride of ammonium. It is also soluble in other ammoniacal salts, as carbonate of ammonia, when recently precipitated, but is very sparingly soluble after having stood for some time after precipitation. (Wittstein.) Insoluble in an aqueous solution of chloride of ammonium or nitrate of ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 98.) H. Rose (*Tr.*, **1.** pp. 68, 69) speaks of ordinary precipitated carbonate of manganese as a *basic* salt. According to him, it is only slightly soluble at the ordinary temperature in a solution of chloride of ammonium, though in presence of the latter it is not immediately precipitated by bicarbonate of potash.

No more soluble in a solution of carbonate of potash, or soda, than in pure water. (Compare Ebelmen, *Ann. Ch. et Phys.*, (3.) **5.** 220.) Is not precipitated from solutions containing a soluble citrate. (Spiller.) Soluble in aqueous solutions of the salts of sesquioxide of iron with evolution of carbonic acid and separation of sesquioxide of iron. [Compare Carbonate of Lime.] (Fuchs, *Schweigger's Journ. für Ch. u. Phys.*, 1831, **62.** 193.) Easily soluble in acids, even in acetic, and sulphurous acids.

II.) $(2\,MnO, CO_2) + Aq$ Permanent. Insoluble in water.

CARBONATE OF MERCUR(*ous*)ETHYL. Readily soluble in water, and alcohol.
(*Carbonate of Hydrargethyl.*)

CARBONATE *of dinoxide* OF MERCURY. Insol- Hg_2O, CO_2 uble in cold, immediately decomposed by boiling water.

Soluble in a hot or warm aqueous solution of chloride of ammonium, though less completely than the protocarbonate; less readily soluble in a solution of nitrate of ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 97.) Slightly soluble in an aqueous solution of carbonate of potash. Partially soluble, with separation of metallic mercury, in ammonia-water. (Wittstein.)

CARBONATE *of protoxide* OF MERCURY.

I.) HgO, CO_2 Permanent. Insoluble in water. Slightly soluble in carbonic acid water, and in an aqueous solution of carbonate of potash. (Berzelius.) Soluble in an aqueous solution of chloride of ammonium. (Wittstein.) Soluble in hot aqueous solutions of chloride of ammonium, and nitrate of ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 97.)

II.) $3\,HgO, CO_2$ Insoluble in cold water.

III.) $4\,HgO, CO_2$ Insoluble in cold water. (Millon, *Ann. Ch. et Phys.*, (3.) **18.** 368.)

CARBONATE OF METHYLAMIN. Very deli- $C_2H_5N, CO_2 + Aq$ quescent. Soluble in water. (Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 461.)

CARBONATE OF MORPHINE.

I.) *acid.* Soluble in 4 pts. of water. (Choulant.)

CARBONATE OF NICKEL.

I.) NiO, CO_2

a = anhydrous(crystalline). Unacted upon by cold chlorhydric or nitric acids, even when these are concentrated. (De Senarmont, *Ann. Ch. et Phys.*, (3.) **30.** 138.)

b = hydrated (precipitated). Permanent. Insoluble in water. Soluble in an aqueous solution of carbonate of ammonia. Very sparingly soluble even in a concentrated solution of carbonate of soda.
$NiO, CO_2 + 6\,Aq$

Insoluble in carbonic acid water. (Bergman, *Essays*, **1.** 55.) Easily soluble in an aqueous solution of chloride of ammonium when this is gently heated. (H. Rose, *Tr.*) Soluble in a solution of cyanide of potassium. It is not precipitated from solutions containing citrate of soda. (Spiller.)

II.) *basic.* Readily soluble in chlorhydric acid.
$2\,(NiO, 3\,HO); NiO, CO_2$ (Silliman.)

Carbonate of Nickel & of Potash.

I.) $KO, CO_2; NiO, CO_2 + 4\,Aq$

II.) $KO, 2\,CO_2; 2\,NiO, CO_2 + 9\,Aq$ Decomposed by water, but may be washed with a solution of bicarbonate of potash.

Carbonate of Nickel & of Soda.
$NaO, CO_2; NiO, CO_2 + 10\,Aq$

Carbonate of NitroHarmalin.

Carbonate of Palladium.

I.) *basic.* Insoluble in water. Partially soluble in ammonia-water. Slightly soluble in an aqueous solution of carbonate of soda. Soluble in acids. (Kane, *Phil. Trans.*, 1842, p. 279.)
$10\,PdO, CO_2 + 10\,Aq$

Carbonate of Picolin. Decomposed by boiling with water. (Unverdorben.)

Carbonate of Platin(*ous*)*bi*amin.
(Ammonio Carbonate of protoxide of Platinum. Carbonate of diPlatosamin.)

I.) *mono.*
$N_2\left\{H_6 . Pt'O, CO_2 + HO\right.$

II.) *sesqui.* More soluble in water than the bicarbonate. (Reiset, *Ann. Ch. et Phys.*, (3.) **11.** 425.)
$2\,(N_2\left\{H_6 . Pt'O\right.), HO, 3\,CO_2$

III.) *bi.* Somewhat soluble in water. (Reiset, *loc. cit.*)
$N_2\left\{H_6 . Pt'O, HO, 2\,CO_2\right.$

Carbonate of $\frac{3}{2}$ PlumbEthyl. Nearly insoluble in water. Sparingly soluble in alcohol, and ether.
$(C_4H_5)_3Pb_2O, CO_2$

Carbonate of Potash.

I.) *anhydrous.* Deliquescent. Very easily soluble in water, with evolution of heat.
KO, CO_2

Soluble in 1.05 pts. of water at 3°
" 0.962 " " 6°
" 0.900 " " 12.6°
" 0.747 " " 26°
" 0.490 " " 70°
(Osann.)

Soluble in 0.92 pt. of cold water, the saturated solution containing 52% of it (M. R. & P); in 0.922 pt. of water at 15° (Gerlach's determination, see his table of sp. grs., below); in 1 pt. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.)

II.) *hydrated, ordinary.*
$KO, CO_2 + 2\,Aq$

At °C	100 pts. of water dissolve pts. of the anhydrous salt KO, CO_2.	of the cryst. salt $KO, CO_2 + 2\,Aq$ (calculated).

(Poggiale, *Ann. Ch. et Phys.*, (3.) **8.** 468.)

[In Berzelius's *Jahresbericht*, **24.** 152, 9° is printed at the top of the temperature column instead of 0°; an error which has found its way into other works.]

Mono-carbonate of potash is more soluble in water than either the sesqui- or the bicarbonate. (Poggiale, *loc. cit.*, p. 474.) The saturated aqueous solution boils at 135°. [Poggiale, *vid. supra*, & Legrand.] (Kremers, *Pogg. Ann.*, **99.** 43.) 100 pts. of water at 15.5° dissolve 100 pts. of it. (Ure's *Dict.*)

The aqueous solutions of several salts, when evaporated, may become supersaturated, as it were, at the boiling-point, nothing being deposited, in spite of the movements of the liquid, while the temperature becomes more and more elevated. But at the moment the salt begins to be deposited the temperature falls to a point where it remains constant. The "boiling-point" of saturated solutions must consequently be taken *while* the salt is separating, and not at the moment when this separation has just commenced. Carbonate of potash exhibits this phenomenon in a very striking manner. In one instance the temperature of a solution rose to 140° without depositing any of the salt, when suddenly a lively effervescence occurred, a large quantity of the salt was deposited, and the temperature fell to the normal 135°, where it remained fixed for an indefinite length of time. (Legrand, *Ann. Ch. et Phys.*, 1835, (2.) **59.** 428.)

Amount of Anhydrous KO, CO_2 contained in the aqueous solution at 15°.

The point of ebullition of pure water, observed in a glass tube containing bits of metallic zinc, having been 100.3°. (Legrand, *Ann. Ch. et Phys.*, 1835, (2.) **59.** 438.) An aqueous solution containing 10% of KO, CO_2 boils at 100.8°; one of 20% boils at 102 2°; one of 30% at 104.5°; one of 40% at 108.6°; and one of 50% at 115.2°. (Gerlach's *Sp. Gew. der Salzlœsungen*, p. 110.) Insoluble in absolute alcohol; it absorbs water from ordinary spirit and deliquesces.

Somewhat soluble in spirit. (Schubarth, *Tech. Chem.*) Soluble in 9 pts. of alcohol of 17° B.; if a larger quantity of dry carbonate of potash is added to this solution it absorbs water and precipitates, as an oily liquor, the carbonate of potash which was originally dissolved. (Guibourt.)

Dry carbonate of potash is not decomposed by an alcoholic solution of sulphuric acid prepared by mixing 1 pt. of oil of vitriol and 6 pts. of absolute alcohol, nor by a mixture of absolute alcohol and nitric acid, or an alcoholic solution of chlorhydric acid gas, oxalic, racemic, tartaric, or glacial acetic acids, but is decomposed by an alcoholic solution of citric acid.

Soluble in phenic acid, without decomposition.

As a general rule all insoluble salts are partially decomposed when boiled with an aqueous solution of carbonate of potash. (Dulong, *Ann. de Chim.*, **82.** pp. 278, 293, 300.)

When treated with an acid in a closed vessel effervescence ceases as the pressure increases, but the action of the acid is at once renewed on opening the vessel. (Bergman, *Essays*, **1.** 9.)

*Sesqui*CARBONATE OF POTASH. $2KO, 3CO_2$ Permanent. Soluble in water. Insoluble in spirit. (Schubarth, *Tech. Chem.*) More soluble in water than the bicarbonate, but less soluble than the normal salt. (Poggiale, *loc. cit.*, p. 474.)

The experiments of Poggiale recorded in the table below were made with a salt which was prepared by *boiling* a solution of bicarbonate of potash. P. observes, however, that another set of experiments made upon a salt prepared by dissolving in boiling water 100 pts. of normal carbonate and 131 pts. of bicarbonate, afforded different results.

At °C.	100 pts. of water dissolve pts. of the anhydrous salt.	of the cryst. salt.

(Poggiale, *Ann. Ch. et Phys.*, (3.) **8.** 468.)

[In Berzelius's *Jahresbericht* there is a typographical error in this table, similar to that mentioned under monocarbonate of potash.]

*Bi*CARBONATE OF POTASH. $KO, HO, 2CO_2$ Permanent. Soluble in 3.5 pts. of water at 15°. When the solution is heated to 80° carbonic acid is evolved, and after long-continued boiling a salt nearly of the composition of the normal carbonate remains. (Redwood, in *Ot Gr.*)

Permanent, even in moist and dry air. Soluble in 4 pts. of water at a moderate temperature. (Bergman, *Essays*, **1.** 18.) Soluble in 0.8333 pt. of boiling water (Pelletier); in 4 pts. of cold, and in 1 2 pts. of boiling water; the saturated cold solution containing 20% of it, and the saturated hot solution 41.6% (M. R. & P.'s *Pharmacy*). Soluble in 4 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.)

---

* Saturated.

At °C.	100 pts. of water dissolve pts. of the anhydrous salt $KO, 2CO_2$ [theoretical].	100 pts. of water dissolve pts. of the cryst. salt $KO, HO, 2CO_2$.
0°	17.56	19.61
10°	20.73	23.23
20°	23.95	26.91
30°	27.05	30.57
40°	30.12	34.15
50°	33.36	37.92
60°	36.25	41.35
70°	39.57	45.24

The salt is decomposed when its solution is heated above 70°. It is less soluble in water than either the mono- or sesquicarbonate. (Poggiale, *Ann. Ch. et Phys.*, (3.) **8.** pp. 468, 474.) [In Berzelius's *Jahresbericht*, **24.** 152, the above table is incorrectly printed, all the figures being misplaced, and the error has been copied by Otto, in his *Lehrbuch*. That the misprint alluded to is really an error is proved by the context of Poggiale's memoir, as well as by his own table. In his *Lehrbuch*, edit. of 1845, vol. **3.** p. 157, Berzelius has printed the table correctly.] 100 pts. of water at 15.5° dissolve 30 pts. of it, and at 100°, 83 pts. (Ure's *Dict.*) Soluble in 1200 pts. of boiling alcohol. (Berthollet.) Insoluble in alcohol. (Dumas, *Tr.*) Sparingly soluble in boiling alcohol. (Gmelin.)

CARBONATE OF POTASH & OF SODA. Permanent, or but slightly efflorescent. Extremely soluble in water, with decomposition. It crystallizes from a saturated solution of carbonate of potash. (Marignac.)
$2(NaO, CO_2); KO, CO_2 + 18 Aq$

CARBONATE OF POTASH & *of protoxide* OF TIN.
$KO, 2CO_2; 2SnO, CO_2 + 2 Aq$

CARBONATE OF POTASH & *of sesquioxide* OF URANIUM. Soluble in 13.51 pts. of water at 15°; or, 100 pts. of water dissolve 7.4 pts. of it. It is a little more soluble in warm water. Partially decomposed by boiling water, at least when not in presence of a slight excess of carbonate of potash. When the aqueous solution is diluted with a large quantity of water it becomes cloudy, and deposits some uranate of potash; but this decomposition does not occur in presence of a small quantity of free alkaline carbonate, no matter how much the solution may be diluted. Completely insoluble in alcohol. When a small quantity of acid is added to the aqueous solution, a basic salt is precipitated. (Ebelmen, *Ann. Ch. et Phys.*, (3.) **5.** 204.) More soluble in an aqueous solution of carbonate or bicarbonate of potash than in water; after standing during some time a precipitate is formed in the solution in the carbonate, but none in the solution in the bicarbonate. (H. Rose, *Tr.*)
$2(KO, CO_2); Ur_2O_3, CO_2$

CARBONATE OF POTASH & OF ZINC.

I.) $KO, CO_2; ZnO, CO_2 + 2 Aq$ Insoluble in water. (Kane.)

II.) $4(KO, 2CO_2); 3(2ZnO, CO_2) + 8 Aq$ Less readily decomposed than most of the double carbonates. It can be washed with cold water. (Deville, *Ann. Ch. et Phys.*, (3.) **33.** 101.)

CARBONATE OF POTASH with CHLORIDE OF POTASSIUM. (Dœbereiner.)
$KO, CO_2; KCl$

*Bi*CARBONATE OF QUININE. Efflorescent. Somewhat soluble in water. Soluble in carbonic acid water. Soluble in alcohol. Insoluble in ether. (Langlois, *Ann. Ch. et Phys.*, (3.) **41.** 90.)
$C_{40}H_{24}N_2O_4, C_2O_4, 2HO + 2 Aq$

CARBONATE OF SILVER. Somewhat soluble in water.
AgO, CO_2

Soluble in 31978 pts. of water at 15°. (Kremers, *Pogg. Ann.*, **85.** 248.) Insoluble in carbonic acid water. (Bergman, *Essays*, **1.** 55.) Soluble in 961 pts. of carbonic acid water. (Lassaigne, *J. Ch. Méd.*, **4.** 312; in *Berzelius's Jahresbericht*, **29.** 132.) Insoluble in alcohol. Soluble in an aqueous solution of carbonate of ammonia. Also readily soluble in ammonia-water.

Slightly soluble in a cold saturated solution of carbonate of potash. (Wittstein.) Readily soluble, with decomposition, in aqueous solutions of the soluble hyposulphites. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 397.) Soluble in a hot aqueous solution of chloride of ammonium; also very imperfectly soluble in a solution of nitrate of ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** pp. 97, 98, 335.) Soluble in an aqueous solution of nitrate of ammonia when this is gently heated. (H. Rose, *Tr.*) It is not precipitated from solutions containing citrate of soda. (Spiller.) Readily decomposed by chlorhydric acid and by solutions of the metallic chlorides.

CARBONATE OF SINKALIN. Deliquescent. Soluble in water. (v. Babo & Hirschbrunn.)

CARBONATE OF SODA.

I.) *mono*, or normal.

a = anhydrous.

NaO, CO_2 Permanent.

It absorbs water from the air, though very slowly. (Fresenius, *Quant.*, p. 122.) Soluble in 5.967 pts. of water at 15°. (Gerlach's determination. See his table of sp. grs., below.) [See also under *b.*] Easily soluble in water, much less soluble in dilute ammonia-water. Insoluble in alcohol. (Margueritte; Fresenius, *Quant.*, p. 122.) Slightly soluble in absolute alcohol. Apparently quite insoluble in an alcoholic solution of soap. (Duffy, *J. Ch. Soc.*, **5.** 305.) Carbonate of soda possesses at least 4 different degrees of solubility according to different states of molecular constitution and degrees of hydration in which it occurs. (Lœwel, *Ann. Ch. et Phys.*, (3.) **44.** 330.) It is a little more soluble at temperatures about 34° @ 38° than at 104°, but the maximum of solubility is at a point still lower, probably at about 15°. (Lœwel, *loc. cit.*, (3.) **44.** 329.)

It would appear from the researches of Lœwel that carbonate of soda presents two maxima of solubility; the one occurring as warm solutions are cooled, which appears to be at about 15°, or even at a lower point; the other when cold solutions are warmed [at 34° @ 38°], the salt being probably of different composition, as regards its proportion of water of crystallization, in the two cases. (Payen, *Ann. Ch. et Phys.*, (3.) **44.** 330.)

An aqueous solution containing 5% of NaO, CO_2 boils at 100.5°, one of 10% boils at 101.1°; and one of 15% at 101.8°. (Gerlach's *Sp. Gew. der Salzlœsungen*, p. 108.)

In a solution containing for 100 parts of water, pts. of anhydrous NaO, CO_2	The boiling point was elevated.	Difference.

26.7	2.0°	5.9
32.0	2.5°	5.3
36.8	3.0°	4.8
41.0	3.5°	4.2
44.7	4.0°	3.7
47.9	4.5°	3.2
48.5	4.63°	

The point of ebullition of pure water, observed in a glass tube containing bits of metallic zinc, having been 100°. (Legrand, *Ann. Ch. et Phys.*, 1835, (2.) **59.** 433.) The saturated aqueous solution boils at 104.4° (T. Griffiths, *Quar. J. Sci.*, 1825, **18.** 90); at 106° (Kremers, *Pogg. Ann.*, **99.** 43); at 104°. (Payen, *Ann. Ch. et Phys.*, (3.) **43.** 233.) A hot aqueous solution of carbonate of soda is liable to become supersaturated on cooling. (Gay-Lussac.) A supersaturated solution of carbonate of soda (2 pts. of $\text{Na O, C O}_2 + 10$ Aq in 1 pt. of water) may be preserved for a long time in a flask loosely stopped with cotton-wool, and only crystallizes after some time when opened to the air, even when shaken. (Schrœder, *Ann. Ch. u. Pharm.*, 1859, **109.** 47.) As is the case with sulphate of soda, a clear hot solution of carbonate of soda does not crystallize when cooled out of contact with the air, but may be kept for a long time as a supersaturated solution: when exposed to low temperatures, the salt with 10 Aq. crystallizes out, but under other circumstances two other salts are formed, each containing 7 Aq.; the one (7 Aq. *a*) being nearly four times as soluble at 10° as the ordinary 10 Aq. salt, and the other (7 Aq. *b*) 2 times as soluble as the 10 Aq. salt. The salt 7 Aq. *b* is identical with the "8 Aq." salt of Thomson. (Lœwel, *Ann. Ch. et Phys.*, (3.) **33.** 337; compare Schrœder, *Ann. Ch. u. Pharm.*, **109.** 50.)

Dry carbonate of soda is not decomposed by a mixture of 1 pt. oil of vitriol and 6 pts. of absolute alcohol, nor by alcoholic solutions of racemic, tartaric, or glacial acetic acids; it is slowly decomposed, however, by a mixture of nitric acid and absolute alcohol.

As a general rule, all insoluble salts are partially decomposed when boiled with an aqueous solution of carbonate of soda. (Dulong, *Ann. de Chim.*, **82.** pp. 278, 293, 300.)

$b = \text{Na O, C O}_2 + 10$ Aq (*Ordinary crystallized Carbonate of Soda. Sal Soda.*)

Efflorescent. Soluble in 1.05 pts. of water at 23°; or, 100 pts. of water at 23° dissolve 95.3 pts. of it; or, the aqueous solution saturated at 23° contains 48.8% of it, or, 18.1% of the anhydrous salt, and is of 1.1995 sp. gr. (H. Schiff, *Ann. Ch. u. Pharm.*, 1859, **109.** 326.)

At °C.	100 pts. of water dissolve pts. of the anhydrous salt Na O, C O_2.	100 pts. of water dissolve pts. of the cryst. salt $\text{Na O, C O}_2 + 10$ Aq.

(Poggiale, *Ann. Ch. et Phys.*, (3.) **8.** 468.)

"Crystallized carbonate of soda melts in its water of crystallization at about 32°. Its point of congelation appears to be at 33°. It is then soluble in all proportions in water above this temperature. Legrand has observed, however, that water saturated with Na O, C O_2 boils at 104.6°, and contains 48.5 pts. of this salt." (Poggiale, *loc. cit.*, p. 474.) The correctness of Poggiale's results is called in question by Lœwel. (*Ann. Ch. et Phys.*, (3.) **33.** 377.)

100 pts. of
water at 14° dissolve 60.4 pts. of the 10 Aq. salt.
" 36° " 833.0 " "
" 104° " 445.0 " "

The solubility increases up to 36°, and then diminishes: if a solution saturated at 36° be boiled, a portion of the carbonate of soda will be precipitated, but as the solution cools again to 36° the precipitate redissolves. A solution saturated at 36° may be cooled to 20° and maintained at that temperature during 8 @ 10 days, even when agitated, without depositing anything. (Payen, *Ann. Ch. et Phys.*, (3.) **43.** 233.) 100 pts. of water at 14.6° dissolve 7.74 pts. of the anhydrous, or 20.64 pts. of the crystallized salt, the solution, which is of 1.0752 sp. gr., containing 7.19% of the anhydrous salt. Soluble in rather less than 1 pt. of boiling water. When heated, crystallized carbonate of soda dissolves in its water of crystallization, and it sometimes happens that when once melted in this way it remains permanently liquid. (T. Thomson, in his *System of Chem.*, London, 1831, **2.** 451.) Soluble in about 2 pts. of water. (Bergman, *Essays*, **1.** 28.) Soluble in 2 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) The aqueous solution saturated at 15° is of 1.166987 sp. gr., and contains dissolved in every 100 pts. of water at least 18.088 pts. of the anhydrous, or 66.059 pts. of the 10 Aq. salt. (Michel & Krafft, *Ann. Ch. et Phys.*, (3.) **41.** pp. 478, 482.) More soluble in water than the sesqui- or bi-salt. (Poggiale.) It melts completely in its water of crystallization at about 65.56°, but on boiling this liquid for a while a quantity of the 5 Aq. salt (*d*) crystallizes out, and the supernatant liquid is of 1.35 sp. gr. (i. e. it contains 28.8% of Na O, C O_2). Mother liquor, from which ordinary 10 Aq. salt has crystallized, i. e. the saturated aqueous solution at ordinary temperatures, is of sp. gr. 1.18, and contains 16.4% of Na O, C O_2. (Dalton, in his *New System*, **2.** 498.)

1.26	22.7	102.78°
1.18	16.4	101.11°

(Dalton, in his *New System*, Pt. **2.** p. 501.)

At 8° the sp. gr. of a saturated solution = 1.107. (Anthon, *Ann. der Pharm.*, 1837, **24.** 211.)

c = Na O, C O_2 + Aq Crystallizes out when a saturated aqueous solution of carbonate of soda is evaporated at temperatures between 75° and 87°. (Schindler.) Crystallizes from a saturated solution of common carbonate of soda kept for a long time at 49°. (Harvey, in *Thomson's System of Chem.*, London, 1831, **2.** 452.) Crystallizes on evaporating a saturated aqueous solution of carbonate of soda at temperatures between 25° and 37°. (Haidinger.) Is deposited from boiling saturated solutions of carbonate of soda. When left in contact with the mother liquor, out of contact with the air, it gradually redissolves as the liquor cools, being less soluble in water at 104° than at lower temperatures. It is not easy to determine the point of its greatest solubility, for when the solution is cooled to 15° a molecular change ordinarily occurs, a salt containing 7 equivalents of water being formed. The

---

* Saturated solution.

solubility of the monohydrated salt increases, however, as the temperature is lowered, until this change takes place. At 15° @ 20° its solution contains, for 100 pts. of water, 52.41 pts. of anhydrous NaO, CO_2, or 1290 pts. of the 10 hydrated salt ($NaO, CO_2 + 10 Aq$). When a solution of carbonate of soda is heated above 34° the monohydrated salt appears to be formed and the solubility decreases as the temperature is elevated. Insoluble in spirit. (Lœwel, *Ann. Ch. et Phys.*, (3.) **44.** 328; also **33.** 337.)

$d = NaO, CO_2 + 5 Aq$ Not efflorescent. (Berzelius, *Tr.*, **3.** 466.) Soluble in water. (Persoz.)

$e = NaO, CO_2 + 6 Aq$

$f = NaO, CO_2 + 7 Aq$ See above. Both of the 7 Aq. salts are insoluble in alcohol. (Lœwel.)

$g = NaO, CO_2 + 8 Aq$ 100 pts. of water at 17.2° dissolve 63.87 pts. of it, or 1 pt. of the salt is soluble in 1.566 pts. of water at 17.2°. (Thomson, *Ann. Phil.*, (2.) **10.** 442 [T.].) Less soluble in water than the 10 hydrated salt. "This salt is identical with my *b* $NaO, CO_2 + 7 HO$." [See above, under *b*.] (Lœwel, *Ann. Ch. et Phys.*, (3.) **33.** 383.)

II.) *Sesqui*Carbonate of Soda. Permanent. $2 NaO, 3 CO_2$ Less soluble in water than the monocarbonate, but more soluble than the bicarbonate. (H. Rose.)

At °C.	100 pts. of water dissolve pts. of the theoretical anhydrous salt $2 NaO, 3 CO_2$.	of the cryst. salt $2 NaO, 3 CO_2 + 3 Aq$.
0°	12.63	16.60

90°	38.63	54.77
100°	41.59	59.48

(Poggiale, *Ann. Ch. et Phys.*, (3.) **8.** 468.)

III.) *Bi*Carbonate of Soda. Permanent. $NaO, 2 CO_2$ Soluble in 13 pts. of cold water, decomposed by boiling water. (V. Rose.) Soluble in 8 pts. of cold water (Berthollet); in 10 pts. of water at ordinary temperature (Dumas, *Tr.*); in 13.33 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) 100 pts. of water at 17.7° dissolve 9.33 pts. of it. [T.]

At °C.	100 pts. of water dissolve pts. of the theoretical anhydrous salt $NaO, 2 CO_2$.	of the cryst. salt $NaO, HO, 2 CO_2$
0°	7.92	8.95
10°	8.88	10.04
20°	9.84	11.15

50°	12.72	14.45
60°	13.68	15.57
70°	14.64	16.69

Since it is decomposed at about 70°, the solubility above that temperature cannot be studied. (Poggiale, *Ann. Ch. et Phys.*, (3.) **8.** pp. 468, 475.)

Carbonate of Soda & *of sesquioxide* of Uranium. Soluble in water. (Ebelmen, *Ann. Ch. et Phys.*, (3.) **5.** 206.) Soluble in aqueous solutions of carbonate and bicarbonate of soda; after standing for some time a precipitate forms in the solution in the carbonate, but not in that of the bicarbonate. (H. Rose, *Tr.*)

Carbonate of Soda & of Yttria.

Carbonate of Soda & of Zinc. Insoluble $3 (NaO, CO_2); 8 (ZnO, CO_2) + 8 Aq$ in water, but is decomposed by water. (Wœhler.) Less readily decomposed by water than most of the double carbonates. (H. Deville, *Ann. Ch. et Phys.*, (3.) **33.** 101.)

Carbonate of Soda with Phosphate of Soda. $NaO, CO_2; 3 (2 NaO, HO, PO_5) + 40 Aq$ Permanent. Tolerably easily soluble in water. (T. Thomson, in his *First Principles*, **2.** 451; and in his *System of Chem.*, London, 1831, **2.** 804.)

Carbonate of Soda with Tartrate of Alumina. NaO, CO_2; 1 "tartrate of alumina" $+ 9 Aq$ When solutions of carbonate of soda and tartrate of alumina are mixed in equivalent proportions, and the solution evaporated, the double salt crystallizes out in long transparent four-sided prisms. (T. Thomson, in his *First Principles*, **2.** 451; and in his *System of Chem.*, London, 1831, **2.** 804.)

Carbonate of StannEthyl. Insoluble in water.

Carbonate of Stib*di*Amyl. Soluble in $Sb (C_{10} H_{11})_2 O, CO_2$ ether, and alcohol.

Carbonate of Stib*tri*Ethyl. Soluble in $(C_4 H_5)_3 Sb O, CO_2$ water. (Merck.)

Carbonate of StibEthylium. Exceedingly deliquescent.

Carbonate of StibMethylEthylium. Soluble in water. $Sb (C_2 H_3) (C_4 H_5)_3 O, CO_2$ (Friedlænder.)

Carbonate of StibMethylium.

I.) *normal.* Deliquescent. Very soluble in water, and alcohol. Very sparingly soluble in ether.

II.) *bi.* Deliquescent. Very soluble in water, and alcohol. Insoluble in ether.

Carbonate of Strontia. Soluble in 18045 SrO, CO_2 pts. of water at ordinary temperatures, and in 56545 pts. of water containing ammonia and carbonate of ammonia. (Fresenius, *Ann. Ch. u. Pharm.*, 1846, **59.** 121.) Soluble in 12522 pts. of water at 15° (Kremers, *Pogg. Ann.*, **85.** 247); in about 33000 pts. of water. (Bineau, *C. R.*, **41.** 511.) 1000 pts. of water dissolve 0.01 pt. of carbonate of strontia. (Bineau, *Ann. Ch. et Phys.*, 1857, (3.) **51.** 299.) Sensibly less soluble in water than sulphate of strontia. (Dulong, *Ann. de Chim.*, **82.** 290.) Soluble in 1536 pts. of boiling water. (Hope, *Edinburgh Trans.*, **4.** 5. [T.].) Soluble in 850 [in 833 pts. at 10° (in *Gmelin*)] pts. of a saturated aqueous solution of carbonic acid (= 1 $SrO : 6 CO_2$). (Lassaigne, *J. Ch. Méd.*, **4.** 312; in *Berzelius's Jahresbericht*, **29.** 132.) Soluble in a boiling aqueous solution of chloride of ammonium, with evolution of ammonia. (Fuchs; Demarçay, *Ann. der Pharm.*, 1834, **11.** 251.) Soluble in a cold aqueous solution of chloride of ammonium. (Vogel, *J. pr. Chem.*, 1836, **7.** 455.) Easily soluble in a cold aqueous solution of chloride of ammonium, and an excess of ammonia produces no precipitate in this solution. (Brett, *Phil. Mag.*, 1837, (3.) **10.** pp. 96, 334.) Readily soluble in cold aqueous solutions of nitrate and succinate of ammonia, and of chloride of ammonium. Decomposed when boiled with solutions of ammoniacal salts.

Tolerably readily soluble in solutions of chloride of ammonium and of nitrate of ammonia, but is reprecipitated on the addition of ammonia and carbonate of ammonia more completely than carbonate of baryta. (Fresenius, *Quant.*, p. 127.) Soluble in an aqueous solution of normal citrate of soda. (Spiller.) Soluble in aqueous solutions of the salts of sesquioxide of iron, with precipitation of a basic iron salt; but few, if any, of the salts of R O oxides are thus decomposed by it in the cold, although on boiling it is dissolved by some of them. [Compare Carbonate of Lime, and of Baryta.] (Demarçay, *Ann. der Pharm.*, 1834, **11.** pp. 242, 244, 251.) It is partially decomposed when boiled with aqueous solutions of the sulphates of potash, soda, lime, ammonia, and magnesia; the phosphates of soda and ammonia; the sulphites of potash, soda, and ammonia; the phosphites of potash, soda, and ammonia; borate of soda; the arseniates of potash and soda; the oxalates of potash and ammonia; fluoride of sodium; and chromate of potash. With the ammonia salts the decomposition is complete. (Dulong, *Ann. de Chim.*, **82.** 286.) Only slightly decomposed by aqueous solutions of the sulphates of potash and soda. (Persoz, *Chim. Moléc.*, p. 385.)

When an equivalent of $Sr O, C O_2$ is boiled with an equivalent of $2 Na O, HO, P O_5$, 0.4412 of it may be decomposed. (Malaguti, *Ann. Ch. et Phys.*, (3.) **51.** 335.) It is not decomposed by a mixture of 1 pt. oil of vitriol and 6 pts. of absolute alcohol, nor by alcoholic solutions of racemic, tartaric, citric, or glacial acetic acids; but is immediately decomposed by a mixture of nitric acid and absolute alcohol, and is also acted upon by a solution of oxalic acid in absolute alcohol, although the oxalate which is formed is insoluble in the alcoholic mixture.

Carbonate of Strychnine. Soluble in carbonic acid water.

Carbonate of SulphEthyl. *Vid.* EthylSulphoCarbonate of Ethyl.

*Bi*Carbonate of *bi*Sulphide of Ethyl. (*Persulfure Ethyl sulphocarbonique* (of Gerhardt).) $C_{12} H_{10} O_8 S_4 = \begin{matrix} C_2 O_4 \\ C_2 O_4 \end{matrix} \left\{ \begin{matrix} C_4 H_5 S_2 \\ C_4 H_5 S_2 \end{matrix} \right.$ Insoluble in water. Readily soluble in alcohol, and ether. Miscible in all proportions with absolute alcohol, but its solubility decreases in proportion as water is added; spirit of 40% taking up but little of it. (Debus.)

*Bi*Carbonate of *bi*Sulphide of Ethyl & of *mono*Sulphide of Ethyl. $C_{12} H_{10} O_8 S_8 = \begin{matrix} C_2 O_4 \\ C_2 O_4 \end{matrix} \left\{ \begin{matrix} C_4 H_5 S_2 \\ C_4 H_5 S \end{matrix} \right.$ Insoluble in water. Soluble in alcohol, and ether. Insoluble in chlorhydric acid. Unacted upon by cold, decomposed by hot nitric acid. (Debus.)

Carbonate of Sulphide of Ethyl & of *X*. *Vid.* EthylSulphoCarbonate of *X*.

Carbonate of Tetryl. *Vid.* Carbonate of Butyl.

Carbonate of Thoria.

I.) *basic.* Insoluble in water, or carbonic acid water. Soluble in aqueous solutions of the alkaline carbonates, tolerably easily if these solutions are concentrated, but difficultly when they are very dilute. [Compare Oxide of Thorium (II.) hydrated).]

Carbonate of Tin. $2 Sn O, C O_2$ Decomposes when exposed to the air. Insoluble in water. (H. Deville.) Insoluble in carbonic acid water. (Bergman, *Essays*, **1.** 55.)

Carbonate *of sesquioxide* of Uranium. Insoluble in water. Soluble in carbonic acid water. (Brande.)

Carbonate of Urea. (*Allophanic Acid.*) $C_4 H_4 N_2 O_6 = C_2 O_4 \left\{ \begin{matrix} N H_3 Cy O \\ H O \end{matrix} \right.$ Not isolated.

Carbonate of Veratrin. Insoluble in water. Soluble in alcohol, and ether. (Langlois, *Ann. Ch. et Phys.*, (3.) **48.** 504.)

Carbonate of Yttria. $Y O, C O_2 + 3 Aq$ Insoluble in water. Slightly soluble in carbonic acid water. (Gadolin.) Soluble in aqueous solutions of the alkaline carbonates; more soluble in a solution of carbonate of ammonia than in carbonate of potash. (Berlin.) More soluble than carbonate of ceria, but five or six times less soluble than carbonate of glucina, in a solution of carbonate of ammonia. (Vauquelin.) Slightly soluble in a large excess of a solution of carbonate of potash; completely soluble in a very large excess of bicarbonate of potash; carbonate of ammonia behaves in a similar manner, but in a saturated solution of carbonate of yttria in carbonate of ammonia a double salt precipitates itself after a time, and might easily lead one to believe that carbonate of yttria were insoluble in carbonate of ammonia. (H. Rose, *Tr.*) Gradually soluble in aqueous solutions of ammoniacal salts. (Berzelius, *Lehrb.*) Soluble in sulphurous acid. (Berthier, *Ann. Ch. et Phys.*, (3.) **7.** 75); and easily in the acids generally.

Carbonate of Zinc.

I.) *normal.* $Zn O, C O_2 + Aq$ Calculated as anhydrous, 1 pt. is soluble in 20895 pts. of water at 15°. (Kremers, *Pogg. Ann.*, **85.** 248.) Soluble in an aqueous solution of carbonate of ethylamin. (Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 483.) Easily soluble in acids. (De Senarmont.) Easily soluble in a warm aqueous solution of chloride of ammonium. (H. Rose, *Tr.*) Carbonate of zinc is not precipitated from solutions containing a soluble citrate. (Spiller.) Soluble in a solution of caustic potash.

All the carbonates of zinc are soluble in carbonic acid water. (Jahn.)

II.) *di.*
$2 Zn O, C O_2 + 2 Aq$

III.) $5 Zn O, 2 C O_2 + 3 Aq$ Dissolves in from 2000 to 3000 pts. of water, but separates out when the solution is heated, and does not redissolve on cooling. (Schindler.) Soluble in 44642 pts. of water at ordinary temperatures. (Fresenius, *Ann. Ch. u. Pharm.*, **59.** 126.) Easily soluble in solutions of potash, soda, ammonia, and carbonate of ammonia, also in acids. When the solution in potash or soda is boiled it is not altered if it be concentrated, but if it is dilute almost all the oxide of zinc will separate out. The ammoniacal solution also, and that in carbonate of ammonia, deposits oxide of zinc when boiled, especially when dilute. Somewhat soluble in solutions of the alkaline bicarbonates, also soluble in solutions of ammoniacal salts. (Fresenius, *Quant.*, pp. 133, 759.) Soluble in a boiling aqueous solution of chloride of ammonium, with evolution of ammonia. (Fuchs; Demarçay, *Ann. der Pharm.*, 1834, **11.** 251.) Soluble even in a cold aqueous solution of chloride of ammonium, and also, though somewhat less perfectly, in a solution of nitrate of ammonia (Brett, *Phil. Mag.*, 1837, (3.) **10.** 97; Wittstein); a free evolution occurring when the mixture is boiled. (L. Thompson, *Phil. Mag.*, (3.) **10.** 179.) Soluble in aqueous solutions of the salts of sesquioxide of iron with evolution of carbonic acid and precipitation of sesquioxide of iron. [Compare Carbonate of Lime.] (Fuchs, *Schweigger's Journ. für Ch. u. Phys.*, 1831, **62.** 193.) Insoluble in aqueous solutions of the monocarbonates of potash or soda. (Compare Ebelmen, *Ann. Ch. et Phys.*, (3.) **5.** 220.) A solution of carbonate of potash produces a precipitate in solutions of sulphate of zinc in presence of 10000 pts. of water, and even in presence of 20000 pts. of water after a time. (Lassaigne.) Soluble in 1428 pts. of a saturated aqueous solution of carbonic acid. (Lassaigne, *J. Ch. Méd.*, **4.** 312; in *Berzelius's J. B.*, **29.** 135.)

IV.) *tetra.*
$4ZnO, CO_2 + 2Aq$

V.) $8ZnO, CO_2 + 2Aq$

CARBONATE OF ZINC & OF ZINCAMMONIUM.

$ZnO, CO_2; N\left\{\begin{matrix}H_3\\Zn\end{matrix}\right.O, CO_2$ Decomposed by water, especially when this is boiling. (Deville.)

CARBONATE OF ZIRCONIA. Insoluble in water. $2Zr_2O_3, CO_2 + 6Aq$ Soluble in aqueous solutions of the alkaline carbonates, better in the bicarbonates, and of carbonate of ammonia, especially if the zirconium salt be added by degrees, and with agitation, to an excess of the carbonate. On boiling the saturated solution, hydrate of zirconia is precipitated, while carbonic acid is expelled. This precipitation by boiling is incomplete, however, unless ammonia be present, in which case carbonate of ammonia is expelled. (Berzelius, *Lehrb.*, **2.** 188.) Slightly soluble in a large excess of a solution of carbonate of potash; somewhat more readily soluble in bicarbonate of potash, the saturated solution becoming cloudy on boiling; also more readily soluble in carbonate of ammonia than in monocarbonate of potash, a gelatinous precipitate falling when the solution is boiled. (H. Rose, *Tr.*)

CARBONIC ETHER. *Vid.* Carbonate of Ethyl.

CARBONIC OXIDE. (*Carbonyl.*) CO, or C_2O_2 Soluble in 50 volumes of recently boiled water (Davy, Thomson); in 16 vols. (De Saussure); in 27 vols. of water. (Dalton, in his *New System*, **2.** 375; D. refers to his memoir in *Manchester Memoirs*, [N. S.] **1.** pp. 272, 436.)

1 vol. of water under a pressure of 0m.76 of mercury, at °C	Dissolves of carbonic oxide gas; vols. reduced to 0°C, and 0m.76 pressure of mercury.

1 vol. of alcohol under a pressure of 0m.76 of mercury at °C.	Dissolves of carbonic oxide gas; vols. reduced to 0°C. and 0m.76 pressure of mercury.
At all temperatures from 0° to 25°	0.20443

(Bunsen's *Gasometry*, pp. 147, 287, 128.)

At 18° and the ordinary pressure, 100 vols. of	Dissolve vols. of C O.
Water	6 2
Alcohol of 0.84 sp. gr.	14.5
Rectified naphtha of 0.784 sp. gr.	20.0
Oil of lavender (freshly distilled) of 0.88 sp. gr.	15.6
Olive oil of 0.915 sp. gr.	14.2
A saturated aqueous solution of chloride of potassium (containing 26% of K Cl) of 1.168 sp. gr.	5.2

(Th. de Saussure, *Gilbert's Ann. Phys.*, 1814, **47.** pp. 167, 169.)

1 vol. of oil of turpentine absorbs from 0.16 @ 0.2 vol. of it. (Saussure, in *Gm.*, **14.** 270.) Soluble in ether. (Regnault, *Phil. Mag.*, (4.) **9.** 16.) Insoluble in caoutchin. Carbonic oxide is almost insoluble in all known solvents, excepting solutions of the compounds of dinoxide of copper. 1 volume of a solution of dichloride of copper in chlorhydric acid can absorb even 15 @ 20 vols. of carbonic oxide. At boiling the solution retains only a trace of this gas. (Berthelot, *Ann. Ch. et Phys.*, (3.) **51.** 65.)

CARBONIC OXIDE with *di*CHLORIDE OF COPPER. *Vid.* Chloride of Carbonyl & of Copper.

CARBONIDSULFOSAURES ETHYL. *Vid.* *bi*Carbonate of *bi*Sulphide of Ethyl.

CARBONYL. *Vid.* Carbonic Oxide.

CARBONYLSULFOSÆURE. *Vid.* OxySulphoCarbonic Acid.

CARBOSTYRYL. Nearly insoluble in cold, tolerably readily soluble in boiling water; somewhat more soluble in chlorhydric acid. Easily soluble in alcohol, and ether. Soluble, without alteration, in warm concentrated sulphuric acid. Easily soluble in a solution of caustic potash. Insoluble in ammonia-water. (Chiozza.)

$C_{18}H_7NO_2 = N(C_{16}H_7)(CO)_2$, or $N\left\{\begin{matrix}C_{18}H_5O_2\\H_2\end{matrix}\right.$

CARBOSULPHAMID. *Vid.* *bi*Sulphide of SulphoCarb(onyl) ammonium.

CARBOTHIACETONIN. Not isolated.

C_4H_4''

Cardol. $C_{42}H_{30}O_4$ Insoluble in water. Readily soluble in alcohol, and ether. Soluble in concentrated sulphuric acid. (Stædeler.)

Carminic Acid. (*Carmin.*) $C_{28}H_{14}O_{16}$ Soluble in all proportions in water, alcohol, and a mixture of alcohol and ether; but only sparingly soluble in pure ether.

Very much less soluble in a solution of chloride of sodium than in pure water. (Robinet, cited in *Schweigger's Journ. für Ch. u. Phys.*, 1825, **45**. 241.) Soluble, without alteration, in chlorhydric and sulphuric acids. Decomposed by nitric acid. (W. De la Rue.)

Carminate of Copper. Ppt.
$C_{28}H_{13}CuO_{16} + Aq$

Carmin (coloring matter of Cochineal). *Vid.* Carminic Acid.

"Carmin (blue)". *Vid.* SulphIndigotate of Potash.

Carmufellic Acid. $C_{24}H_{20}O_{32} = C_{24}H_{19}O_{31}, HO$ Insoluble in cold, sparingly soluble in boiling water. Insoluble in alcohol or ether. Is not attacked by cold concentrated sulphuric acid. Soluble in aqueous solutions of caustic potash and ammonia. (Muspratt & Danson.)

Carmufellate of Baryta. $C_{24}H_{19}BaO_{32} + Aq$ Barely soluble in water. Abundantly soluble in chlorhydric and nitric acids. (M. & D.)

Carmufellate of Copper (CuO). Ppt.

Carmufellate of Iron ($FeO, \& Fe_2O_3$). Ppts.

Carmufellate of Lead. $C_{24}H_{19}PbO_{32} + Aq$ Almost insoluble in water, but dissolves in nitric acid.

Carmufellate of Lime. Ppt.

Carmufellate of Silver. Ppt.

Carmufellate of Strontia. Ppt.

Carotin. $C_{36}H_{24}O_2$ Permanent. Insoluble in water. Soluble in alcohol or ether only when contaminated with an oil which occurs with it. Insoluble in acetic acid or in alkaline solutions. Easily soluble in fatty and essential oils. (Wackenroder.) Completely insoluble in water. After having been purified from an oil which occurs with it in the carrot-root it is almost insoluble in alcohol, and wood-spirit. When pure it is very sparingly soluble in ether, and acetone; but more readily soluble in ether when the oil is present. Abundantly soluble in bisulphide of carbon, from which it may be precipitated by adding absolute alcohol. After having been fused, carotin dissolves with tolerable facility in alcohol, and ether, but it no longer crystallizes from these solutions. (Zeise, *Ann. Ch. et Phys.*, (3.) **20**. 125.)

Insoluble in water. When pure it is not completely insoluble in absolute alcohol. Much more soluble in alcohol when contaminated with hydrocarotin or amorphous carotin. Besides bisulphide of carbon, it is easily soluble in benzin, and essential oils. Also slowly soluble in cold fatty oils. But is difficultly soluble in ether, chloroform, and alcohol. When exposed to daylight, carotin gradually loses its color, and after having been thus bleached is only very difficultly soluble in bisulphide of carbon, and benzin, but is easily soluble in alcohol, and ether. A similar change is produced by heat. (Husemann, *Ann. Ch. u. Pharm.*, 1861, **117**. 216.)

Carotine *chlorée*. *Vid.* ChloroCarotin.

Carthagin. Insoluble in water. Soluble in alcohol. (Parrish's *Pharm.*, p. 408.)

Carthamin (from *Carthamus tinctorius*).

a.) *Yellow principle.* Soluble in water and in weak acids.

ditto with Oxide of Lead.
$C_{16}H_{10}O_{10}, 3PbO$

b.) *Red principle* (*the true Carthamin*). (*Carthamic Acid.*) $C_{28}H_{16}O_{14}$ Insoluble in water, dilute acids, or oils. Sparingly soluble in alcohol, and less so in ether. Readily soluble in dilute alkaline solutions, even in baryta-water.

Little soluble in water. Soluble in alcohol. Insoluble in ether.

Carvacrol. (*Camphocreosote.*) $C_{20}H_{14}O_2$ Slightly soluble in water. Easily soluble in alcohol, ether, and an aqueous solution of caustic potash. Concentrated sulphuric acid precipitates it from the aqueous solution. (Schweitzer.)

Carvene. $C_{20}H_{16}$ Difficultly soluble in water. Easily soluble in alcohol, and ether. (Schweitzer.)

Carvol. $C_{20}H_{14}O_2$ Insoluble, or but sparingly soluble, in water.

Caryophyllin. $C_{20}H_{16}O_2$ Insoluble in water, even when this is boiling. Sparingly soluble in cold, easily soluble in boiling alcohol, and ether. (Bonastre.) Soluble in oil of turpentine; less easily in rock-oil. (Jahn.) Sparingly soluble in strong acetic acid. Insoluble in dilute mineral acids or in aqueous solutions of caustic or carbonated potash or ammonia. (Mylius.) Sparingly soluble in an aqueous solution of caustic soda, and somewhat more readily in caustic potash. (Bonastre.) Soluble in cold concentrated sulphuric acid. (Bonastre.)

Caryophillite of Potash. Soluble in absolute alcohol. The metallic caryophillites are insoluble. (Playfair, *Rep. Br. Assoc.*, 1842, p. 36.)

Cascarillin (from the bark of *Croton Eleuteria*). Very sparingly soluble in water. More readily soluble in alcohol, and ether. Soluble in chlorhydric acid; and in concentrated sulphuric acid, from which it is precipitated by water.

Caseic Oxide. *Vid.* Leucin.

Casein. Some chemists admit two modifications: one soluble, the other insoluble, in water. But soluble casein has never been obtained free from alkali.

a.) *Insoluble casein.* Insoluble in water, alcohol, or ether. Easily soluble in a solution of caustic potash; the solution undergoing decomposition when boiled. Soluble in solutions of carbonate of soda and of diphosphate of soda; also easily soluble in solutions of chloride of sodium, chloride of ammonium, nitrate of potash, &c.

Soluble in cold concentrated chlorhydric acid. (Caventou, *Ann. Ch. et Phys.*, (3.) **8**. 326.)

β.) *Soluble casein.* Soluble in water, the solution not coagulating when heated. After having been dried, casein does not redissolve entirely in water. But when heated with water under pressure it dissolves entirely, with decomposition. (Hlaziwetz.) Insoluble in absolute alcohol; partially soluble in weak alcohol, especially on boiling. (Compare Dumas & Cahours, *Ann. Ch. et Phys.*, (3.) **6**. pp. 417, 390.) Moist casein dissolves completely in water containing $\frac{1}{2000}$ of chlorhydric acid. All the acids, even acetic and lactic, precipitate casein from its aqueous solution, but these precipitates redissolve in an excess of acid. All the soluble earthy and metallic salts precipitate casein solutions, but chloride of calcium, sulphate of lime, acetate of lime, and sulphate of magnesia produce precipitates only when the mixed solutions are heated.

Casein with Lime. Insoluble in water.

Casein with *protoxide of* Mercury. Soluble in alcohol and in acetic acid.

Cassin (from *Cassia fistula*).

Castin (from the seeds of *Vitex Agnus castus*). Sparingly soluble in water. Partially soluble in acetic acid. Soluble in alcohol, and ether. (Landerer.)

Castorin. Insoluble in cold water. Sparingly soluble in cold, more soluble in hot alcohol. Readily soluble in ether. Soluble in warm volatile oils.

Soluble in 100 pts. of boiling alcohol. Insoluble in cold alcohol. Soluble in volatile oils. (Parrish's *Pharm.*, p. 425.)

Catechin. (*Catechuic Acid. Catechucic Acid. Tanningenic Acid.*) $C_{34}H_{18}O_{14} + 6\,Aq$

Soluble in boiling, nearly insoluble in cold water Soluble in 1133 pts. of water at 17°, and in 2 @ 3 pts. at the temperature of boiling. Dry catechin mixed with 2 pts. of cold water swells up to a thick pulp, which at 80° forms a clear solution. (Wackenroder.) Soluble in 16000 pts. of water at 5°, and in 3 @ 4 pts. at boiling. (Buechner.) Soluble in 5 @ 6 pts. of cold, and in 2 @ 3 pts. of boiling alcohol (Wackenroder); in 120 pts. of cold, and in 2 @ 3 pts. of boiling alcohol; and in 7 @ 8 pts. of boiling ether (Buechner); in 120 pts. of cold, and in 7 @ 8 pts. of boiling ether. (Wackenroder.) Insoluble in oil of turpentine. Soluble, without alteration, in acetic acid. Decomposed by concentrated acids, but is soluble, without decomposition, in dilute sulphuric, and hot dilute chlorhydric acid. Soluble, without immediate decomposition, in aqueous solutions of the caustic alkalies and of ammonia.

Catechin with Barium. Insoluble in water. (Svanberg.)

Catechin with *bi*Chromate of Potash. Insoluble in water and in chlorhydric acid. (Wackenroder.) Soluble in chlorhydric acid. (Deltfs.)

Catechin with Copper ($Cu\,O$). Ppt.

Catechin with *ter*Oxide of Gold. Sparingly soluble in water.

Catechin with *prot*Oxide of Iron. Ppt. Soluble in acetic acid.

Catechin with *per*Oxide of Iron. Ppt.

Catechin with Lead.

I.) "$C_{14}H_6O_6, Pb\,O$" Sparingly soluble in water. (Svanberg.)

II.) "$C_{14}H_6O_6, 2\,Pb\,O + Aq$" Insoluble in water. (Hagen.)

Catechin with *din*Oxide of Mercury. Ppt.

Catechin with *prot*Oxide of Mercury. Ppt. Soluble in acetic acid, and in an aqueous solution of chloride of sodium. (Wackenroder)

Catechin with *bin*Oxide of Platinum.

Catechu. (The dried aqueous extract of several tropical trees.) Partially soluble in cold water. Almost entirely soluble in boiling water and in alcohol.

Catechucic Acid. }
Catechuic Acid. } *Vid.* Catechin.

CatechuTannic Acid. *Vid.* MimoTannic Acid.

Cathartin. Hygroscopic. Soluble in water, and alcohol. Insoluble in ether. Decomposed by alkaline solutions. The cathartin of Winckler is now thought to have been impure chrysophanic acid.

Caulophyllin. (From the root of *Caulophyllum thalictroides.*) Partially soluble in water; more soluble in alcohol. Completely soluble in an aqueous or alcoholic solution of ammonia. Insoluble in ether. (Parrish's *Pharm.*, p. 194.)

Cautschin, &c. *Vid.* Caoutchin.

Cedrene. $C_{30}H_{24}$ More soluble in alcohol than the solid body ($C_{30}H_{26}O_2$), which occurs with it in oil of juniper.

Cedrin (from the seeds of *Simaba cedron*). Soluble in alcohol. Insoluble in ether. (Lewy.)

Cedriret. Insoluble in water, alcohol, or ether. Soluble in creosote, in concentrated sulphuric acid, and in an aqueous solution of caustic potash. Also somewhat soluble in an aqueous solution of acetate of potash. (Reichenbach.)

Cellulose. $C_{12}H_{10}O_{10}$ Insoluble in cold water, in alcohol, ether, or the oils. Many samples of it may be disaggregated, with formation of dextrin, by boiling with water; but the more compact varieties are capable of resisting for a long time the action of boiling water and of many other more energetic agents.

Soluble at ordinary temperatures in an aqueous solution of ammoniacal oxide of copper (prepared by dissolving basic hyposulphate or basic sulphate of copper in a concentrated solution of ammonia). Paper and linen dissolve more slowly than cotton. (Schweizer.) The solution of ammoniacal oxide of copper is a more effective solvent of cellulose when recently prepared; after having been repeatedly exposed to the air it is less efficacious. (C. Cramer.) The solvent power of the solution is also often lost when it is preserved in carefully closed vessels. (Schweizer.) In presence of salts the power of ammoniacal oxide of copper to dissolve cellulose (or to cause it to swell up to a thin emulsion) is very much diminished; a clear solution of cellulose being immediately precipitated on the addition of a strong solution of an alkaline salt. A solution of honey, of gum arabic, or of dextrin also produces immediate and complete precipitation. When a clear concentrated solution of cellulose is largely diluted with water it becomes cloudy and deposits flocks. Cellulose is not precipitated from its solution by chloroform or ether (neither of which are miscible therewith) nor by a concentrated solution of urea; but it is precipitated by alcohol. In order that the solvent should be effective it should contain a large quantity of oxide of copper. (Schlossberger.) Schlossberger prepares the solvent by dissolving recently precipitated and well-washed hydrate of copper in strong ammonia-water. Peligot prepares it by causing ammonia-water to trickle over copper turnings exposed to the air; the solution obtained dissolves a weight of cellulose about equal to that of the copper which it contains; when treated with this solution, cotton is first converted into a thick jelly, which disappears on agitation. On the addition of an acid the cellulose is reprecipitated as an amorphous mass.

Cellulose is insoluble in an aqueous solution of ammonio-oxide of nickel. (Schlossberger.)

Concentrated acids, like sulphuric or chlorhydric, dissolve cotton after having first reduced it to a pulpy condition; from the recent solution it can be separated as a matter insoluble in hot or cold water. After longer action of sulphuric acid the cellulose may be separated as a gelatinous mass soluble in cold water ("soluble lignin"); and by still longer continued action of the acid the cellulose is changed to a variety of dextrin, and finally to sugar. (Bèchamp, *Ann. Ch. et Phys.*, (3.) **48.** 458.) Very concentrated sulphuric acid is an excellent solvent of cellulose; dissolving it quickly and with the greatest facility. In this solution, when recently prepared, water occasions a precipitate, but after the solution has been allowed to stand for a day or two no precipitate is produced on the addition of water, the cellulose having been entirely converted into glucose. When cellulose is boiled for a long time in water acidulated with a few hundredths of chlorhydric or sulphuric acids, it is transformed into sugar. When a mixture of cellulose and caustic potash is heated to 160° and then treated with an acid, a substance, having the composition and general properties of cellulose, is precipitated. It is, however, soluble both in cold and in warm alkaline solutions. (Pelouze.) Concentrated phosphoric acid slowly disaggregates it in the cold.

Centaurin. *Vid.* Cnicin.

Cerain. (*Unsaponifiable portion of Beeswax.*) Difficultly soluble in ether or oil of turpentine; and still more difficultly soluble in alcohol. (Boudet & Boissenot, Ettling.)

Cerainic Acid (of Hess). $C_{20}H_{20}O_3$ Soluble in alcohol, and still more readily in ether. Easily soluble, with combination, in aqueous solutions of the caustic alkalies.

Cerasin. *Vid.* Bassorin, under Gum Bassora.

Cerealin. Easily soluble in water. Insoluble in alcohol, ether, or oils. The aqueous solution coagulates when heated to 75°. (Mège-Mouriès.)

Ceric Acid. (*From action of NO_5 on Cork wax.*) $C_{42}H_{33}O_{12}, HO$ Insoluble in water. Soluble in alcohol. Easily soluble in aqueous solutions of caustic potash and ammonia. (Dœpping.)

Cerate of Lead. Ppt.

Cerebric Acid. (*Cerebrin.*) $C_{34}H_{33}NO_0$ Insoluble in water, but swells up to an emulsion in hot water. Readily soluble in boiling, less soluble in cold alcohol. Almost insoluble in cold, more soluble in boiling ether. Soluble in cold concentrated sulphuric acid, the solution being precipitated on the addition of water.

Cerebrate of Ammonia. Almost insoluble in alcohol.

Cerebrate of Baryta. } Form emulsions
Cerebrate of Lime. } with water.

Cerebrate of Potash. } Almost insoluble
Cerebrate of Soda. } in alcohol.

Cerebrate of Strontia. Forms an emulsion with water.

Cerinic Acid (from Beeswax). Very sparingly soluble in ordinary alcohol, and in ether; more readily soluble in absolute alcohol. (Lewy, *Ann. Ch. et Phys.*, (3.) **13.** 444.)

Cerin. *Vid.* Cerotic Acid; also Wax of Cork.

Cerium. Ce Slowly oxidized by water at the ordinary temperature, more rapidly on boiling. Easily soluble in dilute acids. (Mosander.)

Cerolein. Very soluble in cold alcohol, and ether. (Lewy, *Ann. Ch. et Phys.*, (3.) **13.** 444.)

Cerosic Acid. $C_{48}H_{48}O_3$ Insoluble in water. Very sparingly soluble in boiling alcohol or ether. Soluble in naphtha. (Lewy, *Ann. Ch. et Phys.*, (3.) **13.** 556.)

Cerosate of Baryta. Insoluble in boiling alcohol. (Lewy.)

Cerosin. (*Cerosie. Wax of the Sugarcane. Aldehyde of Cerosic Acid.*) $C_{48}H_{48}O_2$ Insoluble in water, or in cold alcohol. Easily soluble in boiling alcohol, the solution solidifying to a stiff emulsion on cooling. Insoluble in cold, difficultly soluble in boiling ether. (Avequin.) Insoluble in cold, very soluble in boiling alcohol. Insoluble in cold, difficultly soluble in hot ether. Soluble, with combination, in concentrated sulphuric acid, forming sulphocerosic acid, the baryta salt of which is very soluble in water. (Lewy, *Ann. Ch. et Phys.*, (3.) **13.** 448.)

Cerotic Acid. (*Cerin(of Beeswax).*) $C_{54}H_{54}O_4 = C_{54}H_{53}O_3, HO$ Soluble in boiling, less soluble in cold alcohol. Soluble in ether. (Lewy, *Ann. Ch. et Phys.*, (3.) **13.** 444.) Insoluble in water.

Soluble in 16 pts. of boiling alcohol, from which it separates out again, almost entirely, as the solution cools. Soluble in 42 pts. of cold absolute ether. (John.?) Soluble in creosote. (Reichenbach.)

Cerotate of Ceryl. (*Wax of China.*) $C_{108}H_{108}O_4 = C_{54}H_{53}(C_{54}H_{55})O_4$ Very sparingly soluble in boiling alcohol, and ether. Easily soluble in naphtha. (Lewy, *Ann. Ch. et Phys.*, (3.) **13.** 445.) Soluble in a mixture of alcohol and naphtha.

Cerotate of Ethyl. $C_{58}H_{58}O_4 = C_{54}H_{53}(C_4H_5)O_4$

Cerotate of Lead. $C_{54}H_{53}PbO_4$ Insoluble in boiling alcohol.

Cerotate of Potash. Soluble in boiling water.

Cerotate of Silver. $C_{54}H_{53}AgO_4$ Insolnble in water.

Cerotene. (*Paraffin.*) $C_{54}H_{54}$ Soluble in ether, and benzin.

Cerotyl. $C_{54}H_{53}O_2$ Not isolated.

Ceroxylin. (*Resin from the wax of the palm-tree (Ceroxylon andicola).*) $C_{20}H_{16}O$ Easily soluble in alcohol, ether, and the essential oils. More soluble than palm wax in alcohol. (Boussingault.)

Ceryl. Not isolated.

Cetene. $C_{32}H_{32}''$ Insoluble in water. Readily soluble in alcohol, and ether. (Dumas & Peligot.) Soluble in ether. (Lawrence Smith, *Ann. Ch. et Phys.*, (3.) **6.** 52.)

Cetin. *Vid.* Palmitate of Cetyl.

Cetraric Acid. (*Cetrarin.*) $C_{30}H_{10}O_{10}$ Permanent. 100 pts. of absolute alcohol dissolve 0.28 pt. of it at 14°, and 1.70 pts. at the temperature of boiling. Alcohol of 0.83 dissolves 0.04 pt. of it at 14°, 0.28 pt. at 25°, and 0.44 pt. at the temperature of boiling. It is still less soluble in boiling or cold water, bisulphide of carbon, etherol, creosote, etc., but more soluble in acetate of ethyl, and especially in ether, 100 pts. of which dissolve 0.57 pt. of it at 14°, and 0.93 pt. at the temperature of boiling; these proportions refer to anhydrous ether, for ordinary ether dissolves only 0.5 pt. of it at 14°, and 0.87 pt. at boiling. Insoluble in fatty oils. Exceedingly easily soluble in aqueous alkaline solutions. Dilute acids precipitate it from its solutions, though not completely. Decomposed by concentrated acids. (Herberger, *Ann. der Pharm.*, 1837, **21.** pp. 139 – 141.) Insoluble in essential oils or in naphtha. Almost insoluble in cold water. Decomposed by boiling with water. Difficultly soluble in cold alcohol. Easily soluble in strong boiling alcohol. Sparingly soluble in ether. (Knop & Schnedermann.)

Cetrarate of Ammonia. Soluble in water, and alcohol. (Herberger, *loc. cit.*, p. 141.)

Cetrarate of Cadmium. Ppt., in alcohol. (Herberger.)

Cetrarate of Cobalt. Ppt., in alcohol. (Herberger.)

Cetrarate of Copper. Ppt. (Herberger.)

Cetrarate of Iron. Ppt. (Herberger.)

Cetrarate of Lead. Insoluble in water. $C_{36}H_{14}Pb_2O_{16}$ (Knop & Schnedermann.)

Cetrarate of Manganese. Ppt., in alcohol. (Herberger.)

Cetrarate of Mercury (HgO). Appears to be soluble in alcohol. (Herberger.)

Cetrarate of Mercury (Hg_2O). Ppt., in alcohol. (Herberger.)

Cetrarate of Nickel. Ppt., in alcohol. (Herberger.)

Cetrarate of Silver. Ppt. (Herberger.)

Cetrarate of Zinc. Ppt., in alcohol. (Herberger.)

Cetrarin-Blue. Slightly soluble in water, alcohol, or the like. Decomposed by alkalies. Soluble in concentrated sulphuric and nitric acids, from which it may be reprecipitated almost unchanged by water, if this be added immediately. (Herberger, *Ann. der Pharm.*, 1837, **21.** 140.)

Cetyl. Not isolated.
$C_{32}H_{33}$

CetylAldehyde. *Vid.* Hydride of Palmityl.

***Tri*CetylAmin.** Insoluble in water. Soluble in boiling alcohol. Soluble in ether.
(*Nitride of Cetyl.*)
$C_{96}H_{90}N = N\left\{(C_{32}H_{33})_3\right.$
Its salts are insoluble in water, but soluble in warm ether, and alcohol.

CetylAnilin. Insoluble in water. Readily soluble in alcohol, and ether.
(*Cetyl Phenylamin.*)
$C_{44}H_{39}N = N\left\{\begin{matrix}C_{12}H_5\\C_{32}H_{33}\\H\end{matrix}\right.$

***Di*CetylAnilin.** Sparingly soluble in boiling, less soluble in cold alcohol.
$C_{76}H_{71}N = N\left\{\begin{matrix}C_{12}H_5\\(C_{32}H_{33})_2\end{matrix}\right.$

Cetylate of *X*. *Vid.* Oxide of Cetyl & of *X*.

CetylPhenylamin. *Vid.* CetylAnilin.

Cetyl*di*SulphoCarbonic Acid. *Vid.* OxySulphoCarbonate of Cetyl.

Cetyl*di*SulphoCarbonate of *X*. *Vid.* OxySulphoCarbonate of Cetyl & of *X*.

CetylSulphuric Acid. Soluble in alcohol.
(*Sulphacetic Acid.*)
$C_{32}H_{34}S_2O_8 = C_{32}H_{33}O, HO, S_2O_6$

CetylSulphate of Potash. Soluble in absolute alcohol. Tolerably soluble in hot alcohol; less easily soluble in hot water. Insoluble in ether. (Kœhler.)
$C_{32}H_{33}KS_2O_8 + 2\,Aq$

Cevadic Acid. Soluble in water, alcohol, and ether.

Chærophyllin (from the seeds of *Chærophyllum bulbosum*).

Chelerythrin. Identical with Sanguinarin, *q. v.* (Schiel, *Am. J. Sci.*, (2.) **20.** 220.)

Chelidonic Acid. Efflorescent. After having been dried at 100°, 1 pt. of the acid is soluble in 166 pts. of water at 8°, and in about 26 pts. at the temperature of boiling; the hot solution solidifying on cooling. (Probst, *Ann. der Pharm.*, 1839, **29.** 116.) Sparingly soluble in cold, but very much more soluble in hot water; the hot aqueous solution solidifying on cooling. More abundantly soluble in chlorhydric and sulphuric acids than in water. (Lerch.) Soluble in 709 pts. of alcohol, of 75° Richter, at 22°. (Probst, *Ann. der Pharm.*, **29.** 116.) Soluble, without alteration, in concentrated sulphuric acid; the solution undergoing decomposition when boiled. Scarcely at all attacked by concentrated nitric acid. Chelidonic acid forms three series of salts: those with one equivalent of metal (acid) are the least stable; most of those with two equivalents of metal are soluble in water; those of three equivalents of metal are difficultly soluble or insoluble in water, excepting the alkaline salts, which are very soluble. They are decomposed by long-continued contact with water.
$C_{14}H_4O_{12} + 2\,Aq \;\&\; 3\,Aq = C_{14}HO_9, 3HO + 2\,Aq \;\&\; 3\,Aq$

Chelidonate of Ammonia.

I.) *di.* Efflorescent. Soluble in water; but is decomposed by repeated evaporation and solution. (Lerch.) Easily soluble in water. (Probst, *Ann. der Pharm.*, **29.** 119.)
$C_{14}H_2(NH_4)_2O_{12} + 4\,Aq$

Chelidonate of Baryta.

I.) *peracid.*
$C_{14}H_3BaO_{12}; C_{14}H_4O_{12} + 4\,Aq$

II.) *di.* Very sparingly soluble in water. (Lerch.)
$C_{14}H_2Ba_2O_{12} + 2\,Aq$

III.) *tri*, or *normal.* Sparingly soluble in water. Insoluble in alcohol. (Lerch.)
$C_{14}HBa_3O_{12} + 6\,Aq$

Chelidonate of Copper. Difficultly soluble in water. (Probst, *Ann. der Pharm.*, **29.** 120.)

Chelidonate *of protoxide* of Iron. Soluble in water, but is quickly oxidized when exposed to the air.

Chelidonate *of sesquioxide* of Iron. Insoluble in water. Somewhat soluble in acetic acid, and in an aqueous solution of sesquichloride of iron. (Lerch.)
$C_{14}HFe_2'''O_{12} + Aq$

Chelidonate of Lead.

I.) *di.* Insoluble, or very sparingly soluble, in water. Very sparingly soluble in dilute nitric acid. Easily soluble in strong nitric acid, and in solutions of the other lead salts. (Lerch.)
$C_{14}H_2Pb_2O_{12} + 2\,Aq$

II.) *tri*, or *normal.* Insoluble in water or alcohol. Soluble in solutions of the other lead salts. (Lerch.)
$C_{14}HPb_3O_{12}$

III.) *basic.* Ppt.
$C_{14}HPb_3O_{12}; 3\,PbO$

Chelidonate of Lime.

I.) *peracid.* Soluble in chlorhydric acid.
$C_{14}H_3CaO_{12}. C_{14}H_4O_{12} + 4\,Aq$

II.) *di.* Permanent. Rather difficultly soluble in water, more easily soluble in hot than in cold. Also soluble in spirit, especially when this is dilute. (Probst, *Ann. der Pharm.*, **29.** 119; Lerch.) Insoluble in absolute alcohol. (Lerch.)
$C_{14}H_2Ca_2O_{12} + 6\,Aq$

III.) *tri*, or *normal*. $C_{14}HCa_3O_{12}+6Aq$ Very sparingly soluble in water. Insoluble in alcohol. (Lerch.)

Chelidonate of Lime & of Potash.

Chelidonate of Lime & of Silver. $C_{14}HCaAg_2O_{12}+Aq$ Decomposed when boiled for a long time with water.

Chelidonate of Magnesia. Efflorescent. After having been dried at 100° it is soluble in 79 pts. of water at 16°, and more readily in hot water. (Probst, *Ann. der Pharm.*, **29.** 120.)

Chelidonate of Potash.

I.) *di*. Very readily soluble in water. (Probst, *Ann. der Pharm.*, **29.** 119.)

II.) *tri*. Efflorescent. Soluble in water. Insoluble, or nearly insoluble, in alcohol.

Chelidonate of Sanguinarin. Soluble in water, and alcohol. (Probst, *Ann. der Pharm.*, **29.** 122.)

Chelidonate of Silver.

I.) *di*. $C_{14}H_2Ag_2O_{12}$ Permanent. Soluble in water, ammonia-water, and strong nitric acid, the last decomposes it when boiling. Insoluble in alcohol. (Lerch.)

II.) *tri*, or *normal*. Ppt.
$C_{14}HAg_3O_{12}$

Chelidonate of Soda.

I.) *mono*.
$C_{14}H_3NaO_{12}+4Aq$

II.) *di*. $C_{14}H_2Na_2O_{12}+\begin{cases}Aq\\3Aq\\5Aq\end{cases}$ Efflorescent. Readily soluble in cold or in hot water. 1 pt. of the salt dried at 100° is soluble in 15.5 pts. of water at 15°, and in far less hot water. (Probst, *Ann. der Pharm.*, **29.** 119.)

III.) *tri*. Resembles the potash-salt.

IV.) *peracid*.
$C_{14}H_3NaO_{12}, C_{14}H_4O_{12}+6Aq$

Chelidonate of Strontia. 1 pt. of the salt dried at 100° is soluble in 224 pts. of water at 16°, and in far less hot water. (Probst, *Ann. der Pharm.*, 1839, **29.** 119.)

Chelidonate of Zinc. 1 pt. of the salt dried at 100° is soluble in 146 pts. of water at 16°, and in far less hot water. (Probst, *Ann. der Pharm.*, **29.** 120.)

Chelidonin. $C_{40}H_{19}N_3O_6+2Aq=N_3\left\{C_{40}H_{19}O_6^{\text{ix}}\right.+2Aq$ Insoluble in water. Soluble in spirit, absolute alcohol, and ether. (Probst, *Ann. der Pharm.*, 1839, **29.** 123.) Since it requires much alcohol to dissolve it, it is better to employ acetic acid, from which solution it crystallizes out uncombined. (Probst., *loc. cit.*, p. 124.) Rather difficultly soluble in water; more easily soluble in ether, and very easily in spirit, and essential oils; also soluble in fatty oils. (Reuling, *Ann. der Pharm.*, 1839, **29.** 133.) The salts of Chelidonin are easily soluble in water; more difficultly soluble in absolute alcohol; and insoluble in anhydrous ether. (Reuling, *loc. cit.*, p. 134.)

ChelidoXanthin. Very difficultly soluble in cold water, requiring several hundred pts. of cold water for its solution, more easily soluble in hot water. Also difficultly soluble in alcohol; but more easily soluble in very dilute, than in concentrated alcohol. Insoluble in ether. Indifferent towards acids and alkalies. Soluble in concentrated sulphuric acid. (Probst, *Ann. der Pharm.*, 1839, **29.** 128.)

Chenocholic Acid.

Chenocholate of Soda. Deliquescent. Soluble in alcohol, and ether.

Chicoccic Acid. *Vid.* Quinovatic Acid.

Chinagerbsæure. *Vid.* KinoTannic Acid.

Chinasæure. *Vid.* Kinic Acid.

Chinese Green. *(Vegetable Green. Vert de Chine. Lo-Ka O.)* The coloring matter proper is almost insoluble in water, but may easily be suspended therein. It is insoluble in alcohol, ether, acetone, bisulphide of carbon, or the essential oils. Somewhat soluble in acetic acid, and dilute sulphuric, chlorhydric, and tartaric acids. Soluble in alkaline solutions.

Chinhydrone. *Vid.* Kinhydrone.

Chinic Acid. *Vid.* Kinic Acid.

Chinicin. *Vid.* Quinicin.

Chinidin. *Vid.* Quinidin.

Chinin. *Vid.* Quinine.

Chinoidin. *Vid.* Quinidin.

Chinolein. }
Chinolin. } Same as Quinolein, *q. v.*
Chinoilin. }

Chinonamid. *Vid.* Kinonamid.

Chinone. *Vid.* Kinone.

Chinoyl. *Vid.* Kinone.

Chitin. Insoluble in water, alcohol, and ether. Weak acids and alkalies exert no action upon it. Slowly disaggregated and dissolved, with combination, by boiling concentrated acids. (Fremy, *Ann. Ch. et Phys.*, (3.) **43.** 94.)

ChloCarbethamid. *Vid. ter*ChlorAcetamid.

ChlorAcetal. $C_{12}H_{13}ClO_4=\left.\begin{matrix}C_4H_3Cl''\\(C_4H_5)_2\end{matrix}\right\}O_4$ Insoluble in water. Soluble in alcohol. Unacted upon by a solution of potash. (Lieben, *Ann. Ch. et Phys.*, (3.) **52.** 319.)

*Bi*ChlorAcetal. $C_{12}H_{12}Cl_2O_4=\left.\begin{matrix}C_4H_2Cl_2''\\(C_4H_5)_2\end{matrix}\right\}O_4$ Insoluble in water. Soluble in alcohol. Unacted upon by a solution of potash. (Lieben, *loc. cit.*)

*Ter*ChlorAcetal. $C_{12}H_{11}Cl_3O_4=\left.\begin{matrix}C_4HCl_3''\\(C_4H_5)_2\end{matrix}\right\}O_4$ Insoluble in water. Soluble in alcohol.

ChlorAcetamic Acid. *Vid. quadri*ChlorAcetamid.

ChlorAcetamid. $C_4H_4ClNO_2=N\begin{cases}C_4H_2ClO_2\\H_2\end{cases}$ Soluble in 10 pts. of water at 24°; and in 10.5 pts. of alcohol at 24°. Very sparingly soluble in ether. (William, *Ann. Ch. et Phys.*, (3.) **49.** 99.)

*Ter*ChlorAcetamid. *(Cloro Carbethamid Chlor-Acetamid. Chlo Carbethamid.)* $C_4H_2Cl_3NO_2=N\begin{cases}C_4Cl_3O_2\\H_2\end{cases}$ Permanent. Very sparingly soluble in cold, more readily soluble in boiling water. Very soluble in alcohol and in ether. Soluble, with decomposition, in ammonia. (Malaguti, *Ann. Ch. et Phys.*, (3.) **16.** pp. 13, 58, 63, & 37, 73, 80.) Insoluble in water; tolerably soluble in alcohol; very easily soluble in ether. Soluble, with decomposition, in dilute nitric acid. Soluble, with decomposition, in ammonia, especially if this be hot. (Cloez, *Ann. Ch. et Phys.*, (3.) **17.** pp. 300, 305.)

*Quadri*ChlorAcetamid. *(ChlorAcetamic Acid.)* $C_4HCl_4NO_2=N\begin{cases}C_4Cl_3O_2\\Cl\\H\end{cases}$ Permanent. Insoluble in water. Tolerably readily soluble in alcohol, and wood-spirit. Very soluble in ether. Soluble in cold ammonia-water, and in solutions of the mineral alkalies, with combination. (Cloez, *Ann. Ch. et Phys.*, (3.) **17.** 306.)

***Quadri*ChlorAcetamid with Ammonia.** Soluble in water. (Cloez.)
(*ChlorAcetamate of Ammonia* (hydrated).)

***Quadri*ChlorAcetamid with Potash.** Soluble in water; the solution undergoing decomposition when boiled. (Cloez.)
(*ChlorAcetomate of Potash.*)

ChlorAcetic Acid. Deliquescent. Very easily soluble in water, with reduction of temperature. Its salts are mostly easily soluble in water.
$C_4 H_3 Cl O_4 = C_4 H_2 Cl O_3, H O$

ChlorAcetate of Ammonia. Deliquescent. More soluble in water than the potash salt.

ChlorAcetate of Baryta. Soluble in hot, very much less soluble in cold water.
$C_4 H_2 Cl Ba O_4 + 2 Aq$

ChlorAcetate of *per*ChlorEthyl ?.
(*Acetate d'éthyle serchloré. Sextichlorovinic Acetate.*)
$C_8 H_2 Cl_6 O_4 = C_4 H_2 Cl (C_4 Cl_5) O_4$

ChlorAcetate of ChloroMethylase. *Vid.* Acetate of *ter*ChloroMethyl.

ChlorAcetate of Ethyl. Insoluble in water. (R. Hoffmann, *Ann. Ch. u. Pharm.*, **102.** 1.)
$C_8 H_7 Cl O_4 = C_4 H_2 Cl (C_4 H_5) O_4$

ChlorAcetate of Potash.

I.) *normal.* Permanent. Very easily soluble in water. Soluble in absolute alcohol.
$C_4 H_2 Cl K O_4 + 3 Aq$

II.) *acid.* Sparingly soluble in water.
$C_4 H_2 Cl K O_4 ; C_4 H_3 Cl O_4$

ChlorAcetate of Silver. Sparingly soluble in cold, more readily in hot water. (Hoffmann.) Somewhat more soluble in water than the simple acetate. (Leblanc.)
$C_4 H_2 Cl Ag O_4$

***Bi*ChlorAcetate of Amyl.** *Vid.* Acetate of *bi*ChlorAmyl.

***Bi*ChlorAcetate of *per*ChlorEthyl.** Insoluble in water. Sparingly soluble in cold spirit. Very soluble in ether. (Leblanc, *Ann. Ch. et Phys.*, (3.) **10.** 209.)
(*Acetate d'éthyle septichloré. Septichlorovinic Acetate.*)
$C_8 H Cl_7 O_4 = C_4 H Cl_2 (C_4 Cl_5) O_4$

***Ter*ChlorAcetic Acid.** Very deliquescent. Very soluble in water. (Dumas.) Most of its metallic salts are soluble in water.
$C_4 H Cl_3 O_4 = C_4 Cl_3 O_3 . H O$

***Ter*ChlorAcetate of Ammonia.** Very soluble in water. (Malaguti.)
$C_4 Cl_3 (N H_4) O_4 + 4 Aq$

***Ter*ChlorAcetate of Baryta.** Very soluble in water. (Dumas.)

***Ter*ChlorAcetate of *per*ChlorEthyl.** Insoluble in water. Decomposed by absolute alcohol. (Malaguti.) Gradually decomposed by moist air and by water. Insoluble in concentrated sulphuric acid. Decomposed by strong alkaline solutions. (Leblanc, *Ann. Ch. et Phys.*, (3.) **10.** 201.)
(*PerChlorAcetic Ether. Acetate d'éthyle perchloré. PerChlorovinic Acetote.*)
$C_8 Cl_8 O_4 = C_4 Cl_3 (C_4 Cl_5) O_4$

***Ter*ChlorAcetate of *ter*ChloroMethyl.** Decomposed by water and by moist air; also decomposed by alcohol, wood-spirit, acids, and alkaline solutions. Appears to be identical with ChloroFormiate of perChloride of Ethyl. (Cloez, *Ann. Ch. et Phys.*, (3.) **17.** 312.)
(*Perchloroformic Ether. PerchloroMethylic Acetote. Perchlorovinic Formiate. Acetate de "Methylène" perchloré. Acetate de Methyl perchloré.*)
$C_6 Cl_6 O_4 = C_4 Cl_3 (C_2 Cl_3) O_4$

***Ter*ChlorAcetate of Ethyl.** Insoluble, or very sparingly soluble, in water.
$C_8 H_5 Cl_3 O_4 = C_4 Cl_3 (C_4 H_5) O_4$

***Ter*ChlorAcetate of Lime.** Very soluble in water.

***Ter*ChlorAcetate of Methyl.** Insoluble in water. Soluble in alcohol, and ether. (Dumas.)
$C_6 H_3 Cl_3 O_4 = C_4 Cl_3 (C_2 H_3) O_4$

***Ter*ChlorAcetate of Potash.** Permanent. Slightly hygroscopic in moist air. Soluble in water. (Dumas.)
$C_4 Cl_3 K O_4 + Aq$

***Ter*ChlorAcetate of Silver.** Sparingly soluble in water. (Dumas.)
$C_4 Cl_3 Ag O_4$

ChlorAcetene. Slowly soluble, with decomposition, in water. (Harnitz-Harnitzky.)
$C_4 H_3 Cl$

***Ter*ChlorAcetic Ether.** *Vid. ter*ChlorAcetate of Ethyl.

***Per*ChlorAcetic Ether.** *Vid. ter*ChlorAcetate of *per*ChlorEthyl.

ChlorAcetone. It does not mix immediately with water, but appears to dissolve in it slowly. It is more rapidly soluble, but with slight decomposition, in boiling water. (Riehe.)
$C_6 H_5 Cl O_2$

***Bi*ChlorAcetone.** Insoluble in water. Miscible in all proportions with alcohol, and ether. (Fittig.)
(*Mesitic Chloral. Xylitic Chloral is also probably identical with it.*)
$C_6 H_4 Cl_2 O_2$

***Ter*ChlorAcetone.**
$C_6 H_3 Cl_3 O_2$

***Quadri*ChlorAcetone.** Very soluble in water, alcohol, and ether. (Bouis, *Ann. Ch. et Phys.*, (3.) **21.** 116.) Melts at 35°.
$C_6 H_2 Cl_4 O_2 + 8 H O$

***Quinqui*ChlorAcetone.**

$a = C_6 H Cl_5 O_2$ Soluble in 10 vols. of water at 0°. When the aqueous solution, saturated at 0°, is gently heated, the quinquichloracetone separates out at 50°. This separation may also be brought about by the addition of chloride of sodium, or chloride of ammonium and other soluble salts. Soluble in all proportions in alcohol, and ether. (Stædeler.)

$b = C_6 H Cl_5 O_2 + 8 Aq$ Melts at 16°.

***Per*ChlorAcetone.**

$a = C_6 Cl_6 O_2$ Resembles the preceding compounds.

$b = C_6 Cl_6 O_2 + 2 Aq$ Melts at 15° @ 16°.

ChlorAcetonitril. *Vid.* Cyanide of *ter*ChloroMethyl.

ChlorAcetyl. *Vid.* Chloride of Acetyl.

***Ter*ChlorAcetyl.** Not isolated.
$C_4 Cl_3 O_2$

ChlorAcetylamid. *Vid.* ChlorAcetamid.

***Ter*ChlorAcetylphosphin.** Permanent. Insoluble in water. Sparingly soluble in alcohol, ether, and wood-spirit. (Cloez, *Ann. Ch. et Phys.*, (3.) **17.** 311.)
(*Phosphide of terChlorAcetyl. ChlorAcethyphide. Ter ChlorAcet Phosphamide.*)
$C_4 H_2 Cl_3 P O_2 = P \left\{ \begin{matrix} C_4 Cl_3 O_2 \\ H_2 \end{matrix} \right.$

ChlorAcetylSulphurous Acid. Slowly soluble in water.
(*ChloroSulphate of Acetyl.*)
$C_4 H_3 Cl S_2 O_8 = C_4 H_3 Cl O_2, O_2 ; S_2 O_4$

ChlorAcetylSulphite of Baryta. Soluble in water. (Williamson.)

ChlorAcetyphid. *Vid.* Phosphide of *ter*ChlorAcetyl.

Chloral. *Vid.* Hydride of *ter*ChlorAcetyl.

ChlorAlbin. $C_{12}H_6'', Cl_2$ Insoluble in water, and in hot concentrated sulphuric acid. Sparingly soluble in boiling alcohol. Soluble in boiling ether. Unacted on by boiling nitric acid, or an alcoholic solution of potash. (Laurent.)

Chloralid. $C_{10}H_2Cl_6O_6$ Insoluble in water and in concentrated sulphuric acid. Sparingly soluble in cold absolute alcohol. Easily soluble in boiling alcohol and in ether. (Stædeler.)

ChlorAldehyde. *Vid.* Chloride of *ter*ChlorAcetyl.

Chloralise. $C_{10}H_4ClO$ (?) Sparingly soluble in cold, very easily soluble in boiling water. Easily soluble in alcohol. Very sparingly soluble in ether. Soluble, with decomposition, in alkaline solutions. Soluble in mineral acids, the solutions undergoing decomposition after a time. (E. Robiquet, in *J. de Pharm.*)

ChlorAloil. $C_{13}Cl_5O_5$? Almost entirely insoluble in water and in cold alcohol. Very soluble in boiling alcohol and in ether. Soluble, with decomposition, in sulphuric, nitric, and acetic acids. (Robiquet, *Ann. Ch. et Phys.*, (3.) **20.** 491.)

ChlorAmidide of Mercury. *Vid.* Chloride of Mercurammonium.

“ChlorAmyl.” *Vid.* Chloride of Amyl.

ChlorAmyl. Insoluble in water.
$C_{10}H_{10}Cl$

*Bi*ChlorAmyl. $C_{10}H_9Cl_2$ Insoluble in water. Soluble in alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **44.** 285.)

*Octi*ChlorAmyl.
$C_{10}H_3Cl_8$

ChlorAmylal. $C_{20}H_{17}Cl_3O_4$ Insoluble in water or alkaline liquors. Easily soluble in alcohol, and ether. (Cahours.)

*Ter*ChlorAnethol.
(*ChlorAnisol. ChlorAnisal.*)
$C_{20}H_9Cl_3O_2$

ChlorAnil. *Vid.* *per*ChloroKinone.

ChlorAnilam. }
ChlorAnilamic Acid. } *Vid.* *bi*ChloroKinonamic Acid.

ChlorAnilamid. *Vid.* *bi*ChloroKinonamid.

ChlorAnilic Acid. *Vid.* *bi*ChloroKinonic Acid.

ChlorAnilin. (*Amachlophenase.*) $C_{12}H_6ClN = N\left\{\begin{matrix}C_{12}H_4Cl\\ H_2\end{matrix}\right.$ Permanent. Extremely sparingly soluble in water. Readily soluble in boiling, but only sparingly soluble in cold alcohol. Easily soluble in ether, wood-spirit, acetone, bisulphide of carbon and the fatty and essential oils. Most of its salts are but sparingly soluble in water or alcohol. (Hofmann.)

*Bi*ChlorAnilin.
(*Amachlophenese.*)
$C_{12}H_5Cl_2N = N\left\{\begin{matrix}C_{12}H_3Cl_2\\ H_2\end{matrix}\right.$

*Ter*ChlorAnilin. (*Chlorindatmit. Amachlophenise.*) $C_{12}H_4Cl_3N = N\left\{\begin{matrix}C_{12}H_2Cl_3\\ H_2\end{matrix}\right.$ Very sparingly soluble in cold, more readily soluble in boiling water. Easily soluble in alcohol, and ether. It does not combine with acids or alkalies (Hofmann.) Soluble in boiling water, and in cold alcohol. (Hofmann, *Ann. Ch. et Phys.*, (3.) **9.** 159.)

ChlorAnisatic Acid. *Vid.* ChlorAnisic Acid.

ChlorAnisic Acid. (*Chloranisylic Acid. ChlorAnisatic Acid. Chloro Dracasic Acid. Chloro Draconesic Acid.*) $C_{16}H_7ClO_6 = C_{16}H_6ClO_5, HO$ Insoluble in water. Tolerably easily soluble in alcohol and in ether, especially when these are warm. Soluble in gently heated concentrated sulphuric acid, from which it is deposited as the liquid cools; water precipitates it from this solution. (Cahours, *Ann. Ch. et Phys.*, (3.) **14.** 498.)

ChlorAnisate of Ammonia. Soluble in water. (Cahours.)

ChlorAnisate of Baryta. Difficultly soluble in water.

ChlorAnisate of Ethyl. $C_{16}H_6(C_4H_5)ClO_6$ Insoluble in water. Easily soluble in alcohol, and ether, especially when these are boiling.

ChlorAnisate of Lead. Insoluble in water.

ChlorAnisate of Lime. Difficultly soluble in water.

ChlorAnisate of Methyl. $C_{16}H_6(C_2H_3)ClO_6$ Resembles the ethyl salt.

ChlorAnisate of Potash. Soluble in water. (Cahours, *loc. cit.*)

ChlorAnisate of Silver. Insoluble in water.

ChlorAnisate of Soda. Soluble in water. (Cahours, *loc. cit.*)

ChlorAnisate of Strontia. Difficultly soluble in water.

ChlorAnisol. *Vid.* ChlorAnethol.

ChlorAnisoNitrAnisic Acid. (*Nitro Chloro Draconesic Acid.*) $C_{32}H_{14}ClNO_{16}$ Insoluble in water. Soluble in hot alcohol, and ether. (Laurent.)

ChlorAnisoNitrAnisate of Ammonia. Soluble in water.

ChlorAnisoNitrAnisate of Baryta.
“ “ Cobalt.
“ “ Copper.
“ “ Lead.
“ “ Lime.
“ “ Manganese.
“ “ Mercury.
“ “ Silver.
“ “ Strontia.
Ppts.

ChlorAnthracenese. (*BiChloroparanaphthalin.*) $C_{30}H_{10}Cl_2$ Soluble in hot, less soluble in cold ether.

ChlorAntimonic Acid. *Vid.* Chloride of Antimony.

ChlorAntimoniate of Picolin.

ChlorAntimoniate of Quinolein (“leucol”). Soluble in boiling, less soluble in cold chlorhydric acid. (Hofmann, *Ann. Ch. et Phys.*, (3.) **9.** 174.)

ChlorAntimoniate of *X*. *Vid.* Chloride of Antimony & of *X*.

ChlorArsenide of Mercury. *Vid.* Arsenide of Mercury with Chloride of Mercury.

Chlorasile. $C_{10}H_4ClO$? Sparingly soluble in cold water, soluble in all proportions in boiling water. Soluble in all proportions in alcohol. Sparingly soluble in boiling ether. (Robiquet, *Ann. Ch. et Phys.*, (3.) **20.** 493.)

Chloric Acid. (*Hyperoxymuriatic Acid.*) ClO_5 Soluble in all proportions in water. (Pelouze & Fremy.)

The solution is not decomposed when exposed to the light (Gay-Lussac), but is decomposed when heated to 40°. (Sérullas.) Rapidly decomposed by alcohol, and ether. All of its salts, excepting the chlorate of dinoxide of mercury, are soluble in water; most of them are deliquescent, and many are soluble in alcohol.

Chlorate of Alumina. $Al_2O_3, 3\,ClO_5$ Deliquescent. Soluble in alcohol. (Chenevix, from *Phil. Trans.*, 1802, in *Nicholson's Journ. of Nat. Phil.*, **3.** 232.)

Chlorate of Ammonia. NH_4O, ClO_5 Is liable to explode after having been kept for a time. Very soluble in water, and alcohol. (Chenevix, from *Phil. Trans.*, 1802, in *Nicholson's Journ. of Nat. Phil.*, **3.** 231.) Much less soluble in water at 0° than the soda salt. (Storer.) Easily soluble in water, but only to an insignificant extent in absolute alcohol. (Wæchter, *J. pr. Ch.*, 1843, **30.** 323.)

Chlorate of Argent*bi*amin. $N_2\left\{H_6 . AgO, ClO_5\right.$ Easily soluble in water, and alcohol (Wæchter, *J. pr. Ch.*, 1843, **30.** 331.)

Chlorate of Baryta.
$BaO, ClO_5 + Aq$

1 pt. of the anhydrous salt is soluble in

pts. of water	at
4.38	0°
2.70	20°
1.92	40°
1.29	60°
1.02	80°
0.79	100°

(Kremers, *Pogg. Ann.*, **99.** 54.)

The saturated aqueous solution boils at 111°. (Kremers, *Pogg. Ann.*, **99.** 43.) Soluble in about 4 pts. of cold, and in less warm water. Its solubility is so nearly the same as that of chloride of barium that it is not easy to separate the two by crystallization. (Chenevix, from *Phil. Trans.*, 1802, in *Nicholson's Journ. of Nat. Phil.*, **3.** 229.) Absolute alcohol only dissolves a trace of it. (Wæchter, *J. pr. Ch.*, 1843, **30.** 324.) Insoluble in alcohol. (Vauquelin.) Very sparingly soluble in weak alcohol. (Ot. Gr.)

Chlorate of Berberin. $C_{42}H_{19}NO_{10}, HO, ClO_5$ Easily soluble in pure water. Sparingly soluble in weak saline solutions. Soluble in alcohol.

Chlorate of Bismuth. Known only in solution: obtained by dissolving oxide of bismuth in an aqueous solution of chloric acid. On being evaporated, this solution is decomposed with separation of basic chloride of bismuth. (Wæchter, *J. pr. Ch.*, 1843, **30.** 334.)

Chlorate of Brucin. Less soluble than chlorate of strychnine. Soluble in water, and alcohol; more readily in hot than in cold. (Sérullas, *Ann. Ch. et Phys.*, 1830, (2.) **45.** pp. 280, 278.)

Chlorate of Cadmium. $CdO, ClO_5 + 2\,Aq$ Very deliquescent. Melts in its water of crystallization at 80°. Also easily soluble in alcohol. (Wæchter, *J. pr. Ch.*, 1843, **30.** 333.)

Chlorate of Cinchonidin (of Pasteur). Soluble in water. May be crystallized from alcohol of 90%. (Leers, *Ann. Ch. u. Pharm.*, **82.** 158.)

Chlorate of Cinchonin. $C_{40}H_{24}N_2O_2, HO, ClO_5$ Soluble in water, and alcohol; much more readily in hot than in cold. (Sérullas, *Ann. Ch. et Phys.*, 1830, (2.) **45.** pp. 278, 279.)

Chlorate of Cobalt. $CoO, ClO_5 + 6\,Aq$ Extremely deliquescent. Easily soluble in alcohol. Melts in its water of crystallization at 50°. (Wæchter, *J. pr. Ch.*, 1843, **30.** 328.)

Chlorate of Copper.

I.) $CuO, ClO_5 + 6\,Aq$ Very deliquescent. Melts in its water of crystallization at 65°, and does not solidify again until cooled to 20°. Easily soluble in alcohol. (Wæchter, *J. pr. Ch.*, 1843, **30.** 328.)

II.) *basic.* Insoluble in water. Easily soluble in dilute acids. (Wæchter, *loc. cit.*, p. 329.)

Chlorate *of protoxide* of Iron. FeO, ClO_5 Soluble in water, but soon decomposes of itself, with formation of the salt of the sesquioxide, unless the temperature is very low. (Wæchter, *J. pr. Ch.*, 1843, **30.** 326.)

Chlorate *of sesquioxide* of Iron.

I.) $Fe_2O_3, 3\,ClO_5$ Soluble in water. (Wæchter, *loc. cit.*)

II.) *basic.* Insoluble in water. (Wæchter, *loc. cit.*)

Chlorate of Lead. $PbO, ClO_5 + Aq$ Permanent. Very easily soluble in water, and alcohol. (Wæchter, *J. pr. Ch.*, 1843, **30.** 329.)

Chlorate of Lime. $CaO, ClO_5 + 2\,Aq$ Extremely deliquescent. Melts at a low heat in its water of crystallization. Produces much cold in dissolving. Very soluble in alcohol. (Chenevix, from *Phil. Trans.*, 1802, in *Nicholson's Journ. of Nat. Phil.*, **3.** 231.) Very deliquescent. When quickly heated, the crystals melt in their water of crystallization at above 100°. Easily soluble in alcohol. (Wæchter, *J. pr. Ch.*, 1843, **30.** 325.)

Chlorate of Lithia. $LiO, ClO_5 + Aq$ Very deliquescent. Melts at 50°. Easily soluble in alcohol. (Wæchter, *J. pr. Ch.*, 1843, **30.** 322.) Very soluble in water. (Troost.)

Chlorate of Magnesia. $MgO, ClO_5 + 6\,Aq$ Very deliquescent. Melts in its water of crystallization at 40°. Also very easily soluble in alcohol. (Wæchter, *J. pr. Ch.*, 1843, **30.** 325.)

Chlorate of Manganese. Known only in solution. The dilute aqueous solution may be boiled without undergoing decomposition, but on evaporating it to a certain degree of concentration it decomposes. (Wæchter, *J. pr. Ch.*, 1843, **30.** 326.)

Chlorate *of dinoxide* of Mercury.

I.) Hg_2O, ClO_5

α = *Soluble modification.* The crystals soon become opaque and lose their lustre when exposed to the air. The unaltered crystals are easily soluble in water, and alcohol, but those which have become opaque leave a small quantity of residue on being dissolved. (Wæchter, *J. pr. Ch.*, 1843, **30.** 332.)

β = *Insoluble modification.* Insoluble in water. Completely soluble in acetic acid. (Wæchter, *loc. cit.*) Insoluble in cold, but is decomposed by boiling water. (Vauquelin, in *Berzelius's Lehrb.*, **3.** 883.)

II.) *basic* (of β). Insoluble in water.
$2\,Hg_2O, ClO_5$

Chlorate *of protoxide* of Mercury. $2\,HgO, ClO_5 + Aq$ More soluble in water than the protochloride, being soluble in about 4 pts. of cold water. (Chenevix, from *Phil. Trans.*, 1802, in *Nicholson's Journ. of Nat. Phil.*, **3.** 241.) Decomposed by water to a more basic, insoluble, and a soluble acid salt. (Wæchter, *J. pr. Ch.*, 1843, **30.** 333.)

Chlorate of Morphin. Soluble in water, and alcohol; much more readily in hot than in cold. (Sérullas, *Ann. Ch. et Phys.*, 1830, (2.) **45.** pp. 278, 279.)

Chlorate of Nickel. Very deliquescent.
$NiO, ClO_5 + 6\,Aq$ Melts in its water of crystallization at 80°. Very easily soluble in alcohol. (Wæchter, *J. pr. Ch.*, 1843, **30.** 327.)

Chlorate of Potash. Permanent. Less
KO, ClO_5 soluble in water than any of the other metallic chlorates, excepting chlorate of dinoxide of mercury.

100 pts. of water At °C	Dissolve pts. of KO, ClO_5.
0°	3.33
13.32°	5.60
15.37°	6.03

35.02°	12.05
49.08°	18 96
74.89°	35.40
104.78°	60.24

(Gay-Lussac, *Ann. Ch. et Phys.*, (2.) **11.** 314.)

Or, 1 pt. of it is soluble in

30.0	pts. of water at	0°
16.7		15°
8.33		35°
5.26		49°
1.67		104°

(Gmelin's *HandBook.*)

Soluble in about 16 pts. of cold water, and in much less warm water (Chenevix. from *Phil Trans.*, 1802, in *Nicholson's Journ. of Nat. Phil.*, **3.** 181); in 30.03 pts. of water at 0°; in 17.85 pts. at 13.3°; and in 1 66 pts. at 104.78°; the solution saturated at 0° containing 3.22% of it, that saturated at 13.3° containing 5.30%, and that at 104.78°, 37.59%. (M. R. & P.) Soluble in 16 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) 100 pts. of water at 15.5° dissolve 6.2 pts. of it, and at 100° 40 pts. (Ure's *Dict.*) 100 pts. of the saturated aqueous solution at its boiling-point (103.3°), contain 40 pts. of the dry salt; or, 100 pts. of water dissolve 66.666 pts. of the dry salt at 103.3°; or, 1 pt. of the dry salt is soluble in 1.5 pts of water at 103.3°. (T. Griffiths, *Quar. J Sci.*, 1825, **18.** 90.) The saturated aqueous solution boils at 105°. (Kremers, *Pogg. Ann.*, **97.** 19.)

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of the anhydrous salt dissolved in 100 pts. of water.
1.0311	5.12
1.0377	6.25

(Kremers, *Pogg. Ann.*, **95.** 120.)

In a solution containing for 100 pts. of water, pts. of anhydrous KO, ClO_5	The boiling is elevated.	Difference.
0.0	0.0°	
14.64	1.0	
29 28	2.0	14.64
43 92	3.0	14.64
58.56	4.0	14.64
61.50	4.2	14.64

The point of ebullition of pure water, observed in a glass tube containing bits of metallic zinc, having been 100.2°. (Legrand, *Ann. Ch. et Phys.*, 1835, (2.) **59.** 434.) Alcohol can dissolve a small portion of it. (Chenevix, *loc. cit.*) Soluble in 120 pts. of alcohol, of 83%, at 16°. (Wittstein.) Soluble in 120 pts. of alcohol, of 77.1%, at 16°; or, 100 pts. of this alcohol dissolve 0.833 pt. of the salt at 16°. (Pohl, *Wien. Akad. Bericht*, **6.** 599.) Soluble in a saturated aqueous solution of chloride of ammonium. More soluble in water containing chloride of sodium, than in pure water. (Margueritte, *C. R.*, **38.** 305.) Soluble in pure concentrated nitric acid, apparently without decomposition at first, and when the solution cools a quantity of chlorate of potash, only slightly contaminated with nitrate, crystallizes out. If the nitric acid is dilute, it may be boiled upon the chlorate without any visible decomposition for several moments, but as the acid becomes more concentrated by evaporation, decomposition of the chlorate ensues. But with nitric acid, containing nitrous acid, as is ordinarily the case, decomposition occurs at once. (Millon, *Ann. Ch. et Phys.*, (3.) **6.** 92.)

Chlorate of Potash with PerManganate of Potash. Soluble in water. The two salts crystallize together in all proportions. (Wœhler.)

Chlorate of Quinine. Soluble in water, and alcohol; much more easily in hot than in cold. (Sérullas, *Ann. Ch. et Phys.*, 1830, (2.) **45.** pp. 278, 279.)

Chlorate of Silver. Very soluble in water,
AgO, ClO_5 being soluble in about 2 pts. of warm water. Somewhat soluble in alcohol. (Chenevix, from *Phil. Trans.*, 1802, in *Nicholson's Journ. of Nat. Phil.*, **3.** pp. 242, 232 note.) Soluble in about 5 pts. of cold water. Also soluble in alcohol. (Wæchter, *J. pr. Ch.*, 1843, **30.** 330.) Soluble in 10 @ 12 pts. of water. (Vauquelin.)

Chlorate of Soda. Deliquescent.
NaO, ClO_5

1 pt. of the anhydrous salt

is soluble in 1.20	pts. of water at	0°
1.02		12°
0.79		30°
0.66		50°
0.56		70°
0.40		90°
0.33		115°
0.30		120°

(Kremers, *Pogg. Ann.*, **92.** 499; and **97.** 10.)

1 pt. of the anhydrous salt is

	I.	II.	III.		
soluble in	1.20	1.22	1.22	pts. of water at	0°
	0.92	1.01			20°
	0.73	0.81			40°
	0.60	0.68			60°
	0.48	0.57			80°
	0.39	0.49			100°

The results in column I. were obtained immediately after the hot solutions had fallen to the given temperatures. Those in column II are from a new series of experiments, in which the solutions stood during an hour at, after having fallen to, the given temperatures, during which time they were frequently agitated. Those in column III. are from another set of experiments, in which the solutions stood at the given temperatures during 9 hours. (Kremers, *Pogg. Ann.*, **97.** 4.) If a solution, not saturated, be concentrated by boiling, it will become somewhat supersaturated. In a solution thus prepared the boiling temperature was 135° just before crystals began to separate; with the separation of crystals, however, it fell at once to its normal, 132°. (Kremers, *Pogg. Ann.*, **97.** 21.)

Slightly deliquescent. Soluble in 3 pts. of cold, and in less warm water. It is extremely difficult to separate this salt from chloride of sodium, as it has nearly the same degree of solubility in water as the latter. Soluble in alcohol, but it cannot readily be separated from chloride of sodium by means of alcohol, since the latter dissolves in alcohol when mixed with chlorate of soda. (Chenevix, from *Phil. Trans.*, 1802, in *Nicholson's Journ. of Nat. Phil.*, **3.** 185.) [Chenevix estimates the solubility of this salt, in water, at too high a figure, as the experiments of Kremers also prove, but his observations on the difficulty of separating it from chloride of sodium are entirely correct. F. H. S.]

Soluble in 3 pts of cold, and in less hot water. Only very slightly soluble in alcohol. (Wæchter, *J. pr. Ch.*, 1843, **30.** 321.) Soluble in 3 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) 100 pts. of water at 15.5° dissolve 35 pts. of it; somewhat more soluble in hot water. (Ure's *Dict.*) The saturated aqueous solution boils at above 125° (Kremers, *Pogg. Ann.*, **92.** 499); at 132°. (Kremers, *Ibid.*, **97.** 10.)

An aqueous solution of sp. gr. at 19.5° (sp. gr. of water at 19.5° = 1)	Contains per cent of NaO, ClO_5.	Pts. of NaO, ClO_5 dissolved in 100 pts. of water.
1.0626 . . .	9.008 . . .	9.90
1.1250	17.232	20.82
1.1836	24.345	32.18
1.2479	31.521	46.03
1.2937 . . .	36.265 . . .	56.90

(Kremers, *Pogg. Ann.*, **95.** 121; the second column is from Gerlach's *Sp. Gew. der Salzlæsungen*, p. 34.) Soluble in 34 pts. of alcohol, of 83%, at 16°, and in a smaller quantity of hot alcohol. Somewhat more easily soluble in alcohol than chloride of sodium. (Berzelius, *Lehrb.*)

CHLORATE OF STRONTIA. Deliquescent. Readily soluble in water More soluble in alcohol than chloride of strontium. (Chenevix, from *Phil. Trans.*, 1802, in *Nicholson's Journ. of Nat. Phil.*, **3.** 230.) Insoluble in alcohol, soluble in spirit. (Wæchter, *J. pr. Ch.*, 1843, **30.** 324.) Easily soluble in alcohol. (Berzelius, *Lehrb.*) Abundantly soluble in alcohol. (Gmelin.) Somewhat less soluble in ordinary alcohol than in water. (Souchay, *Ann. Ch. u. Pharm.*, **102.** 381.)

$SrO, ClO_5 + 5\ Aq$

CHLORATE OF STRYCHNINE. Soluble in water, and alcohol; much more readily in hot than in cold. The concentrated aqueous solution solidifies on cooling. (Sérullas, *Ann. Ch. et Phys.*, 1830, (2.) **45.** pp. 280, 278.)

CHLORATE *of protoxide* OF TIN. Soluble in water, but decomposes in the course of a few minutes, with separation of binoxide of tin. (Wæchter, *J. pr. Ch.*, 1843, **30.** 326.)

CHLORATE *of protoxide* OF URANIUM. Soluble in water, and in an aqueous solution of chloric acid. (Rammelsberg.)

UrO, ClO_5

CHLORATE OF VERATRIN. Soluble in water, and alcohol; more readily in hot than in cold. (Sérullas, *Ann. Ch. et Phys.*, 1830, (2.) **45.** pp. 280, 278.)

CHLORATE OF ZINC. Very deliquescent. Melts in its water of crystallization at 60°. Also very easily soluble in alcohol. (Wæchter, *J. pr. Ch.*, 1843, **30.** 327.) Soluble in water, and alcohol. (Vauquelin.)

$ZnO, ClO_5 + 6\ Aq$

CHLORAURIC ACID. Same as *ter*Chloride of Gold, *q. v.* All the metallic chloraurates are easily soluble in water, and are also soluble in alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 261.)

(*ChloroAuric Acid.*)

CHLORAURATE OF ACETOSAMIN. Ppt.

CHLORAURATE OF ACONITIN. Ppt. Insoluble in chlorhydric acid.

$C_{60}H_{47}NO_{14}, HCl, AuCl_3 + 2\ Aq$

CHLORAURATE OF AGROSTEMMIN. Soluble in alcohol.

CHLORAURATE OF AMMONIUM.

I.) (*yellow.*) Efflorescent. Easily soluble in water, and alcohol (Johnston.)

$NH_4Cl, AuCl_3 + 2\ Aq$

II.) (*red.*) Soluble in water Partially soluble in alcohol. (Johnston.)

CHLORAURATE OF AMYLSTRYCHNINE. Insoluble in water.

CHLORAURATE OF ANILIN. Insoluble in ether. (Hofmann.)

CHLORAURATE OF ARSEN*di*METHYLETHYLIUM.

CHLORAURATE OF ATROPIN. Sparingly soluble in water, and chlorhydric acid.

$C_{34}H_{23}NO_6, HCl, AuCl_3$

CHLORAURATE OF BARIUM. Hygroscopic. Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 261.)

$BaCl, AuCl_3$

CHLORAURATE OF BEBIRIN.

CHLORAURATE OF BUTYLAMIN. Soluble in water, and alcohol.

(*ChlorAurate of Tetrylamin.*)

$2(C_8H_{11}N, HCl); AuCl_3$

CHLORAURATE OF CADMIUM. Permanent. Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, **17.** pp. 261, 263)

$CdCl, AuCl_3$

CHLORAURATE OF CAFFEIN. Soluble in water, but is decomposed when boiled for a long time therewith; more soluble in alcohol. (Nicholson.)

$C_{16}H_{10}N_4O_4, HCl, AuCl_3$

CHLORAURATE OF CALCIUM. Deliquescent. Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 261.)

$CaCl, AuCl_3 + 6\ Aq$

CHLORAURATE OF CAPRYLAMIN. *Vid.* ChlorAurate of Octylamin.

CHLORAURATE OF CHLORANILIN. Ppt.

CHLORAURATE OF COBALT. Permanent. Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** pp. 261, 263.)

CHLORAURATE OF CODEIN. Ppt. Tolerably easily soluble in chlorhydric acid.

CHLORAURATE OF COTARNIN.

CHLORAURATE OF CUMIDIN. Somewhat soluble in alcohol. (Nicholson, *J. Ch. Soc.*, **1.** 9.)

CHLORAURATE OF CYANANILIN. Very readily soluble in ether; the solution undergoing decomposition when evaporated. (Hofmann, *J. Ch. Soc.*, **1.** 169.)

$N\left\{\begin{matrix}C_{12}H_5 . C_2N, HCl, AuCl_3\\H_2\end{matrix}\right.$

CHLORAURATE OF ETHYLAMIN. Soluble in water, alcohol, and ether. (Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 482.)

$C_4H_7N, HCl, AuCl_3$

CHLORAURATE OF *tetra*ETHYLAMMONIUM. Only sparingly soluble in cold water; somewhat more soluble in boiling water. Sparingly soluble in chlorhydric acid. (Hofmann.)

$(C_4H_5)_4NCl, AuCl_3$

ChlorAurate of EthylAnilin.

ChlorAurate of EthylConiin.

ChlorAurate of *di*EthylConiin. Soluble in hot water, but separates out as the solution cools. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **89.** 147.)

ChlorAurate of EthylMethylConiin. $N\left\{\begin{matrix}C_{16}H_{14}'' \\ C_2H_3 \\ C_4H_5\end{matrix}\right\}Cl, Au\,Cl_3$ Somewhat soluble in hot, less soluble in cold water. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **89.** 140.)

ChlorAurate of EthylNicotin. $N\left\{\begin{matrix}C_{10}H_7''' \\ C_4H_5\end{matrix}\right\}Cl, Au\,Cl_3$ Soluble in hot, less soluble in cold water. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **87.** 7.)

ChlorAurate of *tetr*ÆthylPhosphonium. $P(C_4H_5)_4\,Cl, Au\,Cl_3$ Soluble in boiling, less soluble in cold water.

ChlorAurate of EthylPicolin. $C_{16}H_{11}N, H\,Cl, Au\,Cl_3 = N\left\{\begin{matrix}C_{12}H_6'' \\ C_4H_5\end{matrix}\right. H\,Cl, Au\,Cl_3$ Sparingly soluble in cold, readily soluble in boiling water. Insoluble in alcohol, or ether. (Anderson.)

ChlorAurate of EthylPyridin. Sparingly soluble in cold water. Decomposed when boiled with water.

ChlorAurate of EthylStrychnine. Soluble in boiling water.

ChlorAurate of Furfurin.

ChlorAurate of Lithium. Deliquescent. Soluble in water, though less so than chloride of potassium. (Johnston.)

ChlorAurate of LuteoCobalt. $6\,NH_3 . Co_2\,Cl_3, Au\,Cl_3$ Insoluble in cold water. Somewhat soluble in boiling water acidulated with chlorhydric acid. (Gibbs & Genth, *Smithson. Contrib.*, vol. **9.**)

ChlorAurate of Magnesium. Deliquescent. $Mg\,Cl, Au\,Cl_3 + 12\,Aq$ Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** pp. 261, 262.)

ChlorAurate of Manganese. Deliquescent. Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** pp. 261, 263.)

ChlorAurate of MelAnilin. Difficultly $C_{26}H_{13}N_3, H\,Cl, Au\,Cl_3$ soluble in water, more readily soluble in alcohol. Exceedingly soluble in ether. (Hofmann, *J. Ch. Soc.*, **1.** 296.)

ChlorAurate of Methylamin. Soluble in $N\left\{\begin{matrix}H_2 \\ C_2H_3\end{matrix}\right., H\,Cl, Au\,Cl_3$ water, alcohol, and ether. (Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 458.)

ChlorAurate of *tetra*Methylammonium. $N(C_2H_3)_4\,Cl, Au\,Cl_3$ Soluble in boiling, very sparingly soluble in cold water. (Hofmann, *J. Ch. Soc.*, **10.** 197.)

ChlorAurate of MethylCinchonin.

ChlorAurate of MethylNicotin. Almost $N\left\{\begin{matrix}C_{10}H_7''' \\ C_2H_3\end{matrix}\right. Cl, Au\,Cl_3$ insoluble in cold water and in alcohol. (Stahlschmidt, *Ann. Ch. u. Pharm.*, **90.** 224.)

ChlorAurate of Nickel. Deliquescent. $Ni\,Cl, Au\,Cl_3 + 12\,Aq$ (?) Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** pp. 261, 263.)

ChlorAurate of Nicotin. Ppt. Insoluble, or but sparingly soluble, in chlorhydric acid. (v. Planta.)

ChlorAurate of Octylamin. Deliquescent. (*ChlorAurate of Caprylamin.*) $C_{16}H_{19}N, H\,Cl, Au\,Cl_3$ Much more soluble in water than the chloroplatinate. Soluble in alcohol, and ether. (Bouis, *Ann. Ch. et Phys.*, (3.) **44.** 142.)

ChlorAurate of Olanin(of Unverdorben). Sparingly soluble in cold, more freely in boiling water. Soluble in all proportions in alcohol, and ether.

ChlorAurate of Piperidin.

ChlorAurate of Picolin. Soluble in 20 pts. of boiling water. More readily soluble in alcohol than in ether. Soluble in hot dilute sulphuric, chlorhydric, and nitric acids, from which solutions it crystallizes out on cooling. (Unverdorben.)

ChlorAurate of Potassium. Efflorescent. $K\,Cl, Au\,Cl_3 + 5\,Aq$ Readily soluble in water. (Javal.) Easily soluble in alcohol. (Berzelius.)

ChlorAurate of Propyl.
(*ChlorAurate of Trityl.*)
$C_6H_9N, H\,Cl, Au\,Cl_3$

ChlorAurate of Quinolein(or of Chinolin). $N\left\{C_{18}H_7''', H\,Cl, Au\,Cl_3\right.$ Sparingly soluble in water. (Gr. Williams.)

ChlorAurate of Retinin. Insoluble in boiling water.

ChlorAurate of Sinkalin. Sparingly sol- $C_{10}H_{13}NO_2, H\,Cl, Au\,Cl_3$ uble in cold, more soluble in boiling water. (v. Babo & Hirschbrunn.)

ChlorAurate of Sodium. Permanent. $Na\,Cl, Au\,Cl_3 + 4\,Aq$ Easily soluble in water, and absolute alcohol. Also in an aqueous solution of chloride of sodium.

ChlorAurate of Spartein. Very sparingly soluble in water, and alcohol. Readily soluble, without decomposition, in warm, less soluble in cold chlorhydric acid.

ChlorAurate of Strontium. Permanent. $Sr\,Cl, Au\,Cl_3$ Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, **17.** 261.)

ChlorAurate of Strychnine. Very sparing- $C_{42}H_{22}N_2O_4, H\,Cl, Au\,Cl_3$ ly soluble in cold, decomposed by boiling water. Soluble in alcohol. (Abel & Nicholson, *J. Ch. Soc.*, **2.** 256.)

ChlorAurate of Tetryl. *Vid.* ChlorAurate of Butyl.

ChlorAurate of Thebain.

ChlorAurate of Toluidin. Soluble in hot, $C_{14}H_9N, H\,Cl, Au\,Cl_3$ less soluble in cold water. (Chautard.)

ChlorAurate of Trityl. *Vid.* ChlorAurate of Propyl.

ChlorAurate of Veratrin. Insoluble in $C_{64}H_{52}N_2O_{16}, H\,Cl, Au\,Cl_3$ water. Soluble in boiling, less soluble in cold spirit. (Merck, *Ann. Ch. u. Pharm.*, **95.** 202.)

ChlorAurate of *tetra*Vinylium. Decomposes at the temperature of boiling.

ChlorAurate of XanthoCobalt. Soluble $NO_2 . 5\,NH_3 . Co_2O\,Cl_2, Au\,Cl_3 + 2\,Aq$ in hot water.

ChlorAurate of Zinc. Permanent. $Zn\,Cl, Au\,Cl_3 + 12\,Aq$ (?) Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 261, 263.)

ChlorAurite of *X*. *Vid. proto*Chloride of Gold with Chloride of *X*.

ChlorAzol. Very sparingly soluble in water. Easily soluble in alcohol. (Muehlhæuser, *Ann. Ch. u. Pharm.*, **90.** 174.)
$C_8 H_8 Cl_3 (N O_4)_2$

ChlorAzoLitmin. Insoluble in water. Soluble in alcohol, ether, and alkaline solutions. (Kane.)
$C_{18} H_{10} N O_{10} Cl$

ChlorAzoSuccic Acid. *Vid.* ChloroSuccinimid.

ChlorBenzin. *Vid. ter*Chloride of Benzin.

ChlorButyren. *Vid.* ChloroButylene.

ChlorChinone. *Vid.* ChloroKinone.

ChlorDracasic Acid. *Vid.* Chloranisic Acid.

ChlorDraconesic Acid. *Vid.* Chloranisic Acid.

ChlorErythrolitmin.
$C_{26} H_{22} O_{12}$

ChlorÉthase. *Vid. bi*ChlorEthylene.

ChlorÉthasic Acid. *Vid. mono*ChlorAcetic Acid.

ChlorEtheral. *Vid.* Oxide of *mono*ChlorEthyl.

ChlorEthose. *Vid. per*ChlorEthylene.

***Bi*ChlorEthylamin.** [Appears to be insoluble in water, and unacted upon by acids.]
$N \begin{cases} C_4 H_3 Cl_2 \\ H_2 \end{cases}$

ChlorEthylate of Ethylidin.
$C_8 H_9 Cl O_2$

ChlorEthylene. Sparingly soluble in water. Readily soluble in alcohol; and in all proportions in ether. (Liebig. Soluble in concentrated sulphuric acid.
(*Chloride of Acetyl* [*Acetoyl*]. *Chloride of Aldehydin. Chloride of Vinyl.*)
$C_4 H_3 Cl$

***Bi*ChlorEthylene.** Insoluble in water. Soluble in alcohol, and ether. Is not decomposed by potash-lye. (Laurent.)
(*Chloromethylase. Ethylene bichloré.*)
$C_4 H_2 Cl_2$

***Ter*ChlorEthylene.**
$C_4 H Cl_3$

***Per*ChlorEthylene.** Insoluble in water, acids, or aqueous solutions of the alkalies. Soluble in alcohol, ether, and the fatty and essential oils. Unacted upon by nitric, chlorhydric, or sulphuric acids. (Faraday.)
(*Proto Chloride of Carbon. Chlorethose. Ethylène perchloré.*)
$C_4 Cl_4$

ChlorEthyleneSulphurous Acid. *Vid.* ChloroMethylSulphurous Acid.

***Per*(*quinqui*)ChlorEthylOxalic Acid(Anhydrous).** Insoluble in water, but is slowly acidified when in contact with it. Miscible in all proportions with alcohol, and ether. Soluble, with acidification and combination, in cold aqueous solutions of the caustic alkalies. (Malaguti.)
(*Anhydrous Chloroxalovinic Acid. Chloroxethide.*)
$C_8 Cl_5 O_7$

***Per*(*quinqui*)ChlorEthylOxalic Acid.** Very quickly deliquescent. Soluble in all proportions in water, alcohol, and ether. (Malaguti.)
(*Chloroxalovinic Acid. Acid Oxalate of Perchlorethyl. Ethyl OxalicAcid quintichloré. Chloroxetic Acid.*)
$C_8 H Cl_5 O_8 = C_4 (C_4 Cl_5) H O_8$

***Per*ChlorEthylOxalate of Ammonia.** Very deliquescent. Soluble in water, and alcohol. The solution is decomposed on boiling. Soluble in all proportions in ether.
$C_8 Cl_5 (N H_4) O_8$

***Per*ChlorEthylOxalate of Soda.** Soluble in water and in absolute alcohol.

ChlorEthylSelenious Acid.
$C_4 H_6 Cl O, 2 Se O_2$

ChlorEthylSulphurous Acid. Insoluble in water, by which it is very slowly decomposed. (R. Williamson, *J. Ch. Soc.*, **10.** 100.)
(*Chloro Sulphate of Ethyl.*)
$C_4 H_5 Cl O_2, S_2 O_4$

***Bi*ChlorEuxanthic Acid.** Insoluble in water. Difficultly soluble in cold, easily soluble in boiling alcohol. Soluble, with combination, in concentrated sulphuric acid. Soluble in ammonia-water, in which solution carbonate of ammonia produces a precipitate.
$C_{42} H_{16} Cl_2 O_{22}$

***Ter*ChlorEuxanthone.** Insoluble in water. Soluble in alcohol.
$C_{40} H_9 Cl_3 O_{12}$

ChlorHelicin.

I.) Tolerably soluble in boiling, almost insoluble in cold water. Tolerably soluble in alcohol. Decomposed by boiling acids, and alkalies. (Piria, *Ann. Ch. et Phys.*, (3.) **14.** 295.)
$C_{26} H_{15} Cl O_4$

II.) *an isomer of the above.* Insoluble in water. Scarcely at all soluble in boiling alcohol. (Piria, *loc. cit.*, p. 298.)
$C_{28} H_{15} Cl O_4$

ChlorHematosin (?). Soluble in alcohol. (Mulder.) Not decomposed by cold acids or alkaline solutions.
(*ChlorHematin.*)
$C_{44} H_{22} N_3 O_8 Fe Cl_6$

ChlorHippurin. Insoluble in water. Difficultly soluble in ether. Soluble in all proportions in alcohol. Soluble in an alcoholic solution of caustic potash, with scarcely any decomposition, even on boiling; it is precipitated unchanged from this solution on the addition of water. (Schwanert, from *Ann. Ch. u. Pharm.*, **112.** 59 *et seq.*, in *Kolbe's Lehrb.*, **2.** 121.)
$C_{18} H_6 Cl N O_2$

***Bi*ChlorHippurin.** Easily soluble in ether. (*Ibid.*)
$C_{18} H_5 Cl_2 N O_2$

ChlorHydranil. *Vid. per*ChlorHydroKinone.

ChlorHydrargyrate of *X*. *Vid.* ChloroMercurate of *X*.

Chlorhydric Acid. Rapidly and largely absorbed by water, which takes up between four and five hundred times its bulk of the gas, at the ordinary temperature and pressure; that is, rather less than an equal weight. (Dalton, in his *New System*, **2.** 287, 294.) 1 volume of water absorbs 480 vols. of the gas at 0°; this amount being not quite equal to the weight of the water. The specific gravity of the saturated aqueous solution is 1.2109. (H. Davy.) 1 vol. of water at 20.5° absorbs 417.822 vols. of it, with considerable elevation of temperature, the volume of water increasing to 1.3438 vols. 1 vol. of the solution of acid consequently contains 311.0415 vols. of H Cl gas. Acid of this strength is of 1.1958 sp. gr., and contains 40.39% by weight of H Cl. (T. Thomson, in his *System of Chem.*, London, 1831, **2.** 188.) At ordinary temperatures 1 vol. of water absorbs about 500 vols. of the gas. (Ot. Gr.) 1 vol. of water absorbs 464 volumes of H Cl gas, and the saturated solution thus obtained, of 1.21 sp. gr., contains 42.4%, by weight, of the gas. (Wittstein's *Handw.*) Water saturated with H Cl at about 0° contains 480 times its own volume of the gas and its sp. gr. = 1.2109; saturated at the ordinary temperature, the liquid contains 0.383 of
(*Hydrochloric Acid. Muriatic Acid.*)
$H Cl$

its weight of HCl and its sp. gr. = 1.192. (Berzelius, *Lehrb.*, **1.** 774.)

100 pts. of alcohol of 36°(B.) absorb 68 pts. of chlorhydric acid gas at 12.5°, with evolution of heat. (Boullay.) Absorbed by ether. (Achard.) Oil of turpentine absorbs 50% of chlorhydric acid gas with elevation of temperature (Thénard); 163 vols. at 22° and 0.724 met. pressure. Isoterebenthene absorbs 34% of it at 24°, with combination; metaterebenthene absorbs only half as much, viz. 17.7% at 24°. (Berthelot.) Oil of lavender absorbs 68 7 vols. of chlorhydric acid gas (Thénard); 210 vols. without being saturated. (Saussure.) Oil of rosemary absorbs 218 vols. of it at 22°, becoming black and turbid. (Saussure.) Soluble in 0.4 vol. of rock-oil from Amiano. (Saussure.) Absorbed, without combination, by caprylic alcohol (hydrate of capryl), at ordinary temperatures, but is evolved when the solution is heated. (Bouis, *Ann. Ch. et Phys.*, (3.) **44.** 129.) Fuming chlorhydric acid is soluble, without alteration, in cold glycerin. It is also miscible with strong acetic acid. The gas is not absorbed by concentrated sulphuric acid; but is absorbed in large quantity by anhydrous sulphuric acid. (Aimé.)

Solubility of H Cl in water at various temperatures, under a constant pressure, by experiment.

1 gramme of water absorbs, at t° and a pressure of B metres, G grammes of H Cl.

B	0.760	0.762	0.754	0.754	0.739
t°	4.7°	4.8°	7.2°	7.2°	16°

1.11	22.22		

(Edmund Davy.)

From Davy's results Osann (*Kastner's Archiv.*, 1824, **3**. 372) deduces the formula: $Y = 2.02\ X$, by which to calculate intermediate values; in this formula, $X =$ the sp. gr. of the acid solution, and Y the percentage of H Cl contained in the solution.

An aqueous solution of sp. gr. (at 15.56°)	Contains per cent by weight of H Cl.	Boiling-point.
1.500 ?	47.8	15.56°
1.199	25.6	48.89° ?
1.181	23.4	62.78° ?
1.166	21.6	76.67°
1.154	20.0	87.78°
1.114	18.7	100.00°
1.136	17.5	102.78°
1.127	16.4	105.56°
1.121	15.5	108.89°
1.094	12.1	111.11°
1.075	9.91	108.89°
1.064	8.40	107.22°
1.047	6.49	105.56°
1.035	5.21	103.89°
1.018	2.65	102.22°
1.009	1.36	101.11°

(Kirwan, "with some little addition [as the column of boiling-points] and modification" by Dalton, in his *New System*, **2**. 295.)

Sp. gr.	H Cl per cent.	Sp. gr.	H Cl per cent.
1.203	40.659	1.1060	22.700
1.179	37.000	1.1008	21.512

1.1127	24.026		

(T. Thomson, in his *System*, **2**. 189.)

CHLORHYDRATE OF ACE*di*AMIN. $C_4 H_6 N_2, H Cl$ Soluble in water, alcohol, and a mixture of alcohol and ether. (Strecker, *Ann. Ch. u. Pharm.*, **103**. 328.)

CHLORHYDRATE OF ACETAMID. $2 C_4 H_5 N O_2, H Cl$ Readily soluble in water. Readily soluble in warm, less soluble in cold absolute alcohol. (Strecker, *Ann. Ch. u. Pharm.*, **103**. 321.)

CHLORHYDRATE OF ACETOS[ACETOYL]AMIN. (*Chloride of Acetylammonium (of Natanson).*) Soluble in water. The concentrated aqueous solution is not miscible with alcohol, separating as a heavy stratum when mixed therewith. It is not precipitated from its dilute aqueous solution by alcohol. (Natanson, *Ann. Ch. u. Pharm.*, **92**. 56.)

CHLORHYDRATE OF ACONITIN.
$C_{60} H_{47} N O_{14}, 2 H Cl$

CHLORHYDRATE OF ACROLEIN. $C_6 H_4 O_2, H Cl$ Insoluble in water. Readily soluble in alcohol, and ether. Decomposed by strong chlorhydric acid, also by dilute sulphuric and nitric acids. It does not appear to be altered by boiling with water or by the action of dilute solutions of the alkalies. (Geuther & Cartmell.)

CHLORHYDRATE OF ALANIN.

I.) $C_6 H_7 N O_4, H Cl$ Very deliquescent. Very soluble in water, and alcohol.

II.) $2 C_6 H_7 N O_4, H Cl$ Very soluble in water. Sparingly soluble in alcohol.

CHLORHYDRATE OF ALANIN with *sesqui*CHLORIDE OF IRON. Soluble in 2 pts. of cold, and in

4 pts. of boiling water. Soluble in oil of cumin. (Unverdorben.)

Chlorhydrate of Allylamin. Soluble in water.

Chlorhydrate of *tri*Allylamin. Soluble in water. $N C_{18} H_{15}, H Cl$

Chlorhydrate of Amarin. Sparingly soluble in boiling water. Easily soluble in alcohol, and ether. $C_{42} H_{18} N_2, H Cl$

Chlorhydrate of "AmidoBenzoic Acid." *Vid.* Chlorhydrate of Benzamic Acid.

Chlorhydrate of *bi*AmidoBenzoic Acid. $C_{14} H_8 N_2 O_4, 2 H Cl$ Very easily soluble in water, alcohol, and ether; but only sparingly soluble in chlorhydric acid. The aqueous solution is decomposed on exposure to the air. (Voit.)

Chlorhydrate of AmidoSulphoBenzid. $C_{24} H_9 (N H_2) S_2 O_4, H Cl$ Easily soluble in water, and alcohol. The aqueous solution is partially decomposed when heated. (Gericke, *Ann. Ch. u. Pharm.*, **100.** 212.)

*Bi*Chlorhydrate of *bi*AmidoSulphoBenzid. $C_{24} H_8 (N H_2)_2 S_2 O_4, 2 H Cl$ Readily soluble in water, and alcohol. (Gericke, *loc. cit.*)

Chlorhydrate of Ammolin(of Unverdorben). Soluble in water, and alcohol. Insoluble in ether.

Chlorhydrate of Ammonia & of Urea. $2 (C_2 H_4 N_2 O_2, N H_4 Cl)$; $C_2 H_4 N_2 O_2, H Cl$ Readily soluble in water. (Beckmann.)

Chlorhydrate of Amylamin. Permanent. $N \begin{cases} C_{10} H_{11} \\ H_2 \end{cases}, H Cl$ Tolerably soluble in water. Soluble in absolute alcohol. (Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 493.) Sparingly soluble, or insoluble, in absolute ether. (Cahours & Cloez.)

Chlorhydrate of *di*Amylamin. Almost insoluble in cold, more soluble in warm water. $N \begin{cases} (C_{10} H_{11})_2 \\ H \end{cases}, H Cl$

Chlorhydrate of *tri*Amylamin.
$N \big\{ (C_{10} H_{11})_3, H Cl$

Chlorhydrate of AmylAnilin. Rather sparingly soluble in water.

Chlorhydrate of *di*AmylAnilin. Nearly insoluble in water, and in dilute chlorhydric acid. Soluble in alcohol.

Chlorhydrate of AmylChinolin. Soluble in water. (Gr. Williams.)

"Chlorhydrate of Amylene." *Vid.* Chloride of Amyl.

Chlorhydrate of AmylPiperidin. Soluble in water. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 100.) $N \begin{cases} C_{10} H_{11} \\ C_{10} H_{10}''' \end{cases}, H Cl$

Chlorhydrate of AmylStrychnine. Soluble in water. Very easily soluble in alcohol. Insoluble in caustic potash. Ammonia-water decomposes it after a time. (How.) $C_{42} H_{21} (C_{10} H_{11}) N_2 O_4, H Cl + 8 Aq$

Chlorhydrate of Anchietin. Crystallizes from hot water, after which it is insoluble in water. (Parrish's *Pharm.*, p. 399.)

Chlorhydrate of Anilin. Very readily soluble in water, and alcohol. (Zinin.) Very soluble in water, and alcohol. Insoluble in ether. (Hofmann, *Ann. Ch. et Phys.*, (3.) **9.** 151.) It is partially precipitated from the aqueous solution on the addition of concentrated chlorhydric acid. (Hofmann, *J. Ch. Soc.*, **1.** 272.) $C_{12} H_7 N, H Cl$

Chlorhydrate of Animin(of Unverdorben). Soluble in water.

Chlorhydrate of Anisamate of Ethyl. $N \begin{cases} C_{16} H_7 O_4 \\ C_4 H_5 \\ H \end{cases} . O_2, H Cl$ Sparingly soluble in cold, easily soluble in boiling water. Still more easily soluble in alcohol. Tolerably readily soluble in ether. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 348.)

Chlorhydrate of Anisamate of Methyl. $N \begin{cases} C_{16} H_7 O_4 \\ C_2 H_3 \\ H \end{cases} . O_2, H Cl$ Sparingly soluble in cold, very readily soluble in boiling water, and still more easily in alcohol. Soluble in chlorhydric acid. (Cahours, *Ibid.*, p. 351.)

Chlorhydrate of Anisamic Acid. $N \left\{ \begin{matrix} C_{10} H_7 O_4 \\ H_2 \end{matrix} \right\} O_2, H Cl$ Tolerably soluble in water, even when this is cold, but scarcely at all soluble in chlorhydric acid. Tolerably easily soluble in boiling, less soluble in cold alcohol. Very sparingly soluble in ether. Chlorhydric acid precipitates it from the aqueous solution. (Cahours, *Ibid.*, p. 342.)

Chlorhydrate of Anisene. Insoluble in water. $C_{18} H_8 O_2, H Cl$?

Chlorhydrate of Anisin. Sparingly soluble in water. Readily soluble in alcohol. (Bertagnini, *Ann. Ch. u. Pharm.*, **88.** 128.) $C_{48} H_{24} N_2 O_6, H Cl + 2 Aq$

Chlorhydrate of Anisol.
$C_{20} H_{12} O_2, H Cl$

Chlorhydrate of Anthranilic Acid. Soluble in warm concentrated chlorhydric acid, separating ont again as the solution cools. (Kubel.) $C_{14} H_7 N O_4, H Cl$

Chlorhydrate of Antimonious Acid. Soluble in chlorhydric acid; the solution is decomposed, with precipitation, by a small quantity of water, but a large amount of water produces no precipitate.

Chlorhydrate of Aricin. Soluble in hot, less soluble in cold dilute alcohol. $C_{46} H_{28} N_2 O_8, H Cl$

Chlorhydrate of Arnicin.

Chlorhydrate of Asparagin.

I.) $C_8 H_8 N_2 O_6, H Cl$ Permanent. Soluble in water, less soluble in alcohol.

II.) *basic.* Permanent. Soluble in water; less soluble in alcohol. (Dessaignes, *Ann. Ch. et Phys.*, (3.) **34.** 152.) $2 C_8 H_8 N_2 O_6, H Cl$

Chlorhydrate of Aspartic Acid.
$C_8 H_7 N O_8, H Cl$

α (*active.*) Deliquesces and decomposes in the air. It is decomposed, with precipitation of aspartic acid (active), when dissolved in water, unless this be acidulated with chlorhydric acid. (Pasteur.)

β (*inactive.*) Permanent. It is decomposed when dissolved in water, though no precipitation occurs, owing to the fact that inactive aspartic acid is readily soluble in water. (Pasteur, *Ann. Ch. et Phys.*, (3.) **34.** 37.)

Chlorhydrate of Atropin. Permanent. Soluble in water. (Geiger & Hesse.) Easily soluble in water, and alcohol. Difficultly soluble in ether. (v. Planta.)

*Bi*Chlorhydrate of AzoNaphthylamin.

$C_{20}H_{10}N_2, 2HCl$ Sparingly soluble in water, and alcohol. (Zinin.)

Chlorhydrate of AzoPhenylamin. Nearly insoluble in water, alcohol, and ether. (Zinin.)

Chlorhydrate of Bebirin. Readily soluble in water.

Chlorhydrate of Benzamate of Ethyl. Easily soluble in alcohol; less soluble in ether. Soluble in chlorhydrie acid. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 328.)

$C_{18}H_{12}NClO_4 = N\left\{\begin{matrix}C_{14}H_5O_2\\ C_4H_5\\ H\end{matrix}\right. .O_2, HCl$

Chlorhydrate of Benzamic Acid. Tolerably readily soluble in pure water, and alcohol; but very sparingly soluble in these liquids when they are charged with chlorhydric acid. More soluble in hot than in cold chlorhydric acid. Ether does not precipitate it from the alcoholie solution. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 324.)

$N\left\{\begin{matrix}C_{14}H_5O_2\\ H_2\end{matrix}\right. .O_2, HCl$

Chlorhydrate of Benzamid. Very instable. (Dessaignes.)

$C_{14}H_7NO_2, HCl$

*Bi*Chlorhydrate of Benzidin. Permanent. Very soluble in water; still more soluble in alcohol. Almost insoluble in ether.

$C_{24}H_{12}N_2, 2HCl$

Chlorhydrate of Benzylene. *Vid.* Chloride of Toluenyl.

Chlorhydrate of Berberin. Soluble in 600 pts. of water at 18.75^c. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 75.) Soluble in alcohol.

$N\cdot\left\{C_{42}H_{19}O_{10}'''\right., HCl + 4Aq$

Chlorhydrate of Berberin with Glycocoll. Insoluble, or very sparingly soluble, in water. Soluble in hot spirit. (Horsford, *Am. J. Sci.*, (2.) **4.** 65.)

$C_{42}H_{18}NO_9, C_4H_4NO_3, HCl$

Chlorhydrate of Bergamot-Oil. Soluble in alcohol. (Ohme.)

$3C_{20}H_{16}, HCl + Aq$

Chlorhydrate of Borneol. Insoluble in water. Soluble in alcohol. (Berthelot.)

(*Camphol Chlorhydrique.*)
$C_{20}H_{16}, HCl$

Chlorhydrate of *bi*BromAllylamin. Readily soluble in water, and alcohol. Sparingly soluble in ether. (M. Simpson.)

$C_{12}H_9Br_2N, HCl$

Chlorhydrate of BromAnilin. Soluble in water.

$C_{12}H_6BrN, HCl$

Chlorhydrate of *bi*BromAnilin. Decomposed by warm water.

$C_{12}H_5Br_2N, HCl$

*Bi*Chlorhydrate of BromoCinchonin. Tolerably soluble in boiling alcohol. (Laurent, *Ann. Ch. et Phys.*, (3.) **24.** 307.)

$C_{40}H_{23}BrN_2O_2, 2HCl$

*Bi*Chlorhydrate *of sesqui*BromoCinchonin. Soluble in boiling, less soluble in cold alcohol. (Laurent.)

$C_{80}H_{45}Br_3N_4O_4, 4HCl$

*Bi*Chlorhydrate of *bi*BromoCinchonin. Sparingly soluble in boiling, less soluble in cold water.

$C_{40}H_{22}Br_2N_2O_2, 2HCl$

Chlorhydrate of BromoCodein.

Chlorhydrate of *bi*BromoMelanilin. Only slightly soluble in water. (Hofmann, *J. Ch. Soc.*, **1.** 300.)

$C_{26}H_{11}Br_2N_3, HCl$

Chlorhydrate of BromoStrychnine. Soluble in alcohol.

Chlorhydrate of Brucin. Permanent. Tolerably easily soluble in water.

$C_{46}H_{26}N_2O_8, HCl$

Chlorhydrate of Butylamin. Deliquescent. Soluble in water. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **42.** 166.)

(*Chlorhydrate of Tetrylamin.*)
$N\left\{\begin{matrix}C_8H_9\\ H_2\end{matrix}\right., HCl$

Chlorhydrate of Cacothelin. Decomposed by water. Soluble in chlorhydrie acid. (Strecker.)

Chlorhydrate of Caffein.

I.) *normal.* Efflorescent, and decomposes in the air. Decomposed by water, and alcohol. Insoluble in ether. Caffein is easily soluble in concentrated chlorhydric acid; but if water or alcohol be added to this solution, a considerable quantity of hydrated caffein crystallizes out. (Herzog.)

$C_{16}H_{10}N_4O_4, HCl$

II.) *acid.* Decomposed by much water, with separation of caffein.

$C_{16}H_{10}N_4O_4, 2HCl$

Chlorhydrate of Cajputene.

I.) *mono.*

$C_{20}H_{16}, HCl$

II.) *bi.* Sparingly soluble in cold, easily soluble in boiling alcohol, and ether. (Max. Schmidl.)

$C_{20}H_{16}, 2HCl$

Chlorhydrate of Caoutchin. Soluble in absolute alcohol, in ether, and acetate of ethyl, but on adding water or weak alcohol to either of these solutions the whole of the caoutchin is precipitated. (Himly.)

$C_{20}H_{16}, HCl$

Chlorhydrate of *tri*Caproylamin. Deliquescent. Soluble in water, and alcohol. (Gœssmann & Petersen.) Sparingly soluble in water. Easily soluble in alcohol, and ether. (Petersen, *Ann. Ch. u. Pharm.*, **102.** 314.)

$N\left\{(C_{12}H_{13})_3\right., HCl$

Chlorhydrate of Caprylamin. *Vid.* Chlorhydrate of Octylamin.

Chlorhydrate of Carapin. Soluble in water.

Chlorhydrate of Carvene. Readily soluble in water, but is decomposed when heated therewith. Easily soluble in hot, rather difficultly soluble in cold alcohol. (Schweizer.)

$C_{20}H_{16}, 2HCl$

Chlorhydrate of Carvol.

$C_{20}H_{14}O_2, HCl$

Chlorhydrate of Cetyl. Soluble in alcohol, especially if this is boiling.

Chlorhydrate of *tri*Cetylamin. Soluble in boiling alcohol.

Chlorhydrate of CetylAnilin. Soluble in alcohol.

Chlorhydrate of *di*CetylAnilin. Somewhat soluble in alcohol.

Chlorhydrate of Chelidonin. Soluble in 325 pts. of water at 18°. Insoluble in ether. (Probst, *Ann. der Pharm.*, 1839, **29.** 127.) Sparingly soluble in alcohol.

Chlorhydrate of ChlorAnilin. Permanent. Soluble in water.

$C_{16}H_6ClN, HCl$

Chlorhydrate of ChlorEtherose. *Vid.* Chloride of *ter*ChlorEthylene.

Chlorhydrate of Chloride of Antimony. Is rendered cloudy when treated with a small quantity of water, but remains clear if a large excess of water be at once added to it.

$SbCl_5, HCl$

It is as easily precipitated by strong acetic acid as by water. (R. Phillips.)

Chlorhydrate of Chloride of Ethyl with *bin*Oxide of Tin. Soluble in alcohol.
$2\,C_4\,H_5\,Cl, H\,Cl, 2\,Sn\,O_2 + Aq$

Chlorhydrate of *ter*Chloride of Gold. Deliquescent. Not quite so soluble in water as terchloride of gold. (Berzelius.) Slowly decomposed by alcohol. Decomposed by glycerin. Strong sulphuric acid precipitates out the terchloride of gold in the cold, and decomposes it on boiling.

Chlorhydrate of Chloride of Ruthenium. Soluble in water.
$Ru\,Cl, H\,Cl$

Chlorhydrate of Chloride of Silicium. Instantly decomposed by water. Soluble in large quantity, probably with decomposition, in alcohol, and ether. (Buff & Wœhler, *Ann. Ch. u. Pharm.*, **104.** 97.)
$Si_2\,Cl_3, 2\,H\,Cl$

Chlorhydrate of *ter*ChloroBenzin. Insoluble in water. Sparingly soluble in cold, readily soluble in hot alcohol. Readily soluble in ether. (Mitscherlich, Peligot.)
(*TerChloride of Benzin. Chlor Benzin. ChloroBenzol. Chloro Benzone. Chlorhydrate of Chlorophenise. Hydrochlorate of terChloroBenzene.*)
$C_{12}\,H_6\,Cl_6 = C_{12}\,H_3\,Cl_3, 3\,H\,Cl$

Chlorhydrate of ChloroBenzoenise. *Vid.* Chloride of ChloroToluene.

Chlorhydrate of ChloroCamphilene.
$C_{20}\,H_{15}\,Cl, H\,Cl$

*Bi*Chlorhydrate of *bi*ChloroCinchonin. Sparingly soluble in water. Soluble in about 50 pts. of alcohol. (Laurent, *Ann. Ch. et Phys.*, (3.) **24.** 305.)
$C_{40}\,H_{22}\,Cl_2\,N_2\,O_2, 2\,H\,Cl$

Chlorhydrate of ChloroCodein. Very soluble in water.

Chlorhydrate of *bi*ChloroMelAnilin. Sparingly soluble in water, more readily soluble in alcohol, and still more readily soluble in ether. (Hofmann, *J. Ch. Soc*, **1.** 299.)
$C_{28}\,H_{11}\,Cl_2\,N_3, H\,Cl$

Chlorhydrate of ChloroNaphthalin. *Vid.* Chloride of ChloroNaphthalin.

Chlorhydrate of ChloroNicine. Readily soluble in water, even when this is cold. (St. Evre.)
$C_{20}\,H_{12}\,Cl_2\,N_2, 2\,H\,Cl$

Chlorhydrate of ChloroNitroHarmin. Tolerably soluble in water; less soluble in chlorhydric acid. Soluble in boiling, less soluble in cold alcohol.

Chlorhydrate of Chlorophenise. *Vid.* *ter*Chloride of Benzin.

Chlorhydrate of *ter*ChloroPicolin. Insoluble in water. Soluble in alcohol.
$N \left\{ C_{12}\,H_4\,Cl_3{}''', H\,Cl \right.$

Chlorhydrate of ChloroStilbene. *Vid.* Chloride of Stilbene.

Chlorhydrate of *bi*ChloroStilbene. *Vid.* Chloride of ChloroStilbene.

Chlorhydrate of *bi*ChloroSulphoBenzid. Insoluble in water. Soluble in spirit, and ether. Soluble, without decomposition, in dilute alkaline solutions, and in dilute sulphuric and chlorhydric acids. Decomposed by nitric acid. (Gericke, *Ann. Ch. u. Pharm.*, **100.** 213.)
$C_{24}\,H_8\,Cl_2\,S_2\,O_4, 2\,H\,Cl$

Chlorhydrate of ChloroToluene.
(*Chloride of biChloroToluene. Chlorhydrate of Chlorobenzoenise. HydroChlorate of terChloroToluol. Chloride of Toluenebichloré.*)
$C_{14}\,H_6\,Cl_4 = C_{14}\,H_5\,Cl_3, H\,Cl$

Chlorhydrate of *bi*ChloroToluene.
(*ChloroDracyl.*)
$C_{14}\,H_8\,Cl_4 = C_{14}\,H_8\,Cl_2, 2\,H\,Cl$

*Bi*Chlorhydrate of *quinqui*ChloroToluene. Soluble in ether. (Deville.)
(*BiChloride of terChloroToluene. BiHydroChlorate of Chlorobenzoenise. BiHydroChlorate of quinquiChloroToluol. BiChloride of Toluenechloré.*)
$C_{14}\,H_5\,Cl_7 = C_{14}\,H_3\,Cl_5, 2\,H\,Cl$

*Ter*Chlorhydrate of *quinqui*ChloroToluene. Soluble in ether, especially when this is heated under increased pressure. (Deville.)
(*TerChloride of biChloroToluene. TerHydroChlorate of quintiChloroToluol. TriChloride of Toluenebichloré.*)
$C_{14}\,H_6\,Cl_8 = C_{14}\,H_3\,Cl_5, 3\,H\,Cl$

"Chlorhydrate of ChloroToluol." *Vid.* Chloride of ChloroToluene.

Chlorhydrate of Cholesterin. Insoluble, or very sparingly soluble, in water. Soluble in ether.

I.) Chlorhydrate of Cinchonidin (of Wittstein). Soluble in 27 pts. of cold, and in 0.5 pt. of boiling water; in 5.4 pts. of cold, and in 0.5 pt. of boiling alcohol; and in 10.5 pts. of ether.
$C_{36}\,H_{20}\,N_2\,O_2, 2\,H\,Cl + 14\,Aq$

II.) Chlorhydrate of Cinchonidin (of Pasteur).

a = *normal.* Soluble in 27 pts. of water at 17°. Very easily soluble in alcohol; almost completely insoluble in ether. (Leers, *Ann. Ch. u. Pharm.*, **82.** 155.)
$C_{40}\,H_{24}\,N_2\,O_2, H\,Cl + 2\,Aq$

b = *acid.* Very easily soluble in water, and spirit. (Leers, *loc. cit.*, p. 156.)
$C_{40}\,H_{24}\,N_2\,O_2, 2\,H\,Cl + 2\,Aq$

Chlorhydrate of *α* Cinchonin.

I.) *normal.* Easily soluble in water, and alcohol. Almost insoluble in ether.
$C_{40}\,H_{24}\,N_2\,O_2, H\,Cl$

II.) *acid.* Very soluble in water, somewhat less soluble in alcohol. (Laurent, *Ann. Ch. et Phys.*, (3.) **24.** 303.) "Chlorhydrate of Cinchonin" is soluble in 24 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.)
$C_{40}\,H_{24}\,N_2\,O_2, 2\,H\,Cl$

Chlorhydrate of *β* Cinchonin. Soluble in 22 pts. of cold, and in 3.2 pts. of hot water; in 1 pt. of cold, and in 0.5 pt. of boiling alcohol; and in 550 pts. of ether. (W. Schwabe, in *Kopp & Will's J. B., für* 1860, p. 363.)
$C_{40}\,H_{24}\,N_2\,O_2, H\,Cl + 4\,Aq$

Chlorhydrate of Citrene.
" " Citronyl.
" " Citryl.
" " Citrylene.
Vid. Chlorhydrate of Lemon-Oil.

Chlorhydrate of *di*CobaltAmin. *Vid.* Chloride of LuteoCobalt.

Chlorhydrate of Codein. Soluble in 20 pts. of water at 15.5°, and in less than 1 pt. of boiling water.
$C_{36}\,H_{21}\,N\,O_6, H\,Cl + 4\,Aq$

Chlorhydrate of Conhydrin. Soluble in water, and alcohol. (Th. Wertheim.)

Chlorhydrate of Coniin. Permanent.

$C_{16}H_{15}N, HCl$ (Wertheim.) Deliquescent. (Liebig & Blyth.) Extremely soluble in water. [Very soluble in alcohol, and ether.] (Blyth, *J. Ch. Soc.*, **1.** 353.)

CHLORHYDRATE OF COPAIBA-OIL.

I.) *solid.* Insoluble in water, or cold alcohol. Sparingly soluble in hot alcohol. Easily soluble in ether. (Blanchet.)

(*Copaibn-Camphor.*) $C_{20}H_{18}, 2HCl$

II.) *liquid.* Soluble in alcohol, and ether. (Gerber.)

(*Chlorhydrate of Copahilene.*)

CHLORHYDRATE OF CORYDALIN. Easily soluble in water. Also soluble in strong alcohol.

CHLORHYDRATE OF COTARNIN. Readily soluble in water.

$C_{26}H_{13}NO_6, HCl + 5Aq$

CHLORHYDRATE OF CREATIN. Permanent. Soluble in water. (Dessaignes.)

$C_8H_9N_3O_4, HCl$

CHLORHYDRATE OF CREATININ. Very soluble in water. Tolerably soluble in alcohol.

CHLORHYDRATE OF CREATININZINC. Very difficultly soluble in water. Insoluble in alcohol, and ether.

$C_8H_6ZnN_3O_2, HCl$

CHLORHYDRATE OF CUBEBENE. Readily soluble in alcohol.

$C_{30}H_{24}, 2HCl$

CHLORHYDRATE OF CUMARAMIN. Easily soluble in water. (Frappoli & Chiozza.)

CHLORHYDRATE OF CUMARIN. Readily soluble in water.

CHLORHYDRATE OF CUMIDIN. Soluble in water, and alcohol. (Nicholson, *J. Ch. Soc.*, **1.** 7.)

$C_{18}H_{13}N, HCl$

CHLORHYDRATE OF CUMINAMATE OF ETHYL. Easily soluble in water, and alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 340.)

CHLORHYDRATE OF CUMINAMIC ACID. Tolerably easily soluble in water. Difficultly soluble in boiling chlorhydric acid, separating out again as the solution cools; more easily soluble in a mixture of alcohol and chlorhydric acid. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 335.)

$N\left\{\begin{matrix}C_{20}H_{11}O_2\\H_2\end{matrix}\right. . O_2, HCl$

CHLORHYDRATE OF CURARIN.

CHLORHYDRATE OF CYAMELID. Soluble, with decomposition and evolution of much heat, in water, and alcohol.

(*Chlorhydrate of Cyanic Acid* (CyO,HO,HCl).)

$C_2H_2NO_2Cl = N\left\{\begin{matrix}C_2O_2''\\H\end{matrix}\right., HCl$

CHLORHYDRATE OF CYANANILIN. Extremely soluble in water, and alcohol. These solutions are partially decomposed on evaporation. Insoluble in concentrated chlorhydric acid, which precipitates it from the aqueous solution. Readily soluble in dilute chlorhydric acid, the solution undergoing decomposition when evaporated. Insoluble in ether. (Hofmann, *J. Ch. Soc.*, **1.** 164.)

$N\left\{\begin{matrix}C_{12}H_5\\H_2\end{matrix}\right. . C_2N, HCl$

CHLORHYDRATE OF CYANICACID. *Vid.* Chlorhydrate of Cyamelid.

CHLORHYDRATE OF CYANETHIN. Very soluble in water. Soluble in alcohol. (Kolbe & Frankland, *J. Ch. Soc.*, **1.** 72.)

$C_{18}H_{15}N_3, HCl$

CHLORHYDRATE OF CYANETHOLIN. Soluble in water.

CHLORHYDRATE OF CYANIDE OF ETHYL. Instantly decomposed by water. (Habich & Limpricht.)

$C_2(C_4H_5)NO_2, HCl$

CHLORHYDRATE OF CYANOCODEIN. Easily decomposed.

CHLORHYDRATE OF CYANOCUMIDIN. Exceedingly sparingly soluble in water. (Hofmann.)

$NC_{18}H_{13}(C_2N), HCl$

CHLORHYDRATE OF CYMIDIN. Soluble in water. (Barlow, *Ann. Ch. u. Pharm.*, **98.** 250.)

$C_{20}H_{15}N, HCl$

CHLORHYDRATE OF CYSTIN. Permanent. Nearly insoluble in water. (O. Henry.)

$C_8H_8NS_2O_4, HCl$

CHLORHYDRATE OF DELPHIN (or DELPHININ). Deliquescent. Soluble in water.

CHLORHYDRATE OF ELEMI-OIL.

I.) *solid.*

$C_{20}H_{16}, 2HCl$

II.) *liquid.*

CHLORHYDRATE OF ETHYLAMIN. Very deliquescent. Soluble in water. Soluble in strong boiling alcohol. Less soluble in cold alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 480.) Soluble in mixed alcohol and ether. (Gœssmann.)

$N\left\{\begin{matrix}C_4H_5\\H_2\end{matrix}\right., HCl$

CHLORHYDRATE OF ETHYLAMIN with CYANIDE OF MERCURY. Permanent. Easily soluble in water. Difficultly soluble in cold spirit.

$C_4H_7N, HCl; 2HgC_2N$

CHLORHYDRATE OF *di*ETHYLAMYLAMIN. Deliquescent.

$C_{18}H_{22}NCl = N\left\{\begin{matrix}(C_4H_5)_2\\C_{10}H_{11}\end{matrix}\right\}, HCl$

CHLORHYDRATE OF ETHYLAMYLANILIN.

CHLORHYDRATE OF ETHYLANILIN. Soluble in water, and alcohol. (Hofmann.)

CHLORHYDRATE OF *di*ETHYLANILIN. Soluble in water, and alcohol.

CHLORHYDRATE OF ETHYLBRUCIN. *Vid.* Chloride of EthylBrucin.

CHLORHYDRATE OF ETHYLCODEIN. Soluble in water. (How, *J. Ch. Soc.*, **6.** 136.)

CHLORHYDRATE OF ETHYLCONIIN. Very deliquescent.

CHLORHYDRATE OF ETHYL*di*CYAN*bi*AMIN. Soluble in water.

CHLORHYDRATE OF ETHYL CYANANILIN. Very sparingly soluble in concentrated chlorhydric acid.

CHLORHYDRATE OF *di*ETHYLENE *di*PHENYL*bi*AMIN.

$N_2\left\{\begin{matrix}(C_4H_4'')_2\\(C_{12}H_5)_2\end{matrix}\right., 2HCl$

CHLORHYDRATE OF ETHYLMORPHIN. Soluble in water. Soluble in a mixture of alcohol and ether. (How, *J. Ch. Soc.*, **6.** 128.)

CHLORHYDRATE OF ETHYL*tri*PHENYLAMIN. Deliquescent. Soluble in water. (Gœssmann.)

(*Chlorhydrate of EthylbiCinnamylamin.*)

CHLORHYDRATE OF ETHYLPHOSPHIN.

CHLORHYDRATE OF ETHYLPHTALIDIN. Soluble in water. (Dusart, *Ann. Ch. et Phys.*, (3.) **45.** 337.)

CHLORHYDRATE OF ETHYLPIPERIDIN. Soluble in water. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 97.)

$C_{14}H_{15}N, HCl$

CHLORHYDRATE OF *di*ETHYLPLATIN(*ous*)*bi*AMIN. Tolerably soluble in water. Sparingly soluble in alcohol. (Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 485.)

$N_2\left\{\begin{matrix}(C_4H_5)_2\\H_3\\Pt'\end{matrix}\right., HCl$

CHLORHYDRATE OF ETHYLTHIOSINNAMIN. Soluble in water, and spirit. (Weltzien, *Ann. Ch. u. Pharm.*, **94.** 104.)

CHLORHYDRATE OF ETHYLTOLUIDIN. Soluble in water.

Chlorhydrate of Formicyl*di*Phenyl*bi*amin.

$N_2\left\{\begin{matrix}C_2H'''\\(C_{12}H_5)_2\\H\end{matrix}\right. HCl$

Chlorhydrate of Fucusin. Very soluble in water.

Chlorhydrate of Furfurin. Readily soluble in water; less soluble in chlorhydric acid. (Fownes.)
$C_{30}H_{12}N_2O_0, HCl + 2 Aq$

Chlorhydrate of Glaucin. Readily soluble in water, and alcohol. Insoluble in ether.

Chlorhydrate of Glaucopicrin. Soluble in water. Insoluble in ether.

Chlorhydrate of Glyceramin. Extremely hygroscopic. Slowly, but entirely, soluble in absolute alcohol. Insoluble, or very sparingly soluble, in ether. (Berthelot & De Luca.)
$C_6H_9NO_4. HCl$

Chlorhydrate of Glycerin. *Vid.* Chlorhydrin.

Chlorhydrate of Glycocoll.

I.) *normal.* Slowly deliquescent. Readily soluble in water, and in hot ordinary alcohol. Slightly soluble in absolute alcohol. (Horsford, *Am. J. Sci.*, (2.) **3.** 377.)
$C_4H_5NO_4, HCl$

II.) *basic.* Easily soluble in water, less soluble in alcohol.
$2 C_4H_5NO_4, HCl$

Chlorhydrate of Glycocoll with Anhydrous Glycocoll.

I.) $C_4H_5NO_4, HCl; C_4H_4NO_3$ Permanent. Soluble in water; also in spirit, though less so than in water. (Horsford, *Am. J. Sci.*, (2.) **3.** 378.)

II.) *basic.*
$2 C_4H_5NO_4, HCl; C_4H_4NO_3$

Chlorhydrate of Guanin.

I. *normal.*
$C_{10}H_5N_5O_2, HCl + 2 Aq$

II.) *acid.*
$C_{10}H_5N_5O_2, 2 HCl$

Chlorhydrate of Guanin with Chloride of Cadmium. Permanent. Tolerably readily soluble in water, and in acids. (Neubauer & Kerner, *loc. cit.*)
$2(C_{10}H_5N_5O_2, HCl); 5 CdCl + 9 Aq$

Chlorhydrate of Guanin with Chloride of Zinc. Difficultly soluble in water. Easily soluble in chlorhydric acid, and in a solution of caustic soda. (Neubauer & Kerner, *Ann. Ch. u. Pharm.*, **101.** 331.)
$C_{10}H_5N_5O_2, HCl; ZnCl + 3 Aq$

Chlorhydrate of Harmalin. Tolerably soluble in water, and alcohol. Very sparingly soluble in an aqueous solution of chloride of sodium, and even less soluble in a solution of nitrate of soda.
$C_{26}H_{14}N_2O_2, HCl + 4 Aq$

Chlorhydrate of Harmin. Soluble in water, and alcohol.
$C_{26}H_{12}N_2O_2, HCl + 4 Aq$

Chlorhydrate of Hexylamin. *Vid.* Chlorhydrate of Caproylamin.

Chlorhydrate of Hippuramic Acid. Gives off chlorhydric acid when exposed to the air. (Schwanert.)
$C_{18}H_{10}N_2O_6, HCl$

Chlorhydrate of Huanokin. *Vid.* Chlorhydrate of Cinchonin.

Chlorhydrate of Hydride of Cinnamyl (Cinnamic Aldehyde). Decomposed by water.
$C_{18}H_8O_2, HCl$

Chlorhydrate of HydroCyanHarmalin. Soluble in water, and alcohol.
$C_{26}H_{14}N_2O_2HCy, HCl$

Chlorhydrate of Igasurin. Soluble in 2 pts. of warm, and in about 4 pts. of cold water.

Chlorhydrate of IodAnilin. Only slightly soluble in cold water; from this solution it is almost entirely precipitated on the addition of chlorhydric acid. More soluble in boiling water. Soluble in alcohol. Insoluble in ether. (Hofmann, *J. Ch. Soc.*, **1.** 276.)
$C_{12}H_6IN, HCl$

Chlorhydrate of *ter*Iodide of Nicotin.
$N_2\{(C_{10}H_7''')\}I_3, HCl$

Chlorhydrate of *bin*IodoMelAnilin. Very sparingly soluble in hot, less soluble in cold water. (Hofmann.)
$C_{26}H_{11}I_2N_3, HCl$

Chlorhydrate of IodoNicotin. Soluble in alcohol.
$2 C_{20}H_{14}N_2, 3 I, 2 HCl$

Chlorhydrate of Jervin. Very sparingly soluble in water, and in mineral acids. Soluble in alcohol.

Chlorhydrate of Juniper-Oil(or of Juniperilin).

Chlorhydrate of Lemon-Oil.

I.) *mono.*
$C_{20}H_{16}, HCl$

II.) *bi.*
(Chlorhydrate of Citronyl. Chlorhydrate of Citrene.)
$C_{20}H_{16}, 2 HCl$
Insoluble in water. Soluble in 5.88 pts. of alcohol, of 0.806 sp. gr., at 14°. (Saussure.) Soluble in ether. (Blanchet & Sell.) Soluble in oil of lemon. (Saussure.) Less soluble in alcohol than the bichlorhydrate of turpentine-oil. (List.)

III.) "Liquid Lemon-Camphor." Soluble in spirit, from which it is precipitated on the addition of water.
(Chlorhydrate of Citrylene. Chlorhydrate of Citryl.)

Chlorhydrate of Lepidin.
$N\}C_{20}H_9''', HCl$

Chlorhydrate of Leucin.

I.) $C_{12}H_{13}NO_4, HCl$ Readily soluble in water.

II.) $2 C_{12}H_{13}NO_4, HCl$ Soluble in ordinary alcohol. (Schwanert, *Ann. Ch. u. Pharm.*, **102.** 230.)

Chlorhydrate of Lobelin.

Chlorhydrate of Lophin. Nearly insoluble in water. Tolerably easily soluble in alcohol. (Laurent.) More readily soluble in water, and alcohol than the pure base. (Gœssman & Atkinson.) Less soluble in alcohol and ether than the iodhydrate.
$C_{42}H_{16}N_2, HCl + Aq$

*Bi*Chlorhydrate of Mandarin-Oil. Insoluble in water. Soluble in alcohol, and ether. (Luca.)

Chlorhydrate of Melamin.

$C_6H_7N_6Cl = N_3\left\{\begin{matrix}Cy_3\\H_0\end{matrix}\right., HCl$

Chlorhydrate of MelAnilin. Is the most soluble of the melanilin salts. [Compare Bromhydrate of MelAnilin.] (Hofmann, *J. Ch. Soc.*, **1.** 293.)
$C_{26}H_{13}N_3, HCl$

Chlorhydrate of MeNaphtylamin. Moderately soluble in water. Very soluble in alcohol, and ether.
$C_{42}H_{17}N_3, HCl$

Chlorhydrate of Menthene.
(ChloroMenthene.)
$C_{20}H_{18}, HCl$

Chlorhydrate of Mesitylene. *Vid.* Chloride of Mesityl.

Chlorhydrate of Methylamin. Deliquescent. Soluble in water. Easily soluble in hot, less soluble in cold alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 456.)

$N\left\{\begin{matrix}C_2H_3\\H_2\end{matrix}\right., H\,Cl$

Chlorhydrate of *bi*Methylamin. Very hygroscopic. Easily soluble in water; almost as soluble in alcohol; but far less soluble in ether. (Petersen, *Ann. Ch. u. Pharm.*, **102.** 322.)

$N\left\{\begin{matrix}(C_2H_3)_2\\H\end{matrix}\right., H\,Cl$

Chlorhydrate of *tri*Methylamin. Very deliquescent. Very soluble in water. Soluble in absolute alcohol. (Winkles, *Ann. Ch. u. Pharm.*, **93.** 326.)

"Chlorhydrate of Methylene." *Vid.* Chloride of Methyl.

Chlorhydrate of MethylEthylAmylamin. Soluble in water.

Chlorhydrate of MethylNitroPhenidin. Sparingly soluble in cold, readily soluble in boiling water. Soluble in spirit. (Cahours, *Ann. Ch. et Phys.*, (3.) **27.** pp. 445, 447.)

$C_{14}H_8(NO_4)NO_2, H\,Cl$

Chlorhydrate of MethylPhenidin. Easily soluble, even in dilute alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **27.** 443; & **53.** 341.)

(*Chlorhydrate of Anisidin.*)
$C_{14}H_9NO_2, H\,Cl$

Chlorhydrate of *tri*MethylPhosphin. Ppt. (P. Thénard.)

$P(C_2H_3)_3, H\,Cl$

Chlorhydrate of MethylPiperidin. Soluble in water. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 93.)

$C_{12}H_{13}N, H\,Cl$

Chlorhydrate of MethylPlatin(*ous*)amin. Soluble in boiling, less soluble in cold water. Less soluble in water than the chlorhydrate of *di*methylplatin(*ous*)*bi*amin. (Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 464.)

$C_2H_5Cl\,PtN = N\left\{\begin{matrix}C_2H_3\\H\\Pt'\end{matrix}\right., H\,Cl$

Chlorhydrate of *di*MethylPlatin(*ous*)*bi*amin. Less soluble in alcohol than in water. (Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 463.)

$C_4H_{10}N_2PtCl = N_2\left\{\begin{matrix}(C_2H_3)_2\\H_3\\Pt'\end{matrix}\right., H\,Cl$

Chlorhydrate of MethylUranin.

Chlorhydrate of MeToluidin. Soluble in water acidulated with chlorhydric acid. (Wilson, *J. Ch. Soc.*, **3.** 156.)

Chlorhydrate of Molybdic Acid. Soluble in water and in chlorhydric acid.

Chlorhydrate of Morphine. Permanent. Soluble in 16 @ 20 pts. of cold, and in less than 1 pt. of boiling water; still more soluble in alcohol.

$C_{34}H_{19}NO_6, H\,Cl + 6\,Aq$

Soluble in 22 pts. of cold, and in less than 1 pt. of boiling water; in 60 pts. of cold, and in 10 pts. of boiling alcohol of 80%. (Wittstein, in his *Handw.*) Soluble in 20 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) More soluble in an aqueous solution of chloride of sodium than chlorhydrate of narcotin, though less soluble than the latter in water.

Chlorhydrate of Naphtylamin. Soluble in water. (Schiff.) Rather soluble in water; more readily soluble in alcohol, and ether. (Zinin.) Less soluble in chlorhydric acid than in water. (Piria.)

$N\left\{\begin{matrix}C_{20}H_8''\\H\end{matrix}\right., H\,Cl$

Chlorhydrate of Narcein. Readily soluble in water, and alcohol.

$C_{46}H_{29}NO_{18}, H\,Cl$

Chlorhydrate of Narcotin. Extremely soluble in water. More soluble in water, but less soluble in an aqueous solution of chloride of sodium than chlorhydrate of morphine. Soluble in boiling, somewhat less soluble in cold alcohol.

Chlorhydrate of Nicotin. Very deliquescent. Very soluble in water, and alcohol. Insoluble in ether. (Barral, *Ann. Ch. et Phys.*, (3.) **7.** 154.)

$C_{20}H_{14}N_2, 2\,H\,Cl$

Chlorhydrate of Nicotin with Chloride of Cadmium. Readily soluble in water. (Gr. Williams, Galetty.)

$C_{20}H_{14}N_2, 2\,H\,Cl;\ 5\,Cd\,Cl$

Chlorhydrate of NiNaphthylamin.

$C_{20}H_8N_2O_2, H\,Cl$

Chlorhydrate of NitrAmarin. Insoluble in water. Almost insoluble in cold, sparingly soluble in strong boiling alcohol. (Bertagnini, *Ann. Ch. et Phys.*, (3.) **33.** 481.)

$C_{42}H_{18}(NO_4)_3N_2, H\,Cl$

Chlorhydrate of (*a*)NitrAnilin. Permanent. Extremely soluble in water, and alcohol. (Muspratt & Hofmann.) Decomposed by water. Readily soluble in chlorhydric acid. (Arppe, *Ann. Ch. u. Pharm.*, **93.** 359.)

$C_{12}H_6(NO_4)N, H\,Cl$

Chlorhydrate of (β)NitrAnilin. Decomposed by water Soluble in chlorhydric acid. (Arppe.)

$C_{12}H_8(NO_4)N, H\,Cl$

Chlorhydrate of NitrAzoPhenylamin. Decomposed by pure water. (Gottlieb.) Soluble in dilute chlorhydric acid.

$C_{12}H_7(NO_4)N_2, H\,Cl + 2\,Aq$

Chlorhydrate of NitroCodein.

Chlorhydrate of NitroCumidin. Soluble in water.

$C_{18}H_{12}(NO_4)N, H\,Cl + 2\,Aq$

Chlorhydrate of NitroHarmalin. Soluble in water; less soluble in dilute aqueous solutions of chloride of sodium or chlorhydric acid.

$C_{28}H_{13}(NO_4)N_2O_2, H\,Cl$

Chlorhydrate of NitroHarmin. Soluble in water, and in boiling alcohol.

$C_{28}H_{11}(NO_4)N_2O_2, H\,Cl + 4\,Aq$

Chlorhydrate of *bi*NitroMelAnilin. Rather difficultly soluble in water. (Hofmann, *J. Ch. Soc.*, **1.** 306.)

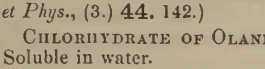
$C_{26}H_{11}(NO_4)_2N_3, H\,Cl$

Chlorhydrate of NitroMesidin. Decomposed by water. Soluble in water acidulated with chlorhydric acid. Soluble in alcohol. (Maule, *J. Ch. Soc.*, **2.** 118.)

$C_{18}H_{12}N_2O_4, H\,Cl$

Chlorhydrate of NitroPapaverin. Sparingly soluble in water. Easily soluble in chlorhydric acid. Easily soluble in alcohol.

Chlorhydrate of NitroTyrosin. Easily soluble in water, and alcohol.



$N\left\{\begin{matrix}C_{14}H_4(NO_4)O_2\\C_2HO_2\\C_2H_3\end{matrix}\right., H\,Cl + 2\,Aq$

Chlorhydrate of Octylamin. Deliquescent. Soluble in water. (Bouis, *Ann. Ch. et Phys.*, (3.) **44.** 142.)

(*Chlorhydrate of Caprylamin.*)
$C_{16}H_{19}N, H\,Cl$

Chlorhydrate of Olanin(of Unverdorben.) Soluble in water.

Chlorhydrate of Oxycanthin.

Chlorhydrate of OxyChloride of Chromium.

I.) $Cr_2O_2Cl, 2\,H\,Cl, 10\,HO$ Soluble in water.

II.) Cr_2O_2Cl, HCl, HO (of Peligot).
$2Cr_2O_3, 2Cr_2Cl_3, 8HO$ (of Moberg).
$Cr_2O_3, 2HCl$ (of Lœwel).
Very hygroscopic. Soluble in water, with evolution of heat. (Peligot, *Ann. Ch, et Phys.*, (3.) **16.** 294.)

Chlorhydrate of OxyCobaltiaque (of Fremy). Very soluble in ammonia-water. Immediately decomposed by water. (Fremy, *Ann. Ch. et Phys.*, (3.) **35.** 279.)

Chlorhydrate of Papaverin. Soluble in boiling water.
$C_{40}H_{21}NO_8, HCl$

Chlorhydrate of ParaNicine. Soluble in water, even when this is cold. (St Evre, in Gerhardt's *Tr.*, **3.** 66.) Insoluble in cold water. (*Idem*, in *Gm.*, **14.** 181.)
$C_{20}H_{13}N, HCl$

Chlorhydrate of Pelosin. Very hygroscopic. Readily soluble in water, and alcohol.
$C_{36}H_{21}NO_6, HCl + 2Aq$

Chlorhydrate of Petinin. Very easily soluble in water.

Chlorhydrate of *di*Phenin. Soluble in chlorhydric acid.

Chlorhydrate of PhenoylBenzoylamid. Decomposed by water, and alcohol. Soluble in ether.
(*Chloride of Benzanilid.*)
$N\left\{\begin{matrix}C_{12}H_4'' \\ C_{14}H_5\end{matrix}\right., HCl$

Chlorhydrate of PhenylAcetosamin. Soluble in water, ammonia-water, and alcohol. (Natanson.)
(*Chlorhydrate of Acet[o]ylAnilin.*)
$C_{16}H_9N, HCl$

Chlorhydrate of *tri*Phenylamin. Easily soluble in water, and in ordinary alcohol; less easily soluble in absolute alcohol, or anhydrous ether. Its solution soon undergoes decomposition. (Gœssmann, *Ann. Ch. u. Pharm.*, **100.** 60.)

Chlorhydrate of PhenylCarbamic Acid. Soluble in warm chlorhydric acid, from which it separates as the solution cools. (Kubel.)
$C_{14}H_7NO_4, HCl$

Chlorhydrate of PhenylUrea. Easily soluble in water.
$C_2H_3(C_{12}H_5)N_2O_2, HCl$

Chlorhydrate of *di*PhenylUrea. Very easily soluble in water; somewhat less soluble in alcohol. (Laurent & Chancel.)
$C_2H_2(C_{12}H_5)_2N_2O_2, 2HCl$

Chlorhydrate of Phorylamin.

Chlorhydrate of Phthalidin. Soluble in water. Very sparingly soluble, or insoluble, in alcohol. (Dusart, *loc. cit.*)
$C_{16}H_9N, HCl$

Chlorhydrate of Picolin. Quickly deliquesces. Soluble in water. (Anderson.)
$N\left\{C_{12}H_7''', HCl\right.$

Chlorhydrate of Picolin with *proto*Chloride of Copper. ? Very readily soluble in water. Soluble in 6 pts. of cold, and in a much smaller quantity of hot absolute alcohol. (Unverdorben.)
(*ChloroCuprate of Picolin.*)

Chlorhydrate of Piperidin. Permanent. Very soluble in water, and alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 80.)
$C_{10}H_{11}N, HCl$

Chlorhydrate of Piperin. Decomposed by water. Soluble in alcohol.

Chlorhydrate of *di*Platinamin. *Vid.* Chloride of AmmoniumChloroPlatin(*ous*)ammonium.

*Bi*Chlorhydrate of PlatinoPicolin. Insoluble in water. (Anderson, *Ann. Ch. u. Pharm.*, **96.** 203.)
$C_{12}NH_5Pt, 2HCl$

*Bi*Chlorhydrate of PlatinoPicolin with ChloroPlatinate of Picolin. Much less soluble than the corresponding pyridin compound. (Anderson.)
$C_{12}NH_5Pt, 2HCl; C_{12}NH_8Cl, PtCl_2$

*Bi*Chlorhydrate of PlatinoPyridin. Insoluble in water and in acids. Decomposed by a warm solution of caustic potash. (Anderson, *Ann. Ch. u. Pharm.*, **96.** 200.)
$C_{10}H_3PtN, 2HCl$, or $N\left\{\begin{matrix}C_{10}H_5''' \\ Pt\end{matrix}\right., Cl_2$

*Bi*Chlorhydrate of PlatinoPyridin with ChloroPlatinate of Pyridin. Soluble in hot, less soluble in cold water. (Anderson.)
$C_{10}H_3PtN, 2HCl; C_{10}H_5N, HCl, PtCl_2$

Chlorhydrate of Platosamin. *Vid.* Chloride of Platin(*ous*)ammonium.

Chlorhydrate of *di*Platosamin. *Vid.* Chloride of Platin(*ous*)*bi*amin.

Chlorhydrate of PlatosoPyridin. Very sparingly soluble in water; more soluble in boiling alcohol, from which it separates on cooling. (Anderson.)
$C_{10}H_4PtN, HCl$

Chlorhydrate of Propylamin. Deliquescent. Readily soluble in water. Soluble in absolute alcohol and in spirit. (Berthelot & De Luca, *Ann. Ch. et Phys.*, (3.) **43.** 266.) Soluble in alcoholic ether. (Parrish's *Pharm.*, p. 418.)
(*Chlorhydrate of Tritylamin.*)

Chlorhydrate of Pyridin. Deliquesces in moist air. Easily soluble in alcohol; less soluble in water. Insoluble in ether.
$N\left\{C_{10}H_5''', HCl\right.$

Chlorhydrate of Quinidin.

I.) *normal.* Less soluble in water than the corresponding quinine salt. Soluble in 27 pts. of water at 17°. Easily soluble in alcohol. Insoluble in ether.
$C_{40}H_{24}N_2O_4, HCl + 2Aq$

II.) *acid.* Easily soluble in water, without decomposition; also soluble in spirit.
$C_{40}H_{24}N_2O_4, 2HCl + 2Aq$

Chlorhydrate of Quinine.

I.) *normal.* Soluble in 26 pts. of cold water, very easily soluble in hot water, and in alcohol. More soluble in water than sulphate of quinine, or chlorhydrate of quinidin.
(" *basic.*")
$C_{40}H_{24}N_2O_4, HCl + 3Aq$

Soluble in 24 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) 100 pts. of chloroform dissolve 11.1 pts. of it. (Schlimpert, *Kopp & Will's J. B., für* 1859, p. 405.)

II.) *acid.* Very easily soluble in water, with decomposition to the normal salt and free acid.
$C_{40}H_{24}N_2O_4, 2HCl$

Chlorhydrate of Quinolein (or of Chinolin). Deliquescent. Soluble in water, and alcohol. Appears to be insoluble in ether. (Hofmann, *Ann. Ch. et Phys.*, (3.) **9.** 172.)

Chlorhydrate of Quinolein with Chloride of Cadmium. Very sparingly soluble in water. Sparingly soluble in alcohol. (Williams.)
$C_{18}H_7N, HCl; 2CdCl + 2Aq$

Chlorhydrate of Quinolein with *proto*Chloride of Tin. Sparingly soluble in alcohol. (Hofmann, *Ann. Ch. et Phys.*, (3.) **9.** 174.)

Chlorhydrate of Quinolein with Chloride of Uranium.

Chlorhydrate of Retinin. Very soluble in water.

Chlorhydrate of Sanguinarin. Readily soluble in water, and alcohol, especially when these are warm. Insoluble in ether and in concentrated chlorhydric acid. (Probst, *Ann. der Pharm.*, **29.** 121.)

Chlorhydrate of Sarcin.

$N_2 \left\{ \begin{matrix} C_6H_2'' \\ (C_2N)_2 \\ H_2 \end{matrix} \right. . O_2, HCl + 2 Aq$

Chlorhydrate of Sarcosin. Very easily soluble in water. Soluble in alcohol.

$N \left\{ C_6H_7O_4, HCl \right.$

Chlorhydrate of Sinamin.

Chlorhydrate of Sinapin. Readily soluble in water. (v. Babo & Hirschbrunn.)

Chlorhydrate of Sinapolin, or of *di*-AllylUrea. Soluble, with partial decomposition, in water.

$C_{14}H_{12}N_2O_2, HCl$

Chlorhydrate of Sinkalin. Deliquescent. Soluble in water. (v. Babo & Hirschbrunn.)

Chlorhydrate of Solanin. Readily soluble in water.

Chlorhydrate of Spartein. Soluble in water.

Chlorhydrate of Strychnine. Soluble in about 40 pts. of water at the ordinary temperature. (Bouchardat, *Ann. Ch. et Phys.*, (3.) **9.** 228.) Easily soluble in alcohol.

$C_{42}H_{22}N_2O_4, HCl + 3 Aq$

Chlorhydrate of Strychnine with Cyanide of Mercury.

$C_{44}H_{22}N_2O_4, HCl ; HgCy$

Chlorhydrate of SulphoBenzamic Acid.

$C_{14}H_6NS_2O_6Cl$

Chlorhydrate of SulphoBenzoic Acid. Insoluble in cold water. Slowly decomposed by boiling water and by alcohol. Easily soluble in ether.

$C_{14}H_5S_2O_8Cl$

Chlorhydrate of SulphoPhenoylBenzoicylamin.

$N \left\{ \begin{matrix} C_{12}H_4S_2O_4'' \\ C_{14}H_5 \end{matrix} \right. , HCl$

Chlorhydrate of Sulphuric Acid. Slowly dissolved, with decomposition, by cold water. When a small quantity of water is added to a considerable quantity of it an explosion ensues. (Williamson.)

$2SO_3 ; HCl$

Chlorhydrate of Terebene.

I.) *mono.* Soluble in alcohol, and ether; from which solutions it is precipitated by water. (Cluzel.) Decomposed by alcohol, especially when heated with it. (Blanchet & Sell.)

(*Chlorhydrate of Peucyl or of Peucylene. Chlorhydrate of Terebene(of Deville).*)

$C_{20}H_{16}, HCl$

II.) *basic.*

$2C_{20}H_{16}; HCl$

Chlorhydrate of Tetrylamin. *Vid.* Chlorhydrate of Butylamin.

Chlorhydrate of Thebain. Readily soluble in water. Sparingly soluble in absolute alcohol. Insoluble in ether.

$C_{38}H_{21}NO_6, HCl + 2 Aq$

Chlorhydrate of Theobromin. Decomposed by water, a subsalt being formed. Soluble in concentrated chlorhydric acid. (Glasson.)

$C_{14}H_8N_4O_4, HCl$

Chlorhydrate of Thiacetonin. Readily soluble in water; much less soluble in cold alcohol. Very easily soluble in boiling alcohol. Insoluble in ether. (Stædeler.)

Chlorhydrate of Thialdin. Tolerably soluble in cold water, less soluble in alcohol, more readily soluble in both when warm. Insoluble in ether.

$N \left\{ C_{12}H_{13}S_4''', HCl \right.$

Chlorhydrate of Thiosinamin.

Chlorhydrate of Thymene.

$C_{20}H_{16}, HCl$

Chlorhydrate of Toluamic Acid. More readily soluble in alcohol than in water. Sparingly soluble in cold, more soluble in boiling water acidulated with chlorhydric acid. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 332.)

$C_{16}H_9NO_4, HCl$

Chlorhydrate of Toluenylamin(or of Toluidin). Easily soluble in water, and alcohol. Sparingly soluble in ether. (Muspratt & Hofmann.)

$N \left\{ \begin{matrix} C_{14}H_7 \\ H_2 \end{matrix} \right. , HCl$

Chlorhydrate of *tri*Toluenylamin. Only sparingly soluble in cold water.

$N \left\{ (C_{14}H_7)_3, HCl \right.$

Chlorhydrate of Tritylamin. *Vid.* Chlorhydrate of Propylamin.

Chlorhydrate of Turpentine-Oil.

I.) *mono.* Imparts its taste to water. (Cluzel.) Insoluble in water. Soluble in boiling, less soluble in cold alcohol. Soluble in 3 pts. of alcohol of 0.806 sp. gr., at 14°. (Saussure.) The alcoholic solution is rendered milky by water. (Trommsdorff.) Readily soluble in oil of turpentine, and oil of almonds. (Trommsdorff.) Readily soluble in ether. Decomposed when boiled with concentrated sulphuric acid. (Blanchet & Sell.) Ordinary nitric acid neither dissolves nor decomposes it. (Cluzel.) Concentrated nitric acid dissolves it with decomposition. (Oppermann.) Slightly decomposed when heated with alcoholic potash to 150° @ 160°. (Buttlerow.) Soluble in terpinol. (List.)

(*Artificial Camphor. Chlorhydrate of Camphene; or of Dadyle.*)

$C_{20}H_{16}, HCl$

II.) *bi.* Very easily soluble in alcohol. (List.) Decomposed by boiling with water or alcohol. (List.)

(*Lemon Camphor.*)

$C_{20}H_{16}, 2HCl$

Chlorhydrate of Tyrosin. Insoluble in water, but is decomposed thereby. Easily soluble in absolute alcohol, also in spirit of 85%, but the latter solution soon deposits pure tyrosin. (C. Wicke, *Ann. Ch. u. Pharm.*, **101.** 315.)

$C_{18}H_{10}NO_5, HCl + Aq$

Chlorhydrate *of sesquioxide* of Uranium. Deliquescent. Readily soluble in water, alcohol, and ether. (Klaproth.)

Ur_2O_3, HCl

Chlorhydrate *of sesquioxide* of Uranium with Chloride of Potassium. Very readily soluble, with decomposition, in water. (Péligot.)

$Ur_2O_3, HCl ; KCl + Aq$

Chlorhydrate of Urea.

I.) *normal.* Deliquesces, with decomposition, in the air. Instantly decomposed by water. Soluble, without decomposition, in absolute alcohol.

$C_2H_4N_2O_2, HCl$

II.) *basic.* Slightly deliquescent. (Dessaignes.)

$2C_2H_4N_2O_2, HCl$

Chlorhydrate of Urea, and Chloride of Ammonium, with Urea.

$C_2H_4N_2O_2, HCl ; 2(C_2H_4N_2O_2, NH_4Cl)$

Very easily soluble in water. Soluble in mixed alcohol and ether. (Beckmann, *Ann. Ch. u. Pharm.*, **91.** 367.)

Chlorhydrate of Valeraldin. Soluble in boiling, less soluble in cold spirit. (Beissenbirtz, *Ann. Ch. u. Pharm.*, **90.** 110.)
$C_{30} H_{31} N S_4, H Cl$

Chlorhydrate of Veratrin. Readily soluble in water, and alcohol.

Chlorhydride of Cyanogen. *Vid.* Chloride of Cyanogen with Cyanhydric Acid.

*Tri*Chlorhydrin.
(Chloride of Glyceryl.)
$C_6 H_5{}''', Cl_3$
(Isomeric with Chloride of ChloroPropylene.)

Chlorhydrin. Miscible with its own volume of water. With 8 or 10 vols. of water it forms a very stable emulsion. Miscible with ether. (Berthelot.)
(Chlorhydrate of Glycerin.)
$C_7 H_6 Cl O_4$

*Bi*Chlorhydrin. Miscible with ether. It does not form a stable emulsion with water.
$C_6 H_6 Cl_2 O_2$

*Epi*Chlorhydrin.
(Oxide of Chloro Glyceryl.)
$C_6 H_5 Cl O_2$

*Epidi*Chlorhydrin.
$C_4 H_4 Cl_2$

Chlorhydro *di*Bromhydrin.
(Isomeric with Bromide of ChloroPropylene.)
$C_6 H_5 Br_2 Cl$

ChlorhydroKinone. Very soluble in water, alcohol, and ether. (Wœhler.)
(Colorless Chlorhydrokinone. Hydroquinone monochloré.)
$C_{12} H_5 Cl O_4$

ChlorHydroKinone with ChloroKinone. Soluble in water, and spirit.
(ChlorKinhydrone. Brown ChlorHydroKinone.)
$C_{24} H_8 Cl_2 O_8 = C_{12} H_5 Cl O_4, C_{12} H_3 Cl O_4$

*Bi*ChlorHydroKinone. Very sparingly soluble in cold, easily soluble in boiling water. Easily soluble in alcohol, and ether; also in hot acetic acid. Sparingly soluble in boiling, less soluble in cold chlorhydric acid. Soluble, without alteration, in warm concentrated sulphuric acid, separating out on cooling. Soluble in solutions of caustic ammonia and of potash. (Stædeler.)
(Colorless biChlorHydroKinone. Hydroquinone bichloré.)
$C_{12} H_4 Cl_2 O_4$

*Bi*ChlorHydroKinone with *bi*ChloroKinone. Scarcely at all soluble in cold, easily soluble in boiling water. Readily soluble in alcohol, ether, and hot acetic acid. Soluble in concentrated sulphuric acid, from which it is precipitated unchanged on the addition of water. Soluble in aqueous solutions of caustic potash and ammonia. (Stædeler.)
(BiChlorKinhydrone. Violet or Yellow biChlorHydroKinone.)
$C_{24} H_6 Cl_4 O_8$ (yellow) & $+ 4 Aq$ (violet) $= C_{12} H_4 Cl_2 O_4, C_{12} H_2 Cl_2 O_4,$ & $+ 4 Aq$

*Ter*ChlorHydroKinone. Sparingly soluble in cold water. Slowly soluble in hot water, with decomposition. Easily soluble in alcohol, and ether. Soluble in warm concentrated sulphuric acid, without decomposition. (Stædeler.)
(Hydroquinone trichloré.)
$C_{12} H_3 Cl_3 O_4$

*Ter*ChlorHydroKinone with *ter*ChloroKinone. Only sparingly soluble in boiling water. Easily soluble in ether, and in hot alcohol, from which it is precipitated on the addition of water.
(TerChlorkinhydrone. Yellow triChlorHydrochinone.)
$C_{24} H_4 Cl_6 O_8 = C_{12} H_3 Cl_3 O_4, C_{12} H Cl_3 O_4$

*Quadri*ChlorHydroKinone. Insoluble in water. Readily soluble in alcohol, and ether. Soluble in boiling acetic acid. Readily soluble in cold dilute aqueous solution of caustic potash. Soluble in ammonia-water, especially when this is hot. Unacted upon by hot concentrated sulphuric acid. (Stædeler.)
(Chlorhydranil. Hydroquinone perchloré.)
$C_{12} H_2 Cl_4 O_4$

*Quadri*ChlorHydroKinone with *per*ChloroKinone.
(PerChlorkinhydrone.)
$C_{24} H_2 Cl_8 O_8 = C_{12} H_2 Cl_4 O_4, C_{12} Cl_4 O_4$

ChlorHydroQuinone. *Vid.* ChlorHydroKinone.

ChlorHypoSulphate of *X*. *Vid.* Chloride of *X* with Hyposulphate of *X*.

ChlorHypoSulphite of ChloroCarbonic Oxide. *Vid.* Sulphite of Chloride of *ter*ChloroMethyl.

Chloric Oxide. *Vid.* HypoChloric Acid.

Chlorides. All the metallic chlorides are soluble in water, excepting chloride of silver and dichloride of mercury, which are insoluble, and the chlorides of lead and bismuth, which are difficultly soluble. (Persoz, *Chim. Moléc.*, p. 463.)

"Chloride of Acetyl"(Acetoyl). *Vid.* Chloride of *bi*ChlorEthyl.

"Chloride of Acetyl"(Acetoyl). *Vid.* *mono*ChlorEthylene.
$C_4 H_3 Cl$

Chloride of Acetyl. Decomposed by water. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** 297.)
(ChlorAcetyl. Chloride of Acetoxyl. Chloride of Othyl. Acetic Chloride.)
$C_4 H_3 O_2, Cl$

*Bi*Chloride of Acetyl(acetoxyl). *Vid.* Oxide of *bi*ChlorEthyl.

*Ter*Chloride of Acetyl(acetoyl). *Vid.* Chloride of ChlorEthylene.
$C_4 H_3 Cl_3$

Chloride of Acetyl*chloré*. *Vid.* Chloride of ChlorAcetyl.
$C_4 H_2 Cl_2 O_2$

Chloride of Acetyl with Hydride of Acetyl(Aldehyde). Very slowly decomposed by cold, quickly decomposed by hot water. Readily soluble, with decomposition, in a dilute solution of caustic potash. (Simpson.)
$C_4 H_3 O_2 Cl ; C_4 H_4 O_2$

Chloride of AcetylAmmonium(of Natanson). *Vid.* Chlorhydrate of Acetosamin.

Chloride of Allyl.
$C_6 H_5 Cl$

Chloride of *tetr*Allylium. Soluble in water.

Chloride of Aluminum.

I.) *mono*.

a = *anhydrous.* Deliquescent. Soluble in water, with evolution of much heat.
$Al_2 Cl_3$

Soluble in 1.432 pts. of water at 15°. (Gerlach's determination. See his table of sp. grs., below.) Soluble in 1 pt. of strong alcohol at 12.5°. (Wenzel, in his *Verwandtschaft*, p. 300 [T.]. Abundantly soluble in alcohol, and ether. Insoluble in rock-oil.

b = $Al_2 Cl_3 + 12 Aq$ Very deliquescent. Very soluble in water, and alcohol.

Soluble in about 0.25 pt. of water; and in about 2 pts. of pure alcohol at the ordinary temperature, and in 1.5 pts. of the same alcohol when boiling. (Thomson's *System of Chem.*, London, 1831, **2.** 815.)

An aqueous solution of sp. gr. (at 15°)	Contains per cent of $Al_2 Cl_3$.	An aqueous solution of sp. gr. (at 15°)	Contains per cent of $Al_2 Cl_3$.

(Th. Gerlach, *Sp. Gew. der Salzlœsungen*, 1859, p. 16.)

* Mother liquor.

An aqueous solution containing 19.15% of $Al_2 Cl_3$ boils at 103.4°; one of 38.3% boils at 112.8°. (Gerlach's *Sp. Gew. der Salzlœsungen*, p. 103.)

not correct See errata

II.) *basic.* Normal chloride of aluminum can part with ⅓ of its acid without becoming insoluble in water; but compounds more basic than this are insoluble. (Ordway.)

CHLORIDE OF ALUMINUM & OF POTASSIUM. $K Cl; Al_2 Cl_3$ Deliquescent. Readily soluble in water, with evolution of heat and decomposition.

CHLORIDE OF ALUMINUM & OF SODIUM. $Na Cl; Al_2 Cl_3$ Soluble in water, with evolution of heat, and apparently with decomposition. (Wœhler.)

CHLORIDE OF ALUMINUM with OXYCHLORIDE OF PHOSPHORUS. $Al_2 Cl_3; P O Cl_3$ Deliquescent. Decomposed by water, with evolution of heat. Soluble in warm oxychloride of phosphorus, from which solution it separates on cooling.

CHLORIDE OF ALUMINUM with PHOSPHURETTED HYDROGEN. $P H_3; Al_2 Cl_3$ Decomposed by water.

CHLORIDE OF ALUMINUM with SULPHYDRIC ACID. Deliquescent. Instantly decomposed by water. (Wœhler.)

CHLORIDE OF AMMONIOIRIDIUM. $5 N H_3 . Ir_2, Cl_3$ Difficultly soluble in water. Soluble, for the most part, with decomposition, in ammonia-water. Completely soluble in caustic potash. (Claus, *Beiträge*, pp. 90, 92.)

CHLORIDE OF AMMONIORHODIUM. $5 N H_3 . Rh_2, Cl_3$ Difficultly soluble in water. Insoluble in alcohol. Completely soluble in aqueous solutions of caustic potash and ammonia. Only very difficultly decomposed by oxygen acids. (Claus, *Beiträge*, p. 87.)

CHLORIDE OF AMMONIUM. (*Muriate of Ammonia. HydroChlorate of Ammonia. SalAmmoniac.*) $N H_4 Cl$ Permanent. Soluble in water, with reduction of temperature. The aqueous solution saturated at 18.75° contains 27.02% of the salt; or, 100 pts. of water at 18.75° dissolve 37.02 pts. of it; or, 1 pt. of the salt is soluble in 2.7 pts. of water at 18.75°. The sp. gr. of this solution = 1.08. (Karsten, *Berlin Abhandl.*, 1840, p. 101.) Soluble in 2.803 pts. of water at 15°. (Gerlach's determination, see his table of sp. grs., below.) Soluble in 2.72 pts. of water at 19°; or 100 pts. of water at 19° dissolve 36.8 pts. of it; or, the aqueous solution saturated at 19° contains 26.9% of it, and is of 1.0767 sp. gr. (H. Schiff, *Ann. Ch. u. Pharm.*, 1859, **109.** 326.) Soluble in 2.727 pts. of water at 10°. (Gren's *Handbuch*, **1.** 488 [T.]); in 2.24 pts. of water at 62.5°. (Wenzel, in his *Verwandtschaft*, p. 309 [T.].) The aqueous solution saturated at 10° is of 1.072 sp. gr. [T.]. Soluble in 2.72 pts. of cold, and in 1 pt. of boiling water. The saturated cold solution contains 26.88% of it, and the boiling saturated solution 50%. (M. R. & P.) Soluble in 3 pts. of water at 18.75. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) Soluble in 6 pts. of cold, and in 1 pt. of boiling water. (Fourcroy.) 100 pts. of water at 18.5° dissolve 36.75 pts. of it. The aqueous solution saturated at its boiling-point (114.2°) contains in 100 pts. 88.9 pts. of the salt. (Berzelius, *Lehrb.*, **3.** 280.) 100 pts. of water at 15.5° dissolve 33 @ 36 pts. of it, and at 100° 100 pts. (Ure's *Dict.*) The aqueous solution saturated at 15° is of 1.075209 sp. gr., and contains dissolved in every 100 pts. of water at least 31.88 pts. of the salt. (Michel & Krafft, *Ann. Ch. et Phys.*, **41.** pp. 478, 482.) 100 pts. of the aqueous solution saturated at the boiling-point (113.5°) contain 50 pts. of the dry salt; or, 100 pts. of water at 113.5° dissolve 100 pts. of it; or, 1 pt. of the salt is soluble in 1 pt. of water at 113.5°. (T. Griffiths, *Quar. J. Sci.*, 1825, **18.** 90.) The aqueous solution saturated at 10° contains 23.8% of it (Eller); in the cold, 14.3% (Fourcroy); at 38° (of B.'s therm.) 23.5% (Boerhave); and at 12.5° 24.4%. (Hassenfratz, *Ann. de Chim.*, **28.** 291.) When the solution is boiled, a portion of ammonia volatilizes; even when the salt is exposed to the air it loses some ammonia. (Emmet, *Am. J. Sci.*, (1.) **18.** 255.) When the aqueous solution is evaporated upon a water-bath, it is decomposed to a slight extent, a little ammonia being evolved. (Fresenius, *Quant.*, p. 123.) Soluble in alcohol. (Berzelius, *Lehrb.*) Very sparingly soluble in alcohol. (Gmelin.) Difficultly soluble in spirit. (Fresenius, *Quant.*, p. 123.) Soluble in 14.1 pts. of boiling highly rectified spirit. (Wenzel, in his *Verwandtschaft*, p. 300 [T.].)

100 pts. of alcohol

of 0.900	sp. gr.	dissolve	6.5	pts. of it.
" 0.872	"	"	4.75	"
" 0.834	"	"	1.5	"

(Kirwan, *On Mineral Waters*, p. 274 [T.].)

Though somewhat soluble in pure absolute alcohol, it is absolutely insoluble in alcohol when in the presence of chlorides of the methylamins. (Winkles, *Ann. Ch. u. Pharm.*, **93.** 324.) Insoluble in ether. Insoluble in bisulphide of carbon. (Fordos & Gélis, *Ann. Ch. et Phys.*, (3.) **32.** 393.) Less soluble in chlorhydric acid than in water, being even precipitated when the acid is added to its strong aqueous solution. (Vogel.) When crystals of chloride of sodium are added to a saturated aqueous solution of chloride of ammonium they dissolve, to a certain extent, while chloride of ammonium is precipitated. When the reaction is completed the solution, at 18.75°, is of 1.1788 sp. gr. and contains 32.62% of mixed salt; or, 100 pts. of water have dissolved 48.42 pts. of salt: viz. 26.36 pts. of $Na Cl$ and 22.06 pts. of $N H_4 Cl$.

The same mixed solution is obtained when a mixture of $\mathrm{Na\,Cl}$ and $\mathrm{N\,H_4\,Cl}$ is dissolved in water. If equal weights of saturated solutions of $\mathrm{Na\,Cl}$ and $\mathrm{N\,H_4\,Cl}$ be mixed together, nothing separates. One may even dissolve more $\mathrm{Na\,Cl}$ or more $\mathrm{N\,H_4\,Cl}$ in this solution without separating the other. But when mixed in certain other proportions, the addition of new quantities of $\mathrm{Na\,Cl}$ or of $\mathrm{N\,H_4\,Cl}$ will cause the precipitation of the other. (Karsten, *Berlin Abhandl.*, 1840, pp. 106, 107.) In like manner, when chloride of potassium is added to a saturated solution of chloride of ammonium it dissolves, while chloride of ammonium is precipitated. When the reaction has ceased, the solution, at 18.75°, contains 31.6% of mixed salt. A solution identical with this is obtained when a mixture of $\mathrm{K\,Cl}$ and $\mathrm{N\,H_4\,Cl}$ is treated with water, 100 pts. of water dissolving 46.1 pts. of mixed salt, viz. 16.27 pts. of $\mathrm{K\,Cl}$ and 29.83 pts. of $\mathrm{N\,H_4\,Cl}$. (Karsten, *Berlin Abhandl.*, 1840, p. 109.) When nitrate of ammonia is added to a saturated solution of chloride of ammonium it dissolves, while $\mathrm{N\,H_4\,Cl}$ is precipitated; the reaction continuing until a definite equilibrium is attained. The mixed solution finally obtained is identical with that prepared by treating a mixture of the two salts with water. (Karsten, *Berlin Abhandl.*, 1840, p. 110.) But if chlorate of potash be dissolved in the saturated solution of chloride of ammonium, nitrate of ammonia will dissolve therein without causing any precipitation. Moreover, if chlorate of potash be added to a solution from which chloride of ammonium has been precipitated by nitrate of ammonia, it causes the chloride of ammonium to redissolve. (Marguerritte, *C. R.*, **38.** 306.) Chloride of ammonium is slowly dissolved by a saturated solution of nitrate of soda, at first to a clear solution, but subsequently chloride of sodium separates out. (Karsten, *Berlin Abhandl.*; p. 128.) It is also soluble in a saturated solution of nitrate of potash, the solution thus obtained containing, at 18.75°, 42.82% of mixed salt; or, 100 pts. of water dissolve 74.89 pts. of mixed salt, viz. 30.56 pts. $\mathrm{K\,O,\,N\,O_5}$, and 44.33 pts. $\mathrm{N\,H_4\,Cl}$. This solution is of different composition from that obtained by treating a mixture of the two salts with water, the latter containing, at 18.75°, 44.28% of mixed salt. Consequently, 100 pts. of water dissolve 79.46 pts. of mixed salt, viz. 39.84 pts. $\mathrm{N\,H_4\,Cl}$, and 38.62 pts. $\mathrm{K\,O,\,N\,O_5}$. (Karsten, *Berlin Abhandl.*, 1840, p. 119.) When nitrate of baryta is added to a saturated solution of chloride of ammonium it dissolves, at first without causing any precipitation of the latter, but after a certain amount has been dissolved the solution of further portions occasions the precipitation of chloride of ammonium, the reaction continuing until a certain definite limit has been attained. The solution thus obtained is identical with that made by treating a mixture of the two salts with water. Chloride of ammonium is soluble in a saturated solution of nitrate of baryta. The solution prepared at 18.75° contains 32.07% of mixed salt. 100 pts. of water dissolve, therefore, 47.2 pts. of mixed salt, viz. 38.6 pts. $\mathrm{N\,H_4\,Cl}$, and 8.6 pts. $\mathrm{Ba\,O,\,N\,O_5}$. This solution is of different composition from that obtained by treating a mixture of the two salts with water. This last, prepared at 18.75°, contains 35.98% of mixed salt. 100 pts. of water, consequently, dissolve 56.2 pts. of mixed salt, viz. 39.18 pts. $\mathrm{N\,H_4\,Cl}$, and 17.02 pts. $\mathrm{Ba\,O,\,N\,O_5}$. (Karsten, *Berlin Abhandl.*, 1840, pp. 110, 119.) Chloride of ammonium is soluble in a saturated solution of sulphate of soda. It is also soluble in a saturated solution of sulphate of potash. The solution thus prepared, saturated at 18.75°, contains 33.02% of mixed salt. 100 pts. of water consequently dissolve 49.3 pts. of mixed salt, viz. 38.2 pts. $\mathrm{N\,H_4\,Cl}$ and 11.1 pts. $\mathrm{K\,O,\,S\,O_3}$. This solution is of different composition from that prepared by treating a mixture of the two salts with water. This last, at 18.75°, contains 32.86% of mixed salt, i. e. 100 pts. water dissolve 51.2 pts. mixed salt, viz. 37.92 pts. $\mathrm{N\,H_4\,Cl}$, and 13.28 pts. $\mathrm{K\,O,\,S\,O_3}$. (Karsten, *Berlin Abhandl.*, 1840, p. 120.) Chloride of ammonium is soluble in a saturated solution of sulphate of copper, at first to a clear solution, but subsequently with precipitation of a double sulphate of ammonia and copper. (Karsten, *loc. cit.*, p. 128.) It is slowly and difficultly soluble in a saturated solution of sulphate of magnesia, while a double sulphate of ammonia and magnesia separates out. In a saturated solution of sulphate of zinc also, it dissolves with formation of a double sulphate. (Karsten, *Berlin Abhandl.*, 1840, p. 129.)

The point of ebullition of pure water, observed in a glass tube containing bits of metallic zinc, having been 100°. (Legrand, *Ann. Ch. et Phys.*, 1835, (2.) **59.** 436.) An aqueous solution containing 10% of NH_4Cl boils at 101.7°; one of 20% boils at 104.4°. (Gerlach's *Sp. Gew. der Salzlœsungen*, p. 97.)

Chloride of Ammonium & of Antimony.
I.) $2NH_4Cl; SbCl_3 + 2Aq$
II.) $3NH_4Cl; SbCl_3 + 3Aq$ Permanent in dry air. Decomposed by much water. (Poggiale.)

Chloride of Ammonium & of Bismuth.
I.) $2NH_4Cl; BiCl_3$ Decomposed by water.
II.) $3NH_4Cl; BiCl_3$ Decomposed by water.

Chloride of Ammonium & of Cadmium. $NH_4Cl; CdCl$ Sparingly soluble in water. Slightly soluble in alcohol, and wood-spirit; but less so than chloride of cadmium. (Croft.)

Chloride of Ammonium & of Cobalt. $NH_4Cl; 2CoCl + 12Aq$ Deliquescent. (Hautz.)

Chloride of Ammonium & *dichloride* of Copper. Water decomposes it, dissolving out the chloride of ammonium. (Becquerel.)

Chloride of Ammonium & *protochloride* of Copper.

I.) $NH_4Cl; CuCl + 2Aq$ Less soluble than chloride of copper in water. (Graham.) Soluble in water, with partial decomposition. Moderately soluble in alcohol, especially in hot, without decomposition. (Cap & Henry.)

II.) $NH_4Cl; 2CuCl + 4Aq$ Soluble in 2 pts. of water. (Hautz.)

Chloride of Ammonium & of Cupr(*ic*)ammonium. $NH_4Cl; N\left\{\begin{matrix}H_3\\Cu\end{matrix}\right., Cl$ Decomposed by water. (Ritthausen.)

Chloride of Ammonium & of Iodine. $NH_4Cl; ICl_3$ Much more readily soluble in water than the potassium compound.

Chloride of Ammonium & *protochloride* of Iridium. $NH_4Cl; IrCl$ Soluble in water and in absolute alcohol. (Berzelius, *Lehrb.*) Soluble in weak alcohol. (Claus.)

Chloride of Ammonium & *sesquichloride* of Iridium.

I.) $2NH_4Cl; Ir_2Cl_3$ Soluble in water, from which solution it is precipitated in great part on the addition of alcohol. (Berzelius, *Lehrb.*)

II.) $3NH_4Cl; Ir_2Cl_3 + 3Aq$ Possesses similar properties to the corresponding rhodium salt, in combination with which it crystallizes in all proportions, but is less soluble in a dilute aqueous solution of chloride of ammonium. (Claus, *Beiträge*, pp. 75, 13.)

Chloride of Ammonium & *protochloride* of Iron. $NH_4Cl; FeCl$ Easily soluble in water. Insoluble in alcohol. (Winckler; A. Vogel.)

Chloride of Ammonium & *sesquichloride* of Iron.

I.) $2NH_4Cl; Fe_2Cl_3 + 2Aq \;\&\; + 3Aq$ Deliquescent. Soluble in water, without decomposition. (Fritzsche, in *Gm.*) Decomposed by water. [?] (Fritzsche, in *Ot. Gr.*) Soluble in 3 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.)

II.) *Mixtures of* NH_4Cl *& of* Fe_2Cl_3 *in various proportions.* More deliquescent in proportion to the amount of iron. One sample examined by Geiger was soluble in 3 pts. of cold water. When the aqueous solution is evaporated, nearly pure chloride of ammonium crystallizes out at first.

Chloride of Ammonium & of Lead.

Chloride of Ammonium & of Magnesium. $NH_4Cl; 2MgCl + 12Aq$ Deliquescent. (Hautz.) Permanent. Soluble in 6 pts. of cold water. (Fourcroy.)

Chloride of Ammonium & of Manganese.

I.) $NH_4Cl; MnCl + 2Aq$

II.) $NH_4Cl; 2MnCl + 4Aq$ Soluble in 1.5 pts. of water at ordinary temperatures. (Hautz.)

Chloride of Ammonium & *protochloride* of Mercury. (*Sel Alembroth.*)

I.) $NH_4Cl; HgCl$ Permanent. Soluble in 0.66 pt. of water at 10°, and in nearly all proportions in boiling water. [Compare *proto*Chloride of Mercury.]

II.) $NH_4Cl; 2HgCl$ Soluble in water.

III.) *with excess of chloride of ammonium.* Soluble in water.

Chloride of Ammonium, of Mercury, & of Sodium. $NH_4Cl; 2HgCl; 4NaCl$ Sóluble in water. (Kosmann, *Ann. Ch. et Phys.*, (3.) **27.** 243.)

Chloride of Ammonium & of Mercury with Sulphate of Mercury. $NH_4Cl; HgCl; 2^{1}(HgO, SO_3)$ Soluble in water acidulated with nitric acid. Decomposed by ether, which dissolves the chloride of mercury. (Kosmann, *Ann. Ch. et Phys.*, (3.) **27.** 238.)

Chloride of Ammonium & *protochloride* of Molybdenum. [Soluble in water.?]

Chloride of Ammonium & *bichloride* of Molybdenum. $NH_4Cl; MoCl_2$ Permanent. Soluble in water. (Berzelius.)

Chloride of Ammonium & of Nickel. $NH_4Cl; 2NiCl + 12Aq$ Soluble in water. (Tupputi.)

Chloride of Ammonium & *protochloride* of Osmium.

Chloride of Ammonium & *sesquichloride* of Osmium. Permanent. Soluble in water, sometimes with separation of a basic salt; less soluble in alcohol.

Chloride of Ammonium & *terchloride* of Osmium. Soluble in water, and alcohol. (Berzelius.)

Chloride of Ammonium & of Platin(*ous*)-ammonium.

$NH_4Cl; N\left\{\begin{matrix}H_3\\Pt'\end{matrix}\right., Cl$ Soluble in water, or at least in an aqueous solution of chloride of ammonium.

Chloride of Ammonium & of Rhodium.

I.) $2NH_4Cl; Rh_2Cl_3 + 2Aq$ More difficultly soluble in water than No. 2. (Claus, *Beiträge*, p. 73.) Soluble in water; but insoluble in alcohol of 36° Bm. (Vauquelin, *Ann. de Chim.*, **93.** 204 [Gm.].) Soluble in water. (Fremy, *Ann. Ch. et Phys.*, (3.) **44.** 396.) Insoluble in alcohol. (Wollaston.)

II.) $3NH_4Cl; Rh_2Cl_3 + 3Aq$ Permanent. Easily soluble in water, though somewhat more difficultly than the corresponding sodium salt. Also soluble in a dilute aqueous solution of chloride of ammonium, but insoluble in spirit. After standing for some time, or on boiling, the aqueous solution changes color, and appears to contain No. 1. (Claus, *Beiträge*, pp. 71, 72.)

Chloride of Ammonium & *sesquichloride* of Ruthenium.

$2NH_4Cl; Ru_2Cl_3$ The crystals do not dissolve readily in water, yet they separate with difficulty from their aqueous solution. Insoluble in a cold aqueous solution of chloride of ammonium. (Claus.) Insoluble in alcohol.

Chloride of Ammonium & of Silver.

$NH_4Cl; AgCl$ Decomposed by much water, chloride of silver being precipitated. (A. Vogel.) Soluble in an aqueous solution of chloride of ammonium.

Chloride of Ammonium & *protochloride* of Tellurium.

$NH_4Cl; TeCl$ Decomposed by water.

Chloride of Ammonium & *bichloride* of Tellurium.

$NH_4Cl; TeCl_2$ Soluble, without decomposition, in a small quantity of water; but is decomposed when treated with much water, or with alcohol.

Chloride of Ammonium & *protochloride* of Tin.

I.) $NH_4Cl; SnCl + Aq$ Permanent. Easily soluble in cold water, the solution becoming turbid when boiled. (Apjohn.)

II.) $2NH_4Cl; SnCl + 3Aq$ Permanent. Decomposed by water. (Poggiale.)

Chloride of Ammonium & *bichloride* of Tin.

(*Chloro Stannate of Ammonium. Pink Salt.*)
$NH_4Cl; SnCl_2$ Permanent. Soluble in 3 pts. of water at 14.5° [18° ?]. The concentrated solution is not decomposed by boiling, but on being diluted and then boiled, decomposition occurs. (Bolley.)

Chloride of Ammonium & of Titanium.

$3NH_4Cl; 2TiCl$ Soluble in water. (H. Rose.)

Chloride of Ammonium & *basic sesquichloride* of Uranium.

$3NH_4Cl; 2Ur_2O_3, Ur_2Cl_3 + 6Aq.$, or "$(NH_4Cl, (Ur_2O_2)Cl + 2Aq)$" Very deliquescent. Very soluble in water. (Péligot, *Ann. Ch. et Phys.*, (3.) **5.** 39.)

Chloride of Ammonium & *basic chloride* of Vanadium. Insoluble in water.

Chloride of Ammonium & of Zinc.

I.) $NH_4Cl; ZnCl + Aq$ Deliquesces in moist air. Soluble, without decomposition, in water. (Schindler.) Very slightly deliquescent. Very soluble in cold, and still more soluble in hot water. (Pierre, *Ann. Ch. et Phys.*, (3.) **16.** 249.)

II.) $NH_4Cl; 2ZnCl + 4Aq$ Deliquescent. Very soluble in water. (Hautz.)

Chloride of Ammonium with Cyanide of Mercury.

I.) $NH_4Cl; 2HgCy$ Soluble in water, and alcohol. It is not decomposed by acids, excepting when these are hot. (Brett.)

II.) $2NH_4Cl; HgCy$

Chloride of Ammonium with *bi*Cyanide of Platinum.

$NH_4Cl; PtCy_2$

Chloride of Ammonium with FerroCyanide of Ammonium.

(*Chloro Ferro Cyanide of Ammonium.*)
$NH_4Cl; 2NH_4Cy, FeCy + 3Aq$ Permanent. Very soluble in water, though less soluble than chloride of ammonium. The solution is decomposed by boiling. (Bunsen.)

Chloride of Ammonium with Iodide of Lead.

I.) $3NH_4Cl; 2PbI$ Decomposed by water, which abstracts the chloride of ammonium. (Vœlckel.)

II.) $2NH_4Cl; PbI + 2Aq$ Decomposed by water. (Poggiale.)

Chloride of Ammonium with Osmiamid.

$NH_4Cl; N\left\{\begin{matrix}H_2\\OsO_2\end{matrix}\right.$ Soluble in pure water, but is rapidly decomposed by boiling water. Entirely insoluble in a dilute aqueous solution of chloride of ammonium, and in alcohol. (Fremy, *Ann. Ch. et Phys.*, (3.) **12.** 523.) Insoluble in water, or in an aqueous solution of chloride of ammonium. (Fremy, *Ann. Ch. et Phys.*, (3.) **44.** 391.)

Chloride of Ammonium with Sulphuric Acid (Anhydrous).

$NH_4Cl; XSO_3$ Instantly decomposed by moisture. (Berzelius, *Lehrb.*, **3.** 280.)

Chloride of Ammonium with Urea.

$NH_4Cl, C_2H_4N_2O_2$ More soluble than urea in water containing chloride of ammonium. It may be repeatedly crystallized in presence of an excess of urea, but is partially decomposed by pure water. (Dessaignes.)

Chloride of Ammonium ChloroPlatin(*ous*)-ammonium.

(*Gros's Chloride. BiChlorhydrate de Diplatinamine.*)
$N_2H_6PtCl, Cl = N\left\{\begin{matrix}H_2\\PtCl, Cl\\NH_4\end{matrix}\right.$ Difficultly soluble in cold, but completely soluble in boiling water. (Gros, *Ann. der Pharm*, 1838, **27.** 249.) Nearly insoluble in water, or ammonia-water. Soluble in a cold aqueous solution of caustic potash, from which it is reprecipitated on the addition of chlorhydric acid; decomposed by boiling the potash solution. (Buckton, *J. Ch. Soc.*, **5.** 216.)

Chloride of Amyl. Insoluble in water.

$C_{10}H_{11}Cl$ (Cahours.) Insoluble in concentrated chlorhydric acid, and in saline solutions. (Balard, *Ann. Ch. et Phys.*, (3.) **12.** 300.) Miscible in all proportions with alcohol, ether, and amylalcohol.

Chloride of *tetr*Amylammonium. Deliquescent.
$N\{(C_{10}H_{11})_4, Cl$

Chloride of Amylene.
$C_{10}H_{10}'', Cl_2$

Chloride of AmylNicotin. Soluble in water. (Stahlschmidt, *Ann. Ch. u. Pharm.*, **90.** 226.)

Chloride of AmylStrychnium. *Vid.* Chlorhydrate of AmylStrychnine.

Chloride of Angelicyl.
$C_{10}H_7O_2, Cl$

Chloride of Anisoyl.
(*Chlorhydrate of Anisene.*)
$C_{16}H_9O_2, Cl$

Chloride of Anisyl. Decomposed by water, alcohol, and wood-spirit. (Cahours, *Ann. Ch. et Phys.*, (3.) **23.** 351.)
$C_{16}H_7O_4, Cl$

*Ter*Chloride of Antimony. Deliquescent. Decomposed by a large quantity of water into an insoluble basic, and a soluble acid chloride. Soluble in absolute alcohol. (Gmelin.) Soluble, without becoming cloudy, in an aqueous solution of chloride of sodium. Soluble in chlorhydric acid, in which solution, unless it be strongly acid, a precipitate is produced on the addition of much water. If to a solution thus rendered milky by water enough dilute chlorhydric acid is added to clear it, and nitric acid then added, no precipitate is produced at once; and the aqueous milky solution may even be rendered clear by adding nitric acid, but in both cases the solutions become troubled again after a time. (H. Rose, *Tr.*) Water does not produce a precipitate in solutions of terchloride of antimony, when these contain tartaric acid, or citric acid. (Spiller.)
$SbCl_3$

*Ter*Chloride of Antimony with Chloride of Barium.
$2\,BaCl; SbCl_3 + 5\,Aq$

*Ter*Chloride of Antimony with Chloride of Calcium.
$2\,CaCl; SbCl_3 + 5\,Aq$

*Ter*Chloride of Antimony with Chloride of Cumarin. Soluble in water, with subsequent decomposition. (Delalande, *Ann. Ch. et Phys.*, (3.) **6.** 350.)

*Ter*Chloride of Antimony with Chloride of Magnesium.
$2\,MgCl; SbCl_3 + 5\,Aq$

*Ter*Chloride of Antimony with Chloride of Potassium. Soluble in water, without decomposition. (Jacquelin.) More soluble than *b* in water.
$a = 2\,KCl; SbCl_3$

$b = 3\,KCl, SbCl_3$ Deliquescent. Decomposed by hot water. (Poggiale.)

*Ter*Chloride of Antimony with Chloride of Sodium. Soluble in water. (Poggiale.)
$3\,NaCl; SbCl_3$

*Ter*Chloride of Antimony with Chloride of Strontium.
$2\,SrCl; SbCl_3 + 5\,Aq$

*Ter*Chloride of Antimony with Sulphide of Antimony. Ppt. Insoluble in dilute chlorhydric acid.

*Quinqui*Chloride of Antimony. Deliquesces with decomposition. Decomposed by water, with evolution of heat. Soluble in chlorhydric acid. If no chlorhydric acid be present, it is decomposed when the least possible quantity of water is added; a basic salt and free chlorhydric acid — but no acid salt — being formed. (H. Rose, *Pogg. Ann.*, **83.** 146.)
$SbCl_5$

*Quinqui*Chloride of Antimony with Chloride of Cyanogen. Immediately decomposed by water.
$SbCl_5; CyCl$

Chloride of Antimony & of Ethyl. Decomposed by water.

Chloride of Antimony & *bichloride* of Sulphur. Decomposed by water.
$SbCl_5; 3\,SCl_2$

Chloride of Antimony with Cyanide of Ethyl. Instantly decomposed by water, and alcohol. It cannot be recrystallized from ether. (Henkel.)
$C_6H_5N; SbCl_5$

Chloride of Antimony with Cyanide of Methyl. Instantly decomposed by water, and alcohol. It cannot be recrystallized from ether. (Henkel.)
$C_4H_3N; SbCl_5$

Chloride of Antimony with Phosphuretted Hydrogen. Decomposed by water.

Chloride of ArsenEthylium. Deliquescent. Readily soluble in water, and spirit. Insoluble in ether. (Landolt, *Ann. Ch. u. Pharm.*, **89.** 332.)
$As(C_4H_5)_4Cl + 8\,Aq$

Chloride of ArsenEthylium & *protochloride* of Mercury. Insoluble in water.

Chloride of Arsen*tri*Ethyl.
$(C_4H_5)_3As, Cl_2$

Chloride of Arsen*di*Ethyl with *prot*Oxide of Mercury. Very difficultly soluble in cold, more easily soluble in boiling water. Very difficultly soluble in alcohol. Unacted upon by dilute, decomposed by concentrated nitric acid.
$(C_4H_5)_2As, Cl_3; 4\,HgO$

Chloride of Arsen*tri*Ethyl with *din*Oxide of Mercury. Tolerably easily soluble in hot, less soluble in cold water, and alcohol.
$(C_4H_5)_3As, Cl_2; Hg_2O$

Chloride of ArsenEthylium. Very deliquescent. Easily soluble in water, and alcohol. Insoluble in ether.
$As\{(C_4H_5)_4Cl + 8\,Aq$

*Ter*Chloride of Arsenic. Soluble in a small amount of water, but is decomposed by a larger quantity, as well as on boiling, to arsenious acid and free chlorhydric acid. Miscible with alcohol. (Gmelin.) Also miscible with oil of turpentine and with olive-oil. (J. Davy.) Easily soluble in water, alcohol, ether, and the essential oils. When in contact with much water it is gradually decomposed to AsO_3 and HCl. (Dumas.) Soluble in alcohol, and ether. Somewhat soluble in chlorhydric acid. (Penny & Wallace.)
$a = AsCl_3$

$b = AsCl_3 + 3\,HO$ With water it behaves like the anhydrous compound.

Chloride of Arsenic & of Sulphur.
$\left.\begin{array}{l}\text{I.)}\ AsCl_3;\ 2\,SCl \\ \text{II.)}\ AsCl_3;\ 3\,SCl\end{array}\right\}$ Decomposed by water. (H. Rose.)

*Bi*Chloride of ArsenMethyl. Tolerably readily soluble in water. (Bæyer.)
AsC_2H_3'', Cl_2

*Quadri*Chloride of ArsenMethyl.
$AsC_2H_3Cl_4$

Chloride of ArsenMethylEthylium. Very deliquescent.

Chloride of Barium. Permanent. 1 pt. of the crystallized salt is soluble in 2.18 pts. of water at 21.5°; or 100 pts. of water at 21.5° dissolve 46 pts. of it; or the solution saturated at 21.5° contains 31.5% of it, and 26.8% of the anhydrous salt, and is of 1.2878 sp. gr. (H. Schiff, *Ann. Ch. u. Pharm.*, 1859, **109.** 326.) 1 pt. of the anhydrous salt is soluble in 2.862 pts. of water at 15°. (Gerlach's determination, see his table of sp. grs., below.)
$BaCl + 2\,Aq$

100 pts. of water at °C.	Dissolve pts. of the anhydrous salt, Ba Cl.	Dissolve pts. of the cryst. salt Ba Cl + 2 Aq.
15.64°	34.86	43.50
49.31°	43.84	55.63
74.89°	50.94	65.51
105.48°	59.58	77.89

(Gay-Lussac, *Ann. Ch. et Phys.*, (2.) **11.** pp. 309, 310.)

The equation of the curve of solubility of chloride of barium is, $y = 0.2711\ x^\circ + 30.62$. (Gay-Lussac, *loc. cit.*), or 100 pts. of water dissolve of the anhydrous salt, pts. $= 32.62 + 0.2711\ T^\circ$. (H. Kopp.) By direct experiment, Kopp found that 100 pts. of water at 17.4° dissolved 36.7 pts. of the salt; according to the formula, 37.3 pts. should have been dissolved. (H. Kopp, *Ann. Ch. u. Pharm.*, 1840, **34.** 262.)

100 pts. of water at °C.	Dissolve of crystallized Chloride of Barium (Ba Cl + 2 Aq), pts.
16.25°	39.6
20.00	42.2
22.50	43.7
37.50	51.0
50.00	65.0
62.50	48.0
75.00	63.0
87.00	65.0
100.00	72.0

(Brandes, *Buchner's Repertitorium*, **14.** pp. 451, 105, cited in *Berzelius's Jahresbericht*, **4.** 102.)

The aqueous solution saturated at 18.1° contains 35.51% of the crystallized salt; hence 100 pts. of water at 18.1° dissolve 44.31 pts. of the salt, or 1 pt. of the salt is soluble in 2.257 pts. of water at 18.1°. The specific gravity of this solution = 1.2851. (Karsten, *Berlin Abhandl.*, 1840, p. 101.) The aqueous solution saturated at 15° is of 1.282345 sp. gr., and contains dissolved in every 100 pts. of water at least 34.379 pts. of the anhydrous, or 42.757 pts. of the crystallized salt. (Michel & Krafft, *Ann. Ch. et Phys.*, (3.) **41.** pp. 478, 482.) Soluble in 2.67 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) 100 pts. of the aqueous solution saturated at its boiling point (104.4°) contain 45 pts. of the dry salt; or 100 pts. of water dissolve 81.81 pts. of it at 104.4°; or, 1 pt. of the dry salt is soluble in 1.2222 pts. of water at 104.4°. (T. Griffiths, *Quar. J. Sci.*, 1825, **18.** 90.) The aqueous solution saturated at its boiling-point (104.4°) contains 60.1 pts. of the anhydrous salt, and 70.36 pts. of the crystallized salt in 100 pts. of water. (Berzelius, *Lehrb.*, citing Legrand.) The aqueous solution saturated at 12.5 contains 28.3% of [the crystallized ?] salt. (Hassenfratz, *Ann. de Chim.*, **28.** 291.) 1 pt. of anhydrous chloride of barium is soluble in 2.86 pts. of water at 15.5°, and in 1.67 pts. of water at the boiling temperature; the crystallized salt is soluble in 2.3 pts. of water at 15.5°, and in 1.28 pts. at the boiling temperature. The solution saturated at 15.5° contains 25.84% of the anhydrous salt and 30.20% of the crystallized; while the saturated boiling solution contains 37.33% of the anhydrous and 43.22% of the crystallized salt. (M. R. & P.) 100 pts. of water at 15.5° dissolve 20 pts. of it, and at 87.7° 43 pts. It is more soluble in boiling water. (Ure's *Dict.*) It is liable to form supersaturated solutions. (Ogden.)

An aqueous solution of sp. gr. (at 15°)	Contains per cent of Ba Cl.	An aqueous solution of sp. gr. (at 15°)	Contains per cent of Ba Cl.

(Hassenfratz, *Ann. de Chim.*, **28.** 298.)

In a solution containing for 100 pts. of water, pts. of anhydrous Ba Cl	The point of ebullition is elevated.	Difference.
0.0	0.0°	
11.0	0.5°	11.0
19.6	1.0°	8.6
26.2	1.5°	6.6
32.5	2.0°	6.3
38.6	2.5°	6.1
44.5	3.0°	5.9
50.3	3.5°	5.8
56.0	4.0°	5.7
60.1	4.4°	

The point of ebullition of pure water, observed in a glass tube containing bits of metallic zinc, having been 100.2°. (Legrand, *Ann. Ch. et Phys.*, 1835, (2.) **59.** 432.) An aqueous solution containing 10% of Ba Cl boils at 100.6°; one of 20% boils at 101.9°. (Gerlach's *Sp. Gew. der Salzlœsungen*, p. 102.) The crystals are soluble in 400 pts. of boiling absolute alcohol; more easily soluble in spirit. (In Gmelin & in Schubarth's *Tech. Chem.*) Insoluble in absolute alcohol. (H. Rose.) Soluble in from 6885 @ 8108 pts. of 99.3% alcohol at 14.5°, and in 4857 pts. of the same alcohol at the temperature of ebullition. (Fresenius, *Ann. Ch. u. Pharm.*, 1846, **59.** 127.) Insoluble in cold absolute alcohol, but dissolves in about 400 pts. of it when boiling. (Bucholz, in his *Beiträge*, **3.** 24 [T.].) Sensibly soluble in alcohol of 0.808 sp. gr. (Thomson, in his *System of Chem.*, London, 1831, **2.** 813.)

100 pts. of alcohol of sp. gr.	Dissolve of the anhydrous salt, pts.	Dissolve of the cryst. salt, pts.
0.900	1.00	1.56
0.848	0.29	0.43
0.834	0.185	0.32
0.817	0.09	0.06

(Kirwan, *On Mineral Waters*, p. 274 [T.].)

A solution (saturated at 15°) in alcohol of sp. gr.	A solution (saturated at 15°) in alcohol of per cent by weight.	Contains per cent of crystallized chloride of barium.
1.000	0	30.25
0.986	10	23.7
0.972	20	18.0
0.958	30	12.8
0.939	40	9.3
0.895	60	3.4
0.847	80	0.5

(H. Schiff, *Ann. Ch. u. Pharm.*, 1861, **118.** 365.)

Less soluble in water acidulated with chlorhydric acid than in pure water, and insoluble in concentrated chlorhydric acid; hence a considerable amount of the salt is precipitated from its aqueous solution on the addition of chlorhydric acid. (Berzelius, *Lehrb.*, **3.** 355.) It has also been stated that chloride of barium is very difficultly soluble in nitric acid, but this is incorrect, the fact being that nitrate of baryta is very difficultly soluble in chlorhydric or nitric acid. (H. Wurtz, *Am. J. Sci.*, (2.) **25.** 376.) If chloride of sodium be added to a saturated aqueous solution of chloride of barium a portion of it dissolves, while chloride of barium is precipitated, the reaction continuing until the amounts of the two salts in solution have attained a certain definite equilibrium. (Karsten, *Berlin Abhandl.*, 1840, p. 109.) When a mixture (in excess) of chloride of barium and chloride of sodium is treated with water, 100 pts. of the water dissolve, at 17°, 38.6 pts. of the mixed salts, of which 4.1 pts. are Ba Cl: at 18.3°, 39.2 pts. of the mixed salts, of which 4.2 pts. are Ba Cl. At 17° or at 18.3° the solubility of pure chloride of sodium = 35.9; that of chloride of barium
$\begin{cases} \text{at } 17° = 37.2. \\ \text{at } 18.3° = 37.6. \end{cases}$

At 17° Found: 38.6 = 34.5 Na Cl + 4.1 Ba Cl.
Calcul.: 38.6 = 35.9 " + 2.7 "
" 18.3° Found: 39.2 = 35.0 " + 4.2 "
Calcul.: 39.2 = 35.9 " + 3.3 "

As a general law, when a mixture of two salts of a single acid is treated with water the salt of the stronger base dissolves as if no other salt than itself were present. (H. Kopp, *Ann. Ch. u. Pharm.*, 1840, **34.** 268.) When chloride of potassium is added to a saturated solution of chloride of barium it dissolves, while the latter is precipitated; this reaction continues until a definite solution of the two salts is obtained, which is identical with that made by treating a mixture of the two salts with water. (Karsten, *Berlin Abhandl.*, 1840, p. 110.) When a mixture (in excess) of the chlorides of barium and potassium is treated with water, 100 pts. of the water dissolve, at 16.8°, 45.9 pts. of the mixed salts, of which 18.2 pts. are Ba Cl; at 16.6°, 45.4 pts. of the mixed salts, of which 18.2 pts. are Ba Cl.

At 16.6° or 16.8° the solubility of pure chloride of potassium = 33.8; that of chloride of barium =
$\begin{cases} \text{at } 16.6°, 37.1. \\ \text{at } 16.8°, 37.2. \end{cases}$

At 16.6° Found: 45.4 = 27.2 K Cl + 18.2 Ba Cl.
Calcul.: 45.4 = 33.8 " + 11.6 "
At 16.8° Found: 45.9 = 27.7 K Cl + 18.2 Ba Cl.
Calcul.: 45.9 = 33.8 " + 12.1 "

These salts furnish a remarkable exception to the general law, that when a mixture of two salts of a single acid is treated with water the salt of the stronger base dissolves as if no other salt were present; this exception is explained by the fact that the two combine, forming a double salt which has its own peculiar coefficient of solubility. (H. Kopp, *Ann. Ch. u. Pharm.*, 1840, **34.** 267.) Chloride of barium is soluble in a saturated solution of nitrate of baryta. Chloride of barium is exceedingly slowly soluble in a saturated solution of nitrate of soda, with separation of nitrate of baryta; it is rapidly soluble in a saturated solution of nitrate of potash, but only to form nitrate of baryta which separates out. (Karsten, *Berlin Abhandl.*, 1840, pp. 129, 130.)

Chloride of Barium with Glycocoll. Permanent. More soluble in hot than in cold water; less soluble in alcohol than in water. (Horsford.)
$C_4H_4NO_3, BaCl + 2Aq$

Chloride of Barium & of Lead.

Chloride of Barium & of Mercury. Effloresces in dry air. Soluble in water. (Bonsdorff.)
$BaCl; 3HgCl + 2Aq$

Chloride of Barium & *sesquichloride* of Ruthenium. Decomposed by alcohol, which dissolves out the sesquichloride of ruthenium.

Chloride of Barium & of Silver.

Chloride of Barium & *protochloride* of Tin.
$Ba\,Cl\,;\,Sn\,Cl + 4\,Aq$

Chloride of Barium & *bichloride* of Tin.
$Ba\,Cl\,;\,Sn\,Cl_2 + 5\,Aq$

Chloride of Barium with Cyanide of Mercury. Efflorescent. Easily soluble in water and in dilute alcohol. (Brett.)
$Ba\,Cl\,;\,2\,Hg\,Cy + 6\,Aq$

Chloride of Barium with Fluoride of Barium. Difficultly soluble in water, though much more readily soluble than fluoride of barium alone. But water decomposes it to a certain extent, so that when it is washed upon a filter more chloride of barium than fluoride of barium is dissolved out. (Berzelius, *Lehrb.*, **3.** 356.)
$Ba\,Cl\,;\,Ba\,Fl$

Chloride of Benzanilidyl. *Vid.* Chloride of PhenoylBenzoicyl.

Chloride of Benzil. Insoluble, or very sparingly soluble, in water, by which it is slowly decomposed. Quickly decomposed by alkaline solutions. (Cahours, *Ann. Ch. et Phys.*, (3.) **23.** 350.)
$C_{28}\,H_{11}\,O_4,\,Cl$

*Ter*Chloride of Benzin. *Vid.* Chlorhydrate of *ter*ChloroBenzin.

Chloride of BenzoicylSulphoPhenoylamid. Fumes in the air. Decomposed by water. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **53.** 303.)
$N\left\{\begin{matrix}C_{12}\,H_4\,S_2O_4''\\ C_{14}\,H_5\\ H\end{matrix}\right.,\,Cl$

Chloride of Benzol ($C_{14}\,H_6''$). Insoluble in water. Easily soluble in alcohol, and ether. (Cahours, *Ann. Ch. et Phys.*, (3.) **23.** 331.)
(*ChloroBenzol. Hydride of ChloroBenzoyl. Chloride of Benzylene.*)
$C_{14}\,H_6'',\,Cl_2$

Chloride of Benzoyl. Insoluble in water. It is decomposed, however, and thus dissolved, by boiling water. Decomposed by hot alcohol, and by ammonia-water. Unacted on by ether. Miscible in all proportions with bisulphide of carbon.
(*ChloroBenzoyl.*)
$C_{14}\,H_5\,O_2,\,Cl$

Chloride of Benzoyl with Hydride of Benzoyl. Decomposed by warm water, or alcohol. Sparingly soluble in cold alcohol. (Laurent & Gerhardt.)
$C_{14}\,H_5\,O_2\,Cl\,;\;C_{14}\,H_5\left.\begin{matrix}O_2\\ H\end{matrix}\right\}$

Chloride of Benzoyl*chloré*. *Vid.* Chloride of ChloroBenzoyl.

Chloride of Benzyl. *Vid.* Chloride of Toluenyl.

Chloride of Benzylene. *Vid.* Chloride of Benzol ($C_{14}\,H_6''$).

*Bi*Chloride of Bismuth. Very hygroscopic. Decomposed by water, and, with partial solution, by dilute mineral acids. (Schneider, *Ann. Ch. u. Pharm.*, **97.** 195.)
$Bi\,Cl_2$

*Ter*Chloride of Bismuth.

I.) $Bi\,Cl_3$ Deliquesces with decomposition. Decomposed by water, with elevation of temperature, an insoluble oxychloride being precipitated, while chlorhydric acid remains in solution, no acid salt being formed. (H. Rose, *Pogg. Ann.*, **83.** 145.) Soluble in dilute chlorhydric acid.

It is not decomposed by water when in presence of citric acid. (Spiller.)

II.) *basic.* *Vid.* Oxychloride of Bismuth.

Chloride of Bismuth & of Potassium. Decomposed by water.
$2\,K\,Cl\,;\,Bi\,Cl_3 + 4\,Aq$

Chloride of Bismuth & of Sodium.

I.) $Na\,Cl\,;\,Bi\,Cl_3 + 3\,Aq$ Deliquescent.

II.) $2\,Na\,Cl\,;\,Bi\,Cl_3 + 2\,Aq$ Permanent. Decomposed by water.

Chloride of Bismuth with Selenide of Bismuth. Unacted upon by water. Scarcely at all acted upon by chlorhydric acid. Easily and completely dissolved, with decomposition, by nitric acid. (Schneider.)
$Bi\,Cl_3\,;\,2\,Bi\,Se_3$

Chloride of Bismuth with Sulphide of Bismuth. Unacted upon by water, or by cold dilute acids. Decomposed by hot acids. (Schneider.)
$Bi\,Cl_3\,;\,2\,Bi\,S_3$

Chloride of BismuthEthyl. Not completely soluble in water. Soluble in alcohol. (Dunhaupt.)
(*Chloride of Bisethyl.*)
$C_4\,H_5\,Bi'',\,Cl_2$

Chloride of Borneol. Soluble in alcohol.
(*Chloride of Camphol.*)
$C_{20}\,H_{17}\,Cl$

Chloride of Boron. Rapidly absorbed by water, with decomposition to boracic and chlorhydric acids. It is also absorbed and decomposed by alcohol, wood-spirit, and fusel-oil.
$B\,Cl_3$

Chloride of Bromine. Soluble in water. Decomposed by sunlight. (Lœwig.) Ether abstracts it from the aqueous solution.

Chloride of BromoNaphthalin. Sparingly soluble in boiling ether. (Laurent.)
(*Subchloride of Bromonaphtase*)
$C_{20}\,H_7\,Br'',\,Cl_2$

Chloride of *bi*BromoNaphthalin. Very sparingly soluble in alcohol, and ether. (Laurent.)
(*Chloride of Bronaphtèse.*)
$C_{20}\,H_6\,Br_2,\,2\,Cl_2$

*Bi*Chloride of *bi*BromoChloroNaphthalin. Very sparingly soluble in ether. (Laurent.)
(*Per Chloride of Bronaphtese* ($C_{20}\,H_6\,Br_2,\,Cl_5$) (Laurent, at first). *Chloride of Bromichlonaphtèse.*)
$C_{20}\,H_5\,Br_2\,Cl_5 = C_{20}\,H_5\,Br_2\,Cl,\,2\,Cl_2$

Chloride of Butoyl.
$C_8\,H_7,\,Cl$

Chloride of Butyl. Insoluble in water. (Kolbe's *Lehrb.*, **1.** 289.)
(*Chloride of Tetryl. Butylchlorhydric Ether.*)
$C_8\,H_9\,Cl$

Chloride of Butylene. Insoluble in water. Readily soluble in alcohol, and ether. (Kolbe, *J. Ch. Soc.*, **2.** 169.)
(*Chloride of Tetrylene.*)
$C_8\,H_8'',\,Cl_2$

"Chloride of Butyrile." *Vid.* ChloroButylene.
$C_8\,H_7\,Cl$

Chloride of Butyryl. Instantly decomposed by water. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **38.** 299.)
(*Butyric Chloride.*)
$C_8\,H_7\,O_2,\,Cl$

Chloride of Cacodyl.
(*Chlor Arsin.*)

I.) $(C_2\,H_3)_2\,As,\,Cl$ Not perceptibly soluble in water. Miscible with alcohol. Insoluble in ether.

II.) *basic.*
$3\,C_4\,H_6\,As\,Cl\,;\,C_4\,H_6\,As\,O$

III.) *ter.* Decomposed by water. Soluble in ether; also soluble in bisulphide of carbon, but less so than in ether. (A. Bæyer.)
$As\,(C_2\,H_3)_2,\,Cl_3$

Chloride of Cacodyl & of Copper. Decomposed by boiling water. Insoluble in water, alcohol, or ether.
$As\,(C_2\,H_3)_2\,Cl\,;\,Cu_2\,Cl$

Calc

Chloride of Cacoplatyl. (*Chloride of Cacodyl Platinum.*) $C_4H_7AsPtClO_2 = \left.\begin{matrix}C_2H_3\\C_2H_2Pt\end{matrix}\right\}As, Cl + 2 Aq$ Soluble in boiling water, and alcohol.

Chloride of Cadmium. $CdCl, \& + 2 Aq$ Deliquescent. Easily soluble in water. (Stromeyer; John.)

The anhydrous salt is soluble in
0.71 pt. of water at 20°
0.72 " " " 40°
0.72 " " " 60°
0.70 " " " 80°
0.67 " " " 100°
(Kremers, *Pogg. Ann.*, **104.** 162.)

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of the anhydrous salt dissolved in 100 pts. of water.
1.1063	13.0
1.2106	26.9
1.3100	41.1

(Kremers, *Pogg. Ann.*, **104.** 155, & **106.** 587.)
Readily soluble in alcohol.

Soluble in strong chlorhydric acid. (H. Wurtz.) Soluble in ammonia-water, with combination.

Chloride of Cadmium & of Cobalt. $2 CdCl; CoCl + 12 Aq$ Deliquescent.

Chloride of Cadmium & of Copper. $CdCl; CuCl + 4 Aq$

Chloride of Cadmium & of Iron. $2 CdCl; FeCl + 12 Aq$

Chloride of Cadmium & of Magnesium.
I.) $CdCl; 2 MgCl + 12 Aq$
II.) $2 CdCl; MgCl + 12 Aq$

Chloride of Cadmium & of Manganese. $2 CdCl; MnCl + 12 Aq$

Chloride of Cadmium & of Nickel.
I.) $CdCl; 2 NiCl + 12 Aq.$
II.) $2 CdCl; NiCl + 12 Aq.$

Chloride of Cadmium & of Potassium.
I.) $KCl; CdCl$ Less soluble in water than the corresponding bromine compound. 100 pts. of water at 15.5° dissolve 33.45 pts. of it. Slightly soluble in alcohol, and wood-spirit; less so than chloride of cadmium. (Croft, *Phil. Mag.*, (3.) **21.** 356.)
II.) $KCl; 2 CdCl + Aq$
III.) $2 KCl; CdCl$ More soluble in water than No. 2. (v. Hauer.)

Chloride of Cadmium & of Sodium. $NaCl; CdCl$ 100 pts. of water at 15.5° dissolve 71.32 pts. of it; or 1 pt. of the salt is soluble in 1.4 pts. of water, at 15 5°. Slightly soluble in alcohol, and wood-spirit; less so than chloride of cadmium. (Croft, *Phil. Mag.*, (3.) **21.** 367.)

Chloride of Cadmium & of Strontium. $2 CdCl; SrCl + 7 Aq$

Chloride of Cadmium with Urea. $2 CdCl; C_2H_4N_2O_2$ Very readily soluble in water. Not absolutely insoluble in alcohol. (Neubauer & Kerner, *Ann. Ch. u. Pharm.*, **101.** 338.)

Chloride of Cadmium*ter*amin. (*Ammonio Chloride of Cadmium.*) $N\left\{H_9 . Cd, Cl\right.$ Extremely sparingly soluble in cold water. (Schueler, *Ann. Ch. u. Pharm.*, **87.** 43.)

Chloride of Cadmiumammonium. $N\left\{\begin{matrix}H_3\\Cd\end{matrix}\right.Cl$ Soluble in warm, less soluble in cold ammonia-water. (Croft.)

Chloride of Cajputene. $C_{20}H_{16}, Cl_2$

Chloride of Calcium.
I.) *normal.* $CaCl, \& + 6 Aq$ Very deliquescent. The anhydrous salt is very soluble in water, with evolution of heat. The anhydrous salt is soluble in 1.459 pts. of water at 15°. (Gerlach's determination, see his table of sp. grs., below.)

The anhydrous salt
is soluble in 1.58 pts. of water at 10.2°
" " 1.35 " " " 20°
" " 0.83 " " " 40°
" " 0.72 " " " 60°

A very strongly supersaturated solution of this salt occurred on one occasion when a solution saturated at the ordinary temperature was left in melting ice during three hours, crystals having been frequently thrown in meanwhile. (Kremers, *Pogg. Ann.*, **103.** 65.) Soluble in 1.5 pts. of cold, and in 0.8 pt. of boiling water. (Fourcroy.) The aqueous solution saturated in the cold contains 40.7% of it (Fourcroy); at 12.5°, 53.8% of it. (Hassenfratz, *Ann. de Chim.*, **28.** 291.) The crystallized salt ($CaCl + 6 Aq$) is also very deliquescent; and is soluble in water with reduction of temperature. It is soluble in 0.5 pt. of water at 0°, in 0.25 pt. at 16°, and in every proportion of hot water. (Gmelin's *Hand-Book.*) The hydrated salt is also readily soluble in alcohol.

Soluble in 0.5 pt. of water at 0°, in 0.25 pt. at 15.5°, and extremely soluble in boiling water. The solution saturated at 0° contains 66.66% of it, and that saturated at 15.5°, 80%. (M. R. & P.) The crystallized salt is soluble in 0.25 pt. of water at 18.75°. (Abl, from *Oesterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.)

The point of ebullition of pure water, observed in a glass tube containing bits of metallic zinc, having been 100.1°. (Legrand, *Ann. Ch. et Phys.*, 1835, (2.) **59.** 437.) The saturated aqueous solution boils at 180° (Legrand), with partial decomposition. (Kremers, *Pogg. Ann.*, **99.** 43.) An aqueous solution containing 10% of Ca Cl boils at 101.4°; one of 20% boils at 104.2°; one of 30% at 109.7°; and one of 40% at 118°. (Gerlach's *Sp. Gew. der Salzlœsungen*, p. 101.) Soluble in 1 pt. of strong boiling alcobol. (Wenzel, in his *Verwandtschaft*, p. 300 [T.].) Dry chloride of calcium is soluble in 8 pts. of alcohol at 15° (Bergman, *Essays*, **1.** 144), and in 1 pt. of boiling spirits of wine. (*Ibid.*, p. 182.) Very easily soluble in absolute alcohol, with evolution of heat.

Soluble in 0.7 pt. of boiling absolute alcohol. (Ot. Gr.) 1 pt. of the anhydrous salt is soluble in 1.43 pts. of absolute alcohol at 78.3°. (Graham.) Soluble in wood-spirit.

Soluble in all proportions in lignone. (Liebig.) Insoluble in lignone. (L. Gmelin.) Insoluble in acetone.

Soluble in butylic alcohol (hydrate of butyl), with combination. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **42.** 137.) Soluble to a certain extent in propylic alcohol (hydrate of propyl). (Berthelot, *Ann. Ch. et Phys.*, (3.) **43.** 399.) Soluble in caprylic alcohol (hydrate of capryl), with combination, *v. inf.* (Bouis.) Ether precipitates it from the alcoholic solution. (Dœbereiner.) It is soluble in many of the compound ethers (Strecker, *Ann. Ch. u. Pharm.*, **91.** 357); as, in acetate of ethyl, with combination (Liebig), and in lactate of ethyl, very readily, with combination. (Strecker.) Soluble in considerable quantity in anhydrous sulphocyanide of amyl. (Medlock, *J. Ch. Soc*, **1.** 374.) Soluble in valyl. (Kolbe, *J. Ch. Soc.*, **2.** 161.) Very readily soluble in concentrated acetic acid. (Liebig.) Soluble in a saturated aqueous solution of nitrate of potash, with elevation of temperature. (Fourcroy & Vauquelin, *Ann. de Chim.*, **11.** 137.) Insoluble in oil of caraway.

II.) *basic.* *Vid.* Oxychloride of Calcium.

Chloride of Calcium & of Mercury.

I.) $Ca\,Cl;\,2\,Hg\,Cl + 6\,Aq$ Exceedingly deliquescent. Very easily soluble in water. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 133.)

II.) $Ca\,Cl;\,5\,Hg\,Cl + 8\,Aq$ Tolerably permanent. When treated with cold water it is decomposed, chloride of calcium being dissolved, while protochloride of mercury ($Hg\,Cl$) remains, but on warming the mixture complete solution ensues. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 132.)

Chloride of Calcium & of Tin.
$Ca\,Cl;\,Sn\,Cl_2 + 5\,Aq$

Chloride of Calcium with Cyanide of Mercury.

I.) $Ca\,Cl;\,2\,Hg\,Cy$ Soluble in water, and alcohol. (Brett.)

II.) ditto $+ 6\,Aq$ Efflorescent. Very soluble in water. (Poggiale.)

Chloride of Calcium with Hydrate of Capryl (Caprylic Alcohol). Very deliquescent. More soluble in cold than in hot caprylic alcohol. It is decomposed by water. (Bouis, *Ann. Ch. et Phys.*, (3.) **44.** 104.)

Chloride of Calcium with Hydrate of Methyl (Wood-spirit). Very deliquescent. Decomposed by boiling water. Soluble in wood-spirit. (Kane.)
$2\,C_2\,H_4\,O_2;\,Ca\,Cl$

Chloride of Calcium with Lactate of Ethyl.
$Ca\,Cl;\,C_{20}\,H_{20}\,O_{12}$

Chloride of Calcium with Lactate of Lime. Permanent. Very easily soluble in water and in boiling ordinary alcohol; rather difficultly soluble in cold alcobol. Only slightly soluble in cold, but rather abundantly soluble in boiling absolute alcohol. Insoluble in ether. On recrystallizing it from the aqueous solution a salt containing less Ca Cl is obtained, and it would even appear that all of the latter might be eliminated by repeated recrystallization. (Engelhardt & Maddrell, *Ann. Ch. u. Pharm.*, 1847, **63.** 113.)
$2\,Ca\,Cl;\,C_{12}\,H_{10}\,Ca_2\,O_{12} + 12\,Aq$

Chloride of Calcium with Oxalate of Lime.

I.) $2\,Ca\,Cl;\,C_4\,Ca_2\,O_8 + 14\,Aq$ Permanent. Decomposed by water. (Fritzsche.)

II.) $Ca\,Cl;\,2\,(C_4\,Ca_2\,O_8) + 24\,Aq$ Decomposed by water. (Souchay & Lenssen, *Ann. Ch. u. Pharm.*, **100.** 317.)

Chloride of Calcium with Platinate of Lime. Readily soluble in chlorhydric acid, also, before drying, in nitric acid.
(*Herschel's precipitate.*)
$Ca\,Cl;\,Ca\,O,\,2\,Pt\,O_2 + 7\,Aq$

Chloride of Calcium with PlatinoCyanide of Calcium. Soluble in an aqueous solution of chloride of calcium. (Quadrat.)

Chloride of Calcium with PlatinoPlatiniCyanide of Calcium. Deliquescent. Very soluble in water. (Quadrat.)

Chloride of Calcium with Sulphide of Calcium. Deliquescent. (Berthier.)

"Chloride of Capryl." *Vid.* Chloride of Octyl.

Chloride of Capryl.
(*Binoxide of ChloroCaprylene.*)
$C_{16} H_{15} O_2, Cl$

Chloride of Caprylene.
$C_{16} H_{16}'', Cl_2$

***Proto*Chloride of Carbon.** *Vid.* *per*Chlor Ethylene.

***Bi*Chloride of Carbon.** *Vid.* Chloride of *per*ChloroMethyl.

***Per*(or *sesqui*)Chloride of Carbon.** *Vid.* Chloride of *per*ChlorEthylene.
$C_4 Cl_6$

***Di*Chloride of Carbon(Julin's).** Insoluble either in hot or in cold water. Readily soluble in boiling alcohol of 1.816 sp. gr., from which solution it separates for the most part on cooling. (Phillips & Faraday.) Soluble in ether. Soluble in hot oil of turpentine, from which it separates on cooling. (Julin.) Insoluble in water. Easily soluble in alcohol, and ether. (Regnault.) Unacted on by boiling nitric, chlorhydric, or sulphuric acids, or by a solution of potash.
$C_4 Cl_2$

Chloride of Carbonic Oxide(or of Carbonyl). *Vid.* ChloroCarbonic Acid.

Chloride of Carbonyl & of Copper. Decomposes in the air. Insoluble in water, by which it is decomposed. (Berthelot, *Ann. Ch. et Phys.*, (3.) **46.** 488.)
(*DiChloride of Copper with Carbonic Oxide.*)
$C_2 H_4 Cu_4 Cl_2 O_6 = \left.\begin{matrix} C_2 O_2'' \\ 2 Cu_2 Cl \end{matrix}\right\} + 4 Aq$

Chloride of Carbonyl with Cyanide of Ethyl. Instantly decomposed by water, and alcohol. It cannot be recrystallized from ether. (Henkel.)
$C_6 H_5 N, C_2 O_2 Cl_2$

Chloride of Cerium.

I.) *proto.*

a = *anhydrous.* Deliquescent. Easily soluble in water, and alcohol. (Mosander.)
$Ce Cl$

b = *hydrated.* Deliquescent. Soluble in 1 pt. of water at ordinary temperatures; and in 3 @ 4 pts. of alcohol. (Dumas, *Tr.*)
$Ce Cl + Aq$

II.) *sesqui.* Known only in solution, and this is partially decomposed when gently heated, or completely by long-continued boiling.
$Ce_2 Cl_3$

two III.) *basic.* Compounds containing 3, and less than 3, equivalents of base to ~~one~~ of acid may be obtained soluble in water, but those more basic than this are insoluble. (Ordway, *Am. J. Sci.*, (2.) **26.** 205.)

Chloride of Cerium & of Mercury(HgCl). Permanent. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 247.)

Chloride of Cetyl. Insoluble in water. Easily miscible with alcohol, and ether. Unacted upon by boiling potash-lye or by dilute acids. Scarcely at all attacked by strong nitric acid.
(*Chlorhydrate of Cetene.*)
$C_{32} H_{33} Cl$

Chloride of ChlorAcetyl. Decomposed by water and by alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **49.** 60.)
(*Chloride of Acetyl monochl*[illegible]
$C_4 H_2 Cl_2 O_2 = C_4 H_2 Cl O_2, Cl$

Chloride of *ter*ChlorAcetyl. Soluble in water, with decomposition. Decomposed by alcohol. (Malaguti.)
(*Aldehyde perchloré.*
ChlorAldehyde.)
$C_4 Cl_4 O_2 = C_4 Cl_3 O_2, Cl$

Chloride of ChlorAllyl.
$C_6 H_4 Cl_2 = C_6 H_4 Cl, Cl$

Chloride of *bi*ChlorAllyl.
$C_6 H_3 Cl_3 = C_6 H_3 Cl_2, Cl$

Chloride of *ter*ChlorAllyl.
$C_6 H_2 Cl_4 = C_6 H_2 Cl_3, Cl$

Chloride of *quadri*ChlorAllyl.
$C_6 H Cl_5 = C_6 H Cl_4, Cl$

Chloride of *quinqui*ChlorAllyl.
$C_6 Cl_6 = C_6 Cl_5, Cl$

Chloride of *octi*ChlorAmyl.
$C_{10} H_3 Cl_9 = C_{10} H_3 Cl_8, Cl$

Chloride of ChlorEthose. *Vid.* Chloride of *per*ChlorEthylene.

Chloride of ChlorEthyl. Insoluble in water. Miscible in all proportions with alcohol, and ether. (Kolbe's *Lehrb.*, **1.** 186.)
(*Chloride of Aldehyde. Monochlorinated Hydrochloric Ether. Chloride of Ethylchloré. Isomeric with Chloride of Ethylene.*)
$C_4 H_4 Cl, Cl$

Chloride of *bi*ChlorEthyl. Insoluble in water. Miscible with alcohol. Unacted upon by an aqueous solution of caustic potash, and is decomposed by alcoholic potash only after long-continued boiling. (*Ibid.*, p. 669.)
(*Chloride of Acetyl(Acetoyl). Isomeric with Chloride of ChlorEthylene.*)
$C_4 H_3 Cl_3 = C_4 H_3 Cl_2, Cl$

Chloride of *ter*ChlorEthyl. Insoluble in water. Miscible with alcohol. Unacted upon by an aqueous solution of caustic potash, but is decomposed when boiled with alcoholic potash. (*Ibid.*, p. 670.)
(*Chloride of Chlor Acetyl (Acetoyl).*)
$C_4 H_2 Cl_4 = C_4 H_2 Cl_3, Cl$

Chloride of *quadri*ChlorEthyl. Not miscible with water. Soluble in alcohol.
(*Chloride of biChlorAcetyl (Acetoyl).*)
$C_4 H Cl_5 = C_2 H Cl_4, Cl$

Chloride of *per*ChlorEthyl. Identical with Chloride of *per*ChlorEthylene(" Sesquichloride of Carbon ").

Chloride of ChlorEthylene. Insoluble in water. Soluble in alcohol, and ether. (Kolbe's *Lehrb.*, **1.** 362.)
(*PerChloride of Acetyl.*
Chlorure de Chloréthose.
Chlorure d'éthylène chloré.)
$C_4 H_3 Cl_3 = C_4 H_3 Cl'', Cl_2$

Chloride of *bi*ChlorEthylene. Insoluble in water. Soluble in alcohol, and ether. (Kolbe's *Lehrb.*, **1.** 365.)
(*PerChloride of Formyl.*
Chlorure d'Ethyleuebichloré.
Chlorure de Chloréthése)
$C_4 H_2 Cl_4 = C_4 H_2 Cl_2'', Cl_2$

Chloride of *ter*ChlorEthylene. Insoluble in water.
(*Chlorure d'Ethylène trichloré.*
Chlorhydrate of Chloretherose.)
$C_4 H Cl_5 = C_4 H Cl_3''; Cl_2$

Chloride of *per*ChlorEthylene. Very sparingly soluble in water, and as difficultly soluble in aqueous solution of the caustic alkalies. Easily soluble in alcohol, but much more readily in hot than in cold. Water precipitates it from the alcoholic solution. More soluble in ether; also soluble in the fixed and volatile oils. Unacted upon by chlorhydric acid, or by sulphuric acid. Nor is it decomposed by aqueous solutions of the caustic or sulphuretted alkalies. Soluble in boiling nitric acid, from which it separates on the addition of water, and partly on cooling. (Faraday.) Soluble in acetate of ethyl-perchloré(Terchloracetate of Perchlorethyl) and in ether. (F. Leblanc, *Ann. Ch. et Phys.*, (3.) **10.** pp. 201, 202, 203.) Soluble in alcohol and in ether, from which it is precipitated by water. (Bouis, *Ann. Ch. et Phys.*, (3.) **20.** 452.)
(*Sesquichloride of Carbon.*
PerChloride of Carbon.
Chlorure de Chlorethose.
Chlorure d'Ethylène perchloré)
$C_4 Cl_6 = C_4 Cl_4'', Cl_2$

Chloride of *per*ChlorEthylene with Chloride of Cyanogen.

I.) $C_{12} N_4 Cl_{14} = C_8 N_4 Cl_8 : C_4 Cl_6$ Insoluble in water, but is soon decomposed thereby. Soluble in alcohol, from which it is precipitated by water. Soluble in ether. (Bouis, *Ann. Ch. et Phys.*, (3.) **20.** 448.)

II.) $C_{20} N_4 Cl_{22} = C_8 N_4 Cl_4 ; 3 C_4 Cl_6$ Insoluble in water. Soluble in alcohol; more soluble in ether. (Bouis, *loc. cit.*, p. 452.)

III.) $C_{12} N_4 Cl_{14} O_4 = \left.\begin{matrix} C_8 N_4 Cl_8 \\ O_4 \end{matrix}\right\} ; C_4 Cl_6$ Insoluble in water. Soluble in alcohol, and ether. (Bouis, *loc. cit.*, p. 454.)

Chloride of ChloroBenzoyl. Decomposed by boiling water after a time. Decomposed at once by concentrated ammonia-water; more slowly by dilute ammonia and by solutions of the fixed alkalies. (Limpricht & v. Uslar.)
(*Chloride of Benzoyl chloré. Oxide of biChloro Benzylene.*)
$C_{14} H_4 Cl_2 O_2 = C_{14} H_4 Cl O_2, Cl$

Chloride of ChloroButylene.
$C_8 H_7 Cl, Cl_2$

*Ter*Chloride of *bi*ChloroCinnamene.
$C_{16} H_6 Cl_2'', 3 Cl_2$

Chloride of ChloroMethyl.
(*Bichloride of Methylene. Chlorure de Méthyl-chloré.*)
$C_2 H_2 Cl_2 = C_2 H_2 Cl, Cl$

Chloride of *Bi*ChloroMethyl. Insoluble in water. Very soluble in alcohol, and ether. Sparingly soluble in water. (Soubeiran.) Mixes in all proportions with alcohol (Soubeiran), from which it may be partially precipitated by water. (Liebig.) Readily soluble in common ether. (Liebig.) Miscible with oil of turpentine. (Huraut & Larocque, *C. R.*, **26.** 103 [*Gm.*].) Insoluble in concentrated sulphuric acid.
(*Chloroform. Chloretherid. Perchloride of Formyl.*)
$C_2 H Cl_3 = C_2 H Cl_2, Cl$

Chloroform dissolves fats, resins, and, in general, organic matters rich in carbon. It is the best solvent known for caoutchouc.

As a general rule it readily dissolves the akaloids and neutral crystalline vegetable principles. (Parrish's *Pharm.*, p. 318.)

Chloride of *per*ChloroMethyl. Insoluble in water. Easily soluble in alcohol, and ether.
(*Chloride of Methyle perchloré. Bichloride of Carbon. Perchloride of Carbon.*)
$C_2 Cl_4 = C_2 Cl_3, Cl$

Chloride of MethylSelenious Acid.
$C_2 H_4 Cl Se_2 O_5 = Se_2 (C_2 H_3) O_4, Cl + Aq$ Permanent. Very easily soluble in water, and alcohol.

Chloride of *bi*ChloroMethylSulphurous Acid. Soluble in water, and alcohol.
(*Sulphite of Chloride of Carbon.*)
$C_2 H Cl_3 S_2 O_4$

Chloride of *ter*ChloroMethylSulphurous Acid. Insoluble in water and in acids. Partially decomposed when heated in water. Soluble in alcohol, ether, and bisulphide of carbon. The alcoholic solution is precipitated by water. Also soluble in the fixed and volatile oils, and in ammonia-water. (Berzelius & Marcet, Kolbe.)
$C_2 Cl_4 S_2 O_4$

*Bi*Chloride of ChloroNaphthalin.
$C_{20} H_7 Cl, 2 Cl_2$

α = *Solid modification.* Insoluble in water. Sparingly soluble in alcohol. Tolerably soluble in ether, being more readily soluble than α bichloride of naphthalin.

β = *Liquid modification.*

Chloride of *bi*ChloroNaphthalin.
$C_{20} H_6 Cl_2'', Cl_2$

*Bi*Chloride of *bi*ChloroNaphthalin. There are three isomeric modifications:
$C_{20} H_6 Cl_2, 2 Cl_2$

α = *Liquid modification.*

β = *Liquid modification* "(*X*)." Soluble in ether.

γ = *Crystalline modification* "(*C*)." Sparingly soluble in ether, and still less soluble in alcohol.

Chloride of *bi*ChloroNitroMethyl. Very sparingly soluble in water. Easily soluble in alcohol, and ether. Unacted on by boiling sulphuric, chlorhydric, or nitric acids, or by aqueous alkaline solutions. (Stenhouse.)
(*ChloroPicrin. Chloride of NitroMethylperchloré.*)
$C_2 Cl_3 N O_4 = C_2 (N O_4) Cl_2, Cl$

Chloride of Chloro*bi*NitroMethyl. Water dissolves traces of it. Very soluble in alcohol, and ether. Very sparingly soluble in chlorhydric and in nitric acids. Insoluble in aqueous, but readily soluble in alcoholic solutions of potash. (Marignac.)
(*Volatile liquor of Marignac.*)
$C_2 Cl_2 N_2 O_8 = C_2 (N O_4)_2 Cl, Cl$

Chloride of ChloroPhenyl. *Vid.* Hydride of *ter*ChloroPhenyl.

Chloride of ChloroPropylene.
$C_6 H_5 Cl'', Cl_2$

Chloride of *bi*ChloroPropylene.
$C_6 H_4 Cl_2'', Cl_2$

Chloride of *ter*ChloroPropylene.
$C_6 H_3 Cl_3'', Cl_2$

Chloride of *quadri*ChloroPropylene.
$C_6 H_2 Cl_4'', Cl_2$

Chloride of *quinqui*ChloroPropylene.
$C_6 H Cl_5, Cl_2$

Chloride of *per* ChloroPropylene.
$C_6 Cl_6'', Cl_2$

Chloride of ChloroStilbene. Somewhat less soluble in ether than chlorostilbene. Soluble in a mixture of alcohol and ether.
$C_{28} H_{11} Cl, Cl_2$

Chloride of ChloroSalyl.

*Ter*Chloride of ChloroSalyl. Insoluble in boiling water or in hot potash-lye. (Kolbe & Lautemann.)
$C_{14} H_4 Cl_4$

Chloride of ChloroToluene. *Vid.* Chlorhydrate of ChloroToluene.

Chloride of ChlorOxethose. *Vid.* Oxide of *per*ChlorEthyl.

Chloride of ChlorOxyNaphthyl. Insoluble in water. Soluble, without decomposition, in concentrated sulphuric acid. Very sparingly soluble in alcohol, and ether. (Laurent.)
(*OxyChloroNaphtalose. OxiChloroxenaphtose.*)
$C_{20} H_4 Cl_2 O_4$

Chloride of *per*ChlorOxyNaphthyl. Insoluble in water or alcohol. Sparingly soluble in boiling ether, more readily soluble in boiling naphtha. (Laurent.)
(*Oxide of ChlorOxeNaphtalise.*)
$C_{20} Cl_6 O_4$

*Proto*Chloride of Chromium.
$Cr Cl$

I.) *Ordinary, colorless.* Soluble in water, with evolution of heat. The solution soon decomposes when exposed to the air. (Péligot, *Ann. Ch. et Phys.*, (3.) **12.** 530.)

II.) *Peach-blossom colored.* Insoluble in water. (Fremy, *Ann. Ch. et Phys.*, (3.) **12.** 459.)

III.) *basic.* Insoluble in water, soluble in chlorhydric acid. (Moberg.)

*Sesqui*CHLORIDE OF CHROMIUM.
$Cr_2 Cl_3$
a = common or soluble modification. Deliquescent. Soluble in water. (H. Rose.) Deliquescent. Readily soluble in water. (T. Thomson, *Phil. Trans*, 1827, Part I. p. 204.) Deliquescent. Very soluble in water. Decomposed by hot water. (Fremy, *Ann. Ch. et Phys.*, (3.) **12.** 459.) Soluble in a concentrated aqueous solution of chloride of ammonium. (Claus, *Beiträge*, p. 8.) Soluble in alcohol.

There are two definite hydrates, $Cr_2 Cl_3 + 6 Aq$, soluble in water with evolution of heat, and $Cr_2 Cl_3 + 12 Aq$, very soluble in water, also soluble in alcohol. (Péligot, *Ann. Ch. et Phys.*, (3.) **12.** 537.)

b = basic. Basic chlorides of chromium which contain 5 or 6, and less, equivalents of base to one of acid may be obtained soluble in water; compounds containing more base than this are insoluble. (Ordway, *Am. J. Sci.*, (2.) **26.** 203.) Sesquibasic chloride of chromium is soluble in water. (Moberg.) For the compounds $Cr_2 O_3$, $2 Cr_2 Cl_3 + 8 Aq$, of Moberg, and $Cr_2 O_3$, $2 H Cl$ of Lœwel, see, *pro tem.*, Chlorhydrate of Oxychloride of Chromium.

c = Insoluble, or violet modification. "Insoluble in
$Cr_2 Cl_3$ water. It is true that some authors * attribute to it a greater or less degree of solubility; but these statements are erroneous. It is certain that sublimed sesquichloride of chromium is *entirely insoluble in water, either cold or boiling.* It is no more soluble in water charged with any of the acids. Nor is it attacked by concentrated boiling sulphuric acid or by aqua-regia. It dissolves, however, with marvellous facility, with development of heat, in water which contains protochloride of chromium in solution, the presence even of $\frac{1}{100000}$ part of $Cr Cl$ in the water being sufficient to produce this solution." "I have not sought to go further; — doubtless, however, a smaller quantity of the protochloride would suffice." (Péligot, *Ann. Ch. et Phys.*, (3.) **12.** 533.) Again, Péligot asserts that sesquichloride of chromium is insoluble either in hot or in cold water. It is, however, soluble in all proportions in water which contains a small quantity of protochloride of chromium; $\frac{1}{40000}$, or even less, of the last-named substance being sufficient to bring about the solvent action. (Péligot, *Ann. Ch. et Phys.*, (3.) **14.** 240.) A suspicion was thrown upon the above statement of Péligot by Pelouze (*Ibid.*, (3.) **14.** 249), who asserted that violet sesquichloride of chromium is slowly soluble in boiling water. It is slowly decomposed by boiling concentrated sulphuric acid. An addition of very small quantities of protochloride of tin renders the sesquichloride of chromium soluble both in cold and in hot water. Other bodies, having more or less affinity for chlorine, also cause the solution of sesquichloride of chromium; for example, protochloride of iron, protochloride of copper, or hyposulphite of soda; but none of these are so efficacious as protochloride of tin, nor is the latter so powerful as protochloride of chromium. Ordinary chlorides — i. e. those having no special affinity for chlorine, such as the alkaline chlorides, chloride of ammonium or bichloride of tin — exert no solvent action upon sesquichloride of chromium. (Pelouze, *Ann. Ch. et Phys.*, (3.) **14.** 251.) The presence also of a small quantity of sesquichloride of titanium will enable water to dissolve a large quantity of the violet chloride of chromium. (Ebelmen, *Ann. Ch. et Phys.*, (3.) **20.** 390.) In reply to Pelouze's strictures, Péligot has shown that the experiments of this chemist were probably made upon an impure article; and has reiterated his previous assertion, thus: — Violet sesquichloride of chromium is insoluble in pure water. By continued boiling with water traces of it are dissolved, with decomposition. If, however, a trace of protochloride of chromium is present, the sesquichloride dissolves very readily in water. (Péligot, *Ann. Ch. et Phys.*, (3.) **16.** 298.) The insoluble modification of sesquichloride of chromium is not acted upon by chlorhydric, sulphuric, or nitric acids, nor by boiling aqua-regia. (H. Rose; Fellenberg.)

*Proto*CHLORIDE OF CHROMIUM & OF POTASSIUM. Deliquescent. Very soluble in water, with subsequent decomposition. (Fremy, *Ann. Ch. et Phys.*, (3.) **12.** 460.)

CHLORIDE OF CINNAMENE (or OF STYROL).
(Chloro Styrol.) Insoluble in water. Miscible in all
$C_{16} H_8, Cl_2$ proportions with alcohol, and ether.

CHLORIDE OF CINNAMYL. Decomposed by
$C_{18} H_7 O_2, Cl$ water, and alcohol. (Cahours.)

CHLORIDE OF CITRACONYL.
(Chloride of Pyrocitryl. Chlorure Pyrocitrique.)
$C_{10} H_4 Cl_2 O_4 = \left.\begin{matrix} C_{10} H_4 O_4'' \\ Cl_2 \end{matrix}\right\}$

CHLORIDE OF COBALT.
I.) *normal.*

a = anhydrous. Absorbs water from the air and
$Co Cl$ combines with it. Slowly, but abundantly soluble in water.

Soluble in absolute alcohol. Sparingly soluble in ether. (Dœbereiner; Gehlen.)

b = $Co Cl + x Aq$ Permanent. Easily soluble in water, and alcohol. When heated, it melts in its water of crystallization. (Berzelius, *Lehrb.*)

II.) *sesqui.* Is obtained in solution when hy-
$Co_2 Cl_3$ drated sesquioxide of cobalt is dissolved in cold chlorhydric acid, but the solution soon undergoes decomposition, especially if it be heated. (Berzelius, *Lehrb.*)

CHLORIDE OF COBALT & OF MERCURY. Quick-
$Co Cl; Hg Cl$ ly deliquescent. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 249.)

CHLORIDE OF COBALT with CYANIDE OF
$Co Cl; 2 Hg Cy + 7 Aq$ MERCURY. Soluble in water. (Poggiale.)

CHLORIDE OF COBALT*bi*AMIN. Partially sol-
$N_2 \left\{ H_6 . Co, Cl = 2 N H_3 . Co Cl \right.$ uble in water. (H. Rose, *Pogg. Ann.*, **20.** 157 [*Gm.*].)

CHLORIDE OF COBALT*ter*AMIN. Soluble, with-
(Ammonio Chloride of Cobalt.) out de-
$N_3 \left\{ H_9 . Co, Cl + Aq = 3 N H_3 . Co Cl + Aq \right.$ composition, in ammonia-water, but is immediately decomposed by pure water, with separation of an insoluble basic salt. (Fremy, *Ann. Ch. et Phys.*, (3.) **35.** 268.)

*Di*CHLORIDE OF COPPER. Insoluble in water.
(Improperly "protoChloride of Copper.") Insoluble in
$Cu_2 Cl$ dilute sulphuric acid, or in sulphurous acid. (Pèan de St. Gilles.) Soluble in strong chlorhydric acid, from which it is precipitated on the addition of water, and in solu-

---

* Thus, Jacquelin had stated that the "insoluble modification" of $Cr_2 Cl_3$ is soluble in 2000 pts. of water at 90°, in 1000 pts. at 100°, and in 68 pts. at 136° (under pressure).

tions of ammonia and of chloride of sodium. Sparingly soluble in ether, from which water precipitates it. (Gehlen.)

*Proto*Chloride of Copper.

I.) *normal.* Very deliquescent. The aqueous $Cu Cl, \& + Aq$ solution saturated at 12.5° contains 38.9% of it. (Hassenfratz, *Ann. de Chim.*, **28.** 291.) Very soluble in water. Tolerably soluble in alcohol, and ether. (Gehlen; Gladstone, *J. Ch. Soc.*, **8.** 215.) Soluble in 1 pt. of strong alcohol at 82.5°. (Wenzel, in his *Verwandtschaft*, p. 300 [T.].)

An aqueous solution of sp. gr. (at 12.5°)	Contains per cent of the salt.	An aqueous solution of sp. gr. (at 12.5°)	Contains per cent of the salt.
1.0100	2	1.1239	22
1.0206	4	1.1369	24

1.0767	14	1.2080	34
1.0881	16	1.2273	36
1.0995	18	1.2466	38
1.1110	20		

(Hassenfratz, *Ann. de Chim.*, **28.** 299.)

Soluble in picolin, with combination. (Unverdorben.) Soluble in an aqueous solution of chloride of ammonium. (Claus, *Beiträge*, p. 8.) Largely soluble in a concentrated aqueous solution of chloride of sodium. (Boussingault, *Ann. Ch. et Phys.*, (2.) **51.** 353.)

II.) *basic.* *Vid.* OxyChloride of Copper.

*Proto*Chloride of Copper & of Ethylamin.

*Proto*Chloride of Copper & of Mercury (Hg Cl). Tolerably permanent. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 249.)

*Proto*Chloride of Copper, of Mercury, & of Potassium. $3 (K Cl, Hg Cl) ; Cu Cl + 2 Aq$ Permanent. Soluble in boiling water and hydrated alcohol, without decomposition in either case, unless the solution be rapidly cooled. Insoluble in absolute alcohol. (Bonsdorff.)

*Di*Chloride of Copper & of Platin(*ous*)*bi*amin. $Cu_2 Cl ; N_2 \left\{ H_6 . Pt', Cl \right.$ Soluble in water, from which alcohol precipitates it. (Buckton, *J. Ch. Soc.*, **5.** 219.)

*Proto*Chloride of Copper & of Platin(*ous*)-*bi*amin. $Cu Cl ; N_2 \left\{ H_6 . Pt', Cl \right.$ Sparingly soluble in cold water. Decomposed by boiling water. (Buckton, *J. Ch. Soc.*, **5.** 218.)

*Di*Chloride of Copper & of Potassium. $2 K Cl ; Cu_2 Cl$ Soluble in water. (Mitscherlich.)

*Proto*Chloride of Copper & of Potassium. $K Cl ; Cu Cl + 2 Aq$ Easily soluble in water, and alcohol. (Berzelius.)

*Di*Chloride of Copper & of Sodium. $Cu_2 Cl ; Na Cl$ Very easily soluble in water. (Mitscherlich.)

*Proto*Chloride of Copper & of Sodium. Soluble in alcohol of 0.837 sp. gr. (Berzelius, *Lehrb.*, **2.** 492.) Easily soluble in an aqueous solution of chloride of sodium. (Boussingault.)

Chloride of Copper with HypoSulphite of Copper. $Cu Cl ; Cu_2 O, 3 S_2 O_2$ Soluble in a warm, less soluble in cold, aqueous solution of chloride of ammonium. (v. Hauer.)

*Proto*Chloride of Copper with Picolin. Decomposed by water and by dilute alcohol. Soluble in 300 pts. of cold, and in 100 pts. of boiling absolute alcohol. (Unverdorben.)

*Proto*Chloride of Copper with Urea. $Cu Cl ; C_2 H_4 N_2 O_2$ Soluble in water, with decomposition.

*Di*Chloride of Copper with Xanthogenamid.

I.) $Cu_2 Cl ; N \left\{ \begin{matrix} C_2 S_2'' \\ C_4 H_5 . O, H O \\ H \end{matrix} \right.$ Almost insoluble in water or in cold alcohol, but tolerably easily soluble in warm alcohol. On boiling the alcoholic solution it is partially decomposed. Soluble to a considerable extent in saline solutions, but is reprecipitated on diluting with water. (Debus.)

II.) $Cu_2 Cl ; 2 N \left\{ \begin{matrix} C_2 S_2'' \\ C_4 H_5 . O, H O \\ H \end{matrix} \right.$ Insoluble in water. Easily soluble in hot alcohol.

III.) $Cu_2 Cl ; 3 N \left\{ \begin{matrix} C_2 S_2'' \\ C_4 H_5 . O, H O \\ H \end{matrix} \right.$ Soluble in cold alcohol, and the alcoholic solution may be heated to boiling without undergoing decomposition.

IV.) $Cu_2 Cl ; 4 N \left\{ \begin{matrix} C_2 S_2'' \\ C_4 H_5 . O, H O \\ H \end{matrix} \right.$ Somewhat soluble in water. Soluble in alcohol, even cold, and much more readily than the preceding compounds.

Chloride of Cresyl.

Chloride of Cumol ($C_{20} H_{12}''$). (*Chloro Cuminol. Chloro Cumol. Hydride of Chloro Cumyl.*) $C_{20} H_{12}'', Cl_2$ Insoluble in water. Easily soluble in alcohol, and ether. Unacted upon by an aqueous solution of caustic potash. (Cahours, *Ann. Ch. et Phys.*, (3.) **23.** 346.)

Chloride of Cumyl. $C_{20} H_{11} O_2, Cl$ Decomposes in moist air; it is also decomposed by water, and alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **23.** 348.)

Chloride of Cupr(*ic*)*bi*amin. (*Ammonio proto Chloride of Copper.*) $N_2 \left\} H_6 . Cu, Cl + Aq \right.$ Soluble in water, and in hot ammonia-water. (Kane.)

Chloride of Cupr(*ic*)*ter*amin. $N_3 \left\} H_9 . Cu, Cl \right.$ Soluble in water. (Faraday; H. Rose.)

Chloride of Cupr(*eous*)ammonium. $N \left\{ \begin{matrix} H_3 \\ Cu_2 \end{matrix} \right., Cl$ Decomposed by water. Unacted upon by alcohol. Soluble, with decomposition, in acids. (Ritthausen.)

Chloride of Cupr(*eous*)ammonium & of Cupr(*ic*)ammonium. $N \left\{ \begin{matrix} H_3 \\ Cu_2 \end{matrix} \right. Cl ; N \left\{ \begin{matrix} H_3 \\ Cu \end{matrix} \right. Cl$

Chloride of Cupr(*ic*)ammonium. $N \left\{ \begin{matrix} H_3 \\ Cu \end{matrix} \right., Cl$ Decomposed by water. (Kane.)

Chloride of Cyan*bi*amin. (*Ammonio Chloride of Cyanogen.*) $C_2 H_6 N_3 Cl = N_2 \left\} H_6 . C_2 N, Cl \right.$ Permanent. Unacted upon by water, even when boiling. Not decomposed by chlorhydric acid. Soluble, with decomposition, in concentrated sulphuric acid, and difficultly in nitric acid, also in an aqueous solution of caustic potash. (Berzelius, *Lehrb.*)

Chloride of Cyanammonium. $C_2 H_3 N_2 Cl = N \left\{ \begin{matrix} H_3 \\ C_2 N \end{matrix} \right., Cl$ Permanent. Insoluble, as such in water, though decomposed thereby to a trifling extent. Unacted upon by chlorhydric acid.

Decomposed, with solution, by sulphuric acid. Difficultly soluble in nitric acid, also in an aqueous solution of caustic potash. (Berzelius, *Lehrb.*)

Chloride of Cyanogen.
$Cy\,Cl = C_2\,N\,Cl$

α) *Gaseous modification.* Water absorbs 25 times
$Cy\,Cl$ its own volume at 20° and the ordinary pressure; alcohol 100 vols.; and ether 50 vols. (Sérullas.) The aqueous solution is decomposed on heating. The alcoholic solution decomposes after standing for several days.

Soluble to almost any extent in caoutchin. (Himly.)

β) *Liquid modification.* Very sparingly soluble in
$Cy_2\,Cl_2 = C_4\,N_2\,Cl_2$ water. (A. Wurtz.) Insoluble in water, but soluble in alcohol. (Berzelius, *Lehrb.*) Soluble in anhydrous ether. (W. Henke.)

γ) *Solid modification.* Very sparingly soluble in
$Cy_3\,Cl_3 = C_6\,N_3\,Cl_3$ cold, more easily soluble, with decomposition, in hot water. (Sérullas.) Very soluble in alcohol, and ether. (Liebig.) The solution in absolute alcohol may be kept without alteration, but the solution in spirit soon decomposes.

(α) Chloride of Cyanogen & *pentachloride*
$Cy\,Cl;\ Sb\,Cl_5$ of Antimony. Decomposed by water.

(α) Chloride of Cyanogen & *sesquichloride* of Iron.

(α) Chloride of Cyanogen & of Titanium.
$Cy\,Cl,\ 2\,Ti\,Cl_2$ Rapidly soluble in water, with decomposition and great disengagement of heat. Soluble in warm bichloride of titanium without alteration. (Wœhler.)

Chloride of Cyanogen with Cyanhydric
$C_6\,N_3\,Cl_2\,H = Cy_2\,Cl_2;\ Cy\,H$ Acid. Perceptibly soluble in water. (A. Wurtz.)

Chloride of Cyanogen with Cyanide of
$Cy\,Cl;\ C_6\,H_5\,N$ Ethyl. Instantly decomposed by water, and alcohol. (Henke.)

Chloride of Cyanogen with Oxide of
$2\,C_4\,H_5\,O;\ Cy\,Cl$ Ethyl. Insoluble in water. Decomposed by boiling with water. Easily soluble in alcohol, and ether. (Aimé.) Does not exist. (Bouis.)

Chloride of Cyanogen with Oxide of Me-
$2\,C_2\,H_3\,O;\ Cy\,Cl$ thyl.

Chloride of Cymene. Insoluble in water,
$C_{20}\,H_{14}'',\ Cl_2$ and but slightly soluble in alcohol. (Sieveking.)

Chloride of Didymium.

I.) $Di\,Cl + 4\,H\,O$ Deliquescent. Very soluble in water, and alcohol. Its solutions are partially decomposed by evaporation. (Marignac, *Ann. Ch. et Phys.*, (3.) **38.** 160.)

II.) *basic.* *Vid.* OxyChloride of Didymium.

Chloride of Didymium & of Mercury.
$Di\,Cl;\ 3\,Hg\,Cl + 8\,Aq$

Chloride of Ethyl. Soluble in 50 pts. of
(*Chlorhydric Ether. Isomeric with Hydride of ChlorEthyl.*)
$C_4\,H_5\,Cl$
water (Thénard); in 60 pts. (Pfaff); in 24 pts. (?). Soluble in 1 volume of water at 18°. (Thénard.)

Soluble in all proportions in alcohol, and ether. Miscible with cacodyl.

It may be separated from the alcoholic solution by means of neutral tartrate of potash. (Funcke.)

Chloride of ethyl dissolves fatty oils and also several essential oils and resins, as well as sulphur and phosphorus.

Chloride of Ethyl & of Iron ($Fe_2\,Cl_3$). Decomposed by water.

Chloride of Ethyl & of Tin ($Sn\,Cl_2$). Decomposed by water.

Chloride of Ethyl with FerroCyanide
$2\,C_4\,H_5\,Cl;\ 2\,Fe\,Cy,\ 4\,C_4\,H_5\,Cy + 12\,Aq$ of Ethyl. Soluble, with decomposition, in a mixture of alcohol and ether. (Buff.)

Chloride of Ethyl*chloré*. *Vid.* Chloride of ChlorEthyl.

Chloride of *tetra*Ethylammonium. Very
$N \left\{ (C_4\,H_5)_4,\ Cl \right.$ deliquescent. Easily soluble in water, and alcohol.

Chloride of *tri*EthylAmylammonium. Very
$C_{22}\,H_{26}\,N\,Cl = N \left\{ \begin{matrix} (C_4\,H_5)_3 \\ C_{10}\,H_{11} \end{matrix} \right\} Cl$ deliquescent. Soluble in water.

Chloride of EthylBrucin. Soluble in water.

Chloride of Ethylene. Almost entirely in-
(*Dutch Liquid. Oil of olefiant gas. Oil of the Dutch Chemists. ChlorÆtherin. ChlorElayl. Chlorhydrate of Chloride of Acetyl.*)
$C_4\,H_4'',\ Cl_2$
soluble in water. Soluble in all proportions in alcohol, and ether.

Very sparingly soluble in water, more readily soluble if chlorhydric acid be present. Soluble in alcohol. (Morin.)

Chloride of Ethylene*chloré*. *Vid.* Chloride of ChlorEthylene.

Chloride of Ethylidene.
(*Isomeric with Chloride of Ethylene.*)
$C_4\,H_4',\ Cl_2$

Chloride of EthylMethylConiin. Deliquescent. Readily soluble in water. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **89.** 139.)

Chloride of EthylNicotin. Soluble in water. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **87.** 6.)

Chloride of *tri*EthylPhenylammonium. Soluble in water.

Chloride of Ethyl*tri*Phenylammonium. Soluble in alcohol.

Chloride of *tri*EthylPhosphin.

Chloride of *tetra*EthylPhosphonium. Deliquescent. Soluble in water, and alcohol. Insoluble in ether.

Chloride of *di*EthylPiperylammonium.
$C_{18}\,H_{20}\,N\,Cl = N \left\{ \begin{matrix} C_{10}\,H_{10}'' \\ (C_4\,H_5)_2 \end{matrix} \right. ,\ Cl$ Very deliquescent. Soluble in water. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 98.)

Chloride of EthylPlatinammonium & of
$C_4\,H_7\,N\,Pt_2\,Cl_2 = N \left\{ \begin{matrix} C_4\,H_5 \\ Pt \\ H_2 \end{matrix} \right. ,\ Cl;\ Pt\,Cl$ Platinum. Somewhat more readily soluble than sulphate of lime in water. More soluble in alcohol than in water. (Zeise.)

Chloride of *di*EthylPlatin*bi*ammonium.
$C_8\,H_{14}\,N_2\,Pt\,Cl = N_2 \left\{ \begin{matrix} (C_4\,H_5)_2 \\ H_3 \\ Pt\,.\,H \end{matrix} \right. ,\ Cl$ Tolerably soluble in water; but scarcely at all soluble in alcohol.

Chloride of *di*EthylPlatin*bi*ammonium &
$C_8\,H_{14}\,N_2\,Pt_2\,Cl_2 = N_2 \left\{ \begin{matrix} (C_4\,H_5)_2 \\ H_3 \\ Pt\,.\,H \end{matrix} \right. ,\ Cl;\ Pt\,Cl$ *protochloride* of Platinum. Ppt.

Chloride of EthylQuinine. Soluble in water, much more readily in hot than in cold. (Streeker, *Ann. Ch. u. Pharm.*, **91.** 168.)
$C_{40} H_{24} (C_4 H_5) N_2 O_4, Cl$

Chloride of EthylStrychnine. Readily soluble in water.

Chloride of EthylSulphurous Acid. Insoluble in water. Readily soluble in alcohol. (Gerhardt & Chancel.)
$C_4 H_5 S_2 O_4 Cl$

Chloride of EthylThiosinamin. ? Soluble in absolute alcohol.

*Per*Chloride of Formyl. *Vid.* Chloride of *bi*ChloroMethyl.

"Chloride of Formyl." *Vid.* *bi*ChlorEthylene.
$C_4 H_2 Cl_2$

Chloride of Furfurin & *bichloride* of Iridium.

Chloride of Furfurin & *bichloride* of Lead.

Chloride of Furfurin & *protochloride* of Mercury. Ppt.

Chloride of FuscoCobalt.
(*Chlorhydrate of FuscoCobaltiaque.*)

I.) "$4 N H_3 . Co_2 Cl_2 O + 3 Aq$" Readily soluble in water. Decomposed by boiling water. Alcohol precipitates it from the aqueous solution. (Fremy, *Ann. Ch. et Phys.*, (3.) **35.** 291.)

II.) *granular.* Soluble in cold water, from which it is reprecipitated on the addition of chloride of ammonium. (Fremy, *Ann. Ch. et Phys.*, (3.) **35.** 293.)
"$N H_3 . Co_3 Cl O_3 + 5 Aq$"

Chloride of Glucinum.

I.) *normal.*

a = *anhydrous.* Deliquescent. Readily soluble in water, with great elevation of temperature. (Rose; Wœhler; Bussy.) Readily soluble in alcohol. (Vauquelin.)
$Gl_2 Cl_3$

b = *hydrated.* Permanent. Easily soluble in water, and alcohol. (Awdejew.)
$Gl_2 Cl_3 + 12 Aq$

II.) *basic.* The compound containing nearly,
three but not quite, three equivalents of base to ~~one~~ of acid is still soluble in water. But compounds more basic than this are insoluble. (Ordway, *Am. J. Sci.*, (2.) **26.** 207.)

Chloride of Glucinum & *proto*Chloride of Mercury. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 136.)

*Proto*Chloride of Gold. Insoluble in water. Gradually decomposed by cold, quickly decomposed by hot water, with formation of the terchloride and precipitation of metallic gold.
$Au Cl$

*Ter*Chloride of Gold. Deliquescent. Easily soluble in water. (Berzelius.) Soluble in 1.47 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) The aqueous solution, after long standing, deposits some gold. (Basseyre.) Soluble in alcohol, forming a tolerably stable solution. The alcoholic solution gradually deposits metallic gold. (Gmelin.) Readily soluble in ether, which abstracts it from its aqueous solution. (Proust.) The ethereal solution is decomposed when exposed to light. (Sage), and by long keeping. Very soluble in chlorhydric acid.
(*ChlorAuric Acid.*)
$Au Cl_3 + 6 Aq$

Readily soluble in nitric acid of 1.43 sp. gr. It is not decomposed by evaporation with an excess of nitric acid. (H. Wurtz, *Am. J. Sci.*, (2.) **25.** 382.)

Chloride of Gold & of Nickel.

*Proto*Chloride of Gold & of Potassium. Decomposed by water and by chlorhydric acid.
(*ChlorAurite of Potassium.*)
$Au Cl ; K Cl$

Chloride of Gold & of Sodium. Soluble in water, and alcohol. (Meillet.)
$Au Cl ; Na Cl$

*Ter*Chloride of Gold with Cyanide of Ethyl. Instantly decomposed by water, and by alcohol. It cannot be recrystallized from ether. (Henke.)
$C_6 H_5 N, Au Cl_3$

*Ter*Chloride of Gold with Cyanide of Methyl. Instantly decomposed by water and by alcohol. It cannot be recrystallized from ether. (Henke.)
$C_4 H_3 N, Au Cl_3$

*Ter*Chloride of Gold with Picolin. Sparingly soluble in boiling, nearly insoluble in cold water. (Unverdorben.)

Chloride of Gros's Radical. *Vid.* Chlorhydrate of Platinamin.

*Proto*Chloride of Iodine.

α) *liquid.* Deliquescent. Very soluble in water. (Gay-Lussac.) Soluble in alcohol, and ether. Ether abstracts it from the aqueous solution. (Dumas.)
$I Cl$

β) *solid.* Decomposed by water. Easily soluble in alcohol, and ether. (Trapp.)
$I Cl$

*Ter*Chloride of Iodine. Deliquescent. Soluble in water, with partial decomposition. Ether does not remove it from the aqueous solution (Dumas), unless protochloride of iodine be present, in which case the terchloride is also taken up. (Sérullas.) If when dry it be treated with anhydrous alcohol or ether, these remove chloride of iodine and chlorhydric acid, leaving iodic acid. (Berzelius, *Lehrb.*) When the somewhat concentrated aqueous solution is mixed with a certain quantity of sulphuric acid, the terchloride of iodine is precipitated unchanged; on warming the mixture, it redissolves, and again separates on cooling. (*Ibid.*)
$I Cl_3$

Chloride of Iodine & of Magnesium. Deliquescent. (Filhol.) Resembles the potassium salt.
$Mg Cl ; I Cl_3 + 5 Aq$

Chloride of Iodine & of Potassium. Efflorescent. Very soluble in water, from which it crystallizes as the solution cools. The aqueous solution rapidly decomposes, especially when dilute. Much less soluble than the corresponding ammonium compound. Decomposed by ether, which removes the terchloride of iodine. (Filhol.)
$K Cl ; I Cl_3$

Chloride of Iridammonium. Insoluble in water. (Skoblikoff.)
$N \left\{ \begin{matrix} H_3 \\ Ir \end{matrix} \right. , Cl$

*Proto*Chloride of Iridium.
$Ir Cl$

α) *Insoluble modification.* Insoluble in water. Very sparingly soluble in boiling chlorhydric acid. Scarcely at all soluble in boiling aqua-regia. (Berzelius.) Unacted upon by sulphide of ammonium; or by boiling chlorhydric, nitric, or sulphuric acids, aqua-regia, or solutions of potash or of carbonate of potash. (Fellenberg.)

β) *Soluble modification.* Completely soluble in a small quantity of boiling water, but a larger quantity of water throws down most of the chloride of iridium in the insoluble state. This soluble modification (β) probably contains some chlorhydric acid in chemical combination. (Berzelius.) Very easily soluble in chlorhydric acid.

*Bi*Chloride of Iridium. *Vid.* ChlorIridic Acid.

*Sesqui*Chloride of Iridium. When obtained $Ir_2 Cl_3$ by sublimation it is insoluble in water; but when obtained by decomposing the nitrate with chlorhydric acid it is soluble in water.

*Sesqui*Chloride of Iridium & of Lead. Ppt. $3 Pb Cl; Ir_2 Cl_3$ (Claus, *Beiträge*, p. 26.)

*Sesqui*Chloride of Iridium & *dichloride* of Mercury. $3 Hg_2 Cl; Ir_2 Cl_3$ (Claus, *Beiträge*, p. 26.)

*Proto*Chloride of Iridium & of Potassium. $K Cl; Ir Cl$ Soluble in water. Insoluble in alcohol, but cannot be completely precipitated from the aqueous solution by alcohol. (Berzelius.)

*Sesqui*Chloride of Iridium & of Potassium. $3 K Cl; Ir_2 Cl_3 + 6 Aq$ Easily efflorescent. Easily soluble in water. Insoluble in alcohol. (Claus; Berzelius.) Insoluble in a saturated aqueous solution of chloride of potassium, but is soluble in a less thoroughly saturated solution. (Berzelius, *Lehrb.*, **2.** 444.)

*Sesqui*Chloride of Iridium & of Potassium with HypoSulphate of Potash. (*Chlorhyposulphate of Iridium with Chloride of Potassium.*) $2 K Cl; Ir_2 Cl_3; 2 K O, S_2 O_4, \& + 4 Aq$ Readily soluble in water. Insoluble in alcohol. (Claus.)

Chloride of Iridium & of Silver. $3 Ag Cl; Ir_2 Cl_3$ Insoluble in water or acids. Difficultly soluble in ammonia-water. (Claus.)

*Proto*Chloride of Iridium & of Sodium. $Na Cl; Ir Cl$ Deliquescent. Soluble in water, and alcohol. (Berzelius.)

*Sesqui*Chloride of Iridium & of Sodium.

I.) $3 Na Cl; Ir_2 Cl_3 + 24 Aq$ Readily efflorescent. Soluble in water. Melts in its water of crystallization at 50°. Completely insoluble in spirit.

The compound ($Ir_2 Cl_3$, 4 $Na Cl$ + 27 Aq) of Karmrodt & Urlaub (*Ann. Ch. u. Pharm.*, **81.** pp. 120–122) was a mixture of the iridium and rhodium salts. (Claus, *Beitrüge*, pp. 74, 62.)

II.) $2 Na Cl; Ir_2 Cl_3$ Deliquescent. Soluble in water, and alcohol. (Berzelius, *Lehrb.*, **3.** 998.)

*Sesqui*Chloride of Iridium with HypoSulphate & Sulphite of Potash.

I.) $Ir_2 Cl_3; 2 K O, S_2 O_4; 2 (K O, S O_2) \& + 12 Aq$ Partially decomposed by being dissolved in hot water. More easily soluble in a solution of potash than in water. (Claus.)

II.) $4 (K O, S O_2); 2 Ir O; S_2 O_4, Cl$ Decomposed, with partial solution, by water. (Claus.)

*Proto*Chloride of Iron.

$a = Fe Cl$ Very deliquescent. Very easily soluble in water, with evolution of heat.

Soluble in 2 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) Soluble in 1 pt. of strong alcohol at 82.5°. (Wenzel, in his *Verwandtschaft*, p. 300 [*T.*].) Insoluble in ether. Sparingly soluble in a mixture of alcohol and ether. The aqueous solution is decomposed when in contact with the air, a basic salt being deposited.

$b = Fe Cl + 4 Aq$ Deliquescent. Soluble in 0.68 pt. of water. Soluble in alcohol. (Reimann.)

*Sesqui*Chloride of Iron.

I.) *normal.*

$a =$ *anhydrous.* $Fe_2 Cl_3$ Deliquescent. Soluble in water, with evolution of heat. Soluble in alcohol, and ether; but in the light these solutions, especially the latter, soon undergo decomposition.

Soluble in an aqueous solution of chloride of ammonium (Claus, *Beiträge*, p. 8); also in a cold saturated solution of chloride of potassium. (W. Gibbs, *Am. J. Sci.*, (2.) **31.** 70.)

$b = Fe_2 Cl_3 + 6 Aq$ Deliquescent, with evolution of heat. (Fritzsche.) Soluble in alcohol. Ether dissolves out $Fe_2 Cl_3$, leaving the water.

$c = Fe_2 Cl_3 + 12 Aq$ Less deliquescent than the anhydrous or the 6-hydrated salt. Soluble in alcohol. Ether dissolves out $Fe_2 Cl_3$, leaving the water.

II.) *basic.* $Fe_2 Cl_3; (Fe_2 O_3)^{1 \text{ to } 23}$ All of these basic compounds may be obtained dissolved in water. Their aqueous solutions may be diluted to any extent, or boiled, without undergoing change. Sesquioxide of iron is precipitated, however, when they are mixed with almost any saline solution. After having been dried, the more basic compounds are no longer soluble in water, but the decibasic and the still more acid compounds do not lose their solubility by drying. (Ordway, *Am. J. Sci.*, (2.) **26.** 201.)

*Proto*Chloride of Iron & of Mercury. $Fe Cl; Hg Cl + 4 Aq$ Deliquescent. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 248.)

*Proto*Chloride of Iron & of Osmium. Soluble in water. (Berzelius, *Lehrb.*, **3.** 1006.)

*Proto*Chloride of Iron & of Potassium. $Fe Cl; K Cl + x Aq$ Easily soluble in water. (Berzelius.)

*Sesqui*Chloride of Iron & of Potassium. $2 K Cl; Fe_2 Cl_3 + 2 Aq$ Decomposed by water; if only a small quantity of water be added to it a portion remains undissolved, but a larger quantity of water dissolves the whole of it. It is less easily decomposed by water than the corresponding ammonium compound. (Fritzsche.)

Chloride of Lactyl. $C_6 H_4 O_2'', 2 Cl$ Decomposed by water, and alcohol.

Chloride of Lanthanum. Very soluble in water. (Mosander.)

Chloride of Lead.

I. *normal.* $Pb Cl$ Permanent. Slowly soluble in 135 pts. of water at 12.5°, and in a much smaller quantity of hot water. (Bischof.) Soluble in 30 [? 130] pts. of cold, and in 22 pts. of hot water. Insoluble in strong alcohol. (Wittstein's *Handw.*) Soluble in 30 pts. of water, at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) 100 pts. of water at 15.5° dissolve 4.59 pts. of it. (Ure's *Dict.*) Insoluble in alcohol of 94%. Very sparingly soluble in cold or hot alcohol of 76%. (Bischof.) Insoluble in alcohol, unless this contains more than 34% of water, in which case it is soluble, and so much the more readily in proportion as the spirit is weaker. (Berzelius, *Lehrb.*) Soluble in 534 pts. of water containing chloride of calcium. (Bischof.) Soluble in acetic acid. (Bergman, *Essays*, **1.** 140.) Its solubility in water is not much increased by the addition of acids. (Fresenius, *Qual.*) Chlorhydric acid, and

Li

several salts, especially chloride of calcium, diminish its solubility in water, and precipitate a portion of it from the saturated aqueous solution. But on the other hand, it is soluble in considerable quantity in concentrated chlorhydric acid, from which solution it is precipitated for the most part on diluting with water. (Berzelius, *Lehrb.*, **3.** 710.) When recently precipitated, chloride of lead is readily soluble in aqueous solutions of the soluble hyposulphites, though less abundantly than chloride of silver. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 27.) Soluble in an aqueous solution of acetate of soda.

Readily soluble in an aqueous solution of nitrate of ammonia. (Bolley.) Soluble in alkaline solutions.

Insoluble in an aqueous solution of chloride of sodium? (Anthon?) Soluble in 1636 pts. of cold water containing chlorhydric acid. It is soluble in concentrated chlorhydric acid, from which solution it is precipitated by water. (Bischof.) On the other hand, being less soluble in water acidulated with chlorhydric acid than in pure water, chlorhydric acid can precipitate it from the concentrated aqueous solution.

Chlorhydric acid no longer precipitates it from a solution of nitrate of lead when 100 pts. of water are present. (Pfaff.) Soluble in hot, but insoluble in cold concentrated sulphuric acid. (Hayes.) Soluble in dilute nitric acid; from this saturated solution chlorhydric acid precipitates a portion of it at once. (Gladstone.) Very easily and completely decomposed by hot nitric acid. (H. Wurtz, *Am. J. Sci.*, (2.) **25.** 381.) Soluble in an aqueous solution of caustic potash. When treated with ammonia-water, it is converted into a basic chloride without being modified in external appearance. (H. Rose, *Tr.*)

II.) *BiChloride of Lead?* $PbCl_2$ (?) Very instable. Decomposed by much water. It unites with alkaline chlorides to form compounds readily soluble in water. (Sobrero & Selmi, *Ann. Ch. et Phys.*, (3.) **29.** 165.)

III.) *basic.* *Vid.* Oxychloride of Lead.

Chloride of Lead & of Platin(*ous*)*bi*amin. $PbCl; N_2 \left\{ H_6 . Pt', Cl \right.$ Soluble in hot, very much less soluble in cold water. Insoluble in alcohol and in chlorhydric acid. (Buckton, *J. Ch. Soc.*, **5.** 213.)

Chloride of Lead & of Rhodium.

I.) $2 PbCl ; Rh_2Cl_3$
II.) $3 PbCl ; Rh_2Cl_3$
Insoluble in water. (Claus, *Beiträge*, pp. 73, 23.)

***Proto*Chloride of Lead & of Sodium.**

***Bi*Chloride of Lead & of Sodium.** $2 PbCl_2 ; 9 NaCl$ Very soluble in water. (Sobrero & Selmi, *Ann. Ch. et Phys.*, (3.) **29.** 165.)

Chloride of Lead with Fluoride of Lead. (*Chlorofluoride of Lead.*) $PbCl ; PbFl$ Slightly soluble, without decomposition, in water. Easily soluble in nitric acid. (Berzelius.)

Chloride of Lead with Iodide of Lead. (*ChlorIodide of Lead.*) $2 PbCl ; PbI$

Chloride of Lead with Phosphate of Lead. (*ChloroPhosphate of Lead.*) I.) $PbCl ; 2 PbO, HO, PO_5$ Insoluble in boiling water. Soluble in dilute nitric acid. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **22.** 505.)

II.) $2 (3 PbO, c PO_5) ; PbCl$ Ppt.

III.) $3 (3 PbO, c PO_5) ; PbCl$

IV.) $3 (3 PbO, c PO_5) ; PbCl + Aq$ Insoluble in water. (Heintz.)

Chloride of Lead with Phosphite of Lead. (*ChloroPhosphite of Lead.*) $PbCl ; 2 PbO, PO_3$ Decomposed by boiling water. (Berzelius.)

Chloride of Lead with Sulphate of Lead. (*ChloroSulphate of Lead.*) $2 PbCl ; PbO, SO_3 + Aq$ Insoluble in water, or an aqueous solution of chloride of sodium. (Becquerel, *C. R.*, 1845, **20.** 1523.)

Chloride of Lead with Sulphide of Lead. $PbCl ; 3 PbS$ Decomposed by boiling water, which dissolves out the chloride of lead. Unacted upon by dilute, decomposed by concentrated chlorhydric acid. (Huenefeld.)

Chloride of Lead with Tartrate of Lead. Appears to be insoluble in water, or an aqueous solution of chloride of sodium. (Becquerel, *C. R.*, 1845, **20.** 1525.)

Chloride of Lithium. $LiCl + 2 Aq$ & $4 Aq$ More quickly deliquescent than any other known salt. (Berzelius, *Lehrb.*) More deliquescent than chloride of calcium. (Troost.) Exceedingly soluble in water. (C. Gmelin.)

1 pt. of the anhydrous salt

is soluble in	1.57	pts. of	water at	0°

(Kremers, *Pogg. Ann.*, **99.** 444.)

Easily soluble in absolute alcohol. (C. Gmelin.) Easily soluble in a mixture of equal parts of absolute alcohol and ether. (Berzelius; Rammelsberg; also Lawrence Smith, *Am. J. Sci.*, (2.) **16.** 57.)

Chloride of Lithium & *protochloride* **of Mercury.** There are two salts, one of which is permanent, the other deliquescent. (v. Bonsdorff.)

Chloride of LuteoCobalt.
(*Chlorhydrate of LuteoCobaltiaque. Chlorhydrate of diCobaltinamin.*)
$6\,NH_3 . Co_2, Cl_3$

Slowly soluble in cold, decomposed by boiling water. (Fremy, *Ann. Ch. et Phys.*, (3.) **35.** 285.) Is not decomposed by boiling water. Acids, like chlorhydric, sulphuric, and nitric, precipitate it from the cold aqueous solution. These acids, when warm, do not alter the salt; on heating the mixture it becomes slightly yellow, and on cooling, all the salt which has been dissolved separates out. Insoluble in ammonia-water. Completely insoluble in cold, and only soluble to an insignificant extent in boiling absolute alcohol. (Rogojski, *Ann. Ch. et Phys.*, (3.) **41.** 450, & *J. pr. Ch.*, **56.** 496.) More soluble than chloride of purpureocobalt in water acidulated with chlorhydric acid. (Rogojski, *Ann. Ch. et Phys.*, (3.) **41.** 447.) Readily soluble in hot, much less soluble in cold water. Insoluble in alcohol, in chlorhydric acid, or in solutions of the alkaline chlorides, which precipitate it unchanged from the aqueous solution. (Gibbs & Genth, *Smithson. Contrib.*, vol. **9.** p. 36 of the memoir.)

Chloride of LuteoCobalt with Chromate of LuteoCobalt.
(*Crystallizing together in all proportions.*)

Chloride of LuteoCobalt with Sulphate of LuteoCobalt.
(*SulphatoChloride of Luteo Cobalt. ChloroSulphate of diCobaltamin.*)
$6\,NH_3 . Co_2O_3, 3\,SO_3 ; 6\,NH_3 . Co_2Cl_3$ (of Rogojski).
(*Isomorphous mixture of its two components* (according to Gibbs & Genth).

Soluble in water. (Rogojski, *Ann. Ch. et Phys.*, (3.) **41.** 453.)

Chloride of Magnesium.

a = $MgCl$ Deliquescent. Soluble in water, with evolution of heat.

Soluble in 1.857 pts. of water at 15°. (Gerlach's determination, see his table of sp. grs., below.) Soluble in 1 pt. of cold water. (Fourcroy.) An aqueous solution saturated in the cold contains 50% of it (Fourcroy); and at 12.5°, 64.8%. (Hassenfratz, *Ann. de Chim.*, **28.** 291.) 100 pts. of water at 15.5° dissolve 200 pts. of it. (Ure's *Dict.*) Dry chloride of magnesium is soluble in 7 pts. of alcohol at 15°. (Bergman, *Essays*, **1.** 144); in 5 pts. of alcohol at a moderate heat. (*Ibid.*, p. 183.)

(Kremers, *Pogg. Ann.*, **104.** 155.)

An aqueous solution containing 10% of $MgCl$ boils at 101.6°; one of 20% boils at 106.2°; and one of 30% at 115.6°. (Gerlach's *Sp. Gew. der Salzlœsungen*, p. 98.) The aqueous solution cannot be evaporated to dryness without undergoing decomposition, a portion of the chlorhydric acid of the salt being evolved. When one equivalent of $MgCl$, in aqueous solution, is mixed with a solution of an equivalent of sulphate of potash (KO, SO_3), 0.43 of it are decomposed to sulphate of magnesia, which may be precipitated by adding alcohol, while 0.57 of it remain unchanged; when mixed with a solution of an equivalent of sulphate of soda (NaO, SO_3), 0.458 of it are decomposed as before, while 0.542 of it remain unchanged. (Malaguti, *Ann. Ch. et Phys.*, 1853, (3.) **37.** 203.)

b = $MgCl + 6Aq$ Deliquescent. Soluble in 0.658 pt. of cold, and in 0.273 pt. of hot water; in 5 pts. of alcohol of 0.90 sp. gr., and in 2 pts. of alcohol of 0.817 sp. gr. When heated it melts in its water of crystallization.

Soluble in 0.1828 pt. of strong alcohol at 82.5°. (Wenzel, in his *Verwandtschaft*, p. 300 [T.].)

An aqueous solution of sp. gr. (at 24°)	Contains (by experiment) per cent of $MgCl + 6 Aq.$

(H. Schiff, *Ann. Ch. u. Pharm.*, 1859, **110.** 72.) Schiff admits (*Ibid.*, 1860, **113.** 355) that Gerlach's table is more accurate than his own. Schiff's solutions were not, like Kremers's, prepared from the crystallized salt.

CHLORIDE OF MAGNESIUM. & *protochloride* OF MERCURY.

I.) $MgCl;\ HgCl + 6 Aq$ Exceedingly deliquescent. More soluble in water than No. 2. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 136.)

II.) $MgCl;\ 3 HgCl + 5 Aq$ Permanent. When treated with water it suffers decomposition at first, the chloride of magnesium dissolving before the chloride of mercury, but finally complete solution ensues, and the double salt is again deposited as the solution evaporates spontaneously. Easily soluble in alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 135.)

CHLORIDE OF MAGNESIUM & OF POTASSIUM.
$2 MgCl;\ KCl + 12 Aq$ Deliquesces to a solution of Mg Cl, while K Cl remains undissolved. (Liebig.) It is decomposed in the same way by water, and alcohol.

CHLORIDE OF MAGNESIUM & OF SODIUM.
$2 MgCl;\ NaCl + 2 Aq$

CHLORIDE OF MAGNESIUM & *bichloride* OF TIN.
$MgCl,\ SnCl_2 + 5 Aq$

CHLORIDE OF MAGNESIUM with *proto*CYANIDE OF MERCURY.
$MgCl;\ 2 HgCy + 2 Aq$ Easily soluble in water and in weak alcohol. (Poggiale.)

CHLORIDE OF MAGNESIUM with OXYCHLORIDE OF PHOSPHORUS.
$2 MgCl;\ PO_2Cl_3$ Very deliquescent. Soluble in water, with decomposition. Very sparingly soluble in warm oxychloride of phosphorus. (Casselmann, *Ann. Ch. u. Pharm.*, **98.** 223)

CHLORIDE OF MANGANESE.

A solution in absolute alcohol, saturated at °C	
11.25°	33.3
37.5	33.3
76.25 (boiling)	36.2

Or, 1 pt. of Mn Cl is soluble in 2 pts. of absolute alcohol at 11.25°, and at 37.5, and in 1.7 pts. of this menstruum at 76.25°. Or, 100 pts. of absolute alcohol dissolve 50 pts. of Mn Cl at 11.25° and 37.5°, and 58 pts. of it at 76.25°. These numbers refer to recently prepared alcoholic solutions, but when these are kept for some time much of the chloride crystallizes out. A solution in absolute alcohol which had been weakened in this manner was found to contain only 21% of Mn Cl at 10°. (Brandes, *loc. cit.*, pp. 266–270.) When 15 @ 20 vols. of ether are added to 1 vol. of absolute alcohol saturated with chloride of manganese the latter is completely precipitated. (Dœbereiner.) Insoluble in oil of turpentine. (Brandes, *loc. cit.*, p. 272.)

b = *hydrated*. Deliquescent.

(Brandes, *loc. cit.*, pp. 266 – 270.)

Insoluble in absolute ether, at the ordinary temperature, and none of its water of crystallization is abstracted by ether. (Brandes, *loc. cit.*, p. 266.) Insoluble in boiling oil of turpentine, and loses but little water during the experiment. (*Ibid.*, p. 272.) When one equivalent of Mn Cl, in aqueous solution, is mixed with a solution of an equivalent of sulphate of potash ($K O, S O_3$) $\frac{425}{1000}$ of it are decomposed to sulphate of manganese, which may be precipitated by adding alcohol, while $\frac{575}{1000}$ of it remain unchanged. (Malaguti, *Ann. Ch. et Phys.*, 1853, (3.) **37.** 203.)

*Sesqui*Chloride of Manganese. (*Chlorhydrate of Manganic Oxide.*) $Mn_2\ Cl_3$ When sesquioxide ($Mn_2\ O_3$) or peroxide ($Mn\ O_2$) of manganese is dissolved in cold, somewhat concentrated chlorhydric acid, — an excess of acid being avoided, — a solution is obtained, which on being decomposed by the addition of much water, deposits hydrated sesquioxide of manganese ($Mn_2\ O_3$, $3\ H\ O$.) (Forchammer; H. Rose, *Pogg. Ann.*, **83.** 147.)

*Per*Chloride of Manganese. $Mn_2\ Cl_7$ Soluble in water. (Dumas.)

*Proto*Chloride of Manganese & of Mercury. $Mn\ Cl;\ Hg\ Cl + 4\ Aq$ Deliquescent. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 247.)

Chloride of Manganese with Cyanide of Mercury. $Mn\ Cl;\ 2\ Hg\ Cy + 3\ Aq$ Efflorescent. Very soluble in water. (Poggiale.)

Chloride of Mannicyl. $C_{12}\ H_{10}\ O_6\ Cl_2$ Easily soluble in ether. (Berthelot.)

Chloride of Mercur(*ic*)ammonium. (*Fusible White Precipitate*, according to Kane.) $N \left\{ \begin{matrix} H_3 \\ Hg \end{matrix} \right. Cl$ Soluble in warm, less soluble in cold ammonia-water. (Mitscherlich.)

Chloride of *di*Mercur(*ic*)ammonium. (*Infusible White Precipitate. Amido Chloride of Mercury.*) $N \left\{ \begin{matrix} H_2 \\ 2\ Hg \end{matrix} \right. . Cl, \& + 2\ Aq$ Permanent. Insoluble in cold water. (Millon, *Ann. Ch. et Phys.*, (3.) **18.** 413.) Soluble in about 600 pts. of water. Insoluble in alcohol. (Wittstein's *Handw.*) Soluble in 719.98 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) Scarcely at all soluble in cold, decomposed by boiling water. Soluble, with combination, in boiling dilute sulphuric acid; also soluble in hot dilute nitric acid. (Kosmann, *Ann. Ch. et Phys.*, (3.) **27.** 238.) Soluble in the mineral acids and in aqueous solutions of nitrate, sulphate, and acetate of ammonia, when these salts are mixed with free ammonia. (Pelouze & Fremy, *Tr.*) Easily soluble in chlorhydric acid, also in nitric and sulphuric acids. (Fourcroy.) Easily soluble in cyanhydric acid. (Hennel.) Soluble in warm aqueous solutions of chloride of ammonium, and of nitrate of ammonia. (Brett.) Completely insoluble in cold water, but soluble to a certain extent in aqueous solutions of the alkaline chlorides, which partially decompose it with formation of protochloride of mercury (Hg Cl). This decomposition is greater in hot than in cold solutions. (Mialhe, *Ann. Ch. et Phys.*, (3.) **5.** 180.)

Chloride of *tetra*Mercur(*ic*)ammonium. (*Amidoxychloride of Mercury.*) $N\ Hg_4\ Cl + 2\ H\ O =$ "$N\ H_2\ Hg,\ Hg\ Cl + 2\ Hg\ O$" Slightly soluble in water. Easily soluble in nitric, and chlorhydric acids. (Kane.)

Chloride of Mercur(*ic*)ammonium & *protochloride* of Mercury.

I.) $N \left\{ \begin{matrix} H_3 \\ Hg \end{matrix} \right. , Cl;\ Hg\ Cl$ Insoluble in water, but turns yellow when boiled therewith for some time. (H. Rose.) Decomposed by water, with partial solution. (Kane.) Partially soluble in water. (Grouvelle.)

II.) $N \left\{ \begin{matrix} H_3 \\ Hg \end{matrix} \right. Cl;\ 2\ Hg\ Cl + Aq$ (*Fusible White Precipitate* (of Duflos, and Riegel).) Insoluble in cold, somewhat decomposed by boiling water. Soluble in acids, even in strong acetic acid.

Chloride of *di*Mercur(*ic*)ammonium & *protochloride* of Mercury. $N \left\{ \begin{matrix} H_2 \\ 2\ Hg \end{matrix} \right. Cl;\ 2\ Hg\ Cl$ Decomposed by cold water. (Millon, *Ann. Ch. et Phys.*, (3.) **18.** 413.)

Chloride of *di*Mercur(*ic*)ammonium & *protochloride* of Mercury with Protoxide of Mercury. $2\ N \left\{ \begin{matrix} H_2 \\ 2\ Hg \end{matrix} \right. Cl;\ 3\ Hg\ Cl;\ 2\ Hg\ O$ Insoluble in cold water. (Millon, *Ann. Ch. et Phys.*, (3.) **18.** 413.)

Chloride of *tetra*Mercur(*ic*)ammonium & *protochloride* of Mercury. $N\ (Hg_4)\ Cl;\ Hg\ Cl$ (*Nitrochloride of Mercury.*) Insoluble in boiling water, alkaline solutions, nitric or dilute sulphuric acids, but is gradually dissolved by boiling concentrated sulphuric acid, and by chlorhydric acid. (Mitscherlich.)

Chloride of *di*Mercur(*ic*)ammonium with Protoxide of Mercury.

I.) $N\left\{\begin{matrix}H_2\\2\,Hg\end{matrix}\right.Cl\,;\,2\,Hg\,O$ Insoluble in warm water.

II.) $3\,N\left\{\begin{matrix}H_2\\2\,Hg\end{matrix}\right.Cl\,;\,4\,Hg\,O$ Insoluble in cold water. (Millon, *Ann. Ch. et Phys.*, (3.) **18.** 413.)

Chloride of Mercur(*ous*)ammonium. (*AmmoniodiChloride of Mercury. ChloroMercurate of Ammonia.*) $N\left\{\begin{matrix}H_3\\Hg_2\end{matrix}\right.Cl$ Decomposes in the air.

Chloride of *di*Mercur(*ous*)ammonium. (*AmidoChloride of Mercury. diChlorAmidide of Mercury.*) $N\left\{\begin{matrix}H_2\\2\,Hg_2\end{matrix}\right.Cl$ Permanent. Insoluble in water. Unacted upon by boiling water. Decomposed by acids. (Kane.)

Chloride of Mercur(*ous*)Ethyl. (*Chloride of HydrargEthyl.*) $C_4\,H_5\,Hg_2,\,Cl$ Nearly insoluble in water. Sparingly soluble in cold, freely soluble in boiling alcohol. Sparingly soluble in ether. (Duenhaupt.)

Chloride of Mercur(*ous*)Methyl. $C_2\,H_3\,Hg_2,\,Cl$ Ppt.

Chloride of *tetra*Mercur(*ic*)Phosphonium & *protochloride* of Mercury. $P\,(Hg_4)\,Cl\,;\,2\,Hg\,Cl+3\,Aq$ Decomposed by boiling, and gradually by cold water. (H. Rose.)

*Di*Chloride of Mercury. (*Calomel. Subchloride of Mercury. Submuriate of Mercury. Mercurous Chloride.*) $Hg_2\,Cl$ When prepared in the moist way, it is almost absolutely insoluble in cold, but is gradually decomposed to a slight extent by boiling water.

Sparingly soluble, with decomposition, in boiling distilled water free from air: — thus, 1.2 grms. of calomel being placed in a flask containing 20 grms. of boiling distilled water, the whole maintained at the temperature of ebullition during an hour, and the flask securely closed until cold, afforded 0.002 grm. of corrosive sublimate. When the water is boiled in contact with air, the decomposition of the dichloride is very much greater, but simple protochloride of mercury is no longer produced, an oxychloride being formed, as has been shown by Guibourt. (Mialhe, *Ann. Ch. et Phys.*, (3.) **5.** 176.) Soluble in 1152 pts. of boiling water. (Rouelle.) Soluble in 12000 pts. of boiling water. (Dumas, *Tr.*)

Insoluble in spirit, but when boiled for a long time therewith it is decomposed to a slight extent.

Insoluble in ether. (Lassaigne.) Insoluble at the ordinary temperature in very dilute acids, but slowly soluble at more elevated temperatures; the solution gradually becomes complete at the temperature of boiling, with decomposition. When treated with warm chlorhydric acid, or with aqueous solutions of the alkaline chlorides, dichloride of mercury is completely transformed to protochloride, which dissolves, and metallic mercury. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 343.) A mixture of 0.6 grm. $Hg_2\,Cl$, 0.6 grm. chlorhydric acid, and 10 grms. of water being left during 24 hours, at the temperature of 40° or 50°, out of contact with the air, 0.004 grm. of corrosive sublimate (Hg Cl) was produced. The same mixture in contact with the air afforded 0.014 grm. of Hg Cl. (Mialhe, *Ann. Ch. et Phys.*, (3.) **5.** 176.) Tolerably rapidly soluble, with decomposition, in concentrated chlorhydric acid. Soluble, with decomposition, in boiling nitric acid, and in cold chlorine-water, or aqua-regia. (Fresenius, *Quant.*, p. 146.) Soluble in a hot or warm aqueous solution of chloride of ammonium; less readily soluble in a solution of nitrate of ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 97.) Somewhat soluble in aqueous solutions of chloride of ammonium, chloride of potassium, and chloride of sodium; traces of it are also dissolved by solutions of chloride of barium, and chloride of calcium. (Pettenkofer.) When treated with aqueous solutions of the chlorides of ammonium, sodium, potassium, or barium, especially chloride of ammonium, it is partially decomposed, some protochloride of mercury (Hg Cl) being formed and dissolved. This decomposition, but slight in the cold, is more rapid in hot solutions; it is also greater in proportion as the solution of the alkaline salt employed is more concentrated; out of contact with the air, but little decomposition occurs, but when exposed to the air, oxygen is absorbed, and the decomposition is greater. In presence of dextrin the decomposition appears to be more rapid; sugar and albumen do not seem to modify it, while fatty matters and gum-arabic retard it. (Mialhe, *Ann. Ch. et Phys.*, (3.) **5.** pp. 171 – 176, & 184 [quantitative results are given by M.].) The amount of protochloride of mercury formed by the action of chloride of ammonium upon calomel may even be greater than would be formed by the action of an equivalent quantity of chlorhydric acid. Thus, in an experiment where 0.3 grm. of calomel, 1.2 grms. of chloride of ammonium, and 10 grms. of distilled water were allowed to act upon each other at the ordinary temperature during 24 hours, 0.019 grm. of protochloride of mercury was formed; while from 0.3 grm. of calomel, 0.673 grm. of chlorhydric acid (the chlorine of which is equivalent to that in the 1.2 grms. of chloride of ammonium), and 10 grms. of water, placed in the same circumstances, only 0.008 grm. of protochloride of mercury was formed. This is not the case, however, with all the salts of mercury, for many of them afford more protochloride when treated with chlorhydric acid than with chloride of ammonium. (Mialhe, *Ann. Ch. et Phys.*, (3.) **5.** 185.) Soluble in aqueous solutions of sulphate of ammonia; but insoluble in solutions of nitrate or succinate of ammonia or of sulphate, nitrate, or tartrate of potash. (Wittstein.) When digested with an aqueous solution of acetate of ammonia at 18.8° @ 25°, even if this have an acid reaction, it is decomposed to a certain extent, protochloride of mercury being formed and dissolved. (Weppen, from *Arch. d. Pharm.*, (2.) **9.** 236, in *J. pr. Ch.*, 1837, **11.** 182.) As Buchner has already shown, dichloride of mercury is decomposed by a solution of caustic ammonia, with formation of protochloride of mercury and metallic quicksilver, which separates, and the same result is obtained when a solution of carbonate of ammonia is substituted for the ammonia-water. (Weppen, *Ibid.*, *J. pr. Ch.*, p. 183.) Easily soluble in an aqueous solution of protonitrate of mercury. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 317.) Easily soluble in a warm aqueous solution of bichloride of platinum. (v. Bonsdorff, *Pogg. Ann.*, 1830, **19.** 353.) Decomposed by ammonia-water, and by solution of carbonate of ammonia, with separation of metallic mercury. (Wittstein.) Very soluble, with decomposition, in warm nitric acid.

Soluble in strong hot chlorhydric acid, with separation of mercury (Proust); soluble in hot dilute chlorhydric acid without separation of mercury. (Guibourt.) Soluble in cold cyanhydric acid, with separation of metallic mercury and formation of protochloride and cyanide of mercury.

1 grain of chlorhydric acid diluted with 250,000 grains of water affords a perfectly distinct precipi-

tate of dichloride of mercury on the addition of a solution of nitrate of dinoxide of mercury. (Pfaff.)

*Proto*CHLORIDE OF MERCURY.
(*Bichloride of Mercury.*
Corrosive sublimate.)

I.) *normal.* Permanent. Soluble in 18.5 pts. $\mathrm{Hg\,Cl}$ of water at 13.8°, or 100 pts. of water at 13.8° dissolve 5.4 pts. of it. Its degree of solubility increases greatly with the temperature, but in what ratio it is not easy to ascertain with precision. (J. Davy, *Phil. Trans.*, 1822, p. 358.) Soluble in 2 @ 3 pts. of boiling water.

Soluble in 3 pts. of boiling water. (Wenzel, *Verwandtschaft*, p. 310. [T.].) Soluble in 18.23 pts. of water at 10°, and in 3 pts. of water at 100°. The solution saturated at 10° contains 5.2% of it, and the solution saturated at 100° contains 25%. (M. R. & P.) Soluble in 18.46 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) Soluble in 16 pts. of cold, and in 3 pts. of warm water. (Dumas, *Tr.*)

70	17.29
80	24.30
90	37.05
100	53.96

(Poggiale, *Ann. Ch. et Phys.* (3.) **8.** 468.)

An aqueous solution saturated at 8° is of 1.041 sp. gr. (Anthon, *Ann. der Pharm.*, 1837, **24.** 211.) The saturated aqueous solution boils at 101.1°. (T. Griffiths, *Quar. J. Sci.*, 1825, **18.** 90.)

Soluble in 2.5 pts. of cold alcohol. (Richter); in 3 pts. of cold alcohol (Karls); in 2.5 pts. of alcohol, of 0.833, at the ordinary temperature, and in 1.167 pts. of the same alcohol at boiling (Berzelius's *Lehrb.*); in 1.132 pts. of boiling alcohol [T.]; in 2 pts of alcohol, of 0.816 sp. gr., at 15.5°, forming a solution of 1.08 sp. gr. (J. Davy, *Phil. Trans.*, 1822, p. 358.)

Soluble in 2.57 pts. of alcohol of 39° (Cartier) at 10°
" 2.9 " " " 38° " " 10°
" 3.6 " " " 35° " " 10°

" 9.3 " " " 22° " " 10°
" 14.6 " " " 15° " " 10°
(N. E. Henry.)

It is mostly precipitated from a saturated solution in absolute alcohol on the addition of an amount of water equal to one quarter the bulk of the alcoholic solution. (Dœbereiner.) Soluble in 4 pts. of ether (Karls); in 4.1 pts. (N. E Henry.); in 2.86 pts. of ether of 0.745 sp. gr., forming a solution of 1.08 sp. gr. The solvent power of the ether does not appear to be increased by elevation of temperature, nor diminished by its reduction; the boiling-point of the solution also appears to be the same as that of pure ether. (J. Davy, *Phil. Trans.*, 1822, p. 359.) Ether abstracts it from the aqueous solution (Orfila), and the quantity thus removed is greater in proportion as the solution is more concentrated. From a solution of 1 pt. $\mathrm{Hg\,Cl}$ in 20 pts. of water, an equal volume of ether takes up 0.7 pt.; while if the remaining aqueous solution is again shaken with its own volume of fresh ether, it gives up to the latter only 0.1 pt. A solution of $\mathrm{Hg\,Cl}$ in 400 pts. of water, when agitated with 100 pts. of ether, loses only 0.3 pt. of the salt. (Lassaigne.) The saturated ethereal solution is of 1.08 sp. gr. (J. Davy.) 4 pts. of ether alone dissolve 1 pt of $\mathrm{Hg\,Cl}$; on addition of 1.33 pts. of camphor, the same quantity of ether dissolves 1.33 pts.; with 4 pts. of camphor, it dissolves 2 pts.; with 8 pts. of camphor, 4 pts.; and with 16 pts. of camphor, 8 pts. of $\mathrm{Hg\,Cl}$. (Karls, *Pogg. Ann.*, **10.** 608, [*Gm.*].) 3 pts. of alcohol which at ordinary temperatures dissolve 1 pt. of $\mathrm{Hg\,Cl}$, take up 2 pts. of that compound on the addition of 1 pt. of camphor; 3 pts. on the addition of 3 pts. of camphor; 6 pts. on the addition of 6 pts. of camphor. (Karls, *Pogg. Ann.*, **10.** 608 [*Gm.*].) 16 pts. of alcohol of 0.865 sp. gr. dissolve 7 pts. of $\mathrm{Hg\,Cl}$, and 9.6 pts. after the addition of 4 pts. of camphor; by agitation with finely pulverized $\mathrm{Hg\,Cl}$ a solution is at length obtained containing 25 pts. of camphor and 16 pts. of protochloride of mercury in 4 pts. of alcohol. This solution is syrupy, of 1.326 sp. gr., and deposits a small quantity of dichloride of mercury. Mixed with water, it deposits camphor, and when covered with water and left to itself for a considerable time, it deposits camphor, together with crystals of $\mathrm{Hg\,Cl}$. When diluted with alcohol, it exhibits, with reagents, the reactions of protochloride of mercury. (Simon, *Pogg. Ann.*, **37.** 553 [*Gm.*].) Abundantly soluble in oil of turpentine and the other essential oils. When a mixture of corrosive sublimate and of oil of turpentine, cinnamon, nutmeg, juniper, caraway, peppermint, cloves, or almonds, is gently heated, decomposition ensues. (J. Davy, *Phil. Trans.*, 1822, pp. 359, 360.) Freely soluble in glycerin. (Parrish's *Pharm.*, p. 236.) Abundantly soluble in boiling creosote, from which it separates for the most part as the solution cools. (Reichenbach.) Its solubility in water is augmented by the presence of acids, chlorhydric acid especially dissolving much of it. It is not altered in these circumstances. (Dumas, *Tr.*) Soluble in 0.5 pt. of chlorhydric acid, of 1.158 sp. gr., at 23.3°, forming a solution of 2.412 sp. gr.; when the temperature is allowed to fall a few degrees, the solution suddenly becomes solid, from the formation of a mass of crystals, which rapidly melt when the containing vessel is held in the warm hand. (J. Davy, *Phil. Trans.*, 1822, p. 361.) More soluble in chlorhydric acid than in water, one cubic inch of boiling concentrated chlorhydric acid dissolving about 1000 grains of it. (J. Davy [1812?], in *Berzelius's Lehrb.*) Abundantly soluble, with combination, in cold chlorhydric acid, the solution subsequently becoming solid from the formation of crystals; more soluble in hot chlorhydric acid. (Boullay, *Ann. Ch. et Phys.*, (2.) **34.** 343.) "It is commonly stated in systematic works that corrosive sublimate is soluble in sulphuric and nitric acids as well as in chlorhydric acid. But from my experiments this does not appear to be the case. $\frac{1}{10}$ of a grain of $\mathrm{Hg\,Cl}$ having been added to 50 grains of nitric acid of 1.45 sp. gr., and the mixture heated for some time at 32.2°, the $\mathrm{Hg\,Cl}$ did not diminish in bulk, nor did it appear to dissolve even at the boiling-point of the acid, nor did the acid appear turbid on cooling, nor were any crystals deposited. A similar experiment was made with $\frac{1}{10}$ of a grain of $\mathrm{Hg\,Cl}$ and 63 grains of concentrated sulphuric acid; at 32.2° the sublimate did not dissolve, and on the application of heat fumes appeared, the salt rose through the acid, and a delicate crust of it was formed in the cool part of the vessel.

(J. Davy, *Phil. Trans.*, 1822, p. 361.) More readily soluble in nitric acid than in water, but crystallizes out again when the solution is cooled or evaporated. (Berzelius, *Lehrb.*, **3.** 845.) It is not decomposed by monohydrated sulphuric acid. (Millon, *Ann. Ch. et Phys.*, (3.) **18.** 373.) Soluble in sulphuric, nitric, iodic and chromic acids, without decomposition. (Millon, *loc. cit.*, p. 390.) Extremely difficultly soluble in nitric acid, which moreover exerts no decomposing action upon it, either when concentrated or dilute. (H. Wurtz, *Am. J. Sci.*, (2.) **25.** 381.) A saturated aqueous solution of chloride of ammonium at 15.5° is capable of dissolving very nearly its own weight of Hg Cl, and the solution thus obtained is capable of taking up more chloride of ammonium; thus 25.3 grains of a saturated solution of chloride of ammonium, after having taken up 25 1 grains of Hg Cl, dissolved 7 grains more of chloride of ammonium. From this experiment it would appear that corrosive sublimate is about 17 times more soluble in a saturated solution of chloride of ammonium than in water, and not 30 times, as is stated by some authors. (J. Davy, *loc. cit.*) A mixture of protochloride of mercury, chloride of ammonium, and water containing

Water, Grains.	NH_4Cl, Grains.	Hg Cl, Grains.	Is liquid at

9	3.37	8.5	12.7°†
9	10.12	25.5	about 40.5°, and [deposits some crystals at 15.5°.

(J. Davy, *Phil. Trans.*, 1822, pp. 362, 363.)

* Sp. gr. of the solution = 1.98.
† " " " 1.58.

1 pt. of a saturated aqueous solution of chloride of sodium dissolves 1.289 pts. of Hg Cl at 14°; that is, 23.9 times more than is dissolved by the same quantity of water. This solution of chloride of sodium saturated with chloride of mercury can now take up a considerable quantity of chloride of sodium, a crystalline double salt subsequently separating. (Voit, *Ann. Ch. u. Pharm.*, **104.** 354.) A saturated aqueous solution of chloride of sodium, composed of 20 grains of water and 7 of salt, dissolved 32 grains of Hg Cl at 15.5°; gently heated, 3 grains more were dissolved, and remained in solution on cooling, but on a further addition of Hg Cl, the solution formed by heat deposited crystals on cooling. The solution containing 35 grains of Hg Cl was of 2.14 sp. gr. As with chloride of ammonium, the solubility of chloride of sodium appears to be increased by combining with corrosive sublimate, but in a less degree. (J. Davy, *Phil. Trans.*, 1822, p. 364.) A saturated aqueous solution of chloride of potassium, formed of 21 grains of water and 7 grains of chloride of potassium, being gently heated, dissolved 8 grains of Hg Cl. On cooling to 15.5°, only a few crystals were deposited, but when cooled to 10° it became nearly solid. (J. Davy, *loc. cit.*) A saturated aqueous solution of chloride of barium, formed of 20 grains of water and of 8.7 grains of crystallized chloride of barium, dissolved 16 grains of Hg Cl at 15.5°, and 4 grains more when gently heated; on cooling, a few crystals were deposited. The solution was of 1.9 sp. gr. After standing for several hours it deposited a small number of crystals. (J. Davy, *Phil. Trans.*, 1822, pp. 363, 364.) A solution of chloride of magnesium, prepared by neutralizing with magnesia 31 grains of chlorhydric acid of 1.58 sp. gr., dissolved 40 grains of Hg Cl, and when gently heated 25 grains more. This solution remained transparent on cooling, and was of 2.83 sp. gr. When 5 grains more of Hg Cl were added, these also were dissolved on heating, but crystals separated when this solution was cooled. (J. Davy, *Phil. Trans.*, 1822, p. 364.) Easily and abundantly soluble in a saturated cold solution of chloride of potassium, but crystals soon begin to separate from the solution, unless this be heated or diluted with water. If it be heated to 50° @ 60° a considerable quantity more of Hg Cl may be dissolved, but on cooling the solution solidifies. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** pp. 123 – 128.) Soluble in a cold aqueous solution of chloride of sodium, with combination, the compound, Na Cl, 2 Hg Cl + 4 Aq, crystallizing out on evaporation. A hot solution of this compound dissolves a considerable quantity of Hg Cl, but on cooling this crystallizes out again as such. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 128.) Soluble in an aqueous solution of the chlorides of manganese, zinc, iron (Fe Cl), cobalt (Co Cl), nickel, and copper (Cu Cl). (*Ibid.*, pp. 247 – 249.)

II.) *acid.*

$a = Hg\,Cl, H\,Cl$ Decomposed by water.

$b = Hg\,Cl, 2\,H\,Cl$ Decomposed by water. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** pp. 343 – 345.)

III.) *basic.* *Vid.* OxyChloride of Mercury.

*Proto*CHLORIDE OF MERCURY & OF NICKEL.

I.) *oblique rhombic prisms.* Deliquescent.

II.) *regular.* Permanent. Crystallizes out before No. 1°. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 249.)

*Proto*CHLORIDE OF MERCURY & *sesquichloride* OF OSMIUM. Soluble in water. (Berzelius, *Lehrb.*, **3.** 1006.)

*Proto*CHLORIDE OF MERCURY & OF PLATIN(*ous*)*bi*AMIN.

$Hg\,Cl;\ N_2 \left\{ H_6 . Pt', Cl \right.$ Easily soluble in boiling, much less soluble in cold water. Insoluble in chlorhydric acid. (Buckton, *J. Ch. Soc.*, **5.** 215.)

*Proto*CHLORIDE OF MERCURY & OF POTASSIUM.
(*Chloro Mercurate of Potassium.*)

I.) $K\,Cl;\ Hg\,Cl + Aq$ Permanent. Soluble in water. Very slowly soluble in alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** p. 126.)

II.) $K\,Cl;\ 2\,Hg\,Cl + 2\,Aq$ Soluble in water. Very slowly soluble in alcohol. (v. Bonsdorff, *loc. cit.*, pp. 125, 127.)

III.) $K\,Cl;\ 4\,Hg\,Cl + 4\,Aq$ Very easily soluble in water, especially when this is hot. A solution which is perfectly clear at 18° deposits a large quantity of crystals at 15°. Very slowly soluble in alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** pp. 124, 128.)

*Di*CHLORIDE OF MERCURY & *sesquichloride* OF RHODIUM.

I.) $2\,Hg_2\,Cl;\ Rh_2\,Cl_3$
II.) $3\,Hg_2\,Cl;\ Rh_2\,Cl_3$ } Insoluble in water. (Claus, *Beiträge*, pp. 73, 23.)

*Proto*CHLORIDE OF MERCURY & OF SODIUM.

I.) $Na\,Cl;\ Hg\,Cl$ Deliquescent. (Voit.) Easily soluble in water. The solution being readily decomposed when evaporated.

II.) $Na\,Cl;\ 2\,Hg\,Cl + 3\,Aq$ Permanent. Soluble in water. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 129.) Soluble in 0.33 pt. of water at 15°. (Schindler.) Exceedingly soluble in water, and alcohol. Soluble in 275 pts. of ether. (Lassaigne.)

Chloride of Mercury & of StibEthylium. $\mathrm{Sb}\left\{(C_4 H_5)_4 Cl; 3 Hg Cl\right.$ Soluble in water, and alcohol. Insoluble in ether. (Lœwig.)

Chloride of Mercury & of Strontium. $Sr Cl; Hg Cl + 2 Aq$ Permanent. Easily soluble in water. (v. Bonsdorff.)

*Di*Chloride of Mercury & *protochloride* of Sulphur. $Hg_2 Cl; S Cl$ Decomposed by water to Hg Cl, which dissolves, and sulphur. (Capitaine.)

*Di*Chloride of Mercury & of Tin. $Hg_2 Cl; Sn Cl$ Decomposed by water. (Capitaine.)

*Proto*Chloride of Mercury & of Yttrium. Appears to be deliquescent. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 136.)

*Proto*Chloride of Mercury & of Zinc. Very deliquescent. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 248.)

*Proto*Chloride of Mercury with ButylSulphide of Mercury. $C_8 H_9 Hg S_2; Hg Cl$, or, $C_8 H_8 S_2, 2 Hg Cl; C_8 H_8 S_2, Hg_2 S$ Insoluble in alcohol or oil of turpentine. Entirely insoluble in ether. Soluble in oil of coal-tar. (Anderson.)

*Proto*Chloride of Mercury with *bi*Chromate of Ammonia.

I.) $N H_4 O, 2 Cr O_3; Hg Cl + Aq$
II.) $3 (N H_4 O, 2 Cr O_3); Hg Cl$ } Soluble in water. (Richmond & Abel.)

*Proto*Chloride of Mercury with *mono*Chromate of Potash. $K O, Cr O_3; 2 Hg Cl$ Readily soluble in water. Soluble in dilute chlorhydric acid. (Darby, *J. Ch. Soc.*, **1.** 22.)

*Proto*Chloride of Mercury with *bi*Chromate of Potash. $K O, 2 Cr O_3; Hg Cl$ Readily soluble in hot, less soluble in cold water. Decomposed by absolute alcohol, and ether. (Millon, *Ann. Ch. et Phys.*, (3.) **18.** 388.)

Chloride of Mercury with Coniin. $C_{16} H_{15} N; 4 Hg Cl$ Insoluble in water or ether. Very sparingly soluble in alcohol. Easily soluble in chlorhydric acid. (Blyth, *J. Ch. Soc.*, **1.** 355.)

*Proto*Chloride of Mercury with Creatinin. Ppt.

*Proto*Chloride of Mercury with *proto*Cyanide of Mercury. $Hg Cl; Hg Cy$ Permanent. Readily soluble in water. (Liebig.) Decomposed by strong alcohol, which dissolves out the chloride of mercury. (Mialhe, *Ann. Ch. et Phys.*, (3) **5.** 181.)

Chloride of Mercury with Cyanide of Mercury, & Nicotin. $C_{20} H_{14} N_2; 4 Hg Cl; 2 Hg Cy$ Easily soluble, without decomposition, in cold or boiling water, and in alcohol. Decomposed by chlorhydric acid. (Bœdeker.)

Chloride of Mercury with EthylSinamin. $C_{12} H_{10} N_2; 3 Hg Cl$ Ppt.

Chloride of Mercury with Gelatin. Soluble both in alkaline and neutral solutions of iodide of potassium, and in most dilute acids. (Melsens, *Ann. Ch. et Phys*, (3.) **26.** 221.)

Chloride of Mercury with Guanin. $C_{10} H_5 N_5 O_2; 2 Hg Cl + 5 Aq$ Very difficultly soluble in water, and still less soluble in alcohol. Easily soluble in acids, and in an aqueous solution of cyanide of potassium. (Neubauer & Kerner.)

Chloride of Mercury with Iodine (of Lassaigne). Is said not to exist.

*Proto*Chloride of Mercury with *prot*Iodide of Mercury.

I.) $Hg Cl; Hg I$ Ppt. (Boullay, *Ann. Ch. et Phys.*, (2.) **34.** 366.)

II.) $2 Hg Cl; Hg I$ Soluble in water. (Liebig.)

Chloride of Mercury with Lutidin. $C_{14} H_9 N; 2 Hg Cl$ Somewhat soluble in boiling water, with partial decomposition; more soluble in boiling alcohol, from which it separates unchanged as the solution cools. (Anderson.)

Chloride of Mercury with Nicotin.

I.) $C_{20} H_{14} N_2; 2 Hg Cl$ Insoluble in water or ether. Sparingly soluble in alcohol. (Ortigosa.)

II.) $C_{20} H_{14} N_2; 6 Hg Cl$ Sparingly soluble in water, and alcohol. Decomposed by boiling water. Easily soluble in weak chlorhydric acid. (Bœdeker.)

*Proto*Chloride of Mercury with Nitrate of Mercury. $4 Hg Cl; N H_4 O, N O_5$ Insoluble, or nearly insoluble, in water. Decomposed by ether, which dissolves out the Hg Cl. (Kosmann, *Ann. Ch. et Phys.*, (3.) **27.** 240.)

*Proto*Chloride of Mercury with Odmyl, &c. $C_8 H_8 S_2, Hg Cl; C_8 H_8 S_2, Hg_2 S$ Insoluble in water. Soluble in some hundred parts of boiling alcohol. About as soluble in oil of turpentine as in alcohol; but most abundantly soluble in the most volatile oil of coal-tar. (Anderson.)

Chloride of Mercury with Oxide of Cacodyl. $2 Hg Cl; C_4 H_6 As O$ 100 pts. of water at 18° dissolve 0.21 pt. of it, and at boiling 3.47 pts. Also soluble in alcohol; more in boiling than in cold. (Bunsen, *Ann. Ch. u. Pharm.*, 1841, **37.** 47.)

*Proto*Chloride of Mercury with OxyChloride of Phosphorus.

*Proto*Chloride of Mercury with Phosphide of Mercury. $3 Hg Cl; P\left\{Hg_3 + 3 Aq\right.$ Very slowly decomposed by damp air. Quickly decomposed by boiling water. Also decomposed by acids and alkalies. (H. Rose.)

*Proto*Chloride of Mercury with Picolin. (*Chloro Mercurate of Picolin.*) $C_{12} H_7 N; 2 Hg Cl$ Sparingly soluble in cold, more soluble in warm water. The aqueous solution is decomposed when boiled for some time. Soluble in boiling, less soluble in cold alcohol. Easily soluble in dilute chlorhydric acid. (Anderson.) Soluble in 10 pts. of boiling water. Soluble in warm, less soluble in cold alcohol, and ether. (Unverdorben.)

Chloride of Mercury with Quinolein. $2 Hg Cl; C_{18} H_7 N$ Readily soluble in hot water, from which it separates on cooling.

Chloride of Mercury with SelenioCyanide of Mercury. $Hg C_2 N Se_2; Hg Cl$ Scarcely soluble in cold, rather more readily soluble in hot water. Very soluble in alcohol. Very soluble, with slight decomposition, in dilute chlorhydric acid. (Crookes, *J. Ch. Soc.*, **4.** 16.)

Chloride of Mercury with Sinamin. Ppt.
$N \left\{ \begin{matrix} C_6 H_5 \\ C_2 N \\ H \end{matrix} \right. ; 2 Hg Cl$

Chloride of Mercury with Strychnine.
$C_{42} H_{22} N_2 O_4 ; 2 Hg Cl$ Insoluble in water, alcohol, or ether. Soluble in sulphuric acid. (Abel & Nicholson, *J. Ch. Soc.*, **2.** 258.)

*Proto*Chloride of Mercury with Sulphate of Ammonia, Mercury, and Quinine.
$Hg Cl; (N H_4 O, Hg O, 6 \overset{+}{Quin}), 14 S O_3$ Rather difficultly soluble in water; more easily soluble in alcohol. (Kosmann, *Ann. Ch. et Phys.*, (3.) **27.** 250.)

*Proto*Chloride of Mercury with Sulphate of Strychnine.
$2 Hg Cl ; C_{42} H_{22} N_2 O_4, H S O_4$

*Proto*Chloride of Mercury with Sulphide of Copper & of Mercury.
$2 Hg Cl; 3 Cu S; 2 Hg S$ Permanent. Insoluble in water, or in chlorhydric acid. Soluble, with decomposition, in aqua-regia. Decomposed by an aqueous solution of caustic potash. (Rammelsberg.)

*Proto*Chloride of Mercury with Sulphide of Ethyl.
$Hg Cl ; C_4 H_5 S$ Sparingly soluble in cold water or alcohol; easily soluble in boiling alcohol. Easily soluble in boiling, less soluble in cold ether or wood-spirit. (A. Loir, *Ann. Ch. et Phys.*, (3.) **39.** 441.)

Chloride of Mercury with Sulphide of Ethyl & of Mercury.
$Hg Cl; \left. \begin{matrix} Hg \\ C_4 H_5 \end{matrix} \right\} S_2$ Difficulty soluble in water, alcohol, or ether. Only slightly acted upon by nitric acid.

Chloride of Mercury with Sulphide of Methyl.
$Hg Cl ; C_2 H_3 S$ Soluble in hot, less soluble in cold alcohol, ether, and wood-spirit. (Loir, *Ann. Ch. et Phys.*, (3.) **39.** 449.)

*Proto*Chloride of Mercury with Sulphide of Mercury.
$Hg Cl ; 2 Hg S$ Insoluble in water, even boiling, or in hot or cold dilute or concentrated sulphuric, nitric, or chlorhydric acids. Decomposed by boiling nitric acid. (H. Rose.)

Chloride of Mercury with Sulphide of Mercur(*ic*)Allyl.
$3 Hg Cl ; C_6 H_5 Hg S_2$ Insoluble in water. Sparingly soluble in alcohol, and ether.

Chloride of Mercury with Sulphide of Mercur(*ic*)Ethyl.
$Hg Cl ; C_4 H_5 Hg S_2$ Very sparingly soluble in water, alcohol, and ether. Somewhat soluble in boiling alcohol. (Debus.)

Chloride of Mercury with Sulphite of Ammonia.
$3 Hg Cl ; 2 (N H_4 O, S O_2)$ Somewhat soluble in cold, decomposed by boiling water. (Péan de St. Gilles, *Ann. Ch. et Phys.*, (3.) **36.** 95.)

Chloride of Mercury with SulphoCarbamate of Amyl.
(*Xanthamylamid.*)
$4 Hg Cl ; C_{12} H_{13} N O_2 S_2$ Insoluble in water, by which it is slowly decomposed. Very sparingly soluble in cold, but more soluble in boiling alcohol, and ether. (M. W. Johnson, *J. Ch. Soc.*, **5.** 147.)

Chloride of Mercury with Tartrate of Potash.
$Hg Cl; 2 C_8 H_5 K O_{12} + 6 Aq$ Difficultly soluble in water. Kosmann, *Ann. Ch. et Phys.*, (3.) **27.** 245.)

Chloride of Mercury with ThioSinamin.
$C_8 N_2 S_2 H_8 ; 4 Hg Cl$ Ppt. Soluble in acetic acid. (Will.)

Chloride of Mercury with Urea.
$2 Hg Cl ; C_2 H_4 N_2 O_2$ Difficultly soluble in cold, decomposed by boiling water. Soluble in boiling absolute alcohol, from which it separates on cooling. (Neubauer & Kerner, *Ann. Ch. u. Pharm.*, **101.** 326.)

Chloride of Mesityl.
$C_6 H_5 Cl$ Insoluble, or very sparingly soluble, in water. Soluble in alcohol. (Kane.)

Chloride of Methyl.
(*Methylic Chloride. HydrochloricMethylEther. Chlorhydrate of Methylene.*)
$C_2 H_3 Cl$

1 volume of
water at 7° dissolves 5.304 vols. of it.
" 14° " 4.172 "
" 20° " 3.462 "
" 25° " 3.034 "

At 6° a crystalline hydrate is formed. (Bæyer, *Ann. Ch. u. Pharm.*, **103.** 183.) 1 vol. of water at 16° dissolves 2.8 vols. of it. (Dumas & Péligot.) Soluble in about $\frac{1}{4}$ volume of water. (Berthelot, *loc. inf. cit.*) Abundantly soluble in alcohol; somewhat less soluble in ether. (Bunsen.) Soluble in about $\frac{1}{35}$ volume of absolute alcohol; and, without decomposition, in $\frac{1}{40}$ volume of glacial acetic acid. (Berthelot, *Ann. Ch. et Phys.*, (3.) **52.** 100.)

Chloride of *tri*MethylAcetos[Acetoyl]-ammonium.
(*Chloride of triMethyl Vinylammonium.*)
$C_{10} H_{12} N Cl = N \left\{ \begin{matrix} (C_2 H_3)_3 \\ C_4 H_3 \end{matrix} \right\} Cl$

Chloride of *tetra*Methylammonium.
$N (C_2 H_3)_4 Cl$ Hygroscopic.

Chloride and Iodide of *tetra*Methylammonium.

I.) *bichloride.* $N (C_2 H_3)_4, Cl_2 I$ Soluble, with partial decomposition, in water, especially when this is warm.

II.) *terchloride.* $N (C_2 H_3)_4, Cl_3 I$ Soluble, with decomposition, in water. (Weltzien.)

III.) *quadrichloride.* $N (C_2 H_3)_4, Cl_4 I$

IV.) *quinquichloride.* $N (C_2 H_3)_4, Cl_5 I$ Soluble in water; not removed therefrom by ether.

Chloride of Methyl*chloré*. *Vid.* Chloride of ChloroMethyl.

Chloride of MethylCinchonin. Soluble in water. (Stahlschmidt, *Ann. Ch. u. Pharm.*, **90.** 221.)

Chloride of Methylene.
$C_2 H_2 Cl_2$ Insoluble, or but sparingly soluble, in water. (Buttlerow.)

"*Bi*Chloride of Methylene." *Vid.* Chloride of monoChloroMethyl.

Chloride of MethyldiEthylAmylammonium.
$C_{20} H_{24} N Cl = N \left\{ \begin{matrix} C_{10} H_{11} \\ C_2 H_3 \\ (C_4 H_5)_2 \end{matrix} \right\} Cl$

Chloride of MethylNicotin. Soluble in water.

Chloride of MethylTungsten. Soluble in water. (Riche.)

*Proto*Chloride of Molybdenum. There are

$\mathrm{Mo\,Cl}$ two isomeric compounds, one of which is soluble, the other insoluble, in water. (Berzelius.)

*Bi*Chloride of Molybdenum. Deliquescent. $\mathrm{Mo\,Cl_2}$ Soluble in water, with evolution of so much heat that the liquid boils. When the aqueous solution is exposed to the air, oxidation ensues.

*Ter*Chloride of Molybdenum. Soluble in $\mathrm{Mo\,Cl_3}$ water. (Berzelius, *Lehrb.*)

*Proto*Chloride of Molybdenum & of Potassium. Efflorescent. Partially soluble in water. (Berzelius)

*Ter*Chloride of Molybdenum with Molybdic Acid. $\mathrm{2\,Mo\,O_3;\ Mo\,Cl_3}$ Easily and completely soluble even in a small quantity of water. Also soluble in alcohol. (H. Rose, in *Berzelius's Lehrb.*, 3. 1035.)

Chloride of Naphthalin. Insoluble in water. Soluble in all proportions in ether; less soluble in alcohol. (Laurent.)
(*Subchloride of Naphthalin.*)
$\mathrm{C_{20}\,H_8'',\ Cl_2}$

*Bi*Chloride of Naphthalin.
$\mathrm{C_{20}\,H_8,\ 2\,Cl_2}$

I.) *Modification α.* Insoluble in water. Scarcely at all soluble in cold, and only very slightly soluble in boiling alcohol; somewhat more soluble in ether. Tolerably soluble in ether at 100° (in a sealed tube). Very soluble in boiling, almost insoluble in cold oil of petroleum. (Laurent.)

II.) *Modification β.* Very easily soluble in alcohol, ether, and oil of petroleum.

Chloride of Nickel.

I.) *mono.*

$a =$ *anhydrous.* $\mathrm{Ni\,Cl}$ Soluble in water, with evolution of heat. Immediately after sublimation, before it has been exposed to the air, it dissolves very slowly, and only after long-continued boiling in water. (Fellenberg.) Soluble in alcohol. Slowly soluble in ammonia-water.

Even hot chlorhydric acid dissolves the sublimed chloride with difficulty. (Proust.)

$b = \mathrm{Ni\,Cl + 9\,Aq}$ Deliquesces or effloresces according as the air is moist or dry. Soluble in 1 5 @ 2 pts. of cold water. Easily soluble in alcohol. (Tupputi.) Difficultly soluble in alcohol. (Berzelius, *Lehrb.*, 3. 658.)

II.) *basic.* Difficultly soluble in water.

Chloride of Nickel with Cyanide of Mercury. $\mathrm{Ni\,Cl;\ 2\,Hg\,Cy + 7\,Aq}$ Deliquescent. Soluble in water.

Chloride of Nickel*bi*amin. Soluble in water, the solution undergoing decomposition when boiled. Insoluble in alcohol. (Erdmann.)
$\mathrm{N_2}\left\{\mathrm{H_6\,.\,Ni,\ Cl}\right.$

Chloride of Nickel*ter*amin. Partially soluble, with decomposition, in water. (H. Rose.)
$\mathrm{N_3}\left\{\mathrm{H_9\,.\,Ni,\ Cl}\right.$

Chloride of Nitranisyl. Decomposes in moist air. Decomposed by alcohol. (Cahours.)
$\mathrm{C_{16}\,H_6\,N\,O_8\,Cl}$

Chloride of NitroBenzoyl. Insoluble in water, but is gradually decomposed thereby. Decomposed at once by alcohol, and wood-spirit. Soluble in ether, without alteration even on boiling. (Cahours.)
(*ChloroNitroBenzoyl.*)
$\mathrm{C_{14}\,H_4(N\,O_4)\,O_2,\ Cl}$

Chloride of Nitrogen. Gradually decomposes when in contact with water. (Ot. Gr.) Miscible with bisulphide of carbon, terchloride of phosphorus, and protochloride of sulphur. With alcohol, and ether, it forms compounds insoluble in alcohol. (Pelouze & Fremy.)
$\mathrm{N\,Cl_3}$

Chloride of NitroMethyl*chloré.* *Vid.* Chloride of ChloroNitroMethyl.

Chloride of *bi*NitroMethylene. *Vid.* Chloride of *per*Chloro*bi*NitroMethyl.

Chloride of *bi*NitroPhenyl. Insoluble in water. Sparingly soluble in cold, somewhat more soluble in warm alcohol. (Laurent & Gerhardt.)
(*BiNitroChloroBenzene. BiNitroChloroPhenile. Chlorhydrophénide binitré.*)
$\mathrm{C_{12}\,H_3\,(N\,O_4)_2\,Cl}$

Chloride of *ter*NitroPhenyl. Decomposed by water. Soluble in alcohol, and ether. (Pisani.)
(*Chloride of Picryl. ChloroPicryl.*)
$\mathrm{C_6\,H_2\,(N\,O_4)_3\,Cl}$

Chloride of Octyl. Insoluble in water. Very sparingly soluble in alcohol. (Bouis.)
(*Chloride of Capryl. Chlorcapryl. Caprylchlorhydric Ether.*)
$\mathrm{C_{16}\,H_{17}\,Cl}$

Chloride of Œnanthyl. Decomposed by water. (Cahours.)
(*Hydride of ChlorŒnanthyl.*)
$\mathrm{C_{14}\,H_{13}\,O_2\,Cl}$

Chloride of Œnanthylene. Insoluble in $\mathrm{C_{14}\,H_{14}'',\ Cl_2}$ water. (Limpricht.)

*Proto*Chloride of Osmium. Hygroscopic. It $\mathrm{Os\,Cl}$ requires only a very small quantity of water for its solution, but the aqueous solution can only exist in a very concentrated state, and if to such a solution there is added only a very little more water than is necessary to dissolve the chloride, the solution becomes cloudy, and osmium is reduced. A large quantity of water decomposes the solution at once with precipitation of metallic osmium, while osmic and chlorhydric acids remain in solution. If decomposition has once been commenced, by the addition of a small quantity of water it continues gradually. Soluble in concentrated aqueous solutions of the alkaline chlorides, with combination and partial decomposition. (Berzelius's *Lehrb.*)

*Sesqui*Chloride of Osmium. Not known $\mathrm{Os_2\,Cl_3}$ except in combination.

*Bi*Chloride of Osmium. Soluble in a small $\mathrm{Os\,Cl_2}$ quantity of water, but is decomposed by much water, like the protochloride. (Berzelius's *Lehrb.*)

*Proto*Chloride of Osmium & of Potassium. Much more soluble in water than in alcohol. (Berzelius.)

*Sesqui*Chloride of Osmium & of Potassium. Slightly soluble in alcohol.

*Proto*Chloride of Osmium & of Zinc. Soluble in water. (Berzelius, *Lehrb.*, 3. 1006.)

Chloride of Pallad*bi*amin. Easily soluble in water. (Fehling.)
$\mathrm{N_2}\left\{\mathrm{H_6\,.\,Pd,\ Cl + Aq}\right.$

Chloride of Palladammonium.
(*Ammonio Chloride of Palladium.*)

I.) *red.* Insoluble in cold, soluble, with decomposition, in boiling water. Slowly soluble in cold, quickly soluble in warm water acidulated with chlorhydric acid. Easily soluble in concentrated chlorhydric or nitric acids. Soluble in ammonia only after continuous boiling. (Fischer; Fehling.)
$\mathrm{N}\left\{\begin{matrix}\mathrm{H_3}\\ \mathrm{Pd}\end{matrix}\right.\mathrm{,\ Cl}$

II.) *yellow.* Insoluble in boiling water. (Fischer.)

On boiling with water, and then allowing the whole to cool during several hours, one part of the compound remains dissolved in 382 pts. of water when the temperature has fallen to 16°. (Lampadius.) Sparingly soluble in chlorhydric or nitric acids, and this only when heated. Easily soluble in a cold solution of ammonia. (Fischer.) Much more soluble than the red compound in a cold solution of ammonia. (Fehling.)

*Di*Chloride of Palladium. (*SubChloride of Palladium.*) $Pd_2\,Cl$ Deliquescent. Soluble in water and in aqueous solutions of chloride of ammonium, iodide of potassium, or of caustic ammonia, with separation of some metallic palladium (about $\frac{1}{5}$ or $\frac{1}{6}$ of that contained in the dichloride) in either case. The clear aqueous solution, which consists of a mixture of proto and dichloride, is rendered turbid when diluted with more water. (Kane, *Phil. Trans.*, 1842, p. 281.)

*Proto*Chloride of Palladium.

I.) *normal.*

a = *anhydrous.* $Pd\,Cl$ Slowly but completely soluble in water. (Fellenberg.) Slightly soluble in water. Much more readily soluble in water acidulated with chlorhydric acid. (Vauquelin.) Alcohol precipitates from the aqueous solution a basic salt, while an acid salt remains dissolved.

b = *hydrated.* $Pd\,Cl + 2\,Aq$ Very deliquescent. (Kane, *Phil. Trans.*, 1842, p. 280.) It combines with basic metallic chlorides, forming salts easily soluble in water, and alcohol.

II.) *basic.* *Vid.* OxyChloride of Palladium.

*Bi*Chloride of Palladium. Known only in acid solution and in combination.

*Proto*Chloride of Palladium & of *X*. *Vid.* ChloroPalladite of *X*.

*Bi*Chloride of Palladium & of *X*. *Vid.* ChloroPalladiate of *X*.

*Bi*Chloride of Pelargonene.
(*BiChloride of Nonylene.*)
$C_{18}\,H_{16},\,Cl_2$

Chloride of Pelargyl. $C_{18}\,H_{17}\,O_2,\,Cl$ Decomposed by alcohol. (Cahours, *J. Ch. Soc.*, **3.** 241.)

Chloride of PhenoylBenzoicyl. (*Chloride of Benzanilidyl.*)

$$C_{26}\,H_{10}\,N\,Cl = N\left\{\begin{array}{l} C_{12}\,H_4{}'' \\ C_{14}\,H_5,\,Cl \\ H \end{array}\right.$$

Fumes in the air. Decomposed by water, and alcohol. Easily soluble, without decomposition, in dry ether. (Gerhardt, *Ann. Ch. et Phys.*, (3) **53.** 307.)

Chloride of Phenyl. (*Chlorhydrophenid. ChloroBenzene.*) $C_{12}\,H_5\,Cl$ Insoluble as such in water. Water, and especially a solution of caustic potash, soon decomposes it. (Laurent & Gerhardt.) Soluble in alcohol, and ether. Insoluble in ammonia-water. Partially soluble in cold, easily in a hot solution of caustic potash. (Schrugham, *J. Ch. Soc.*, **7.** 238.)

Chloride of PhenylAconitin.

$$C_{24}\,H_8\,N\,Cl\,O_6 = N\left\{\begin{array}{l} C_{12}\,H_3\,O_6{}''' \\ C_{12}\,H_5 \end{array}\right\}Cl$$

Chloride of PhenylSulphurous Acid. $C_{12}\,H_5\,S_2\,O_4\,Cl$ Insoluble in water. Easily soluble in alcohol.

Chloride of Phloretyl. $C_{16}\,H_9\,O_4,\,Cl$ Decomposed by water.

Chloride of Phoryl. $C_{18}\,H_{13},\,Cl$ Soluble in alcohol. (Liès-Bodard.)

*Ter*Chloride of Phosphorus. (*ProtoChlorure de Phosphore.*) $P\,Cl_3$ Slowly soluble in water, with decomposition. (H. Davy.) Abundantly soluble in Kremers's compound of sulphurous acid and pentachloride of phosphorus ($P\,Cl_5 + 2\,S\,O_2$).

*Quinqui*Chloride of Phosphorus. (*Pentachloride of Phosphorus. Deutochlorure de Phosphore.*) $P\,Cl_5$ Decomposed by water, with evolution of heat. Soluble in Kremers's compound of sulphurous acid and pentachloride of phosphorus ($P\,Cl_5 + 2\,S\,O_2$).

Soluble, without decomposition, in warm chloride of benzoyl, from which solution it separates on cooling. (Gerhardt.) Somewhat soluble, without decomposition, in bisulphide of carbon. (Schiff, *Ann. Ch. u. Pharm.*, **102.** 118.) "Chloride of Phosphorus" is soluble in bisulphide of carbon. (Corenwinder, *Ann. Ch. et Phys.*, (3.) **30.** 243.) Easily soluble in oil of turpentine, with evolution of heat.

Easily soluble in caoutchin. (Himly.)

Chloride of Phosphorus & of Sulphur. *Vid.* Sulpho-perChloride of Phosphorus.

*Ter*Chloride of Phosphorus with Cyanide of Methyl. $C_4\,H_3\,N,\,P\,Cl_3$ Decomposed by water. (Hencke.)

Chloride of Picryl. *Vid.* Chloride of *ter*NitroPhenyl.

Chloride of Platin(*ous*)*bi*amin.
(*Chlorhydrate of diPlatosamine. AmmonioprotoChloride of Platinum.*)

a = *anhydrous.* $N_2\left\{H_6\,.\,Pt,\,Cl\right.$ Absorbs one equivalent of water from the air very rapidly. Soluble in 4 pts. of water at 16.5°; and more soluble in boiling water. Alcohol and ether precipitate from it the aqueous solution. (Reiset, *Ann. Ch. et Phys.*, (3.) **11.** pp. 419, 420.) Exceedingly easily soluble in water, and about as readily in an aqueous solution of chloride of ammonium. Insoluble in absolute alcohol, and only very sparingly soluble in ordinary alcohol. Easily soluble in dilute chlorhydric acid. (Peyrone, *Ann. Ch. et Phys.*, (3.) **12.** pp. 196 – 198.) As prepared by Reiset's method (solution of the chloride of Platin(ous)amin & of Platinum [green salt of Magnus] in boiling ammonia-water, and subsequent crystallization), Peyrone found it a little less readily soluble in water, and alcohol than when prepared by the action of ammonia upon an aqueous solution of protochloride of platinum. (*Ann. Ch. et Phys.*, (3.) **12.** 207.) This is to be attributed to the presence of impurities.

b = *hydrated.* Permanent. (Reiset, *loc. cit.*)
$N_2\left\{H_6\,.\,Pt,\,Cl + Aq\right.$

Chloride of Platin(*ous*)*bi*amin & of Platinum. (*Green Salt of Magnus. ChloroPlatinate of diPlatosamine.*) $N_2\left\{H_6\,.\,Pt,\,Cl\,;\,Pt\,Cl\right.$ Insoluble in, and is not decomposed by, water, alcohol, or chlorhydric acid. (Magnus.) Completely insoluble in water. (Gros, *Ann. der Pharm.*, 1838, **27.** 242.) Soluble, after long-continued boiling, in an aqueous solution of caustic ammonia, with combination (Reiset, *Ann. Ch. et Phys.*, (3.) **11.** 418 ; Peyrone, *Ibid.*, (3.) **12.** 206), and in concentrated solutions of ammoniacal salts, as the nitrate, sulphate, or chlorhydrate, from which solutions the yellow chloride of platin(ous)ammonium is deposited on cooling. (Reiset, *Ann. Ch. et Phys.*, (3.) **11.** 427.) Almost as easily soluble in a boiling aqueous solution of carbonate of ammonia as in caustic ammonia, but some carbonate of platin(ous)-

biamin is liable to separate out. (Peyrone, *Ann. Ch. et Phys.*, (3.) **12.** 207.) Also soluble in a boiling aqueous solution of bichloride of platinum, from which solution chloroplatinate of platin(ous)-biamin separates on cooling. (Reiset, *Ann. Ch. et Phys.*, (3.) **11.** 429.) It is not in the least decomposed by boiling with aqueous solutions of the caustic alkalies; or by boiling dilute chlorhydric or sulphuric acids, in both of which it is completely insoluble. Easily decomposed by nitric acid. (Gros, *Ann. der Pharm.*, **27.** 245.)

Chloride of Platin(*ous*)*bi*amin & *protochloride* of Tin. Ppt. Easily soluble in a warm aqueous solution of protochloride of tin.

Chloride of Platin(*ous*)*bi*amin & *bichloride* of Tin. Insoluble in alcohol or chlorhydric acid. (Buckton, *J. Ch. Soc.*, **5.** 219.)

Chloride of Platin(*ous*)*bi*amin & of Zinc. $N_2\left\{H_6 . Pt, Cl; Zn\,Cl\right.$ Very readily soluble in water, from which it is precipitated on the addition of alcohol. (Buckton, *J. Ch. Soc.*, **5.** 217.)

*Bi*Chloride of Platin(*ic*)ammonium.

I.) $N\left\{\begin{matrix}H_3\\ Pt\end{matrix}\right. Cl_2$ Insoluble in cold, decomposed by boiling water. Also decomposed by much washing. (Kane, *Phil. Trans.*, 1842, p. 300.) Insoluble in cold, very slightly soluble in boiling water, or in water acidulated with chlorhydric acid. By boiling with ammonia-water it is converted into chloride of ammoniumchloroplatin(*ous*)ammonium (Gros's Chloride). Soluble in a boiling aqueous solution of caustic potash, without evolving ammonia.

II.) $(N\left\{\begin{matrix}H_3\\ Pt\end{matrix}\right., Cl_2)_2$ Soluble in water.

Chloride of *di*Platin(*ic*)Ammonium. Very soluble in water. (Gerhardt, in his *Traité*, **4.** 620 (note).)

Chloride of Platin(*ous*)ammonium. (*Chloride of Platosammonium. Chlorhydrate of Platosamine.*) $N\left\{\begin{matrix}H_3\\ Pt\end{matrix}\right., Cl$ There are several isomeric modifications of this compound.

α.) (*yellow.*) Soluble in boiling, but almost insoluble in cold water. Very easily soluble in ammonia-water, with combination. (Reiset, *Ann. Ch. et Phys.*, (3.) **11.** pp. 427, 428.) Sparingly soluble in cold, somewhat more soluble in boiling water. Very sparingly soluble in chlorhydric and sulphuric acids, but finally dissolves without alteration. Much more easily soluble, with decomposition, in nitric acid, and in ammonia-water than the green modification (*γ*). Scarcely at all acted upon at the ordinary temperature by monohydrated sulphuric acid, but on heating the mixture, decomposition ensues. Soluble in aqueous solutions of the alkaline carbonates. (Peyrone, *Ann. Ch. et Phys.*, (3.) **12.** pp. 193–195, 200.) When prepared directly (as by dropping potash lye into a solution of protochloride of platinum neutralized with carbonate of ammonia at 13°) it is soluble in about 33 pts. of boiling water. But when prepared by reduction it requires nearly 140 pts. of boiling water to dissolve it. (Peyrone, *Ann. Ch. u. Pharm.*, **61.** 180.)

β.) *red.*

1*st variety.* Insoluble in cold water. Decomposed by boiling water, with separation of metallic platinum. Soluble in nitric acid. Ammonia converts it into the green modification (*γ*). (Peyrone, *Ann. Ch. et Phys.*, (3.) **16.** 464.)

2*d variety.* Tolerably soluble in cold and much more easily in boiling water, without decomposition. With nitric acid, and with ammonia it behaves like the 1st variety. (Peyrone, *Ann. Ch. et Phys.*, (3.) **16.** 465.)

γ.) *green.* *Vid.* Chloride of Platin(*ous*)*bi*amin & of Platinum.

δ.) *orange-red.* Very sparingly soluble in cold water, and in about 50 pts. of boiling water. Readily soluble in boiling ammonia-water, without passing into the green modification. Decomposed by nitric acid. (Peyrone, *Ann. Ch. et Phys.*, (3.) **16.** 467.) Much more easily attacked by a solution of sulphite of ammonia than the green modif. (*γ*). (Peyrone, *Ann. Ch. u. Pharm.*, **61.** 179.)

Chloride of (*α*) Platin(*ous*)ammonium with Sulphite of Ammonia & of Platin(*ous*)*bi*amin. $N\left\{\begin{matrix}H_3\\ Pt\end{matrix}\right., Cl; 2(NH_4O, SO_2)$; $N_2\left\{H_3 . Pt, O, HO, 2SO_2 + 2\,Aq\right.$

Chloride of Platin(*ous*)ammonium with Sulphite of Platin(*ous*)*bi*amin. $N\left\{\begin{matrix}H_3\\ Pt\end{matrix}\right., Cl; N_2\left\{H_6 . PtO, HO, 2SO_2 + 2\,Aq\right.$

*Proto*Chloride of Platinum.

I.) *normal.*

$Pt\,Cl$ There are two modifications:

α.) *green modif.* Permanent. Insoluble in water, and cannot be moistened by water. (Berzelius, *Lehrb.*) Insoluble in water, or in a mixture of 2 pts. of alcohol and 1 pt. of ether. Soluble in ammonia-water. (Reiset, *Ann. Ch. et Phys.*, (3.) **5.** 476, & (3.) **11.** pp. 417, 418.) Insoluble in water. (Raewsky, *Ann. Ch. et Phys.*, (3.) **22.** 280.) Insoluble in alcohol of 38°. Unacted on in the cold by a somewhat concentrated aqueous solution of iodide of potassium, but on heating the mixture, combination ensues with formation of an insoluble salt. (Lassaigne, *Ann. Ch. et Phys.*, 1832, (2.) **51.** 117.) Not decomposed by boiling sulphuric or nitric acids, but gradually dissolves in boiling concentrated chlorhydric acid, the solution containing nothing but protochloride. (Berzelius, *Lehrb.*) Soluble in boiling aqua-regia with formation of bichloride; if air be present, chlorhydric acid also converts it into bichloride. (Gm.)

β.) *brown modif.* Insoluble in water. Very easily soluble in chlorhydric acid, being much more easily soluble than the green modification. (Magnus.) Soluble in an aqueous solution of bichloride of platinum. (H. Rose, *Tr.*)

II.) *basic.* *Vid.* OxyChloride of Platinum.

*Bi*Chloride of Platinum. Hygroscopic. $Pt\,Cl_2$ & $+ 8\,Aq$ Soluble in water, with evolution of heat. (Dumas, *Tr.*) Soluble in water; also in alcohol, with gradual decomposition. Readily soluble in ether, the solution undergoing decomposition when exposed to daylight. (Gehlen.) Soluble in a mixture of 2 pts. of alcohol and 1 pt. ether, but is liable to be reduced to a slight extent, when treated therewith, a small quantity of protochloride of platinum being formed. (Reiset, *Ann. Ch. et Phys.*, (3.) **5.** 476.) When dry it is quickly and abundantly soluble in anhydrous acetone, with subsequent decomposition. (Zeise, *Ann. Ch. u. Pharm.*, 1840, **33.** 34.) Insoluble in concentrated sulphuric acid. (Dumas, *Tr.*)

*Proto*Chloride of Platinum & of *X*. *Vid.* ChloroPlatinite of *X*.

Pot

*Bi*CHLORIDE OF PLATINUM & OF *X*. *Vid.* ChloroPlatinate of *X*.

*Bi*CHLORIDE OF PLATINUM with CYANIDE OF ETHYL. $C_6H_5N ; PtCl_2$ Instantly decomposed by water and by alcohol. It cannot be recrystallized from ether. (Henke.)

*Bi*CHLORIDE OF PLATINUM with GLYCOCOLL. $C_4H_5NO_3, PtCl_2 + 2\,Aq$ Soluble in water. Only sparingly soluble in alcohol. (Horsford.)

*Proto*CHLORIDE OF PLATINUM with *prot*IODIDE OF PLATINUM. Insoluble in water. Slightly soluble in alcohol. Soluble in a solution of caustic potash, from which it is precipitated, unchanged, by sulphuric acid. (Mather.)

*Bi*CHLORIDE OF PLATINUM with LOPHIN. Ppt. $4\,C_{42}H_{17}N_2 ; 3\,PtCl_2$

*Proto*CHLORIDE OF PLATINUM with METHYLAMIN. *Vid.* Chlorhydrate of *di*MethylPlatin(*ous*)*bi*amin.

*Bi*CHLORIDE OF PLATINUM with NITRIC OXIDE. Deliquescent. Decomposed by water. (Rogers & Boyé.)

*Bi*CHLORIDE OF PLATINUM with ODMYL, &c. $C_8H_8S_2, PtCl_2 ; C_8H_8S_2, PtS$ Ppt. (Anderson.)

*Bi*CHLORIDE OF PLATINUM with *tri*PHENYLAMIN. $C_{36}H_{15}N, PtCl_2$ (?) Ppt. in alcohol.

CHLORIDE OF PLATINUM with PICOLIN. Soluble in boiling, much less soluble in cold water. (Unverdorben.)

*Proto*CHLORIDE OF PLATINUM with STRYCHNINE. Difficultly soluble in water. (Abel & Nicholson, *J. Ch. Soc.*, **2.** 262.)

*Bi*CHLORIDE OF PLATINUM with SULPHIDE OF ETHYL. $C_8H_{10}S_2 ; PtCl_2$ Very soluble in boiling, less soluble in cold alcohol. Water precipitates it from the alcoholic solution. (Loir, *Ann. Ch. et Phys.*, (3.) **39.** 446.)

*Bi*CHLORIDE OF PLATINUM with SULPHIDE OF METHYL. $C_4H_6S_2 ; PtCl_2$ Soluble in boiling, less soluble in cold alcohol. (Loir, *Ann. Ch. et Phys.*, (3.) **39.** 450.)

*Bi*CHLORIDE OF PLATINUM with XANTHAMYLAMID. Insoluble, or but sparingly soluble, in water. Easily soluble in alcohol.

Proto- and *bi*CHLORIDE OF PLATINUM with XANTHOGENAMID (*Hydrate of SulphoCarbonylEthylammonium*). $PtCl ; N\left\{\begin{matrix}C_2S_2''\\ C_4H_5.O,HO\\ H\end{matrix}\right. ; PtCl_2 ; N\left\{\begin{matrix}C_2S_2''\\ C_4H_5.O,HO\\ H\end{matrix}\right.$ Insoluble in water, alcohol, or ether. Unacted upon by potash, or by nitric or chlorhydric acids. Slightly attacked by warm concentrated sulphuric acid. Easily soluble in aqua-regia. (Debus.)

*Bi*CHLORIDE OF PLATINUM*tri*PHENYLAMMONIUM. $N\left\{\begin{matrix}(C_{12}H_5)_3\,Cl_2\\ Pt\end{matrix}\right.$ Permanent. Readily soluble in water and in hydrated alcohol. (Gœssmann, *Ann. Ch. u. Pharm.*, **100.** 63.)

CHLORIDE OF PLATINUM PYRIDIN. *Vid. Bi*Chlorhydrate of PlatinoPyridin.

CHLORIDE OF PLATOSAMMONIUM. *Vid.* Chloride of Platin(*ous*)ammonium.

CHLORIDE OF *di*PLUMBIC*tri*ETHYL. $Pb_2(C_4H_5)_3, Cl$ Insoluble in water. Soluble in alcohol, and ether. (Buckton.)

CHLORIDE OF POTASSIUM. KCl Permanent. Soluble in water, with reduction of temperature. Soluble in 3.016 pts. of water at 15°. (Gerlach's determination, see his table of sp. grs., below.) Soluble in 3.03 pts. of water at 17.5°; or, 100 pts. of water at 17.5° dissolve 33 pts. of it; or, the aqueous solution saturated at 17.5° contains 24.8% of it and is of 1.1729 sp. gr. (H. Schiff, *Ann. Ch. u. Pharm.*, 1859, **109.** 326.)

100 pts. of water at °C.	Dissolve pts. of K Cl.
0°	29.21
19.35°	34.53
52.39°	43.59
79.58°	50.93
109.60°	59.26

(Gay-Lussac, *Ann. Ch. et Phys.*, (2.) **11.** 308.)

The equation of the curve of the solubility of chloride of potassium is $y = 0.2738\,x° + 29.23$. (Gay-Lussac, *loc. cit.*, (2.) **11.** 309.) 100 pts. of water dissolve parts of the salt $29.23 + 0.2738\,T°$. (H. Kopp, *Ann. Ch. u. Pharm.*, 1840, **34.** 261.)

By direct experiment Kopp found that 100 pts. of water dissolved of the salt

at 11.8° 34.6 pts.; by the formula this would be 32.5
" 13.8° 34.9 " " " " " 33.0
" 15.6° 35 " " " " " 33.5

In other words, 1 pt. of the salt is soluble in 2.89 pts. of water at 11.8°; in 2.87 pts. at 13.8°; and in 2.85 pts. at 15.6°. (Kopp.) The boiling-point of the saturated aqueous solution is 110° (Kremers, *Pogg. Ann.*, **99.** 43); 108.3°, and the solution contains 59.4% of the salt. (Berzelius, *Lehrb.* **3.** 93.) The solution saturated at 17.5° contains 24.95% of the salt; or, 100 pts. of water dissolve 33.24 pts. of the salt at 17.5°; or, 1 pt. of the salt is soluble in 3.008 pts. of water at 17.5°. The sp. gr. of this solution = 1.1635. (Karsten, *Berlin Abhandl.*, 1840, p. 101.) 100 pts. of water at 12° dissolve 32 pts. of it, and at 100° 59.4 pts. (Ot. Gr.) Soluble in 3 pts. of water at a moderate temperature, and in 2 pts. of boiling water (Bergman, *Essays*, **1.** 179); in 3.33 pts. of water, either hot or cold (Fourcroy); in 3 pts. of water at 15°; and in 1.68 pts. at 110°. The solution saturated at 15° contains 25% of it, and the solution saturated at 110° contains 37.2%. (M. R. & P.) Soluble in 3.5 pts. of water at 0°, and in less than 1 pt. of hot water. (Schubarth, *Tech. Chem.*) 100 pts. of water at 15.5° dissolve 30.7 – 33.0 pts. of it. (Ure's *Dict.*) The aqueous solution saturated at 15° is of 1.180949 sp. gr., and contains dissolved in every 100 pts. of water, at least 35.405 pts. of the salt. (Michel & Krafft, *Ann. Ch. et Phys.*, (3.) **41.** pp. 478, 482.)

The aqueous solution saturated at any temperature contains 25% of it (Fourcroy); at 12.5°, 30.5% of it. (Hassenfratz, *Ann. de Chim.*, **28.** 291.)

0.847	80	0.45

(H. Schiff, *Ann. Ch. u. Pharm.*, 1861, **118.** pp. 365, 366.)

Soluble in 48 pts. of boiling alcohol. (Wenzel, in his *Verwandtschaft*, p. 300 [T.].) Insoluble in absolute alcohol containing chloride of lithium. (Mitscherlich, *Lehrb.*, **2.** 85.) A solution in wood-spirit, of 40% (by weight), saturated at 15°, contains 9.2% of it. (H. Schiff, *Ann. Ch. u. Pharm.*, 1861, **118.** 365.) Very sparingly soluble in a mixture of equal parts of absolute alcohol and ether. (Berzelius; Rammelsberg.) Ether precipitates it from the alcoholic solution. (Dœbereiner.) Almost absolutely insoluble in a mixture of equal pts. of anhydrous alcohol and ether; 500 milligrs. of K Cl treated with 10 grms. of such a solution yielded only $\frac{8}{10}$ of a millegramme to the liquid. (J. Lawrence Smith, *Am. J. Sci.*, (2.) **16.** 56.) Soluble in glycerin. (Pelouze.) Insoluble in bisulphide of carbon. (Bæyer.) Much less soluble in very dilute chlorhydric acid than in water. (Fresenius, *Quant.*, p. 120.) When pieces of chloride of ammonium are added to a saturated aqueous solution of chloride of potassium they are dissolved, while a portion of the latter is precipitated. When the reaction has ceased, the solution, at 18.75°, contains 31.616% of mixed salt. Or, 100 pts. of water have dissolved 45.91 pts. of mixed salt. A solution identical with this may be obtained when a mixture of K Cl and NH_4Cl is treated with water. By experiment 100 pts. of water dissolved 46.1 pts. mixed salt, viz. 16.27 pts. K Cl and 29.83 pts. NH_4Cl. (Karsten, *Berlin Abhandl.*, 1840, p. 109.) When chloride of sodium is added to a saturated solution of chloride of potassium it dissolves, while K Cl is precipitated, until the amount of the two salts in solution have reached a certain definite equilibrium. (Karsten, *loc. cit.*, p. 109.) Chloride of potassium dissolves in a saturated solution of chloride of ammonium plus chloride of sodium, while portions of both these salts separate out. (Karsten, *loc. cit.*, p. 132.) When chloride of barium is added to a solution of chloride of potassium it dissolves without precipitating K Cl at first, but after a time K Cl begins to fall, and this continues until a certain definite amount of Ba Cl has been dissolved. The mixed solution thus obtained is identical with that prepared by treating a mixture of the two salts with water. (Karsten, *Berlin Abhandl.*, 1840, p. 110.) For the solubility of chloride of potassium when mixed with chloride of barium, see the last-named salt. Chloride of potassium is soluble in a saturated solution of nitrate of potash, the latter being meanwhile precipitated until a certain definite limit is attained, when the reaction ceases. A solution of sp. gr. identical with the above is obtained when a mixture of the two salts is treated with water. [See Nitrate of Potash.] (Karsten, *Berlin Abhandl.*, 1840, p. 113.) It is soluble in a saturated solution of nitrate of soda without causing any precipitation; it is also soluble in a saturated solution of nitrate of baryta. (Karsten.) Soluble in a saturated solution of sulphate of potash, with precipitation of the latter. The solution thus obtained, at 18.75°, contains 25.86% of mixed salt. Or, 100 pts of water dissolve 34.87 pts. of mixed salt, viz. 33.12 pts of $K\,Cl$ and 1.75 pts. of $K\,O, S\,O_3$. A solution identical with the above is obtained when a mixture of the two salts is treated with water. (Karsten, *Berlin Abhandl.*, 1840, p. 112.) When a mixture of chloride of potassium and sulphate of potash is treated with water at 14.8°, 100 pts. of the water dissolve 30.2 pts. of the mixed salts, of which 2.0 pts. are sulphate of potash. At 15.8°, 30 2 pts. of the mixed salts are dissolved, of which 2.3 pts. are sulphate of potash; at 16.1°, 30.4 pts. of the mixed salts, of which 3.3 pts. are sulphate of potash. At these temperatures the solubility of pure $K\,Cl$ is from 33.3 to 33.6, the mean being 33.5; that of $K\,O, S\,O_3$ is from 10.9 to 11.2, the mean being 11.1.

$$\text{Found}\ \left\{\begin{array}{l} 30.2 = 28.2 + 2.0 \\ 30.2 = 27.9 + 2.3 \\ 30.4 = 27.1 + 3.3 \end{array}\right.$$

$$\text{Calcul.}\ \begin{array}{l} 33.5 \\ 11.1 \end{array}\Big\}\ 44.6 : 33.5 : 11.1 = 30.3 : 22.8 : 7.5$$

(H. Kopp, *Ann. Ch. u. Pharm.*, 1840, **34.** 264.)

For the solubility of mixed chloride of potassium and nitrate of potash see the last-named salt. Soluble in a saturated solution of sulphate of soda with formation of sulphate of potash; also soluble in a saturated solution of nitrate of ammonia, with formation of chloride of ammonium and nitrate of potash, which separate. In a saturated solution of sulphate of magnesia it is converted into sulphate of potash. (Karsten, *loc. cit.*, p. 130.) When one equivalent of $K\,Cl$, in aqueous solution, is mixed with a solution of an equivalent of sulphate of zinc ($Zn\,O, S\,O_3$), 0.84 of it are decomposed to sulphate of potash, which may be precipitated by adding alcohol, while 0.16 of it remain unchanged; when mixed with a solution of an equivalent of sulphate of manganese ($Mn\,O, S\,O_3$), 0.58 of it are decomposed as before, while 0.42 of it remain unchanged; when mixed with a solution of an equivalent of sulphate of magnesia ($Mg\,O, S\,O_3$), 0.56 of it are decomposed, while 0.44 of it remain unchanged. (Malaguti, *Ann. Ch. et Phys.*, 1853, (3.) **37.** 203.)

Chloride of Potassium & of Rhodium.

I.) $2\,K\,Cl;\ Rh_2\,Cl_3 + 2\,Aq$ Permanent. Rather difficultly soluble in water. (Claus, *Beiträge*, p. 72.) More soluble than chloroplatinate of potassium in an aqueous solution of chloride of potassium. (Berzelius.) Insoluble, or but sparingly soluble, in alcohol. (Berzelius.) Insoluble in a strong cold aqueous solution of chloride of potassium. (W. Gibbs, *Am. J. Sci.*, (2.) **31.** 70.)

II.) $3\,K\,Cl;\ Rh_2\,Cl_3 + 6\,Aq$ Efflorescent. Considerably more difficultly soluble than the other salts [of the formula $3\,M\,Cl;\ Rh_2\,Cl_3$?]. After standing for some time, or on boiling, the aqueous solution changes color, and appears to be changed to No. 1. (Claus, *Beiträge*, p. 72.)

Chloride of Potassium & *sesquichloride* of
$2\,K\,Cl;\ Ru_2\,Cl_3$ Ruthenium. Somewhat sparingly soluble in cold, more readily soluble in boiling water. Insoluble in alcohol of 80%; it is, nevertheless, only partially precipitated from the aqueous solution by means of alcohol. Soluble in alcohol when in presence of soluble metallic chlorides. Nearly insoluble in a concentrated aqueous solution of chloride of ammonium.

The neutral aqueous solution decomposes very readily on standing, and especially when heated. (Claus.)

Chloride of Potassium & of Silver. Decomposed by water, with separation
$K\,Cl;\ Ag\,Cl$ of chloride of silver. Soluble in an aqueous solution of chloride of potassium.

Chloride of Potassium & of Tellurium. Deliquescent. Decomposed by water, and by absolute alcohol. (Berzelius.)

Chloride of Potassium & of Thorium.
$K\,Cl;\ Th\,Cl$ Deliquescent. Very soluble in water. Easily soluble in alcohol.

Chloride of Potassium & *protochloride* of
$2\,K\,Cl;\ Sn\,Cl + 3\,Aq$ Tin. Soluble in water.

Chloride of Potassium & *bichloride* of Tin.
$K\,Cl;\ Sn\,Cl_2$ Permanent.

Chloride of Potassium & *basic sesquichloride*
$3\,K\,Cl;\ 2\,Ur_2\,O_3, Ur\,Cl_3 + 6\,Aq$, or "$(K\,Cl, (Ur_2\,O_2)\,Cl + 2\,Aq)$" of Uranium. Easily soluble in water, and alcohol. (Arfvedson.) Extremely soluble in water, but with decomposition and separation of $K\,Cl$, unless the water is acidulated with chorhydric acid. (Péligot, *Ann. Ch. et Phys.*, (3.) **5.** 37.)

Chloride of Potassium & of Yttrium.
$K\,Cl;\ Yr\,Cl$ Soluble in water, with evolution of heat.

Chloride of Potassium & of Zinc. More
$K\,Cl;\ Zn\,Cl + Aq$ deliquescent than the corresponding ammonium compound. Soluble in water. (Schindler.) Very deliquescent. Soluble in 1 pt. of water at ordinary temperatures. Apparently soluble in all proportions in boiling water. (Pierre, *Ann. Ch. et Phys.*, (3.) **16.** 248.)

Chloride of Potassium with Chromic Acid. *Vid.* Chromate of Chloride of Potassium.

Chloride of Potassium with Cyanide of
$K\,Cl;\ 2\,Hg\,Cy + Aq$ Mercury. Soluble in 6.75 pts. of water at 18°. (Brett.) Soluble in alcohol. (Desfosses.)

Chloride of Potassium with *bi*Cyanide of
$K\,Cl;\ Pt\,Cy_2 + 2\,Aq$ Platinum. Efflorescent. Easily soluble in water, and alcohol. (Knop & Schnedermann.)

Chloride of Potassium with Glycocoll.
$C_4\,H_4\,N\,O_3;\ K\,Cl$ Readily deliquescent. Soluble in water. (Horsford.)

Chloride of Potassium with Iodate of
$K\,Cl;\ K\,O, 2\,I\,O_5 + Aq$ Potash. Efflorescent. Soluble in 19 [18 @ 20 in Berzelius's *Lehrb.*] pts. of water at 15°. The aqueous solution is decomposed when evaporated by heating. (Sérullas.) Cold alcohol decomposes it, dissolving out the iodate. (Filhol.)

Chloride of Potassium with Sulphite of

$3KCl; IrO, 2SO_2$ Iridium. Very soluble in water. (Claus.)

Chloride of Potassium with *bi*Sulphite of Osmium. $3KCl; OsO, 2SO_2$ Very soluble in water. (Claus.)

Chloride of Potassium with Sulphuric Acid(*anhydrous*). $KCl; XSO_3$ Instantly decomposed by moisture.

Chloride of Propyl. Insoluble in water. (*Chloride of Trityl. Propyl-Chlorhydric Ether.*) C_6H_7Cl (Berthelot, *Ann. Ch. et Phys.*, (3.) **43.** 405.)

Chloride of Propylene. C_6H_6'', Cl_2 Insoluble, or very sparingly soluble, in water.

Chloride of Pteleyl. *Vid. Ter*Chloro-Mesitylene.

Chloride of PurpureoCobalt. (*Chlorhydrate de Roséo-Cobaltiaque*(of Fremy).) $5NH_3 . Co_2, Cl_3$ Sparingly soluble in cold water, 1 pt. of it being soluble in 244 pts. of water at 15.5°; it is slightly decomposed, however, by cold water, and completely on boiling the aqueous solution, but this decomposition may be prevented by keeping the solution slightly acid with chlorhydric acid. Crystallizes on cooling the boiling solution in water acidulated with a few drops of chlorhydric acid. Completely precipitated from the aqueous solution on the addition of alcohol, chlorhydric acid, or saturated aqueous solutions of the chlorides of ammonium and sodium. The salt is not decomposed by boiling chlorhydric acid. (Claudet, *Phil. Mag.*, (4.) **2.** pp. 253, 254.) Nearly insoluble in cold water; but is soluble, without decomposition, in boiling water to which a few drops of chlorhydric acid have been added. From this solution it crystallizes on cooling. A neutral aqueous solution is readily decomposed by boiling, but it may be boiled for a very long time with concentrated chlorhydric acid, without decomposition. Chlorhydric acid and the alkaline chlorides precipitate it from its solutions almost completely, slowly in the cold, but instantly on boiling. Insoluble in alcohol. (Gibbs & Genth, *Smithson. Contrib.*, Vol. **9.** pp. 22 – 27 of the memoir.) Scarcely at all soluble in cold water. Entirely insoluble in water acidulated with chlorhydric acid, or containing chloride of ammonium. (Fremy, *Ann. Ch. et Phys.*, (3.) **35.** 302.) Less soluble than chloride of luteo-cobalt in water acidulated with chlorhydric acid. (Rogojski, *Ann. Ch. et Phys.*, (3.) **41.** 447.)

Chloride of PyroCitryl. *Vid.* Chloride of Citraconyl.

Chloride of PyroMucyl. $C_{10}H_3O_4, Cl$ Decomposed by water.

*Proto*Chloride of Rhodium. $RhCl$ Insoluble in water, or in chlorhydric or nitric acids. Unacted on by boiling solutions of caustic potash or carbonate of potash. (Fellenberg.) Insoluble in water or chlorhydric acid. Unacted upon in the cold, but is decomposed by boiling potash. (Berzelius.) Claus (*Beiträge*, p. 64) denies the existence of the compound ($2RhCl; Rh_2Cl_3$) mentioned by Berzelius.

*Sesqui*Chloride of Rhodium. Rh_2Cl_3 Unacted upon by boiling acids like concentrated chlorhydric acid or aqua-regia. When boiled for a long time with concentrated potash-lye it swells up, and is then slightly soluble in strong boiling chlorhydric acid. (Claus, *Beiträge*, p. 64.) Deliquescent. Soluble in water, alcohol, and chlorhydric acid. (Berzelius; Wollaston.)

Chloride of Rhodium & of Silver.
I.) $2AgCl; Rh_2Cl_3$ } Insoluble in water. (Claus,
II.) $3AgCl; Rh_2Cl_3$ } *Beiträge*, pp. 73, 23.)

*Proto*Chloride of Rhodium & of Sodium. Soluble in water. (Fremy, *Ann. Ch. et Phys.*, (3.) **44.** 396.)

*Sesqui*Chloride of Rhodium & of Sodium. (*ChloroRhodiate of Sodium.*) $3NaCl; Rh_2Cl_3 + 24$ (not 18) Aq Exceedingly efflorescent. Easily soluble in water. Melts in its water of crystallization at 50°. Completely insoluble in spirit. But when mixed with a large quantity of metallic chlorides soluble in spirit a portion of it also dissolves. (Claus, *Beiträge*, pp. 70, 62.) Soluble in 1.5 pts. of water. (Wollaston.)

Chloride of RoseoCobalt. $5NH_3 . Co_2, Cl_3 + 2Aq$ Soluble in cold water, the solution being easily decomposed when heated. Nearly insoluble in strong chlorhydric acid. (Gibbs & Genth, *Smithson. Contrib.*, Vol. **9.**)

"Chloride of RoseoCobalt" (of Fremy). *Vid.* Chloride of PurpureoCobalt.

*Proto*Chloride of Ruthenium. $RuCl$ Insoluble in water, and in acids. Only slightly acted upon by a solution of caustic potash. (Claus.)

*Sesqui*Chloride of Ruthenium. Ru_2Cl_3 Deliquescent. Soluble in water and in alcohol. (Claus.)

*Bi*Chloride of Ruthenium.
$RuCl_2$

*Sesqui*Chloride of Ruthenium & of Sodium. Deliquescent. Easily soluble in alcohol.

Chloride of Salicyl. $C_{14}H_5O_4, Cl$ Decomposed by water, alcohol, and wood-spirit. (Gerhardt.)

Chloride of SelenEthyl. C_4H_5Se, Cl Sparingly soluble in water; somewhat more soluble in chlorhydric acid. Soluble in ammonia-water. (Joy.)

*Di*Chloride of Selenium. Se_2Cl Slowly decomposed by cold water. (Berzelius.) Slowly decomposed by cold, instantly by hot water. (Sacc, *Ann. Ch. et Phys.*, (3.) **22.** 124.)

*Bi*Chloride of Selenium. $SeCl_2$ Soluble in water, with evolution of heat and decomposition. (Berzelius.)

*Ter*Chloride of Silicon. $SiCl_3$ Decomposed by water, being dissolved for the most part if an excess of water be present; but when mixed with an equal volume of water the liquid becomes gelatinous from the silica which separates. (Berzelius, *Lehrb.*, **1.** 326.)

Chloride of Silver. $AgCl$ As good as insoluble in water. When chloride of silver is left for some hours in contact with pure water at 20° @ 22°, and especially if the temperature be elevated to 75°, traces of it go into solution; more chlorine than silver, however, is thus dissolved, consequently the solvent action of the water must depend, in part, at least, upon a decomposition of the chloride of silver. (Mulder, *Die Silber-Probirmethode*, p. 74.) When 1 pt. of silver is precipitated as chloride of silver in presence of 1000000 pts. of water a slight bluish milkiness may still be observed; but in order to have a distinctive characteristic precipitate with this amount of water 4 pts. of silver should be present.

Dilute nitric acid does not increase the solubility of chloride of silver in the least, but in stronger nitric acid chloride of silver is not absolutely insoluble: thus, if a solution of $\frac{1}{20}$ milligr. silver be mixed with 50cc. of nitric acid of 1.2 sp. gr., and enough solution of chloride of sodium to neutralize the nitrate of silver be added, the precipitate which forms at first will disappear, but the addition now of a trace either of chloride of sodium or of nitrate of silver to this solution will occasion the formation of a persistent precipitate. (Mulder, *Die Silber-Probirmethode*, p. 24.) 1 pt. of nitrate of silver causes an opalescence when mixed with chlorhydric acid, even in presence of 120000 pts. of water (Pfaff); even in presence of 240000 pts. of water. (Harting.) 1 pt. of silver gives a slight turbidity with chlorhydric acid in presence of 200000 pts. of water; a scarcely opalescent cloudiness in presence of 400000 pts. of water, and the same after the lapse of 15 minutes in presence of 800000 pts. of water. (Lassaigne.) Soluble in 3072 pts. of water (Monnet); or 100 pts. of water dissolve 0.0333 pt. of it. Insoluble, or very nearly insoluble, in most of the acids, with the exception of concentrated chlorhydric acid, from which it is almost completely precipitated on the addition of water.

Soluble in 200 pts. of strong chlorhydric acid; and in 600 pts. of the same chlorhydric acid diluted with twice its weight of water. (Pierre, *N. J. Pharm.*, **12.** 237, in *Gmelin's Handbook*, **6.** 428.) Tolerably dilute chlorhydric acid can dissolve chloride of silver: thus, a solution of 1 pt. of nitrate of silver in 15000 pts. of water becomes turbid when chlorhydric acid is added to it, but the addition of more acid renders the solution clear again. (Reinsch.) Chloride of silver is more or less soluble in dilute chlorhydric acid. If this acid is added to water in which the precipitate of $\frac{1}{1000000}$ pt. silver is suspended, as Ag Cl, the milkiness disappears completely. The solubility of chloride of silver in chlorhydric acid increases with elevation of temperature, the chloride of silver separating out again as the solution cools. (Mulder, *op. cit.*, p. 25.) Sparingly soluble in a hot alcoholic solution of chlorhydric acid, from which it separates in part on cooling. (Erdmann.) Sparingly soluble in concentrated bromhydric acid. (Lœwig.) Insoluble in nitric acid. (Wackenroder.) Entirely unacted upon by boiling nitric acid of 1.43 sp. gr. (H. Wurtz, *Am. J. Sci.*, (2.) **25.** 382.) As has been previously stated, the solubility of chloride of silver in dilute nitric acid may be admitted to be the same as its solubility in water; $\frac{1}{2000000}$ pt. of silver cannot be detected in the presence of either by precipitating it as chloride of silver; but $\frac{1}{1000000}$ pt. can be detected in both cases. (Mulder, *op. cit.*, p. 25.) 1 pt. of silver, in the form of chloride of silver, dissolves at 25° in 83000 pts. of water containing free nitric acid and 0.33 pt. of chlorhydric acid. (Mulder, *op. cit.*, p. 87.) Insoluble in cold concentrated sulphuric acid; but on boiling, the acid decomposes a portion of it while another portion dissolves; this does not separate again on cooling.

In dilute sulphuric acid chloride of silver is no more soluble than in dilute nitric acid. (Mulder, *op. cit.*, p. 26.) Unacted upon by cold sulphurous acid, but slight decomposition ensues when the acid is heated. (A. Vogel.) Perceptibly soluble in a warm solution, less soluble in a cold solution, of tartaric acid. (Mulder, *op. cit.*, p. 26.) Chloride of silver is soluble in solutions of all the metallic chlorides which are soluble in water: — thus, aqueous solutions of the chlorides of sodium, potassium, calcium, strontium, and barium all dissolve it, especially when they are hot; chloride of magnesium, and ammonium, and protochloride of mercury, also dissolve some chloride of silver, the Hg Cl dissolving the least of it. (Mulder, *op. cit.*, p. 27.) Horn silver [i. e., fused chloride of silver ?] is insoluble in an aqueous solution of chloride of sodium. (J. Davy, *Phil. Trans.*, 1822, p. 365.) Readily soluble, when recently precipitated, in a hot aqueous solution of chloride of ammonium, and from this solution it is not precipitated by chlorhydric acid. A solution of nitrate of ammonia is a very imperfect solvent of it. (Brett, *Phil. Mag*, 1837, (3.) **10.** pp. 97, 98.) Insoluble in solutions of the ammoniacal salts, excepting chloride of ammonium. (Wittstein.) Sparingly soluble in strong aqueous solutions of chloride of potassium, chloride of sodium, and a few other metallic chlorides.

Soluble in a strong solution of chloride of calcium. (Wetzlar.) Soluble in an aqueous solution of chloride of roseocobalt. (Gibbs & Genth, *Smith. Contrib.*, vol. 9.) It is also soluble in aqueous solutions of the nitrates of soda, potash, lime, magnesia, and ammonia; — at the ordinary temperature this solubility is not considerable, but increases so much by heat, that hot solutions, which are perfectly clear, become strongly clouded as they cool, owing to separation of the chloride of silver. (Mulder, *op. cit.*, p. 28.) [I have had frequent occasion to observe the truth of this last remark, at least as far as regards solutions of nitrate of ammonia. F. H. S.] It is more soluble in a solution of nitrate of soda in proportion as the amount of this salt increases; it is also more readily soluble as the relative quantity of water is increased, thus: at a temperature of 15° @ 20°,

There are dissolved milligrs. of Ag Cl	In Na O, N O_5, grammes.	and H O, cc.
1.33	0 787	100
1.93	0.787	200
3.99	2.361	300
2.53	2.787	100

At higher temperatures it is more soluble. (Mulder, *op. cit.*, pp. 49 to 53.)

There are dissolved milligrs. of Ag Cl	In Na O, N O_5, grammes.	and H O, cc.	at temp. of
0.86	0.787	100	5°
1.33	0.787	100	15° – 17°
1.46	0.787	100	18°
2.33	0.787	100	30°
3.99	0.787	100	45° – 55°

(Mulder, *op. cit.*, pp. 56 – 58.)

At 25^c, 100000 pts. of water containing a little free nitric acid and 0.787 grm. of Na O, N O_5, dissolve 2.128 milligrs. of Ag Cl. If, the other conditions remaining the same, 2 grammes of Na O, N O_5 be added to the above, then 2.526 milligrs. (or $\frac{1}{5}$ more) Ag Cl will dissolve. (Mulder, *op. cit.*, p. 71.) 1 pt. of silver in 200000 pts. of water containing 0.79 pt. of nitrate of soda can be readily detected by means of chloride of sodium at the ordinary temperature; but at 75° the precipitate dissolves, separating out again, however, as the solution cools; in 200000 pts. of water containing 1574 pts. of nitrate of soda one part of silver can readily be detected by chloride of sodium at the ordinary temperature; but at 75° the precipitate dissolves, and remains in solution after cooling. (Mulder, *op. cit.*, p. 66.) If only a small quantity of nitrate of soda is present less chloride of silver is dissolved in proportion to the weight of the nitrate of soda than when a large quantity of this salt is present. (Mulder, *op. cit.*, p. 68.) An aqueous solution of nitrate of protoxide of mercury also dissolves considerable quantities of chloride of silver, but most of the remaining nitrates do not do so. (Mulder, *op. cit.*, p. 28.) Soluble in an aqueous solution of nitrate of protoxide of mercury, from which solution it is easily precipitated by chlorhydric acid and by solutions of chloride of sodium or chloride of ammonium, also with tolerable completeness by an excess of a solution of nitrate of silver, but not by nitric acid. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 317.) When the hot solution of chloride of silver in nitrate of protoxide of mercury is cooled, or diluted with water, crystals of Ag Cl separate out. The Ag Cl is precipitated from this solution on the addition of solutions of the alkaline acetates. (Liebig, *Ann. Ch. u. Pharm.*, **81.** 128.) Soluble to a considerable extent in an aqueous solution of nitrate of protoxide of mercury. (Lœwig.) Much more soluble in hot than in a cold solution of nitrate of protoxide of mercury, and much more soluble in this solution than in a solution of nitrate of ammonia. Chloride of sodium precipitates it from this solution. In presence of acetate of soda or of ammonia this solubility is much less marked. Acetate of soda precipitates it from its solution in nitrate of mercury. (Mulder, *op. cit.*, pp. 195–197.) Imperfectly soluble in an aqueous solution of nitrate of silver. (Wackenroder.) It is not dissolved to an appreciable extent by a solution of nitrate of copper, nor by solutions of the nitrates of iron, manganese, cadmium, cobalt, zinc, or nickel. (Mulder, *op. cit.*, pp. 59–62.) Insoluble, or exceedingly sparingly soluble, in a solution of nitrate of lead. (Mulder, *op. cit.*, p. 178.) Insoluble in a solution of sulphate of soda. (Mulder, *op. cit.*, p. 163.) Very readily soluble in an aqueous solution of cyanide of potassium. (Liebig.) Readily soluble, with decomposition, in an aqueous solution of hyposulphurous acid. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 397.) When recently precipitated, chloride of silver is soluble in aqueous solutions of any of the soluble hyposulphites, and with especial ease in a somewhat concentrated solution of hyposulphite of soda which dissolves it in large quantity, and almost as readily as water dissolves sugar; a solution of hyposulphite of potash, even when very dilute, also readily dissolves it, as does a solution of hyposulphite of strontia. Mutual decomposition occurs, and a solution of intense sweetness is produced; this solution becomes slightly turbid on standing, but the decomposition may be retarded, if not altogether prevented, by dilution. Alcohol precipitates from it a syrup. (Herschel, *Edin. Phil. Journ*, 1819, **1.** pp. 27, 11, 19, 21, 397.) When recently precipitated, it is soluble in an aqueous solution of arsenite of potash. (Reynoso.) Abundantly soluble in ammonia-water. (Wackenroder.) Easily soluble in ammonia-water, even after it has been fused. (Dumas, *Tr.*) [After having been thoroughly boiled with water and having stood at rest for some time subsequent to its precipitation, it is very difficultly soluble in strong ammonia-water. F. H. S.] As soluble in coniin as in ammonia-water. (Blyth, *J. Ch. Soc.*, **1.** 350.) Soluble in an aqueous solution of methylamin. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 453.) Also soluble in a solution of amylamin, though less so than in ammonia-water. (Wurtz.) Soluble in caprylamin. (Bouis.) Soluble in aqueous solutions of sinamin and thiosinamin. Insoluble in cold dilute solutions of the caustic alkalies, but is decomposed by hot concentrated solutions, especially if it be treated with them before it has become dry. (Gregory.) Decomposed by a solution of carbonate of potash.

Slightly soluble in a cold solution of carbonate of potash. (Wittstein.)

*Sub*CHLORIDE OF SILVER. Chloride of silver which has become violet-colored by exposure to the light is much less soluble than the pure white chloride in an aqueous solution of nitrate of soda.

(*DiChloride of Silver?*)
Ag_2Cl?

Mulder (*op. cit.*, p. 54) does not doubt but that chloride of silver which has been decomposed by light as completely as possible is entirely insoluble in a solution of nitrate of soda.

It is decomposed by ammonia-water, and by boiling chlorhydric acid or solutions of chloride of sodium or chloride of ammonium; all of which extract Ag Cl and leave Ag. (Scheele; Wœhler.) Perfectly soluble in ammonia. (Berthollet.) Unacted upon by nitric acid. (Wetzlar.)

CHLORIDE OF SILVER & OF SODIUM. Soluble in a strong aqueous solution of chloride of sodium. This solution is decomposed by the addition of much water. (Wetzlar.)

CHLORIDE OF SILVER & OF TELLURIUM.

CHLORIDE OF SILVER with CYANIDE OF POTASSIUM. (Liebig.)

CHLORIDE OF SODIUM. Permanent, when pure.

(*Muriate of Soda. Common Salt.*)
Na Cl

Slowly absorbs water from moist air. (Fresenius.) It causes only a slight reduction of temperature while dissolving in water. (Gay-Lussac.)

100 pts. of water at —15° dissolve 32.73 pts. of it.

100 pts. of cold water dissolve 35.4 pts. of it.
" boiling " " 36.2 " "
(Berzelius, cited by Unger, *loc. cit.*)

100 pts. of water dissolve 37 pts. of it at all temperatures. (Fuchs & G. Reichenbach, *Kastner's Archiv.*, 1826, **7.** 413.) The aqueous solution saturated at 15° is of 1.207148 sp. gr., and contains dissolved in every 100 pts. of water at least 35.837 pts. of the salt. (Michel & Krafft, *Ann. Ch. et Phys.*, (3.) **41.** pp. 478, 482.) From Gay-Lussac's experiments, H. Kopp deduces the following formula: — 100 pts. of water dissolve of the salt, parts $= 35.48 + 0.024748\ T° - 0.00011000\ T^2 + 0.0000026555\ T^3$. By this formula the solubility of the salt would be less at 0° than at ordinary temperatures, though Gay-Lussac thought that he had observed the contrary. By direct experiment Kopp found that 100 pts. of water dissolved of Na Cl, at 25°, 35.8 pts., and 35.6. According to the formula the solubility should be, at this temperature, 36 pts. (H. Kopp, *Ann. Ch. u. Pharm.*, 1840, **34.** 262.)

1 pt. of Na Cl is soluble in 2.78 pts. water at 13.89°.
" " " " 2.70 " " 59.93°.
" " " " 2.48 " " 109.73°.
(Gay-Lussac, *Ann. Ch. et Phys.*, (2.) **11.** 310.)

1 pt. of Na Cl is soluble in 2.505 pts. water, at boiling. (Fehling, *Ann. Ch. u. Pharm.*, **77.** 382.)

1 pt. of Na Cl is soluble in 2.8 pts. water at 25°. (H. Kopp, *Ann. Ch. u. Pharm.*, 1840, **34.** 262.)

1 pt. of Na Cl is soluble in 2.738 pts. water at 18.75°. (C. J. B. Karsten, *Berlin Abhandl.*, 1840, p. 101.)

1 pt. of Na Cl is soluble in 2.7685 pts. water at 1°.
" " " " 2.7230 " 18.75°.
" " " " 2.4345 " 100°.
(G. Karsten, *Karsten u. Dechen's Archiv.*, **20.** 48.)

1 pt. of Na Cl is soluble in 2.77 pts. water at 1.25°.
" " " " 2.56 " " boiling.
(Unger, *J. pr. Chem.*, **8.** pp. 285, 294.)

1 pt. of Na Cl is soluble in 2.6496 pts. water at 18.75°. (Bischof.)

1 pt. of Na Cl is soluble in 2.333 pts. water at 106°+ (Griffiths, *Quar. J. Sci.*, 1825, **18.** 90.)

1 pt. of Na Cl is soluble in 2.78 pts. of water at 20°. (H. Schiff, *Ann. Ch. u. Pharm.*, 1859, **109.** 326.)

1 pt. of Na Cl is soluble in 2.789 pts. water at 15°. (Gerlach's determination, see his table of sp. grs., below.)

1 pt. of Na Cl is soluble in 3 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p 76.)

Soluble in 2 8235 ("$2\frac{14}{17}$") pts of water at a moderate heat.
" 2.7647 ("$2\frac{13}{17}$") " of boiling water.
(Bergman, *Essays*, **1.** 180.) [The numbers ("soluble in 2.59 pts. of cold water and in 2.77 pts. of hot water") attributed to Bergman in Gmelin's Handbook, **3.** 112, appear to be erroneous.] Soluble in 2.857 pts. of water, either cold or boiling. (Fourcroy, cited by Hassenfratz, *Ann. de Chim.*, **28.** 290.) When chemically pure, 1 pt. of chloride of sodium is soluble in 2.7 pts. of water, either cold or boiling; or 100 pts. of water dissolve 37 pts. of it; or the saturated aqueous solution contains 27% of it. (Fuchs & G. Reichenbach, *Kastner's Archiv.*, 1826, **7.** 413.) In the cited article, Fuchs specially insists that "pure chloride of sodium requires precisely as much cold as hot water for its solution" (p. 410). But the assertion has been decidedly contradicted by Poggiale (*Ann. Ch. et Phys.*, (3.) **8.** 476), by Fehling (*Ann. Ch. u. Pharm.*, **77.** 382), and by Unger (*J. pr. Chem.*, **8.** 294). It is, moreover, disproved by the experiments of the other observers above cited. Bergman (*Essays*, 1779, **1.** 231) long ago condemned the notion in these terms: "Some moderns contend that more of common salt is taken up by cold than by warm water; but this assertion is contrary to the nature of things and to experience: upon accurate examination, I found the quantities taken up by boiling water, and by water of a moderate heat, to be respectively as 77 to 71.5." Poggiale (*loc. cit.*) was unable to perceive that the solubility of chloride of sodium is greater at 0° than at 14°, as had been thought to be the case by Gay-Lussac.

The aqueous solution
saturated at 1° contains 26.536% of Na Cl
" 18.75° " 26.860% " "
" 100° " 29.116% " "
(G. Karsten, *Karsten's Archiv.*, **20.** 48.)

G. Karsten has reduced the experiments of several other observers to per cents; thus, according to Unger (*J. pr. Ch.*, **8.** 294), the aqueous solution saturated at 1.25° contains 26.535% Na Cl, and that saturated at the temperature of boiling contains 28.225%; according to C. J. B. Karsten, the solution saturated at 18.75° contains 26.75%; and according to Bischof, 27.40% at the latter temperature; "but as both Unger's, C. J. B. Karsten's, and my own (G. Karsten) results are lower, this is doubtless too high." According to Gay-Lussac, the solution saturated at from 14° @ 20° contains 26.362% of it; and at 100°, 28.724%. According to Bergman, the solution saturated in the cold contains 26.154%; and the warm saturated solution 26.562%. "But since these determinations are much lower than those of any subsequent observer, it is probable that the solutions were not saturated." (G. Karsten, *Karsten u. Dechen's Archiv.*, **20.** 48.) The solution saturated at 20° contains 26.4% of Na Cl, and is of 1.2021 sp. gr. (H. Schiff, *Ann. Ch. u. Pharm.*, 1859, **109.** 326.) That saturated at 10° contains from 27.8% to 30.4% of it (Eller); at 38° (of B.'s thermometer), 23.7% (Bœrhave); in the cold, 22.2% (Fourcroy); at 12.5°, 30.1% (Hassenfratz, *Ann. de Chim.*, **28.** 291); at all temperatures, 27.0% (Fuchs). 100 pts. of a solution saturated at 12° contain 26.423 pts. of Na Cl; 100 pts. of a solution saturated at its boiling-point contain 28.53 pts. of Na Cl. (Fehling, *Ann. Ch. u. Pharm.*, **77.** 382.) 100 pts. of the saturated solution, at its boiling-point (224° F. = 106°+ C.), contain 30 pts. of Na Cl. (T. Griffiths, *Quar. J. Sci.*, 1825, **18.** 90.)

Na Cl is not deposited from its boiling aqueous solution, unless the vessel containing it is open to the air. (Unger, *J. pr. Ch.*, 1836, **8.** 293.) Since the solubility of chloride of sodium in water is nearly the same for temperatures between 0° and 100°, little or no tendency to form supersaturated solutions is observed at these temperatures, but at temperatures below 0°, and especially below —10°, the phenomenon is well marked. Thus, if a tube in which a saturated solution of salt is boiling be loosely stopped with a pledget of cotton-wool, and after cooling be thrust into a freezing mixture of snow and salt at —19°, it may be left there for some time without any separation of the salt, but when the tube is taken up from the snow and the cotton removed from its orifice, so that fresh air can reach the solution, crystals of hydrated chloride of sodium separate out immediately. The success of this experiment is liable to be impaired by the water condensed on the sides of the tube, which often freezes before the solution of salt has been cooled to the desired point. (Schrœder, *Ann. Ch. u. Pharm.*, 1859, **109.** 46.)

(Kremers, *Pogg. Ann.*, **95.** 120. The second column is from Gerlach's *Sp. Gew. der Salzlœsungen*, p. 33.) An aqueous solution saturated at 18.75° is of 1.2046 sp gr. (C. J. B. Karsten); a solution saturated at 8° is of 1.205 sp. gr. (Anthon, *Ann. der Pharm.*, 1837, **24.** 210.)

G. Karsten, in his memoir (*Karsten u. Dechen's Archiv.*, Vol. 20) cited above, has published a very elaborate and complete table of the sp. grs. of solutions of salt, to which we would refer the reader who may desire special information upon the subject.

Contrary to the assertion of various authors, chloride of sodium is soluble in alcohol, and seems to be much more so when accompanied by chlorate of soda. (Chenevix, from *Phil. Trans.*, 1802, in *Nicholson's Journ. of Nat. Phil.*, **3.** 185.)

100 pts. of
alcohol of 0.900 sp. gr. dissolve 5.8 pts. of it.
" 0.872 " " 3.67 "
" 0.834 " " 0.5 "

0.895	60	5.6
0.847	80	1.2

(H. Schiff, *Ann. Ch. u. Pharm.*, 1861, **118.** 365.)

Schiff (*loc. cit.*, p. 366) remarks that R. Wagner's determination of the solubility of Na Cl in alcohol of 75% (*vid. sup.*) does not agree with his own results. A solution in wood-spirit, of 40% (by weight), saturated at 15°, contains 13% of it. (H. Schiff, *Ann. Ch. u. Pharm.*, 1861, **118.** 365.)

Ether precipitates it from the alcoholic solution. (Gmelin.) Very sparingly soluble in a mixture of equal parts of absolute alcohol and ether. (Berzelius; Rammelsberg.) Almost absolutely insoluble in a mixture of equal volumes of anhydrous alcohol and ether; 500 milligrs. of Na Cl treated with such a solution yielded only ½ a milligrm. to the liquid. (J. Lawrence Smith, *Am. J. Sci.*, (2.) **16.** 57.) 100 pts. of a mixture of equal volumes of 96% alcohol and 98% ether, dissolves 0.11 pt. of Na Cl. (W. Mayer, *Ann. Ch. u. Pharm.*, **98.** 205.) Insoluble in oil of turpentine. (T. S. Hunt, *Am. J. Sci.*, (2.) **19.** 417.) Soluble in glycerin. (Pelouze.) Much less soluble in very dilute chlorhydric acid than in water. Concentrated chlorhydric acid precipitates it from the aqueous solution.

Soluble in an aqueous solution of chloride of ammonium with elevation of temperature, all of the NH_4Cl being precipitated. (Vauquelin, *Ann. de Chim.*, **13.** 94.) When bits of chloride of ammonium are added to a saturated aqueous solution of chloride of sodium a portion of the latter salt is precipitated while chloride of ammonium dissolves until the solution, at 18.75°, is of 1.1799 sp. gr. This solution contains 32.64% of saline matter. Or, 100 pts. of water dissolve 48.44 pts. of the mixed salts, viz. 26.38 pts. of Na Cl and 22.06 pts. of NH_4Cl. The same solution may be prepared by acting on a mixture of Na Cl and NH_4Cl with pure water. (Karsten, *Berlin Abhandl.*, 1840, pp. 106, 107.) If equal weights of saturated solutions of Na Cl and NH_4Cl be mixed, the mixture is capable of dissolving a further portion of either of these salts without precipitating any of that already dissolved; if the solutions have been mixed in other proportions, however, precipitation may of course occur. (Karsten.)

Insoluble in a saturated solution of chloride of calcium. (Vauquelin, *Ann. de Chim.*, **13.** 95.) Chloride of sodium is much more soluble in hot than in cold water which contains in solution chloride of magnesium or chloride of calcium, pure chloride of sodium separating out as the solutions cool. On the other hand, a considerable quantity of chloride of sodium is precipitated when its aqueous solution, saturated at the ordinary temperature, is mixed with a solution of chloride of magnesium, or chloride of calcium, similarly saturated. According to Fuchs, these reactions depend upon the strong affinity of the deliquescent salts for water at the ordinary temperature, they being thus enabled to deprive the chloride of sodium of a portion of its solvent; and upon the fact that they melt in their own water of crystallization at temperatures below that at which the saturated solution of chloride of sodium boils. (Fuchs & G. Reichenbach, *Kastner's Archiv.*, 1826, **7.** 410, *et seq.*) Less soluble in a concentrated solution of chloride of calcium than in pure water. (Hermann.)

Soluble in a saturated solution of chloride of barium, with elevation of temperature and precipitation of Ba Cl. (Vauquelin, *Ann. de Chim.*, **13.** 94.) If crystals of chloride of barium be added to a saturated solution of Na Cl they are dissolved, at first without separation of Na Cl, but after a certain amount has been thus dissolved, the solution of further portions occasions the precipitation of Na Cl, and this reaction goes on until the amounts of the two salts in solution have attained a certain definite equilibrium. (Karsten, *Berlin Abhandl.*, 1840, p. 109.) [See also under Chloride of Barium.] Soluble in a saturated solution of chloride of potassium, with elevation of temperature and precipitation of K Cl. (Vauquelin, *Ann. de Chim.*, **13.** 94.) When chloride of potassium is added to a saturated solution of chloride of sodium it dissolves, while Na Cl is precipitated until a certain definite equilibrium is attained. (Karsten, *loc. cit.*, p. 109.)

Soluble in a saturated solution of nitrate of ammonia, without causing any precipitation of the latter. (Karsten.) Soluble in a saturated solution of nitrate of ammonia, from which solution it is not displaced by salts which would precipitate it from its solution in pure water. (Margueritte, *C. R.*, **38.** 307.) Soluble in a solution of nitrate of soda, with elevation of temperature and precipitation of $Na O, N O_5$. The solution obtained marks 29° B. (Vauquelin, *Ann. de Chim.*, **13.** 92.) When crystals of nitrate of soda are added to a saturated solution of chloride of sodium, the former rapidly dissolve while Na Cl is precipitated. After the reaction is completed the solution at 18.75° contains 43.9% of mixed salt. Or, 100 pts. of water dissolve 78.11 pts. of mixed salt, viz. 25.22 pts. Na Cl, and 52.89 pts. $Na O, N O_5$. A mixed solution of identical composition is obtained when mixed Na Cl and $Na O, N O_5$ are treated with water. (Karsten, *loc. cit.*, p. 108.)

Soluble in a saturated solution of nitrate of potash, with slight elevation of temperature. The mixed solution obtained is now capable of dissolving more nitrate of potash; the solubility of the latter appearing to increase in the same ratio as the quantity of chloride of sodium present. [See also under Nitrate of Potash.] (Fourcroy & Vauquelin, *Ann. de Chim*, **11.** 130, *et seq.*) When a mixed solution of chloride of sodium and of nitrate of potash is evaporated at the boiling temperature, Na Cl separates out, while $K O, N O_5$ remains in solution. At the ordinary temperature the converse of this is true, $K O, N O_5$ separating out before Na Cl. (Vauquelin, *Ann. de Chim.*, **13.** 97.) Soluble in a saturated solution of nitrate of potash, a few needles of $K O, N O_5$ separating out at first, but these soon re-dissolve. The solution thus obtained at 18.13° contains 40.34% of mixed salt. Or, 100 pts. of water dissolve 67.7 pts. of mixed salt, viz. 38.25 pts. Na Cl and 29.45 pts. $K O, N O_5$. This solution is not of the same composition as that prepared by treating a mixture of the two salts with water. Such a solution prepared at 18.75° contained 43.73% of mixed salt. Or, 100 pts. of water dissolve 77.72 pts. of mixed salt, viz. 39.19 pts. Na Cl and 38.53 pts. $K O, N O_5$. (Karsten, *Berlin Abhandl.*, 1840, p. 118.) Soluble in a saturated solution of nitrate of baryta (Karsten, *loc. cit.*), with diminution of temperature and without occasioning any precipitation. (Vauquelin, *loc. cit.*, p. 93.) Insoluble in a solution of nitrate of lime. Somewhat soluble in a saturated solution of nitrate of magnesia, with slight elevation of temperature and deposition of a small portion of $Mg O, N O_5$. (Vauquelin, *loc. cit.*, **13.** 93.)

Soluble in a saturated solution of sulphate of ammonia, with elevation of temperature and precipitation of a considerable portion of $N H_4 O, S O_3$. (Vauquelin.) Soluble in a cold saturated solution of sulphate of soda, with elevation of temperature, and precipitation of some $Na O, S O_3$. At the boiling temperature, however, Na Cl is precipitated, when sulphate of soda is added to the solution. (Vauquelin, pp. 90 – 92.) Soluble in a saturated solution of sulphate of soda, at first without any precipitation, but subsequently with precipitation of $Na O, S O_3$ A solution of the same sp. gr. as the above is obtained when a mixture of the two salts is treated with water at the same temperature. (Karsten, *Berlin Abhandl.*, 1840, p. 114.) Soluble in a saturated solution of sulphate of potash (Karsten), with elevation of temperature and precipitation of some $K O, S O_3$. (Vauquelin.) Soluble in a saturated solution of sulphate of magnesia, with slight diminution of temperature, and precipitation of some $Mg O, S O_3$. (Vauquelin, *loc. cit.*, pp. 90 – 92; Karsten, *loc. cit.*, p. 115.) Soluble in a saturated solution of sulphate of copper (Karsten); and of sulphate of zinc, a quantity of a double salt ($Na O, S O_3$; $Zn O, S O_3$) separating. (Karsten, *loc. cit.*, p. 127.) When one equivalent of chloride of sodium (Na Cl), in aqueous solution, is mixed with a solution of an equivalent of sulphate of zinc ($Zn O, S O_3$), 0.72 of it are decomposed to sulphate of soda, which may be precipitated by adding alcohol, while 0.28 of it remain unchanged; when mixed with a solution of an equivalent of sulphate of magnesia 0.545 of it are decomposed as before, while 0.455 of it remain unchanged. (Malaguti, *Ann. Ch. et Phys.*, 1853, (3.) **37.** 203.) Soluble in a saturated solution of acid sulphate of alumina, with diminution of temperature; no precipitate is formed. (Vauquelin, *loc. cit.*, pp. 90 – 92.)

Soluble in a solution of chlorate of potash. The solution thus obtained can now dissolve a further portion of $K O, Cl O_5$. (Margueritte, *C. R.*, **38.** 305.)

$b = Na Cl + 4 Aq$ Crystallizes from saturated solutions of common salt, at temperatures below —5° @ —10°.

Efflorescent at temperatures below 0°, but partially deliquescent at temperatures above 0°. (Fuchs, *Kastner's Archiv.*, 1826, **7.** 415.)

Chloride of Sodium & *bichloride* of Tin.
I.) $Na Cl; Sn Cl_2$ Hygroscopic. (Wittstein.)
II.) $Na Cl; Sn Cl_2 + 5 Aq$ Permanent; efflorescing only in warm air. Very easily soluble. (Bolley.)

Chloride of Sodium & of Uranium (basic). Soluble in water.

Chloride of Sodium & of Zinc. Easily soluble in water, apparently with decomposition. (Schindler.)

Chloride of Sodium with *proto*Cyanide of Mercury.
$Na Cl; 2 Hg Cy$ Readily soluble, especially in hot water. Sparingly soluble in alcohol. (Poggiale; Brett.)

Chloride of Sodium with Glucose (Grape sugar).
$2 C_{12} H_{12} O_{12}; Na Cl + 2 Aq$ Permanent. Soluble in 3.685 pts. of cold water. Difficultly soluble in alcohol. Very sparingly soluble in alcohol of 96%. Melts in its water of crystallization at 120°, when rapidly heated.

Insoluble in oil of turpentine. (T. S. Hunt, *Am. J. Sci.*, (2.) **19.** 416.)

Chloride of Sodium with Glycocoll. Soluble in water; less soluble in alcohol. (Horsford.)

Chloride of Sodium with Iodate of Soda.
$Na Cl ; Na O, I O_5 + 12 Aq$ Permanent. Decomposed by water, which removes chloride of sodium. (Rammelsberg.)

Chloride of Sodium with Mannite. Soluble in water. Almost insoluble in alcohol. (Riegel.)

Chloride of Sodium with Sulphuric Acid
$Na Cl ; X S O_3$ (anhydrous). Instantly decomposed by moisture.

Chloride of Sodium with Urea. Deliques-
$Na Cl ; C_2 H_4 N_2 O_2 + 2 Aq$ cent Very soluble in water. Partially decomposed by absolute alcohol.

Unlike chloride of sodium, it is soluble in tolerably large quantity in ether, and alcohol.

*Bi*Chloride of Stann(*ic*)ammonium. Per-
$N \left\{ \begin{matrix} H_3 \\ Sn' \end{matrix} \right. Cl_2$ manent. Completely soluble in cold water, but after several days, or when heated, the solution is liable to become suddenly gelatinous. (H. Rose.)

Chloride of Stann(*ic*)Amyl. Soluble in
(*Chloride of bi StannAmyl.*) alcohol, and ether.
$Sn_2 (C_{10} H_{11}), Cl$

Chloride of Stann(*ic*)*di*Amyl. Less solu-
$Sn_2 (C_{10} H_{11})_2, Cl$ ble in alcohol, and ether, than the chloride of stann(*ous*)amyl.

Chloride of Stann(*ic*)*tri*Amyl. Insoluble in
$Sn_2 (C_{10} H_{11})_3, Cl$ water. Readily soluble in alcohol.

Chloride of Stann(*ic*)*tetr*Amyl. Insoluble
$Sn_2 (C_{10} H_{11})_4, Cl$ in water. Soluble even in dilute alcohol.

Chloride of Stann(*ous*)Amyl. Readily sol-
(*Chloride of StannAmyl.*) uble in alcohol, and ether.
$Sn (C_{10} H_{11}), Cl$

Chloride of Stann(*ic*)*tri*Ethyl. Miscible in
(*Chloride of ⅔ StannEthyl.*) all proportions with al-
$Sn_2 (C_4 H_5)_3, Cl$ cohol, and ether. (Lœwig.)

Chloride of *tetra*StannEthyl. Soluble in alcohol, and ether, from both of which it is precipitated by water.

Chloride of Stann(*ous*)Ethyl. Soluble in
$Sn (C_4 H_5), Cl$ water.

$2 (C_4 H_5 Sn), Cl$ Sparingly soluble in alcohol. (Lœwig.)

$Sn_2 (C_4 H_5)_3, Cl ; 5 (Sn C_4 H_5, Cl)$
$Sn_4 (C_4 H_5)_5, Cl$
$Sn_6 (C_4 H_5)_4, Cl$ Soluble in ether. (Lœwig.)

Chloride of Stann(*ous*)Methyl.
$C_2 H_3 Sn, Cl$

Chloride of Stib*di*Amyl.

Chloride of Stib*tri*Amyl. Insoluble in
$Sb \left\{ (C_{10} H_{11})_3, Cl_2 \right.$ water. Easily soluble in alcohol, and ether. (Berlé.)

Chloride of Stib*tri*Ethyl.

I.) $Sb \left\{ (C_4 H_5), Cl \right.$ Deliquescent. Very soluble in water. Soluble in chlorhydric acid, with combination. (Merck.)

II.) $Sb \left\{ (C_4 H_5)_3, Cl_2 \right.$ Insoluble in water. Readily soluble in alcohol, and ether. (Lœwig & Schweitzer.)

Chloride of StibEthylium. More deli-
$Sb \left\{ (C_4 H_5)_4, Cl + 3 Aq \right.$ quescent than chloride of calcium. Very easily soluble in water, and alcohol.

Chloride of StibMethylEthylium. Per-
$Sb \left\{ \begin{matrix} (C_2 H_3) \\ (C_4 H_5)_3 \end{matrix} \right. Cl$ manent. Soluble in water. (Friedlænder.)

Chloride of StibMethylium. Very sol-
$Sb \left\{ (C_2 H_3)_4, Cl \right.$ uble in water; less soluble in alcohol. Insoluble in ether. (Landolt.)

Chloride of Stilbene. There are two iso-
$C_{28} H_{12}'', Cl_2$ meric modifications: —

α.) *small monoclinic crystals.* Almost insoluble in boiling alcohol. Very sparingly soluble in ether.

β.) *octagonal tables.* Readily soluble in alcohol, and still more soluble in ether. (Laurent.)

Chloride of Strontium. Permanent. De-
$Sr Cl + 6 Aq$ liquesces in moist air. The anhydrous salt is soluble in 1.5 pts. of water at 15°, and in 0.8 pt. at boiling. (Dumas, *Tr.*) Soluble in 1.996 pts. of water at 15°. (Gerlach's determination, see his table of sp. grs., below.)

1 pt. of anhydrous chloride of strontium is
soluble in 2.21 pts. of water at — 0.5°
" 2.20 " + 2°
" 2.07 " 8°
" 1.88 " 20°
" 1.69 " 29°
" 1.55 " 37°
" 1.39 " 47°
" 1.24 " 57°
" 1.09 " 67°
" 1.02 " 84°
" 0.99 " 93°
" 0.89 " 106°
(Kremers, *Pogg. Ann.*, **92.** 499.)

1 pt. of the anhydrous salt is
soluble in 2.27 pts. of water at 0°
" 1.88 " 20°
" 1.54 " 40°
" 1.18 " 60°
" 1.08 " 80°
" 0.98 " 100°

This new set of determinations was made with care, since their author has frequently observed a slight tendency in this salt to form supersaturated solutions. (Kremers, *Pogg. Ann.*, **103.** 66.) The hydrated salt is soluble in 0.75 pt. of cold water, and in all proportions in hot water. (Hope [?].) Ure (*Dict.*) cites from two sets of observations: —

100 pts. of water at 87.7° dissolve 43 pts. of it.
" 15.5° " 150 "
" 100° " an unlimited am't.

Soluble in 3 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.)

The point of ebullition of pure water, observed in a glass tube containing bits of metallic zinc, having been 100.4°. (Legrand, *Ann. Ch. et Phys.*, 1835, (2.) **59.** 436.) The anhydrous salt is soluble in from 111.6 to 116.4 pts. of alcohol, of 99.3%, at 14.5°, and in 262 pts. of the same alcohol, at boiling. (Fresenius, *Ann. Ch. u. Pharm.*, 1846, **59.** 127.) The hydrated salt is soluble in 6 pts. of alcohol, of 0.833 sp. gr., at 15°. (Vauquelin.) Soluble in 24 pts. of absolute alcohol at 15°, and in 19 pts. at the temperature of boiling. (Bucholz, *Beiträge*, **3.** 29. [*T.*].) Soluble in 2.5 pts. of boiling alcohol. Concentrated chlorhydric acid precipitates it from the aqueous solution. (Hope.) Less soluble in acidulated than in pure water.

Chloride of Strontium & *protochloride* **of Tin.**
$Sr Cl ; Sn Cl + 4 Aq$

Chloride of Strontium & *bichloride* **of Tin.**
$Sr Cl ; Sn Cl_2 + 5 Aq$

Chloride of Strontium with *proto***Cyanide of Mercury.** Easily soluble in water and in dilute alcohol. (Brett.) Readily soluble in water. (Poggiale.)
$Sr Cl ; 2 Hg Cy + 6 Aq$

Chloride of Styracyl (or **of Styryl**). Insoluble in water. Difficultly soluble in cold, more readily soluble in hot alcohol. Easily soluble in ether. (Ramdohr.)
$C_{18} H_9 Cl$

Chloride of Styracylammonium. Soluble in water.
$N \left\{ \begin{matrix} C_{18} H_9 \\ H_3 \end{matrix} \right. Cl$

Chloride of Succinyl. Decomposed by water, and alcohol. Soluble in anhydrous ether. Easily soluble in ammonia. (Gerhardt & Chiozza.)
$C_8 H_4 O_4'', Cl_2$

Chloride of *bi***Sulphide of Methyl.** *Vid.* Chloride of Sulphur with Sulphide of Methyl.

*Bi***Chloride of SulphoBenzid.** *Vid.* Chlorhydrate of *bi*ChloroSulphoBenzid.

Chloride of SulphoBenzoyl. Insoluble in water, but is slowly decomposed thereby. Soluble in alcohol, with evolution of heat and decomposition. Soluble in ether, apparently without decomposition. Soluble, with decomposition, in an aqueous or alcoholic solution of ammonia. (Limpricht & v. Uslar, *Ann. Ch. u. Pharm.*, **102.** 250.)
(*Sulphate of biChloro Benzylene. Chloro Sulpho Benzoic Acid.*)
$C_{14} H_4 S_2 O_6, Cl_2$

Chloride of SulphoPhenyl. Insoluble in water. Readily soluble in alcohol. (Gerhardt & Chiozza.)
(*Sulphite of ChloroBenzene. Phenyl Sulphurous Chloride.*)
$C_{12} H_5 S_2 O_2, Cl$

Chloride of SulphoPhenylamidyl. Decomposed by water, alcohol, and ether. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **53.** 310.)
$N \left\{ \begin{matrix} C_{12} H_4 S_2 O_2'' \\ H_2 \end{matrix} \right. , Cl$

*Di***Chloride of Sulphur.** Slowly decomposed by water. Soluble in alcohol, with decomposition. (Stümcke.) Soluble in ether, with subsequent decomposition. (Dumas.) Readily miscible with bisulphide of carbon.) "Chloride of sulphur" is easily soluble in oil of turpentine, with evolution of heat.
(*ProtoChlorure de Soufre* (incorrectly).)
$S_2 Cl$

"Chloride of sulphur" is easily soluble in caoutchin. (Himly.)

*Proto***Chloride of Sulphur.** Slowly decomposed by water; immediately decomposed by alcohol, and ether.
(Incorrectly *DeutoChlorure de Soufre.*)
$S Cl$

Solid protoChloride of Sulphur. Decomposed by water. Readily soluble in dichloride of sulphur. (Millon.)

*Bi***Chloride of Sulphur.** Decomposed by water. (H. Rose.)

*Ter***Chloride of Sulphur.** Decomposed by water.

Chloride of Sulphur & of Tin. It forms a milky solution with water. Soluble, with decomposition, in dilute nitric acid.
$Sn Cl_2 ; 2 S Cl_2$

Chloride of Sulphur & of Titanium. Deliquescent. Decomposed by water.

Chloride of Sulphur with **Sulphide of Methyl.**
(*Chloride of bi Sulphide of Methyl.*)
$C_4 H_6 S_2 ; S_2 Cl_2$

Chloride of Sulphur with **Sulphide of Nitrogen.**
(*ChloroSulphate of Sulphide of Nitrogen.*)

I.) $S Cl ; N S_2$ } Very easily decomposed.
II.) $S Cl ; 2 (N S_2)$ (?) } Very easily decomposed.

III.) $S Cl ; 3 (N S_2)$ Tolerably permanent. Slowly decomposed by pure water; instantly decom-
(*ChloroSulphide of Nitrogen. ChloroSulphate of Sulphide of Nitrogen. Sulphozotic Chloride of Nitrogen.*)

posed by water containing a little ammonia. Very sparingly soluble in bisulphide of carbon. (Fordos & Gélis, *Ann. Ch. et Phys.*, (3.) **32**. 407.)

IV.) $S\,Cl;\,N\,S_3$ *(Chloro Sulphide of Nitrogen.)* Soluble in water, with subsequent partial decomposition. Insoluble in alcohol, and ether. (Soubeiran.)

Chloride of Tantalum. $Ta\,Cl_2$ Decomposed by water, to chlorhydric acid and insoluble tantalic acid. Completely soluble in absolute alcohol. Decomposed, with solution, by concentrated sulphuric, and chlorhydric acids; also partially by potash-lye; but a solution of carbonate of potash does not dissolve any of it. (H. Rose.)

Chloride of TellurEthyl. $C_4\,H_5\,Te,\,Cl$ Sparingly soluble in water and in concentrated chlorhydric acid. (Wœhler.)

*Proto*Chloride of Tellurium.

I.) $Te\,Cl$ Hygroscopic. Decomposed by water.

II.) *basic.*

*Bi*Chloride of Tellurium.

I.) $Te\,Cl_2$ Deliquesces more rapidly than chloride of calcium. Decomposed by water. Completely soluble in boiling water. When the hot aqueous solution is allowed to cool slowly, tellurous acid crystallizes out, and a basic salt also. Soluble, without decomposition, in chlorhydric acid, and this solution can be diluted with water to a considerable extent without being precipitated. (Berzelius, *Lehrb.*, **3**. 1133.) It is decomposed by water even in the cold; but is completely dissolved by a large excess of water. (H. Rose, *Pogg. Ann.*, **83**. 150.)

II.) *basic.* *(Tellurite of bi Chloride of Tellurium.)* Somewhat soluble, especially in boiling water.

*Bi*Chloride of Tellurium with Chloride of *X*. *Vid.* ChloroTellurate of *X*.

Chloride of TellurMethyl. $C_2\,H_3\,Te,\,Cl$ Soluble in warm, much less soluble in cold water acidulated with nitric acid. Readily soluble in alcohol. (Wœhler & Dean, *Ann. Ch. u. Pharm.*, **93**. 235.)

Chloride of Tetryl. *Vid.* Chloride of Butyl.

Chloride of Tetrylene. *Vid.* Chloride of Butylene.

Chloride of Thionyl. $S_2\,O_2,\,Cl_2$ Decomposed by water and by alkaline solutions. (Schiff.)

Chloride of Thorium.

I.) *normal.*

a = anhydrous. $Th\,Cl$ Deliquescent. Soluble in water, with great evolution of heat. The solution is not decomposed by boiling, but chlorhydric acid is given off when it is evaporated. Perfectly soluble in alcohol.

b = hydrated. $Th\,Cl + x\,Aq$ Deliquescent. Soluble in water; less soluble in water acidulated with chlorhydric acid. Easily soluble in alcohol.

II.) *basic.*

*Proto*Chloride of Tin. *(Chloro Stannous Acid.)*

I.) *normal.* $Sn\,Cl + 2\,Aq$ When freshly prepared it is readily and completely soluble, without decomposition, in cold water which has been deprived of air; even when large quantities of water are used. This solution may be boiled without undergoing decomposition, but as soon as air is admitted to it oxidation occurs and precipitation ensues. (H. Rose, *Pogg. Ann.*, **83**. 143.) Easily soluble in absolute alcohol, especially when hot. (Capitaine.) Insoluble in oil of turpentine. Soluble in chlorhydric acid.

The aqueous solution saturated at 15° is of 1.827055 sp. gr., and contains dissolved in every 100 pts. of water at least 269,836 pts. of the salt. (Michel & Krafft, *Ann. Ch. et Phys.*, (3.) **41**. pp. 478, 482.) Melts in its water of crystallization at 41.6°, and the liquid may be cooled to 28.3° without becoming solid: — it boils at 121.7°. (Ordway, *Am. J. Sci.*, (2.) **27**. 15.)

II.) *basic.* *Vid.* OxyChloride of Tin.

*Bi*Chloride of Tin.

α.) Ordinary modification.

a = anhydrous. $Sn\,Cl_2$ Absorbs water from the air, and combines therewith. Soluble in water. Very soluble in absolute alcohol, with combination; water precipitates it from this solution. (Dœbereiner.) In contact with a small quantity of water it forms a solid hydrate, with more water it dissolves completely. On evaporating the aqueous solution, chlorhydric acid and then bichloride of tin pass off with the aqueous vapor as soon as the solution has become somewhat concentrated; but the solution remains clear, and the basic salt contained in it is susceptible of crystallizing, and is still soluble in water. On continuing the distillation, much bichloride of tin and chlorhydric acid are evolved, and a residue of binoxide of tin is left. On diluting the aqueous solution with much water and then boiling it, hydrated oxide of tin will be precipitated; the precipitation may be made complete by diluting with a sufficient amount of water. A solution of bichloride of tin (*α*) is not precipitated on the addition of nitric or chlorhydric acid, nor does sulphuric acid produce a precipitate, unless the solution has been largely diluted with water; it is not modified at first by phosphoric acid, but the mixture gelatinizes at the end of several days; with an aqueous solution of arsenious acid it forms a precipitate, but only after the lapse of some time. No precipitate is produced on the addition of aqueous solutions of the sulphates of potash and soda, the chlorides of potassium, sodium, and ammonium, nitrate of potash, or analogous salts. (H. Rose, *Tr.*) Readily soluble in ether, forming a compound which is easily soluble in an excess of ether, but is precipitated therefrom by water. (Kuhlmann.) Decomposed by oil of turpentine.

b = hydrated. When bichloride of tin is treated with a small quantity of water it combines therewith, a hydrate ($Sn\,Cl_2 + 2\,Aq$) heing precipitated; this dissolves, however, when more water is added. Another hydrate ($Sn\,Cl_2 + 5\,Aq$) is very deliquescent and soluble in water. (Lewy, *Ann. Ch. et Phys.*, (3.) **16**. 304.) When heated, the hydrated salt melts like ice, and solidifies again on cooling. It is easily soluble in water. Alcohol decomposes it with formation of basic protochloride. (Berzelius, *Lehrb.*, **3**. 763.) The aqueous solution is decomposed on boiling, the more completely in proportion as the solution is more dilute and as it contains less free chlorhydric acid. (H. Rose, *Pogg. Ann.*, **83**. 150.) Soluble in chlorhydric acid. When the aqueous solution contains a slight excess of chlorhydric acid it remains clear and unaltered on boiling. (Berzelius, *Lehrb.*, **2**. 597; **3**. 763.) Two thirds of the acid of bichloride of tin may be abstracted, and the basic tin-salt formed still be soluble in water, but the abstraction of more acid causes gelatinization. (Ordway, *Am. J. Sci.*, (2.) **23**. 222.)

β.) Anomalous modification. *(Chloride of MetaStannic Acid.)* [Compare *bin*Oxide of Tin, *β*.] Soluble in cold water, but the solution coagulates on boiling. Strong chlorhydric acid precipitates it from the aqueous solution. (Berzelius, *Lehrb.*) On evaporating the aqueous solution it behaves quite differently from that of modif. α, becoming troubled on the application of heat, and only chlorhydric acid, but no bichloride of tin, being evolved. On diluting the aqueous solution with much water and then boiling, hydrated oxide of tin (β) will be precipitated; other circumstances being equal the oxide β is more readily precipitated in this case than the oxide α. When the solution does not contain an excess of acid, the addition of chlorhydric acid causes an abundant precipitate, though all of the salt cannot thus be removed from the solution; on decanting the supernatant acid and treating the precipitate with water it dissolves readily. Nitric acid also occasions a slight precipitate in solutions which do not contain an excess of acid, the precipitate being, as before, soluble in water. Dilute sulphuric acid produces an abundant precipitate of sulphate of tin (β) [*q. vid.*], even when the solution has not been previously diluted with water. Aqueous solutions of the sulphates of potash and soda produce abundant precipitates, insoluble in water, but soluble in chlorhydric acid. A solution of chloride of sodium also produces a precipitate, but solutions of the chlorides of potassium and ammonium do not; a solution of nitrate of potash gives a precipitate only after a long time. (H. Rose, *Tr.*)

*Bi*CHLORIDE OF TIN with CYANIDE OF ETHYL.
$C_6H_5N, SnCl_2$ Instantly decomposed by water, and alcohol. It cannot be recrystallized from ether. (Henke.)

*Bi*CHLORIDE OF TIN with CYANIDE OF METHYL.
$C_4H_3N, SnCl_2$ Instantly decomposed by water, and alcohol. It cannot be recrystallized from ether. (Henke.)

CHLORIDE OF TIN with GLYCOCOLL. Somewhat soluble in water. (Horsford.)

*Proto*CHLORIDE OF TIN with IODIDE OF TIN.
$SnCl; SnI$ Decomposed by water. (Henry, *Phil. Trans.*, 1845, p. 363, [*Gm.*].)

*Bi*CHLORIDE OF TIN with IODIDE OF TIN.
$SnCl_2; SnI$ (Kane.)

*Bi*CHLORIDE OF TIN with NITRATE OF TIN. Highly basic compound, readily soluble in water. (Ordway, *Am. J. Sci.*, (2.) **23.** 221.)

*Bi*CHLORIDE OF TIN with OXALATE OF ETHYL.
$C_4H_5O, C_2O_3; SnCl_2$ Decomposed by water. (Lewy, *Ann. Ch. et Phys.*, (3.) **16.** 311.)

*Bi*CHLORIDE OF TIN with OXIDE OF ETHYL.
$2C_4H_5O; SnCl_2$ Decomposed by water. Easily soluble in ether. (Lewy, *Ann. Ch. et Phys.*, (3.) **16.** 309.)

*Proto*CHLORIDE OF TIN with OXYCHLORIDE OF PHOSPHORUS.
$2SnCl; PO_2Cl_3$ Hygroscopic, with decomposition. Decomposed by water. (Casselmann, *Ann. Ch. u. Pharm.*, **91.** 242.)

*Bi*CHLORIDE OF TIN with PHOSPHURETTED HYDROGEN.
$PH_3; 3SnCl_2$ Decomposed by water.

*Bi*CHLORIDE OF TIN with *bi*SULPHIDE OF TIN.
(*Chloro Sulphide of Tin.*)
$2SnCl_2; SnS_2$ Decomposed by water. (Dumas.)

CHLORIDE OF TITAN*bi*AMIN.
(*Ammonio-Chloride of Titanium.*)
$N_2\left\{H_6 . Ti, Cl_2\right.$ Deliquesces in moist air. Soluble in water, without decomposition. (H. Rose.)

*Proto*CHLORIDE OF TITANIUM. (?) Unacted upon by water. Soluble, with decomposition, in ammonia-water. (Ebelmen, *Ann. Ch. et Phys.*, (3.) **20.** 391.)

*Sesqui*CHLORIDE OF TITANIUM.
Ti_2Cl_3 Hygroscopic. Soluble in water, with evolution of heat. This solution decomposes after a time. (Ebelmen, *Ann. Ch. et Phys.*, (3.) **20.** 387.)

*Bi*CHLORIDE OF TITANIUM.

a = *anhydrous.* $TiCl_2$ Deliquescent. Soluble in water, with evolution of much heat. If too much water be added at once the chloride is decomposed, binoxide of titanium being formed. On boiling the aqueous solution, and especially if it be acidulated with nitric acid, precipitation occurs. (Berzelius, *Lehrb.*)

b = *hydrated.* $TiCl_2 + 5Aq$ Very hygroscopic. Soluble in water. (Demoly.)

CHLORIDE OF TITANIUM with CYANHYDRIC ACID.
$TiCl_2; HCy$ Deliquescent. Soluble in water, with evolution of heat, and decomposition. (Wœhler.)

CHLORIDE OF TITANIUM with CYANIDE OF ETHYL.
$C_6H_5N, TiCl_2$ Instantly decomposed by water, and alcohol. It cannot be recrystallized from ether. (Henke.)

CHLORIDE OF TITANIUM with CYANIDE OF METHYL.
$C_4H_3N, TiCl_2$ Instantly decomposed by water, and alcohol. It does not recrystallize from its solution in ether. (Henke.)

CHLORIDE OF TITANIUM with HYDRATE OF ETHYL.
$TiCl_2; 2C_4H_6O_2$ Decomposed by water. (Demoly.)

CHLORIDE OF TITANIUM with OXIDE OF ETHYL.
$TiCl_2; 2C_4H_5O$ Decomposed by water. Easily soluble in ether. (Demoly.)

CHLORIDE OF TITANIUM with PHOSPHURETTED HYDROGEN.
$PH_3, HCl; 2TiCl_2$ Decomposed by water, acids, and alkaline solutions. (H. Rose.)

CHLORIDE OF TOLUENE*chloré*. *Vid.* Chloride of ChloroToluene.

CHLORIDE OF TOLUENYL.
(*Chloride of Benzyl. Chloro-Toluol. Chloro Toluene. Chloride of Benzethyl. Benzhydrochloric Ether. ChloroBenzoenase. Hydrochlorate of Benzylene.*)
$C_{14}H_7Cl$ Insoluble in water. Readily soluble in alcohol and in ether. (Cahours.) It is identical with monochlorotoluene. (Cannizzaro.)

CHLORIDE OF TOLUYL.
$C_{16}H_7O_2Cl$ Rapidly decomposed by water. (Cahours.)

CHLORIDE OF *alpha*TOLUYL.
$C_{16}H_7O_2, Cl$

CHLORIDE OF TRITYL. *Vid.* Chloride of Propyl.

*Bi*CHLORIDE OF TUNGSTEN.
WCl_2 Decomposed by water. Soluble, with decomposition, in solutions of potash or ammonia. (Wœhler.)

*Ter*CHLORIDE OF TUNGSTEN.
WCl_3 Decomposed by water (Wœhler), and by absolute alcohol. (Riche.)

$W_2Cl_5 = WCl_2, WCl_3$ Quickly decomposed by water, and by exposure to the air.

*Proto*CHLORIDE OF URANIUM.
(*Green Chloride of Uranium.*)

I.) $UrCl$ Exceedingly deliquescent. Very easily soluble in water, with evolution of heat, and apparently with decomposition. When the aqueous solution is evaporated to dryness much chlorhydric acid is disengaged, but the residue is still soluble in water; when evaporated in vacuo at the ordinary temperature, a deliquescent mass is obtained differing from the original chloride. (Péligot, *Ann. Ch. et Phys.*, (3.) **5.** pp. 10, 16.) Dissolves in water with a hissing noise. (Rammelsberg.) The aqueous solution is decomposed when boiled or evaporated. (Berzelius.)

II.) *basic.* Extremely soluble in water, with
$Ur_4\,Cl_3$ decomposition in the course of a few moments. (Péligot, *Ann. Ch. et Phys.*, (3.) **5.** 20.)

*Sesqui***Chloride of Uranium.**
(*Chloride of Uranyl.*)
I.) *basic.* Quickly deliquescent. Easily soluble
$Ur_2\,Cl_3\,;\,2\,Ur_2\,O_3 =$ ("$Ur_2\,O_2\,Cl$" of Péligot). in water. (Péligot, *Ann. Ch. et Phys.*, (3.) **5.** 36.) Easily soluble in alcohol, and ether.

Chloride of Valeryl. Decomposed by
$C_{10}\,H_9\,O_2,\,Cl$ water. (Moldenhauer.)

*Bi***Chloride of Vanadium.**
a.) *Blue modification.* Soluble in water. There
$V\,Cl_2$ appear to be two salts, of which the one containing most acid is soluble in alcohol.

β.) *Brown modification.* Soluble in water.

*Ter***Chloride of Vanadium.** It forms a clear
$V\,Cl_3$ solution when treated with much water, but is rendered turbid by a small quantity of water. Abundantly soluble, with decomposition, in alcohol.

"**Chloride of Vinyl.**" *Vid. mono*Chlor-Ethylene.

Chloride of ***tetra*****Vinylium.** Very hygro-
$C_{16}\,H_{12}\,N,\,Cl + Aq$ scopic. Soluble in water. (Heintz & Wislicenus.)

Chloride of Yttrium. Deliquescent. Sol-
$Y\,Cl + 3\,Aq$ uble in water, with evolution of heat. (Wœhler.) When heated it melts in its water of crystallization. (Steel, in *Thomson's System of Chem.*, London, 1831, **2.** 816.)

Chloride of XanthoCobalt. Rather in-
$N\,O_2\,.\,5\,N\,H_3\,.\,Co_2\,O,\,Cl_2 + Aq$ soluble in cold water. Readily soluble in hot water, but the solution is partially decomposed on boiling. Insoluble in chlorhydric acid, and in solutions of the alkaline chlorides. Easily decomposed by boiling with acids, even dilute. (Gibbs & Genth, *Smithson. Contrib.*, Vol. **9.**)

Chloride of Zinc.
I.) *normal.*
a = *anhydrous.* Hygroscopic. Very soluble in
$Zn\,Cl$ water.
Soluble in 0.333 pt. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) The aqueous solution saturated at 12.5° contains 78.5% of it. (Hassenfratz, *Ann. de Chim.*, **28.** 291.)

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of the anhydrous salt dissolved in 100 pts. of water.
1.1331	16.7
1.2714	38.8
1.3677	56.3
1.5336	92.4

(Kremers, *Pogg. Ann.*, **104.** 155.)

1.2360 . .	40		

(Hassenfratz, *Ann. de Chim.*, **28.** 299.)

Abundantly soluble in hot absolute alcohol, and in ether. Soluble in 1 pt. of strong alcohol at 12.5°. (Wenzel, in his *Verwandtschaft*, p. 300 [T.].) Soluble in 0.35 pt. of absolute alcohol, to a viscid liquor, from which a compound of the salt with alcohol subsequently crystallizes out. (Graham.) Soluble at ordinary temperatures in butylic alcohol (hydrate of butyl), but the solution is decomposed on heating. (Wurtz, *Ann. Ch. et Phys.*, (3.) **42.** 138.) Very easily soluble at ordinary temperatures in caprylic alcohol (hydrate of capryl), but the solution is decomposed when heated. (Bouis, *Ann. Ch. et Phys.*, (3.) **44.** 115.) Soluble in ether. (Dœbereiner.)

When one equivalent of Zn Cl, in aqueous solution, is mixed with a solution of an equivalent of sulphate of potash ($K\,O,\,S\,O_3$), 0.176 of it are decomposed to sulphate of zinc, which may be precipitated by adding alcohol, while 0.824 of it remain unchanged; when mixed with a solution of an equivalent of sulphate of soda ($Na\,O,\,S\,O_3$), 0.29 of it are decomposed as before, while 0.71 of it remain unchanged. (Malagnti, *Ann. Ch. et Phys.*, 1853, (3.) **37.** 203.)

b = $Zn\,Cl + Aq$ Very soluble in water. When nearly dry it is abundantly soluble in alcohol of 36° B. (Masson.)

II.) *basic.*
(*OxyChloride of Zinc.*)
a = $Zn\,Cl\,;\,3\,Zn\,O + 2\,Aq$ Sparingly soluble in water; more readily soluble in an aqueous solution of chloride of zinc. Easily soluble in solutions of caustic ammonia and potash. (Schindler.)

b = $Zn\,Cl\,;\,6\,Zn\,O + 6\,Aq$ Insoluble in water. (Kane.)

c = $Zn\,Cl\,;\,9\,Zn\,O + 14\,Aq$ Insoluble in water. (Kane; Schindler.)

Chloride of Zinc & of Zincammonium.
$Zn\,Cl\,;\,N\left\{\begin{matrix}H_3\\Zn\end{matrix}\right.Cl$ Decomposed by water. (Kane.)

Chloride of Zinc with **Cyanide of Mer-**
$Zn\,Cl\,;\,2\,Hg\,Cy + 6\,Aq$ **cury.** Efflorescent. Soluble in water. (Poggiale.)

Chloride of Zinc with **Urea.** Very deli-
$Zn\,Cl\,;\,C_2\,H_4\,N_2\,O_2$ quescent. Extremely soluble in water, and alcohol, even

absolute. (Neubauer & Kerncr, *Ann. Ch. u. Pharm.*, **101.** 340.)

CHLORIDE OF ZINC*bi*AMIN. (*AmmonioChloride of Zinc.*) $N_2 \left\{ H_6 . Zn, Cl + Aq \right.$ Partially decomposed by water. Soluble in warm, less soluble in cold ammonia-water. (Kane.)

CHLORIDE OF ZINCAMMONIUM. $N \left\{ \begin{matrix} H_3, \\ Zn' \end{matrix} \right. Cl$ Soluble in water. (Kane.) Not completely soluble in water. Soluble in a hot aqueous solution of chloride of ammonium, separating out again as the solution cools. (Ritthausen.)

***Sesqui*CHLORIDE OF ZIRCONIUM.**

I.) *normal.*

a = *anhydrous.* $Zr_2 Cl_3$ Very easily soluble in water, with evolution of heat. Abundantly soluble in alcohol.

Scarcely soluble in concentrated chlorhydric acid. (Dumas, *Tr.*, **6.** 321.) Readily soluble in chlorhydric acid. (Gmelin's *Handbook.*)

b = *hydrated.* $Zr_2 Cl_3 + 3 Aq$ Efflorescent. Readily soluble in water, and alcohol. If the aqueous solution be evaporated to dryness at 60°, half of the acid is expelled, leaving the basic salt. (Ot. Gr.) Very sparingly soluble in concentrated chlorhydric acid, being much less soluble therein than the sesquichloride of iron [or of alumina]. (Berzelius, *Lehrb.*, **2.** 186.)

II.) *basic.*

a = $Zr_2 Cl_3 ; Zr_2 O_3 + 3 Aq$

b = $2 Zr_2 Cl_3 ; Zr_2 O_3 + 24 Aq$ Efflorescent. Easily soluble in water. After having been evaporated on the water-bath it assumes a gummy condition, and is then slowly, though completely, soluble in water. When the aqueous solution is largely diluted with water, and then boiled for some time, it is decomposed, and a more basic insoluble salt separates out. (Berzelius, *Lehrb.*, **3.** 504.) Soluble in alcohol.

c = $Zr_2 Cl_3 ; 2 Zr_2 O_3$ Insoluble in water. (Hermann.)

CHLORIMASATIN. (*Imachlorisatinase.*) $C_{32} H_9 Cl_2 N_3 O_6$ Insoluble in boiling alcohol. Soluble in a solution of potash. (Laurent.)

CHLORIMESATIN. (*Imechlorisatinase.*) $C_{16} H_5 Cl N_2 O_2$ Very sparingly soluble in boiling alcohol. Almost insoluble, or insoluble, in ether. (Laurent.) Slowly decomposed by boiling water.

CHLORINATED CHLORIDE [&c.] OF *X*. *Vid.* Chloride [&c.] of Chloro *X*.

CHLORINATED OIL FROM CINNAMIC ACID. Difficultly soluble in water. Easily soluble in alcohol, from which it is precipitated by water. (Herzog.)

CHLORINDATMIT(of Erdmann). *Vid. ter*Chlor-Anilin.

CHLORINDIN. $C_{32} H_8 Cl_2 N_2 O_4$ Insoluble in water, alcohol, or chlorhydric acid. (Erdmann.) Soluble in potash-lye.

***Bi*CHLORINDIN.** $C_{32} H_6 Cl_4 N_2 O_4$ Insoluble in water, alcohol, or chlorhydric acid. (Erdmann.)

CHLORINDOPTIC ACID. *Vid. ter*ChloroPhenic Acid.

CHLORINE. (*Oxymuriatic Acid.*) Cl At 15.56°, and the ordinary atmospheric pressure, 1 vol. of water takes up about 2 vols. of the gas; if the latter be diluted with air then much less is absorbed, but the quantity is not proportionate to the abstract pressure of the gas, as is the case with other of the permanent gases. Thus, at $\frac{1}{7}$ of the atmospheric pressure water will take up $\frac{2}{3}$ of its bulk of chlorine, which is more than twice the quantity it ought to take by the rule of proportion. Hence, it is evident that the absorption of this gas by water is partly of a mechanical, and partly of a chemical nature. (Dalton, in his *New System*, **2.** 297.) From 0° to 9° its solubility in water increases, but above this point rapidly diminishes, until at 100° scarcely any of the gas is dissolved. (Gay-Lussac.) Water absorbs 2 vols. of it at 15°, i. e. 1 pt. by weight is soluble in about 150 pts. of water at this temperature; but an aqueous solution of chloride of potassium absorbs $\frac{1}{3}$ less. (Berzelius.) 1 vol. of water absorbs 3.04 vols. of it at 8°. This is the maximum, the solubility decreasing rapidly as the temperature is elevated. At 50° 1 vol. of water dissolves 1.09 vols. Below 8° also the solubility diminishes rapidly, and at 0° water only dissolves about 1.5 vols. of chlorine. (Pelouze & Fremy, *Tr.*) The aqueous solution, saturated at 6°, is of 1.003 sp. gr.

The solution slowly decomposes by keeping, more rapidly when exposed to the light. (Berthollet.)

1 vol. of water, under a pressure of $0^{m}.76$ of mercury, at °C.	Dissolves of chlorine gas, — vols., reduced to 0° and $0^{m}.76$ pressure of mercury.	1 vol. of water, under a pressure of $0^{m}.76$ of mercury, at °C. * The numbers in the table designate only the apparent solubility of chlorine; the true solubility may be obtained by multiplying these figures by $\frac{P}{f}$; P being the atmospheric pressure, and f the tension of aqueous vapor corresponding to each of the temperatures. Thus, the apparent solubility of chlorine at 70° beiug 0.71 vol., the true solubility would be $0.71 \times \frac{0m.7600}{0m.2291} = 2.355$ vol. (Gay-Lussac, *Ann. Ch. et Phys.*, (3.) 7. 124.)

A saturated aqueous solution of caustic potash absorbs chlorine with difficulty. (Fremy, *Ann. Ch. et Phys.*, (3.) **12.** 370.) Insoluble in benzin. (Moride, *Ann. Ch. et Phys.*, (3.) **39.** 452.) Chloral, and iodal, absorb a small quantity of chlorine. (Dumas.) Soluble in perchlorethylene (protochloride of carbon), without change, when not exposed to sunlight. (Faraday.) Soluble in very large quantity, with decomposition, in ether.

All the metallic chlorides are soluble in water, excepting those of silver and lead, the dichlorides of copper and of mercury, and the protochlorides of gold and platinum. Many of them are soluble in alcohol, ether, volatile oils, glycerin, &c.

ChlorIodide of *X*. *Vid.* Chloride & Iodide of *X*.

ChlorIodoform. *Vid.* Iodide of *bi*Chlor-Methyl.

ChlorIridic Acid. (*Bichloride of Iridium.*) $Ir Cl_2$ Deliquescent. Easily soluble in water; the solution undergoing decomposition when boiled. Soluble in alcohol. (Berzelius.)

Most of the chloriridiates are very difficultly soluble in water, though a little more soluble than the corresponding chloroplatinates. They are insoluble, or nearly so, in alcohol, though not quite so difficultly soluble as the chloroplatinates. (H. Rose, *Tr.*)

ChlorIridiate of Ammonium. $N H_4 Cl, Ir Cl_2$ Soluble in 20 pts. of cold water. (Vauquelin.) Soluble in chlorhydric acid. (Sobolewsky.) Difficultly soluble in cold, much more soluble in hot water. Insoluble in alcohol. (Berzelius.) Insoluble in a cold aqueous solution of chloride of ammonium. (Claus, *Beiträge*, p. 55.)

ChlorIridiate of Potassium. $K Cl, Ir Cl_2$ Slowly soluble in cold water. Soluble in 15 pts. of boiling water, from which only ⅓ separates out on cooling. (Vauquelin.) Insoluble in alcohol, or in water saturated with chloride of calcium, chloride of potassium, or other salts. (Berzelius.)

ChlorIridiate and ChlorOsmiate of Potassium. $3 K Cl ; 2 Ir Cl_2 ; Os Cl_2$ Soluble in water. (Hermann.)

ChlorIridiate and ChloroPlatinate of Potassium. $5 K Cl ; Ir Cl_2 ; 4 Pt Cl_2$

ChlorIridiate of Quinine.

ChlorIridiate of Sodium. Deliquescent. $Na Cl, Ir Cl_2$ Easily soluble in water. (Berzelius.) Soluble in alcohol of 0.837 sp. gr.

ChlorIsamic Acid. $C_{32} H_{11} Cl_2 N_3 O_8$ More soluble than isamic acid in alcohol, and ether. Soluble in the strong acids. (Laurent.)

ChlorIsamate of Ammonia. Soluble in alcohol.

ChlorIsamate of Silver. Ppt.

*Bi*ChlorIsamic Acid. $C_{32} H_9 Cl_4 N_3 O_8$

*Bi*ChlorIsamate of Ammonia. Soluble in alcohol. (Laurent.)

*Bi*ChlorIsamate of Silver. $C_{82} H_8 Ag Cl_4 N_3 O_8$ Ppt.

ChlorIsamid. (*ChlorIsamamide.*) $C_{32} H_{12} Cl_2 N_4 O_6$ Insoluble in boiling water. Tolerably soluble in alcohol. Soluble in concentrated acids. (Laurent.)

*Bi*ChlorIsamid. (*biChlorisamamide.*) $C_{32} H_{10} Cl_4 N_4 O_6$ Somewhat soluble in alcohol; decomposed by boiling alcohol. Soluble in strong acids. (Laurent.)

ChlorIsathyde. *Vid.* ChlorIsatyde.

ChlorIsatic Acid. (*ChlorIsatinasic Acid.* $C_{16} H_6 Cl N O_6$ Not isolated.

"*b.* ChlorIsatic Acid." *Vid.* ChlorIsatydic Acid.

ChlorIsatate of Alumina. Appears to be very soluble in water.

ChlorIsatate of Baryta. $C_{16} H_5 Ba Cl N O_6 + Aq \;\&\; 3 Aq$ Sparingly soluble in hot water. (Erdmann.)

ChlorIsatate of Bismuth. Ppt.

ChlorIsatate of Cadmium. Ppt.

ChlorIsatate of Copper. Ppt.

ChlorIsatate *of protoxide* of Iron. Appears to be soluble in water.

ChlorIsatate *of sesquioxide* of Iron. Ppt.

ChlorIsatate of Lead. $C_{16} H_5 Pb Cl N O_6 + 2 Aq$ Soluble in boiling water.

ChlorIsatate of Lime. Somewhat soluble in water.

ChlorIsatate of Magnesia. Appears to be very soluble in water.

ChlorIsatate *of dinoxide* of Mercury. Ppt.

ChlorIsatate *of protoxide* of Mercury. Ppt.

ChlorIsatate of Potash. $C_{16} H_5 K Cl N O_6$ Readily soluble in water. Soluble in spirit; less so as this is more concentrated. More soluble in boiling, than in cold alcohol.

ChlorIsatate of Silver. $C_{16} H_5 Ag Cl N O_6$ Soluble in boiling, less soluble in cold water.

*Bi*ChlorIsatic Acid. $C_{16} H_5 Cl_2 N O_6$ Readily soluble in cold water.

"*b. bi*ChlorIsatic Acid." *Vid. bi*ChlorIsatydic Acid.

*Bi*ChlorIsatate of Alumina. Appears to be soluble in water.

*Bi*ChlorIsatate of Baryta. $C_{16} H_4 Ba Cl_2 N O_6 \;\&\; + 2 Aq$ Only slightly soluble in cold water.

*Bi*ChlorIsatate of Bismuth. Ppt.

*Bi*ChlorIsatate *of sesquioxide* of Chromium. Appears to be soluble in water.

*Bi*ChlorIsatate of Copper. $C_{16} H_4 Cu Cl_2 N O_6$ Ppt.

*Bi*ChlorIsatate *of sesquioxide* of Iron. Ppt.

*Bi*ChlorIsatate of Lead. Ppt.

*Bi*ChlorIsatate of Magnesia. Appears to be soluble in water.

*Bi*ChlorIsatate of Potash. $C_{16}H_4KCl_2NO_6 + 2\,Aq$ Readily soluble in cold, and still more readily soluble in boiling water. Difficultly soluble in cold alcohol, much more easily soluble in boiling alcohol, Soluble in spirit, the more abundantly in proportion as it contains less alcohol. (Erdmann.)

*Bi*ChlorIsatate of Silver. $C_{16}H_4AgCl_2NO_6$ Sparingly soluble in boiling water, from which it separates out as the solution cools.

ChlorIsatin. (*ChlorIsatinase.*) $C_{16}H_4ClNO_4$ Only slightly soluble in cold water. Soluble in 1000 pts. of water at 0°, and in more than 200 pts. at boiling. Soluble in 220 pts. of alcohol, of 0.83 sp. gr., at 14°; and more readily in boiling alcohol. (Erdmann.) Soluble in concentrated sulphuric acid, from which it is precipitated, apparently undecomposed, by water. Soluble in a cold solution of caustic potash, with subsequent decomposition; the solution is immediately decomposed on boiling.

ChlorIsatin with Argentammonium. $C_{16}H_3(NH_3Ag)ClNO_4$ Ppt., from alcohol.

ChlorIsatin with Potassium.

ChlorIsatin with Silver. Ppt.

*Bi*ChlorIsatin. (*ChlorIsatinese.*) $C_{16}H_3Cl_2NO_4$ Rather more soluble in water, and much more soluble in alcohol than chlorisatin. Soluble in 30 pts. of alcohol of 0.83 sp. gr., at 14°. (Erdmann.) Soluble in a cold aqueous solution of caustic potash.

*Bi*ChlorIsatin with Potassium.

*Bi*ChlorIsatin with Silver. Ppt.

ChlorIsatinase. *Vid.* ChlorIsatin.

ChlorIsatinasic Acid. *Vid.* ChlorIsatic Acid.

ChlorIsato Sulphurous Acid. Not known in the free state.

ChlorIsatoSulphite of Potash. $C_{16}H_5ClKNO_6, 2\,SO_2$ Only slightly soluble in cold water.

*Bi*ChlorIsato Sulphite of Potash. $C_{16}H_4Cl_2KNO_8, 2\,SO_2$ Slightly soluble in cold water. (Laurent.)

ChlorIsatyde. $C_{32}H_{10}Cl_2N_2O_8$ Insoluble in cold, sparingly soluble in warm water. Soluble in boiling, less soluble in cold alcohol. Soluble in a solution of caustic potash, with decomposition, and in a solution of sulphide of potassium, apparently without decomposition.

*Bi*ChlorIsatyde. $C_{32}H_8Cl_4N_2O_8$

ChlorIsatydic Acid. (*a.Chlorisatic Acid.*) $C_{16}H_6ClNO_4$ Soluble in boiling water; separating out again as the solution cools. (Erdmann.)

ChlorIsatydate of Baryta. Soluble in hot water; separating out again as the solution cools.

ChlorIsatydate of Copper. Soluble in hot water; separating out again as the solution cools.

ChlorIsatydate of Lead. Soluble in hot water; separating out again as the solution cools.

ChlorIsatydate of Potash. Soluble in water, and in alcohol.

*Bi*ChlorIsatydic Acid. (*b.biChlorisatic Acid.*) $C_{32}H_{10}Cl_4N_2O_8$ Soluble in boiling water. (Erdmann.)

*Bi*ChlorIsatydate of Copper. Soluble in boiling, less soluble in cold water.

*Bi*ChlorIsatydate of Lead. Soluble in boiling water; separating out again on cooling.

*Bi*ChlorIsatydate of Potash. Readily soluble in water, and alcohol.

*Bi*ChlorIsatydate of Silver. Ppt.

ChlorIsatydase. *Vid.* ChlorIsatyde.

ChlorIsatyde. (*ChlorIsathydase.*) $C_{32}H_{10}Cl_2N_2O_8$ Insoluble in cold, very slightly soluble in hot water. Slightly soluble in boiling alcohol.

*Bi*ChlorIsatyde. (*ChlorIsathydèse.*) $C_{32}H_8Cl_4N_2O_8$ Insoluble in cold, very slightly soluble in boiling water. Somewhat soluble in boiling, insoluble in cold alcohol. Soluble, with decomposition, in a warm solution of potash.

Chlorous Acid. ClO_3 1 volume of water absorbs 5 or 6 vols. of the gas at the ordinary temperature. Decomposed by alcohol. The aqueous solution, on exposure to sunlight, is decomposed in the course of a few hours; in diffused light this decomposition is completed only after the lapse of several months. (Millon, *Ann. Ch. et Phys.*, (3.) 7. pp. 323, 331.)

Chlorite of Ammonia. Known only in solution.

Chlorite of Baryta. BaO, ClO_3 Very soluble in water; but the solution is decomposed on evaporation, more readily than that of the strontia salt. Easily soluble in alcohol. (Millon.)

Chlorite of Lead. PbO, ClO_3 Insoluble in water (Millon, *loc. cit.*, (3.) 7. pp. 310, 328.)

Chlorite of Potash. KO, ClO_3 Deliquescent, with gradual decomposition. Soluble in water, and in spirit of 38°. Soluble in an aqueous solution of chlorous acid. (Millon, *Ibid.*, pp. 325, 332.)

Chlorite of Silver. AgO, ClO_3 Soluble in boiling, less soluble in cold water. (Millon, *Ann. Ch. et Phys.*, (3.) 7. pp. 310, 329.)

Chlorite of Soda. NaO, ClO_3 Deliquescent. Soluble in water, and in an aqueous solution of chlorous acid. (Millon, *Ibid.*, p. 326.)

Chlorite of Strontia. SrO, ClO_3 Deliquescent. Soluble in water. This solution is decomposed by slow evaporation; less readily, however, than that of the baryta salt. (Millon.)

ChlorKinhydrone. *Vid.* ChlorHydroKinone with ChloroKinone.

ChloroAuric Acid. *Vid.* ChlorAuric Acid.

ChloroBenzamid. (*ChloroBenzoylamid.*) $C_{14}H_6ClNO_2 = N\left\{\begin{matrix}C_{14}H_4ClO_2\\ H_2\end{matrix}\right.$ Sparingly soluble in cold, readily soluble in hot water. Readily soluble in alcohol. (Limpricht & v. Uslar.)

Insoluble in water. Soluble in alcohol and in ammonia-water. (Gerhardt & Drion.)

ChloroBenzene. *Vid.* Chloride of Phenyl.

ChloroBenzoic Acid. More soluble in water, and alcohol, than chlorocinnamic acid. (E. Kopp, *Ann. Ch. et Phys.*, (3.) 20. 380.) Soluble in 2840 pts. of water at 0°. (Kolbe & Lautemann, *Ann. Ch. u. Pharm.*, 115. 187 [K.].) Readily soluble in alcohol, and ether. (Herzog.)

(*ChloroNiceic Acid*(of St. Evre). *ChloroMichmylic Acid.* (*Isomeric with ChloroSalylic Acid, q. vid., Chloride of Salicyl, and ChloroSalicylous Acid.*)

$C_{14} H_5 Cl O_4 = C_{14} H_4 Cl O_3, H O$

ChloroBenzoate of Ammonia. Readily soluble in water; the solution decomposing on evaporation. Soluble in alcohol. (St. Evre.)

$C_{14} H_4 (N H_4) Cl O_4$

ChloroBenzoate of Copper (Cu O). Insoluble in water.

ChloroBenzoate of Ethyl. Insoluble, or very sparingly soluble, in water. Soluble in alcohol. (St. Evre.)

$C_{14} H_4 (C_4 H_5) Cl O_4$

ChloroBenzoate of Lead. Ppt.

ChloroBenzoate of Silver. Sparingly soluble in water.

$C_{14} H_4 Ag Cl O_4$

ChloroBenzoenase. *Vid.* Chloride of Toluenyl.

ChloroBenzoenyl. *Vid.* *Sexi*ChloroToluene.

ChloroBenzol. *Vid.* Chlorhydrate of *ter*ChloroBenzin; also Hydride of ChloroPhenyl, and Chloride of Benzol.

ChloroBenzone. *Vid.* *ter*Chloride of Benzin.

ChloroBenzoyl. *Vid.* Chloride of Benzoyl.

ChloroBromAnilin, &c. *Vid.* BromoChlorAnilin, &c.

ChloroBromide of *X.* *Vid.* Bromide & Chloride of *X.*

Chloro Butylene. Insoluble in water. Soluble in all proportions in alcohol, and ether. (Chancel.)

(*ChlorButyren. Butyrenechloré. Chloride of Butyril. ChloroButyrase. ButyleneChloré. TetryleneChloré.*)

$C_8 H_7 Cl$

ChloroButyral. *Vid.* Hydride of ChloroButyryl.

ChloroButyrase. *Vid.* ChloroButylene.

*Bi*ChloroButyric Acid. Almost insoluble in water. Soluble in all proportions in alcohol. (Pelouze & Gélis, *Ann. Ch. et Phys.*, (3.) 10. 448.)

$C_8 H_6 Cl_2 O_4 = C_8 H_5 Cl_2 O_3, H O$

*Bi*ChloroButyrate of Ammonia. Very soluble in water. (P. & G., *loc. cit.*)

*Bi*ChloroButyrate of Ethyl. Scarcely soluble in water. Very soluble in alcohol, and ether. (Pelouze & Gélis, *Ann. Ch. et Phys.*, (3.) 10. 449.)

$C_8 H_5 (C_4 H_5) Cl_2 O_4$

*Bi*ChloroButyrate of Potash. Very soluble in water. (P. & G., *loc. cit.*)

*Bi*ChloroButyrate of Silver. Very sparingly soluble in water. (P. & G., *loc. cit.*, p. 450.)

*Bi*ChloroButyrate of Soda. Very soluble in water. (P. & G.)

*Quadri*ChloroButyric Acid. Insoluble in water. Very soluble in alcohol, and ether. (Pelouze & Gélis, *Ann. Ch. et Phys.*, (3.) 10. 449.)

$C_8 H_4 Cl_4 O_4$

*Quadri*ChloroButyrate of Ethyl. Scarcely at all soluble in water. Tolerably abundantly soluble in alcohol, and ether. (P. & G., *loc. cit.*)

$C_8 H_3 (C_4 H_5) Cl_4 O_4$

*Quadri*ChloroButyrate of Potash. Soluble in water.

*Quadri*ChloroButyrate of Silver. Very sparingly soluble in water. (P. & G., *loc. cit.*, p. 450.)

ChloroButyrene. Insoluble in water. Soluble in all proportions in alcohol. (Chancel, *Ann. Ch. et Phys.*, (3.) 12. 152.)

$C_{14} H_{13} Cl$

ChloroCaffein. Soluble in water and in alcohol. (Rochleder.)

$C_{16} H_9 Cl N_4 O_4$

*Quadri*ChloroCamphene.

$C_{20} H_{12} Cl_4$

*Quadri*ChloroCamphor. Insoluble in water, with which it forms a cream-like mass. Readily soluble in alcohol, and ether. (Claus.)

$C_{20} H_{12} Cl_4 O_2$

*Sexi*ChloroCamphor. Resembles quadriChloroCamphor.

$C_{20} H_{10} Cl_6 O_2$

ChloroCaoutchin. Sparingly soluble in water. Easily soluble in alcohol, and ether. Water precipitates it from the alcoholic solution. Soluble in concentrated sulphuric and nitric acids, separating out again unchanged on cooling. (Himly.)

ChloroCaprylal. Insoluble in water. Soluble in alcohol, and ether. (Bouis, *Ann. Ch. et Phys.*, (3.) 44. 113.)

$C_{16} H_{11} Cl_5 O_2$

*Quinqui*ChloroCaprylene. Insoluble, or but sparingly soluble, in water. (Bouis.)

(*PentaChlorOctylene.*)

$C_{16} H_{11} Cl_5''$

ChloroCarbethamic Acid. Not isolated.

ChloroCarbethamate of Ammonia. Very readily soluble in water, alcohol, and ether. (Malaguti, *Ann. Ch. et Phys.*, (3.) 16. 39.)

$C_{10} H_6 Cl_7 N O_{10}$

ChloroCarbethamid. *Vid.* *ter*ChlorAcetamid.

ChloroCarbolic Acid. *Vid.* ChloroPhenic Acid.

ChloroCarbonic Acid. Immediately decomposed by water. Soluble, without decomposition, in 0.0833 vol. of alcohol. Soluble in chloride of sulphur (S Cl), and in dichloride of sulphur (S_2 Cl). 1 vol. of terchloride of arsenic (As Cl_3) absorbs 10 vols. of it, but this is again evolved on the addition of water.

(*ChlorOxyCarbonic Acid. Phosgene Gas. Chloride of Carbonyl. Chloride of Carbonic Oxide. ChloroCarbonic Oxide.*)

$C \left\{ \begin{matrix} O \\ Cl \end{matrix} \right.$, or $\begin{matrix} C O_2 \\ C Cl_2 \end{matrix}$

ChloroCarbonate of "Ammonia." Said to be a mixture of carbamid and chloride of ammonium. Soluble in acetic acid, without effervescence.

$2 N H_3, C O Cl$

ChloroCarbonate of Amyl, or Carbonate & ChloroCarbonate of Amyl. Decomposed by an aqueous solution of ammonia. (Medlock.)

(*ChloroFormiate of Amyl.*)

$C_{12} H_{11} Cl O_4 = C_{12} H_{11} O \left\{ \begin{matrix} C O_2 \\ C \begin{matrix} O \\ Cl \end{matrix} \end{matrix} \right.$

ChloroCarbonate of *per*ChlorEthyl. Decomposed by water and by moist air, by alcohol, wood-spirit, acids, and al-

(*ChloroFormiate of perChlorEthyl. Formiate of Ethyl perchlorée.*)

$C_6 Cl_6 O_4 = C_4 Cl_5 O \left\{ \begin{matrix} C O_2 \\ C \begin{matrix} O \\ Cl \end{matrix} \end{matrix} \right.$

kalies. (Cahours, *Ann. Ch. et Phys.*, (3.) **17.** pp. 300, 302.)

ChloroCarbonate of *per*ChloroMethyl.
(Chloro Formiate of ter Chloro Methyl. Formiate de Methyle perchloré. Per-Chloro Methylic Formiate.)
$C_4 Cl_4 O_4 = C_2 Cl_3 O \left\{ \begin{matrix} C O_2 \\ C O Cl \end{matrix} \right.$
Decomposed by alcohol, by wood-spirit, and by dilute solutions of the caustic alkalies. (Cahours, *Ann. Ch. et Phys.*, (3.) **19.** 353.) Insoluble in water. Decomposed by fusel-oil (hydrate of amyl), and violently by ammonia-water. Solutions of potash, even when hot and concentrated, exert scarcely any decomposing action upon it. (Cahours.)

ChloroCarbonate of Ethyl.
(Chloro Carbonic Ether. Chloro-Formic Ether. Oxy Chloro Carbonic Ether. Chlorovinic Formiate.)
$C_6 H_5 Cl O_4 = C_4 H_5 O \left\{ \begin{matrix} C O_2 \\ C O Cl \end{matrix} \right.$
Insoluble, or very sparingly soluble, in cold water; partially decomposed by warm water. Soluble in alcohol. Soluble in concentrated sulphuric acid, but soon decomposes on standing, and especially when heated. Violently decomposed by solution of ammonia. (Dumas.)

ChloroCarbonate of Methyl.
(Oxy Chloro Carbonate of Methylene. Chloromethylic Formiate.)
$C_4 H_3 Cl O_4 = C_2 H_3 O \left\{ \begin{matrix} C O_2 \\ C O Cl \end{matrix} \right.$
Insoluble, or but slightly soluble, in water. Soluble, with decomposition and great evolution of heat, in caustic ammonia. (Dumas & Péligot.)

ChloroCarbonic Ether. *Vid.* Carbonate of ChlorEthyl.

ChloroCarbonic Oxide. *Vid.* CbloroCarbonic Acid.

ChloroCarotin.
(Carotinechlorée.)
$C_{36} H_{20} Cl_4 O_2$
Insoluble in water. Tolerably easily soluble in alcohol, and ether. Very readily soluble in bisulphide of carbon. (Zeise, *Ann. Ch. et Phys.*, (3.) **20.** 127.) Easily soluble in boiling alcohol, in ether, benzin, and bisulphide of carbon. Water precipitates it from the alcoholic solution. (Husemann.)

ChloroCarvene. Insoluble in water.
$C_{20} H_{12} Cl_4$? (Schweizer.)

ChloroCerotic Acid. Soluble in absolute alcohol.
$C_{54} H_{42} Cl_{12} O_4$

ChloroCerotate of Ethyl.
$C_{54} H_{41} Cl_{12} (C_4 H_5) O_4$

ChloroCerotate of Soda. Almost insoluble in water.

ChloroCerotone.

I.) $C_{54} H_{36} Cl_{18}$

II.) $C_{54} H_{33} Cl_{21}$

III.) $C_{54} H_{32} Cl_{22}$

ChloroChloric Acid.
(Euchlorine.)
$Cl_3 O_{13} = 2 Cl O_5, Cl O_3$
Soluble in water. On exposure to sunlight, the aqueous solution is decomposed in the course of a few hours, but in diffused light this decomposition is not completed until after the lapse of several months. (Millon, *Ann. Ch. et Phys.*, (3.) **7.** pp. 315, 331.)

ChloroCholesterin. Insoluble in water.
$C_{52} H_{37} Cl_7 O_2$
Sparingly soluble in alcohol. Easily soluble in ether.

ChloroChromic Acid.
(Chromate of Ter Chloride of Chromium.)
$Cr_2 Cl_8, 2 Cr O_3$
Decomposed by water, alcohol, wood-spirit, naphtha, oil of turpentine, and olive-oil, with evolution of much heat, and, in several of the cases, production of flame. Not altered at first by liquid glacial acetic acid, but is decomposed thereby in the course of a fortnight. Neither nitric nor muriatic acid have any sensible action upon it. (T. Thomson, *Phil. Trans.*, 1827, Part I. pp. 192–195.)

*Bi*ChloroCinchonin.
(Cinchonine bichlorée.)
$C_{40} H_{22} Cl_2 N_2 O_2$
Soluble in boiling, less soluble in cold alcohol. (Laurent, *Ann. Ch. et Phys.*, (3.) **24.** 304.)

ChloroCinnamic Acid. Sparingly soluble
$C_{18} H_7 Cl O_4 = C_{18} H_6 Cl O_3, H O$
in cold, more easily soluble in hot water. Easily soluble in alcohol, and ether. (Toel.) Less soluble in water and in alcohol than chlorobenzoic acid. (E. Kopp, *Ann. Ch. et Phys.*, (3.) **20.** 380.)

ChloroCinnamate of Ammonia.
$C_{18} H_6 Cl (N H_4) O_4 + Aq$

ChloroCinnamate of Baryta. Soluble in
$C_{18} H_6 Cl Ba O_4 + Aq$
boiling, less soluble in cold water.

ChloroCinnamate of *ter*ChloroStyracyl.
(Chloro Styracin.)
$C_{36} H_{12} Cl_4 O_4 = C_{18} H_6 Cl (C_{18} H_6 Cl_3) O_4$
Insoluble in water. Soluble in boiling alcohol, and ether. (Toel.)

ChloroCinnamate of Lime. Sparingly soluble in water.

ChloroCinnamate of Potash. Soluble in boiling, very sparingly soluble in cold alcohol. (Toel.)

ChloroCinnamate of Silver.
$C_{18} H_6 Cl Ag O_4$

ChloroCinnamene.
(Chloro Styrol.)
$C_{16} H_7 Cl''$

ChloroCinnamyl. *Vid.* Hydride of ChloroCinnamyl.

ChloroCinnose. *Vid.* Hydride of *quadri*-ChloroCinnamyl.

ChloroCodein. Sparingly soluble in boiling,
$C_{36} H_{20} Cl N O_6 + 3 Aq$
less soluble in cold water. Very soluble in strong alcohol, especially if it be warm. Sparingly soluble in ether. Soluble in chlorhydric acid, and in cold concentrated sulphuric acid, without decomposition; also soluble in nitric acid, the solution being decomposed when heated. Iusoluble in ammonia-water.

ChloroColophene. [Insoluble? in alcohol.]
$C_{40} H_{24} Cl_8$ (Deville.)

ChloroComenic Acid. More readily soluble,
$C_{12} H_3 Cl O_{10} + 3 Aq$
both in cold and in hot water, than comenic acid. Readily soluble in boiling, less soluble in cold water. Very readily soluble in warm alcohol. Its metallic salts are in general more soluble than the corresponding meconates. (How.)

ChloroComenate of Ammonia.

a = *mono.* Readily soluble in water.

ChloroComenate of Baryta.

a = *mono.* Sparingly soluble in water.

b = *bi.* Insoluble in water.

ChloroComenate of Copper.

a = *mono.* Ppt.

b = *bi.* Insoluble in water.

ChloroComenate of Lime.

a = *mono.* Sparingly soluble in water.

b = *bi.* Insoluble in water.

ChloroComenate of Magnesia.
a = *mono*. Sparingly soluble in water.
b = *bi*. Insoluble in water.

ChloroComenate of Potassium.
a = *mono*. Soluble in water.

ChloroComenate of Silver.
a = *mono*. Insoluble in cold, soluble in boiling water.
$C_{12}H_2AgClO_{10}$
b = *bi*, or *normal*. Insoluble in boiling water. Soluble in nitric acid, with decomposition, if heated. Not entirely decomposed by boiling with chlorhydric acid. (How.)
$C_{12}HAg_2ClO_{10}$

ChloroComenate of Soda.
a = *mono*. Readily soluble in water.

ChloroCreosol.
$C_{16}H_7Cl_3O_4$

ChloroCuminol. *Vid.* Hydrate of ChloroCumoyl; and also Chloride of Cumol($C_{20}H_{12}''$).

ChloroCumol. *Vid.* Chloride of Cumol.

ChloroCuprate of *X*. *Vid.* Chloride. of Copper & of *X*.

ChloroCyanamid. Insoluble in cold, sparingly soluble in hot water. Soluble, with decomposition, in an aqueous solution of potash. (Liebig.)
(*Para ChloroCyanate of Ammonia.*)
$C_6H_4N_5Cl = 2N\left\{CyH_2, CyCl\right.$

ChloroCyanAnilid. *Vid.* PhenylChloroCyanamid.

*Para*ChloroCyanate of Ammonia. *Vid.* Chlorocyanamid.

ChloroCyAnilid. *Vid.* PhenylChloroCyanamid.

"ChloroCyanide of Ethyl." Slowly decomposed by cold, quickly by hot water. Soluble in wood-spirit, ether, and alcohol, the last-named solution decomposing in the course of 24 hours. Water precipitates it from the alcoholic solution. (Aimé, *Gmelin's Handbook*, 8. 492.)
$C_6H_5NClO = C_4H_5O, C_2NCl$

"ChloroCyanide of Formic Ether." Sparingly soluble in cold, more soluble in hot water or ammonia-water. Readily soluble in alcohol, and ether, from both of which it is precipitated by water. Soluble in warm concentrated sulphuric acid, from which it is precipitated, unchanged, by water. Insoluble in chlorhydric acid. (Stenhouse, *Gmelin's Handbook*, 8. 492.)
$C_8H_6NClO_4$

"ChloroCyanic Oil." Insoluble in water. Readily soluble in alcohol. (Sérullas.) Soluble in ether. (Bouis.)
$C_{12}N_4Cl_{14}$

ChloroCyanuric Ether. Soluble in absolute alcohol, from which it is precipitated on the addition of water. (Habich & Limpricht.)
$C_{18}H_{11}Cl_4N_3O_6$

ChloroDracyl. *Vid.* Chlorhydrate of *bi*ChloroToluene.

ChlorŒnanthic Acid. Insoluble, or very sparingly soluble, in water. (Malaguti.)
$C_{28}H_{24}Cl_4O_6$

ChlorŒnanthate of *bi*ChlorEthyl. Soluble in 15 @ 16 pts. of alcohol at 40°. (Malaguti.)
(*ChlorŒnanthic Ether. Œnanthic Etherchloré.*)
$C_{36}H_{28}Cl_8O_8 = C_{28}H_{22}Cl_4(C_4H_3Cl_2)_2O_8$

ChlorŒnanthol. *Vid.* Hydride of ChlorŒnanthyl.

ChlorŒnanthylene. Insoluble in water. (Limpricht.)
$C_{14}H_{13}Cl''$

ChloroEuxanthic Acid. *Vid.* ChlorEuxanthic Acid.

*Bi*ChloroDumasin.
$C_{12}H_8Cl_2O_2$

ChloroFerrocyanide of *X*. *Vid.* Chloride of *X* with Ferrocyanide of *X*.

Chloroform. *Vid.* Chloride of *bi*ChloroMethyl.

ChloroFormiate of *X*. *Vid.* ChloroCarbonate of *X*.

ChloroFormic Ether. *Vid.* ChloroCarbonate of Ethyl.

*Bi*ChloroFormic Ether. *Vid.* Formiate of *bi*ChlorEthyl.

*Per*ChloroFormic Ether. *Vid.* *ter*ChlorAcetate of *ter*ChloroMethyl.

Chloroginic Acid. *Vid.* CaffeoTannic Acid.

ChloroHelicin. *Vid.* ChlorHelicin.

*Bi*ChloroKinonamic Acid. Sparingly soluble in water. (Erdmann.) Soluble in water, alcohol, and ether.
(*ChlorAnilamic Acid. ChlorAnilam. BiChloro Quinonamic Acid.*)
$C_{12}H_3Cl_2NO_6 + 5Aq =$
$N\left\{\begin{matrix}C_{12}Cl_2O_4'' \\ H_2\end{matrix}\right. . O, HO, + 5Aq$

*Bi*ChloroKinonamate of Ammonia. Soluble in water, especially when this is warm. (Erdmann.)
(*ChlorAnilammon.*)
$C_{12}H_2(NH_4)Cl_2NO_6 + 4Aq$

*Bi*ChloroKinonamate of Baryta. Soluble in warm water. (Erdmann.)

*Bi*ChloroKinonamate of Copper. Ppt.

*Bi*ChloroKinonamate of *peroxide* of Iron. Ppt.

*Bi*ChloroKinonamate of Lead. Ppt.

*Bi*ChloroKinonamate of Nickel. Ppt.

*Bi*ChloroKinonamate *of dinoxide* of Mercury. Ppt.

*Bi*ChloroKinonamate of Silver. Soluble in warm water, in caustic ammonia, and in acetic acid. (Erdmann.)
$C_{12}H_2AgCl_2NO_6$

*Bi*ChloroKinonamid. Insoluble in water. Almost insoluble in alcohol or ether. Soluble in a dilute aqueous solution of ammonia. Soluble in monohydrated sulphuric acid. Soluble in an alcoholic solution of caustic potash. Unacted on by chlorhydric acid. (Laurent.)
(*BiChloro Quinonamid. ChlorAnilamid.*)
$C_{12}H_4Cl_2N_2O_4 = N_2\left\{\begin{matrix}C_{12}Cl_2O_4'' \\ H_4\end{matrix}\right.$

*Bi*ChloroKinonic Acid. Soluble in water, and is precipitated therefrom by chlorhydric or sulphuric acid. (Erdmann.)
(*BiChloro Quinonic Acid. ChlorAnilic Acid.*)
$C_{12}H_2Cl_2O_8 + 2Aq = C_{12}Cl_2O_6, 2HO + 2Aq$

*Bi*ChloroKinonate of Ammonia.

*Bi*ChloroKinonate of Baryta. Very sparingly soluble in boiling water.
$C_{12}Cl_2Ba_2O_8 + 6Aq$

*Bi*ChloroKinonate of Cobalt.

*Bi*ChloroKinonate of Copper.

*Bi*ChloroKinonate *of peroxide* of Iron. Ppt.

*Bi*ChloroKinonate of Lead. Ppt.

*Bi*ChloroKinonate of Magnesia.

*Bi*ChloroKinonate *of dinoxide* of Mercury. Ppt.

*Bi*ChloroKinonate of Nickel.

*Bi*ChloroKinonate of Potash. $C_{12}K_2Cl_2O_8 + 2\,Aq$ Tolerably soluble in water, and alcohol; less soluble in a solution of caustic potash. (Erdmann.)

*Bi*ChloroKinonate of Silver. $C_{12}Ag_2Cl_2O_8$ Very sparingly soluble in water. (Erdmann.)

*Bi*ChloroKinonate of Soda. $C_{12}Cl_2Na_2O_8 + 8\,Aq$ Soluble in water, and alcohol.

ChloroKinone. (*Chloro Quinone.*) $C_{12}H_3ClO_4$ Soluble in boiling, but nearly insoluble in cold water. Tolerably soluble in strong alcohol, from which it is precipitated on the addition of water. Also soluble in hot spirit of 50%, a portion of it being re-precipitated as the solution cools. Very soluble in ether. Soluble in strong acetic acid, and in hot dilute acetic acid. (Stædeler.)

*Bi*ChloroKinone. (*BiChloro Quinone. Quinonebichloré.*) $C_{12}H_2Cl_2O_4$ Insoluble in water. Nearly insoluble in cold, but abundantly soluble in boiling strong alcohol. Very sparingly soluble in spirit of 40%, even when this is boiling. Readily soluble in ether. Tolerably soluble in strong boiling acetic acid, from which solution it separates out on cooling. Soluble, without decomposition, in strong boiling chlorhydric acid, less soluble in the cold. Sparingly soluble in cold, abundantly soluble in hot nitric acid of 1.25 sp. gr., without decomposition. (Stædeler.) Also soluble, without decomposition, in warm concentrated sulphuric acid; and, with decomposition, in an aqueous solution of caustic potash.

*Ter*ChloroKinone. (*Tri Chloro Quinone. Quinone terchloré. TriChlor Chinone.*) $C_{12}HCl_3O_4$ Soluble in *cold*, but very sparingly soluble in hot water. Sparingly soluble in cold, more abundantly soluble in hot alcohol or acetic acid, being more soluble in both these liquids in proportion as they are more concentrated. Soluble in ether. Soluble in cold monohydrated sulphuric acid, from which water precipitates it unchanged. Soluble, without decomposition, in hot strong nitric acid, less soluble in cold nitric acid. (Stædeler.)

*Per*ChloroKinone. (*Quinone perchloré. Chloranil.*) $C_{12}Cl_4O_4$ Insoluble in water. Difficultly soluble in hot, and almost entirely insoluble in cold alcohol; somewhat more soluble in ether. Unacted upon by acids. Easily decomposed by alkalies. (G. Hofmann, *Ann. Ch. et Phys.*, (3.) **16.** 286.) Unacted on by concentrated chlorhydric or nitric acid, or by aqua-regia, even when boiling. (Stenhouse.) Soluble in an aqueous solution of caustic potash.

ChlorOleic Acid.
$C_{36}H_{32}Cl_2O_4$

ChloroMeconin. (*Chlor Opianyl. Hydride of Chlor Opianyl.*) $C_{20}H_9ClO_8$ Nearly insoluble in cold, somewhat more easily soluble in boiling water. Abundantly soluble in alcohol, and ether. No more soluble in alkaline solutions than in water. Soluble in cold concentrated sulphuric acid. Soluble in nitric acid, the solution undergoing decomposition when heated. (Anderson, *J. Ch. Soc.*, **9.** 275.)

ChloroMelal.
$C_{60}H_{45.5}Cl_{14.5}O_2$

*Bi*ChloroMelAnilin. $C_{26}H_{11}Cl_2N_3$ Difficultly soluble in water. Easily soluble in alcohol, and ether Soluble in alcohol. (Hofmann, *J. Ch. Soc.*, **1.** 299.)

*Ter*ChloroMelAnilin. $C_{26}H_{10}Cl_3N_8$ Insoluble in water. Soluble in alcohol. (Hofmann.)

"ChloroMenthene." *Vid.* Chlorhydrate of Menthene.

*Quinqui*ChloroMenthene. $C_{20}H_{13}Cl_5$ Sparingly soluble in water. Easily soluble in alcohol, and wood-spirit, and still more readily in ether, and oil of turpentine. (Walter.)

ChloroMercuric Acid. *Vid. proto*Chloride of Mercury (Hg Cl).

ChloroMercurate of Acetosamin. Very sparingly soluble in cold, tolerably easily soluble in boiling water. Insoluble in alcohol. (Natanson.)

ChloroMercurate of Aconitin. Tolerably soluble in an aqueous solution of chloride of ammonium, and in chlorhydric acid.

ChloroMercurate of Allyl with Sulphide of Allyl & of Mercury. $C_6H_5Cl, 2\,HgCl;\ C_6H_5S, 2\,HgS$ Insoluble in water. Difficultly soluble in alcohol, and ether.

ChloroMercurate of AmylStrychnine. Sparingly soluble in boiling, less soluble in cold water.

ChloroMercurate of Atropin. Somewhat soluble in water.

ChloroMercurate of AzoNaphthylamin. Readily soluble in water. (Zinin.)

ChloroMercurate of Berberin. Soluble in an aqueous solution of chloride of ammonium and in chlorhydric acid.

ChloroMercurate of Benzidin. Soluble in water, and alcohol.

ChloroMercurate of Brucin. $C_{46}H_{26}N_2O_8, HCl, 2\,HgCl$ Sparingly soluble, or insoluble, in water or strong alcohol.

ChloroMercurate of *tri*Caproylamin. Deliquescent. Easily soluble in alcohol, and ether. (Petersen, *Ann. Ch. u. Pharm.*, **102.** 317.)

ChloroMercurate of ChlorAnilin.

ChloroMercurate of Cinchonidin (of Pasteur). $C_{40}H_{24}N_2O_2, 2\,(HCl, HgCl)$ Difficultly soluble in cold water. (Leers, *Ann. Ch. u. Pharm.*, **82.** 157.)

ChloroMercurate of Cinchonin. $C_{40}H_{24}N_2O_2, 2\,(HgCl, HCl)$ Almost insoluble in cold water, ordinary alcohol, or ether; tolerably soluble in boiling water and in warm alcohol. Easily soluble in concentrated chlorhydric acid.

ChloroMercurate of Codein. Soluble in boiling water, and alcohol.

ChloroMercurate of Collidin. Soluble in hot, less soluble in cold water, and alcohol. (Anderson.)

ChloroMercurate of Coniin. Insoluble in water, alcohol, and ether. (Ortigosa.) [Compare Chloride of Mercury with Coniin.]

ChloroMercurate of Corydalin. Ppt.

ChloroMercurate of Cotarnin. Ppt.
$C_{26}H_{13}NO_6, HCl, 2\,HgCl.$

ChloroMercurate of Emetin. Sparingly soluble in water.

ChloroMercurate of Ethylamin. Solu-

$N \left\{ \begin{matrix} C_4 H_5 \\ H_2 \end{matrix} \right., H Cl, Hg Cl$ ble in water, and alcohol. (Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 481.)

ChloroMercurate of *tetr*Ethylammonium.

I.) $N \left\{ (C_4 H_5)_4 Cl, 5 Hg Cl \right.$ Easily soluble in water, and in chlorhydric acid, especially when these are boiling.

II.) $N \left\{ (C_4 H_5)_4 Cl, Hg Cl \right.$ Soluble in water, and alcohol. (Sonnenschein.)

ChloroMercurate of EthylAnilin.

ChloroMercurate of EthylConiin.

ChloroMercurate of *di*EthylConiin. Ppt.

ChloroMercurate of EthylNicotin. Soluble in boiling, sparingly soluble in cold water. $N \left(C_{10} (C_4 H_5) H_8''' \right), H Cl, 3 Hg Cl$ (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **87.** 8.)

ChloroMercurate of EthylStrychnine. Somewhat soluble in boiling, less soluble in cold water.

ChloroMercurate of Guanin.
$C_{10} H_5 N_5 O_2, H Cl, Hg Cl + Aq$

ChloroMercurate of Harmalin. Sparingly soluble in water.

ChloroMercurate of Harmin.

ChloroMercurate of Iodide of *tetra*Ethylammonium. Easily soluble in water and in chlorhydric acid, especially on boiling. (Hofmann.) Soluble in warm alcohol. (Sonnenschein.)
$N (C_4 H_5)_4 I, 5 Hg Cl$

ChloroMercurate of MelAnilin. Soluble in water acidulated with chlorhydric acid. (Hofmann.)

ChloroMercurate of Mercury. *Vid.* Oxy-Chloride of Mercury.

ChloroMercurate of Methylamin. Soluble in water. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 459.)
$N \left\{ \begin{matrix} C_2 H_3 \\ H_2 \end{matrix} \right., H Cl, Hg Cl$

ChloroMercurate of MethylCinchonin.

ChloroMercurate of MethylEthylConiin.

I.) $N \left\{ \begin{matrix} C_{16} H_{14}'' \\ C_2 H_3 \\ C_4 H_5 \end{matrix} \right. . Cl ; 5 Hg Cl$

II.) $N C_{22} H_{22} Cl ; 6 Hg Cl$ Tolerably easily soluble in water, alcohol, and ether. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **89.** 141.)

ChloroMercurate of MethylNicotin. Somewhat soluble in boiling, less soluble in cold water. (Stahlschmidt, *Ann. Ch. u. Pharm.*, **90.** 225.)
$N \left(C_{10} H_7 (C_2 H_3) \right) Cl, 4 Hg Cl$

ChloroMercurate of Morphin. Very sparingly soluble in cold water, alcohol, or ether; more soluble in boiling alcohol. Very readily soluble in chlorhydric acid.
$C_{34} H_{19} N O_6, H Cl, 4 Hg Cl$

ChloroMercurate of Naphthylamin. Difficultly soluble in cold, completely soluble in boiling alcohol. (Zinin.)

ChloroMercurate of Narcotin. Soluble in alcohol acidulated with chlorhydric acid.
$C_{48} H_{25} N O_{14}, H Cl, Hg Cl$ (?)

ChloroMercurate of Nicotin. Soluble in boiling water. [Compare Chloride of Mercury with Nicotin.]
$C_{20} H_{14} N_2, H Cl, 8 Hg Cl$

ChloroMercurate of *ter*NitrAmarin. Ppt.

ChloroMercurate of NitroHarmalin.

ChloroMercurate of NitroHarmin.

ChloroMercurate of *tri*Phenylamin. Decomposed by water.

ChloroMercurate of PhenylUrea.

ChloroMercurate of Picolin. Permanent. Soluble in water. (Unverdorben.) [Compare Chloride of Mercury with Picolin.]

ChloroMercurate of Piperin. Insoluble in water. Sparingly soluble in cold, more soluble in boiling alcohol. Sparingly soluble in concentrated chlorhydric acid.
$C_{68} H_{38} N_2 O_{12}, H Cl, 2 Hg Cl$

ChloroMercurate of PurpureoCobalt. Tolerably soluble in hot, less soluble in cold water. (Claudet, *Phil. Mag.*, (4.) **2.** 258.)
$5 N H_3 . Co_2 Cl_3, 6 Hg Cl$

ChloroMercurate of Pyrrol. Insoluble in water. Sparingly soluble in cold, more soluble in boiling alcohol; but this solution is attended with partial decomposition.
$N \left\{ \begin{matrix} C_8 H_5''' \\ Hg \end{matrix} \right. Cl, 3 Hg Cl$

ChloroMercurate of Quinine. Very sparingly soluble in water, cold alcohol, and ether.
$C_{40} H_{24} N_2 O_4, 2 (H Cl, Hg Cl)$

ChloroMercurate of Retinin. Sparingly soluble in warm water; much more soluble in alcohol. Readily soluble in cold dilute chlorhydric acid.

ChloroMercurate of Spartein. Almost insoluble in water, and alcohol. Readily soluble in water acidulated with chlorhydric acid. Soluble, without decomposition, in warm, less soluble in cold, chlorhydric acid. (Stenhouse.)
$N \left\{ C_{16} H_{13}''', H Cl, Hg Cl \right.$

ChloroMercurate of StibEthylium.

$a = Sb (C_4 H_5)_4 Cl, 3 Hg Cl$ Soluble in water, and alcohol. Insoluble in ether. (Lœwig.)

$b = 2 Sb (C_4 H_5)_4 Cl, 3 Hg Cl$ Difficultly soluble in water. (Lœwig.)

ChloroMercurate of Strychnine. Difficultly soluble in water. Easily soluble in spirit, especially if it is hot. (Abel & Nicholson, *J. Ch. Soc.*, **2.** 259.)
$C_{42} H_{22} N_2 O_4, H Cl, 2 Hg Cl$

ChloroMercurate of Thebain.

ChloroMercurate of Theobromin. Sparingly soluble in water, and alcohol.

ChloroMercurate of *tetra*Vinylium. Very sparingly soluble in boiling, less soluble in cold water. (Heintz & Wislicenus.)

ChloroMercurate of XanthoCobalt. Insoluble in cold, difficultly soluble, without decomposition, in hot water. (Gibbs & Genth, *Smithson. Contrib.*, Vol. **9.**)
$N O_2 . 5 N H_3 . Co_2 O, Cl_2 ; 4 Hg Cl + 2 Aq$

ChloroMesitate of Methylene. Permanent. Insoluble in water. Very soluble in alcohol, and ether. (Bouis, *Ann. Ch. et Phys.*, (3.) **21.** 114.)
$C_{10} H_{10} Cl_2 O_4$

*Ter*ChloroMesitylene. Insoluble in water. Soluble in alcohol and in boiling ether. (Kane.)
(*Chloride of Pteleyl. Hydride of terChloroMesityl.*)
$C_{18} H_9 Cl_3$

ChloroMetAldehyde. Insoluble in water.
$C_8 H_7 Cl O_4$

*Bi*ChloroMethylamin.
$C_2 H_3 N Cl_2 = N \left\{ \begin{matrix} C_2 H Cl_2 \\ H_2 \end{matrix} \right.$

ChloroMethylene (?). Insoluble in water. Soluble in alcohol, and ether. (Laurent.)
(*ChlorMethylase.*)
C_2HCl

ChloroMethylicAcetate. *Vid.* Acetate of ChloroMethyl.

*Per*ChloroMethylic Acetate. *Vid. ter*ChlorAcetate of *ter*ChloroMethyl.

ChloroMethylic Formiate. *Vid.* ChloroCarbonate of Methyl.

*Per*ChloroMethylic Formiate. *Vid. per*ChloroFormiate of *per*ChloroMethyl.

ChloroMethylic Oxalate. *Vid.* Oxalate of ChloroMethyl.

ChloroMethylSelenious Acid. Permanent. Easily soluble in water, and alcohol. (Wœhler & Dean, *Ann. Ch. u. Pharm.*, **97**. 7.)
$C_2H_3Se_2ClO_4 + Aq$

ChloroMethylSulphurous Acid. Soluble in water, and alcohol. All of its salts are soluble in water.
(*Chloro SulphoMethylic Acid. Acide Sulfoformique chloré. ChloroMethyl di ThionicAcid. Sulphite of ChloroMethyl. Acide Metholique Chlorosulfuré.*)
$C_2H_2\left.\begin{matrix}ClO\\HO\end{matrix}\right\}S_2O_4$

ChloroMethylSulphite of Ammonia. Deliquescent. Soluble in water.

ChloroMethylSulphite of Baryta. Soluble in water.

ChloroMethylSulphite of Lead.

I.) *normal.* Very soluble in water.
$C_2H_2ClPbO_2, S_2O_4$

II.) *basic.* Soluble in water.

ChloroMethylSulphite of Potash. Soluble in water and in hot spirit. Insoluble in absolute alcohol.
$C_2H_2ClKO_2, S_2O_4$

ChloroMethylSulphite of Silver. Deliquescent. Soluble in water. (Kolbe.)

ChloroMethylSulphite of Soda. Deliquescent. Soluble in water and in hot, strong alcohol.

*Bi*ChloroMethylSulphurous Acid. Deliquesces in moist air. Soluble in alcohol, and ether. Its salts are soluble in water, and also, for the most part, in alcohol.
(*BiChloro Sulphoso-Methylic Acid.*)
$C_2HCl_2\left.\begin{matrix}O\\HO\end{matrix}\right\}S_2O_4$

*Bi*ChloroMethylSulphite of Ammonia. Permanent. Soluble in water.

*Bi*ChloroMethylSulphite of Potash. Permanent. Soluble in water. Soluble in boiling alcohol; but insoluble in cold absolute alcohol.
$C_2HKCl_2O_2, S_2O_4$

*Bi*ChloroMethylSulphite of Silver. Soluble in water. (Kolbe.)
$C_2HAgCl_2O_2, S_2O_4$

*Bi*ChloroMethylSulphite of Zinc. Soluble in water.

*Ter*ChloroMethylSulphurous Acid. Deliquescent. Soluble in water. Unacted on by boiling nitric or chromic acids or by aqua-regia. Its salts are soluble in water, and also, to a certain extent, in alcohol.
(*TerChloro SulphosoMethylic Acid.*)
$C_2HCl_3O_2, S_2O_4 + 2\,Aq$

*Ter*ChloroMethylSulphite of Ammonia. Permanent. Soluble in water.

*Ter*ChloroMethylSulphite of Baryta. Soluble in water and in boiling absolute alcohol. (Kolbe.)
$C_2Cl_3BaO_2, S_2O_4 + Aq$

*Ter*ChloroMethylSulphite of Copper. Permanent. Soluble in water. (Kolbe; Laurent.)
$C_2Cl_3CuO_2, S_2O_4 + 5\,Aq$

*Ter*ChloroMethylSulphite of Lead.

I.) *normal.* Soluble in water.

II.) *basic.* Soluble in water.

*Ter*ChloroMethylSulphite of Potash. Efflorescent. Soluble in water, and alcohol.
$C_2Cl_3KS_2O_6 + 2\,Aq$

*Ter*ChloroMethylSulphite of Silver. Soluble in water.
$C_2Cl_3AgO_2, S_2O_4 + 2\,Aq$

*Ter*ChloroMethylSulphite of Soda. Very efflorescent. Much more soluble in water than the potash-salt.

"ChloroMethylSulphurous Chloride" (of Gerhardt). *Vid.* Sulphite of Chloride of ChloroMethyl.

ChloroMichmyl. Very sparingly soluble in water. Readily soluble in alcohol. (Scharling.)

ChloroMichmylic Acid. *Vid.* ChloroBenzoic Acid.

ChloroNaphthalic Acid. *Vid.* ChlorOxy-Naphthalic Acid.

ChloroNaphthalin. Insoluble in water. Soluble in all proportions in ether. Easily soluble in alcohol.
(*Chlonaphtase. ChloroNaphthalid. Naphthaline Chloré.*)
$C_{20}H_7Cl$

*Bi*ChloroNaphthalin. [Has at least seven isomeric modifications.]
(*Chlonaphtèse. BiChloroPhthalin.*)
$C_{20}H_6Cl_2$

I.) *Modif.* (*a*).

II.) *Modif.* (*c*). Insoluble in water. Very soluble in ether. Somewhat less soluble in alcohol.

III.) *Modif.* (*a d*). Insoluble in water. Very soluble in ether, and alcohol.
(*Parachloronaphthalose.*)

IV.) *Modif.* (*e*). Very soluble in ether, and alcohol; more soluble in alcohol than No. III.

V.) *Modif.* (*f*). Very soluble in alcohol, and ether. Soluble in warm fuming sulphuric acid, and the solution is not precipitated by water.

VI.) *Modif.* (*x*). Soluble in ether, and in a mixture of alcohol and ether.

VII.) *Modif.* (*y*). Is the least soluble in alcohol, and ether, of all the modifications of bichloronaphthalin.

*Ter*ChloroNaphthalin. [Has seven modifications.]
(*Chlonaphtise.*)
$C_{20}H_5Cl_3$

I.) *Modif.* (*a*). Insoluble in water. Extremely soluble in ether, which dissolves more than its own weight of it at the ordinary temperature. Difficultly soluble in boiling alcohol. Alcohol precipitates it from the ethereal solution. (Laurent.)

II.) *Modif.* (*a c*). Very soluble in ether. More soluble in alcohol than modif. (*a*).

III.) *Modif.* (*c*). Soluble in alcohol, and ether.

IV.) *Modif.* (*g*). Very soluble in ether; somewhat less soluble in alcohol.

V.) *Modif.* (*d*). Very soluble in ether; much less soluble in alcohol.

VI.) *Modif.* (*a d*). Tolerably soluble in ether, though less soluble therein than the other modifications. Very sparingly soluble in alcohol. [Readily soluble in alcohol (in Gm.).]

VII.) *Modif.* (*a e*). Less soluble in ether than (*a*), but more soluble than (*a*) in alcohol.

***Quadri*ChloroNaphthalin.** [Has four modifications.]
(*Chlonaphtose.*)
$C_{20} H_4 Cl_4$

I.) *Modif.* (*a*). Is 4 or 5 times less soluble in ether than modif. (*a*) of terchloronaphthalin. Sparingly soluble in boiling alcohol.

II.) *Modif.* (*b*). Very sparingly soluble in ether.

III.) *Modif.* (*e*). Only very slightly soluble in boiling alcohol, and not much more soluble in warm ether. Its solubility is considerably increased by the presence of a brown oil, which is liable to contaminate it. Almost insoluble in rock-oil at the ordinary temperature, but dissolves therein readily on boiling. (Laurent.)
(*Parachloronaphtalose.*)

IV.) *Modif.* (*k*). Very sparingly soluble in boiling alcohol or ether. Sparingly soluble in cold, but very soluble in boiling petroleum.

***Sexi*ChloroNaphthalin.** Scarcely at all soluble in alcohol. Soluble in about 20 pts. of ether. Very soluble in oil of petroleum. (Laurent.)
(*Chlonaphtalase.*)
$C_{20} H_2 Cl_6$

***Per*ChloroNaphthalin.** Very sparingly soluble in boiling alcohol or ether. Easily soluble in naphtha.
(*Chlonaptalise.*)
$C_{20} Cl_8$

ChloroNiceic Acid. *Vid.* ChloroBenzoic Acid.

ChloroNiceamid. *Vid.* ChloroBenzene.

ChloroNicene.
(*Nicène monochlore.*)
$C_{20} H_{10} Cl_2$

ChloroNicine. Sparingly soluble in water. Soluble in ether. (St. Evre.)
$C_{20} H_{12} Cl_2 N_2$

ChloroNitroBenzoic Acid. *Vid.* NitroChloroBenzoic Acid.

ChloroNitroBenzoyl. *Vid.* Chloride of NitroBenzoyl.

***Bi*ChloroNitroGlycocoll.**

$$C_4 H_2 N_2 Cl_2 O_8 = N \left\{ \begin{matrix} C_2 H O_2 \\ C_2 Cl_2 (N O_4) . O_2 \\ H \end{matrix} \right.$$

ChloroNitroHarmin, or ChloroNitroHarmidin. Sparingly soluble in cold, more readily soluble in boiling water. Sparingly soluble in ether. Easily soluble in boiling coal-oil, and naphtha. (Fritzsche.)
$C_{26} H_{10} Cl (N O_4) N_2 O_2 + 4 Aq$

***Bi*ChloroNitroPhenic Acid.** Sparingly soluble in water. Tolerably readily soluble in boiling, less soluble in cold alcohol. Tolerably readily soluble in ether. (Laurent & Delbos, *Ann. Ch. et Phys.*, (3.) **19.** 380.)
(*Nitro biChloro Carbolic Acid.*)
(*Nitro biChloro Phenic Acid.*)
$C_{12} H_3 Cl_2 N O_6 = C_{12} H_3 Cl_2 (N O_4) O_2$

***Bi*ChloroNitroPhenate of Ammonia.** Soluble in water.
$C_{12} H_2 (N H_4) Cl_2 (N O_4) O_2$

***Bi*ChloroNitroPhenate of Potash.** Soluble in water.
$C_{12} H_2 K Cl_2 (N O_4) O_2$

ChloroOctylene. *Vid.* ChloroCaprylene.

ChloroPalladic Acid. *Vid. bi*Chloride of Palladium. The metallic chloropalladiates are generally very soluble in water, and are soluble in alcohol also. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 264.)

ChloroPalladiate of Ammonium. Very sparingly soluble in cold, decomposed by boiling water. (Berzelius.)
$N H_4 Cl, Pd Cl_2$

ChloroPalladiate of Barium. Permanent. Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 264.)

ChloroPalladiate of Cadmium. Permanent. Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** pp. 264, 265.)

ChloroPalladiate of Caffein.

ChloroPalladiate of Calcium. Deliquescent. Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 264.)

ChloroPalladiate of ChlorAnilin. Ppt.

ChloroPalladiate of Magnesium. Deliquescent. Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 264.)

ChloroPalladiate of Manganese. Permanent. Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 264.)

ChloroPalladiate of *tri*MethylAmin.

ChloroPalladiate of Nickel. Permanent, at least in dry air. Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** pp. 264, 265.)

ChloroPalladiate of Potassium. Difficultly soluble, with partial decomposition, in cold water. Soluble, with decomposition, when boiled with water in an open vessel, but when heated with water in a closed vessel it dissolves at 100°, separating out again unchanged when the solution is cooled. Insoluble in alcohol; but is decomposed when boiled therewith. Insoluble in water which contains in solution chloride of ammonium, chloride of potassium, or chloride of sodium. Very sparingly soluble, without decomposition, in dilute chlorhydric acid. (Berzelius.)
$K Cl, Pd Cl_2$

ChloroPalladiate of Sodium. Appears to be very soluble in water, and to be very easily decomposed thereby. (Berzelius, *Lehrb.*, **3.** 963.)

ChloroPalladiate of Toluidin. Ppt.

ChloroPalladiate of Zinc. Quickly deliquesces. Soluble in water, and alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 264, 265.)

ChloroPalladous Acid. *Vid. proto*Chloride of Palladium.

ChloroPalladite of Ammonium. Easily soluble in water. Insoluble in strong alcohol. (Wollaston.) Slightly soluble in spirit. (Fischer.) Soluble in an aqueous solution of chloride of ammonium. (Claus, *Beiträge*, p. 56.)
$N H_4 Cl, Pd Cl + Aq$

ChloroPalladite of Anilin.

ChloroPalladite of Barium. Easily soluble in water, and alcohol. (Bonsdorff.)

ChloroPalladite of Cadmium. Permanent. Soluble in water, and alcohol.

ChloroPalladite of Calcium. Deliquescent. Soluble in water, and alcohol. (Bonsdorff.)

ChloroPalladite of Codeine. Ppt. Decomposed by boiling with water.

ChloroPalladite of Cumidin. Soluble in water, and alcohol. (Nicholson, *J. Ch. Soc.*, 1. 9.)

ChloroPalladite of Ethylamin.

I.) $N \left\{ \begin{matrix} H_2 \\ C_4 H_5 \end{matrix} \right. H Cl, Pd Cl$ Soluble in water. (Reckenschuss.)

II.) $2 N C_4 H_7 ; 2 Pd Cl$? Soluble in ethylamin.

III.) $2 N C_4 H_7 ; Pd Cl$?

IV.) $N C_4 H_7, N H_3 Pd Cl$?

ChloroPalladite of EthylNicotin. Soluble in water, and alcohol. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **87.** 8.)

ChloroPalladite of Magnesium. Deliquesces in moist air. Soluble in water, and alcohol. (Bonsdorff.)

ChloroPalladite of Manganese. Permanent. Soluble in water, and alcohol.

ChloroPalladite of MethylNicotin. Soluble in water, and alcohol. (Stahlschmidt, *Ann. Ch. u. Pharm.*, **90.** 225.)

ChloroPalladite of Nickel. Permanent in dry air. Soluble in water, and alcohol.

ChloroPalladite of Potassium. Tolerably easily soluble in water, and much more readily in hot than in cold. Insoluble in alcohol. (Wollaston.) Tolerably soluble in spirit of 0.84 sp. gr., but very sparingly soluble in absolute alcohol; on boiling the alcoholic solution decomposition ensues, metallic palladium being precipitated. Soluble in ammonia-water. (Berzelius.) Soluble in a cold saturated solution of chloride of potassium. (W. Gibbs, *Am. J. Sci.*, (2.) **31.** 70.)

$K\,Cl, Pd\,Cl$

ChloroPalladite of Quinolein. Sparingly soluble in water. (Williams.)

$C_{18}H_7N, H\,Cl, Pd\,Cl$

ChloroPalladite of Sodium. Deliquescent. Easily soluble in water, and alcohol. (Berzelius.)

$Na\,Cl, Pd\,Cl$

ChloroPalladite of Strychnine. More readily soluble in hot than in cold water, and alcohol. (Abel & Nicholson, *J. Ch. Soc.*, **2.** 257.)

$C_{42}H_{22}N_2O_4, H\,Cl, Pd\,Cl$

ChloroPalladite of Zinc. Very deliquescent. Soluble in water, and alcohol.

ChloroPalmiticAcid.

$C_{32}H_{28}Cl_4O_4$

*Bi*ChloroParaNaphthalin. *Vid.* Chlor-Anthracenese.

*Bi*ChloroPhenic Acid. Insoluble in water. Readily soluble in alcohol, and ether. (Laurent.)

(*ChloroPhenesic Acid. ChloroSpirolic Acid. BiChloroCarbolic Acid.*)

$C_{12}H_4Cl_2O_2 = C_{12}H_3Cl_2O, HO$

*Bi*ChloroPhenate of Ammonia. Difficultly soluble in water. (Laurent.)

*Ter*ChloroPhenic Acid. Insoluble in water. (Laurent.) Almost insoluble in water at ordinary temperatures, and scarcely more soluble in boiling water. (Piria, *Ann. Ch. et Phys.*, (3.) **14.** 271.) Soluble in all proportions in alcohol, and ether; also soluble in wood-spirit. (Laurent.) Very soluble in alcohol, ether, and the fatty and volatile oils. (Piria, *loc. cit.*) Readily soluble in warm concentrated sulphuric acid, separating out on cooling. (Laurent.) Soluble in aqueous solutions of potash, and ammonia. (Piria, *loc. cit.*)

(*ChloroPhenisic Acid. TerChloroCarbolic Acid. ChloroSpirolic Acid. ChlorIndoptic Acid. ChlorPhenisic Acid.*)

$C_{12}H_3Cl_3O_2 = C_{12}H_2Cl_3O, HO$

*Ter*ChloroPhenate of Ammonia. Very sparingly soluble in cold, very easily soluble in hot water. Easily soluble in water containing alcohol. (Laurent.)

$C_{12}H_2(NH_4)Cl_3O_2$

*Ter*ChloroPhenate of Baryta. Sparingly soluble in water.

$C_{12}H_2BaCl_3O_2$

*Ter*ChloroPhenate of Cobalt. Ppt.

*Ter*ChloroPhenate of Copper. Ppt. Soluble in hot, less soluble in cold alcohol. (Erdmann.)

*Ter*ChloroPhenate *of protoxide* of Iron. Ppt.

*Ter*ChloroPhenate *of sesquioxide* of Iron. Ppt.

*Ter*ChloroPhenate of Lead. Ppt.

*Ter*ChloroPhenate of Lime. Sparingly soluble in water.

*Ter*ChloroPhenate *of dinoxide* of Mercury. Ppt.

*Ter*ChloroPhenate *of protoxide* of Mercury. Ppt.

*Ter*ChloroPhenate of Nickel. Ppt.

*Ter*ChloroPhenate of Potash. Very easily soluble in water. (Erdmann.)

*Ter*ChloroPhenate of Silver. Ppt.

$C_{12}H_2AgCl_3O_2$

*Ter*ChloroPhenate of Soda. Very easily soluble in water. (Laurent.)

*Quinqui*ChloroPhenic Acid. Sparingly soluble, or insoluble, in water. Soluble in alcohol and in naphtha.

(*ChloroPhenusic Acid. ChlorIndoptic Acid chloré.*)

$C_{12}HCl_5O_2 = C_{12}Cl_5O, HO$

*Quinqui*ChloroPhenate of Ammonia. Very sparingly soluble in water. (Laurent.)

*Quinqui*ChloroPhenate of Baryta. Ppt.

*Quinqui*ChloroPhenate of Cobalt. Ppt.

*Quinqui*ChloroPhenate of Copper (Cu O). Ppt.

*Quinqui*ChloroPhenate *of protoxide* of Iron. Ppt.

*Quinqui*ChloroPhenate *of sesquioxide* of Iron. Ppt.

*Quinqui*ChloroPhenate of Lead. Ppt.

ChloroPhenise. *Vid. ter*ChloroBenzin.

ChloroPhenyl. *Vid.* Chloride of Phenyl.

ChloroPhenylamin. *Vid.* ChlorAnilin.

ChloroPhenylBenzoylamid. Difficultly soluble in boiling, less soluble in cold alcohol.

(*BenzoChloranilid.*)

$C_{26}H_{10}ClNO_2 = N\left\{\begin{array}{l}C_{14}H_5O_2\\ C_{12}H_4Cl\\ H\end{array}\right.$

ChloroPhenylImesatin. Insoluble in water. Readily soluble in boiling, slightly soluble in cold alcohol. (Engelhardt.)

$C_{28}H_9ClN_2O_2$

ChloroPhenylSulphurous Acid.

(*ChloroSulphoBenzolic Acid. Sulphate of ChloroBenzene. Sulphate of PhenylicChloride.*)

$C_{12}H_5ClS_2O_6 = C_{12}H_5ClO_2, S_2O_4$

ChloroPhenylSulphite of Lime. Soluble in water. (Hutchings, *J. Ch. Soc.*, **10.** 101.)

$C_{12}H_4CaClO_2, S_2O_4$

ChloroPhloretic Acid. Insoluble in water. Soluble in alcohol, and ether. (Hlasiwetz.)

ChloroPhosphate of *X*. *Vid.* Chloride of *X* with Phosphate of *X*.

ChloroPhosphamid. $P\,Cl_3\,N_2\,H_4$ (?) Decomposed by water. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **18.** 190.)

ChloroPhosphide of Nitrogen. $N_2\,P_3\,Cl_6$ Entirely insoluble in water, but is slowly decomposed when in contact therewith. Easily soluble in alcohol, ether, oil of turpentine, bisulphide of carbon, chloroform, benzin, and in other hydrocarbons. When dissolved in ordinary alcohol or ether, the solution gradually but completely decomposes on standing; the solution in absolute alcohol, however, or that in anhydrous ether, may be preserved unchanged for a long time if kept in well-stopped bottles, — the decomposition occurring in the cases first mentioned seeming to depend upon the water which is present. Soluble in oxychloride of phosphorus. Insoluble in sulphuric, chlorhydric, or nitric acids, or in an aqueous solution of potash. Decomposed by an alcoholic solution of potash. (Gladstone, *J. Ch. Soc.*, **3.** pp. 138, 354, 357.)

ChloroPhosphite of *X*. *Vid.* Chloride of *X* with Phosphite of *X*.

*Bi*ChloroPhthalic Acid. $C_{16}\,H_4\,Cl_2\,O_8$ Soluble in alcohol.

*Bi*ChloroPhthalate of Potash. $C_{16}\,H_2\,K_2\,Cl_2\,O_8$ (Strecker, *J. Ch. Soc.*, **3.** 252.)

*Ter*ChloroPhthalic Acid (Anhydrous). $C_{16}\,H\,Cl_3\,O_6 = C_{16}\,H\,Cl_3\,O_4''\}\,O_2$ Very sparingly soluble in water.

*Ter*ChloroPhthalic Acid. (*ChloroPhthalisic Acid.*) $C_{16}\,H_3\,Cl_3\,O_8 = C_{16}\,H\,Cl_3\,O_6,\,2\,H\,O$ Very soluble in boiling water, in alcohol, ether, and alkaline solutions.

*Ter*ChloroPhthalate of Ammonia.

*Ter*ChloroPhthalate of Silver.

Chlorophyll. (*Chromule.*) $C_{18}\,H_9\,N\,O_8$? Permanent. Insoluble in boiling water. Easily soluble in alcohol, less soluble in ether. Soluble in concentrated acids, and alkalies.

Chlorophyll with Lime. Insoluble in water or alcohol.

ChlorOpianyl. *Vid.* ChloroMeconin.

*Ter*ChloroPicolin. $N\,\{\,C_{12}\,H_4\,Cl_3'''$

ChloroPicrin. *Vid.* Chloride of *per*ChloroNitroMethyl.

ChloroPlatinic Acid. *Vid.* *bi*Chloride of Platinum.

ChloroPlatinate of Acediamin. $C_4\,H_6\,N_2,\,H\,Cl,\,Pt\,Cl_2$ Readily soluble in water; less soluble in alcohol, and scarcely at all soluble in a mixture of alcohol and ether. (Strecker, *Ann. Ch. u. Pharm.*, **103.** 328.)

ChloroPlatinate of Acetonin. $C_{18}\,H_{18}\,N_2,\,H\,Cl,\,Pt\,Cl_2$ Soluble in water, and in boiling alcohol acidulated with chlorhydric acid. Insoluble in ether. (Stædeler.)

ChloroPlatinate of Acetosamin [Acetoylamin]. (*ChloroPlatinate of Acetylamin.*) $C_4\,H_5\,N,\,H\,Cl,\,Pt\,Cl_2$ Somewhat sparingly soluble in cold, readily soluble in boiling water. Almost insoluble in alcohol, and ether. (Natanson, *Ann. Ch. u. Pharm.*, **98.** 296.)

ChloroPlatinate of *tetra*Acetosammonium [Acetoylammonium]. $N\,\{\,(C_4\,H_3)_4\,Cl,\,Pt\,Cl_2 + 2\,Aq$

ChloroPlatinate of Aconitin.

ChloroPlatinate of Agrostemmin. Ppt., from alcohol.

ChloroPlatinate of Alanin. $2\,C_6\,H_7\,N\,O_4,\,H\,Cl,\,Pt\,Cl_2$ Soluble in water, alcohol, and a mixture of alcohol and ether.

ChloroPlatinate of Allyl with Sulphide of Allyl & of Platinum. $C_6\,H_5\,Cl,\,Pt\,Cl_2\,;\,3\,(C_6\,H_5\,S,\,Pt\,S_2)$ Nearly insoluble in water. After having once separated out it is also very sparingly soluble in alcohol, and ether. Unacted upon by chlorhydric acid, or alkaline solutions. (Wertheim.)

ChloroPlatinate of Allylamin. $C_6\,H_7\,N,\,H\,Cl,\,Pt\,Cl_2$ Soluble in water.

ChloroPlatinate of *tri*Allylamin. $C_{18}\,H_{15}\,N,\,H\,Cl,\,Pt\,Cl_2$

ChloroPlatinate of *tetr*Allylammonium. $C_{24}\,H_{20}\,N\,Cl,\,Pt\,Cl_2$ Soluble in water.

ChloroPlatinate of Aluminum. Deliquescent. Soluble in water. (Salm-Horstmar.)

ChloroPlatinate of Amarin. $C_{42}\,H_{18}\,N_2,\,H\,Cl,\,Pt\,Cl_2$ Somewhat soluble in boiling alcohol.

ChloroPlatinate of AmidoBenzoic Acid. *Vid.* ChloroPlatinate of Benzamic Acid.

ChloroPlatinate of *bi*AmidoBenzoic Acid. $C_{14}\,H_8\,N_2\,O_4,\,2\,H\,Cl,\,Pt\,Cl_2$ Soluble in water, alcohol, and ether. (Voit.)

ChloroPlatinate of AmidoSulphoBenzid. $C_{24}\,H_9\,(N\,H_2)\,S_2\,O_4,\,H\,Cl,\,Pt\,Cl_2$ Insoluble in cold, soluble, with partial decomposition, in hot water. Easily soluble in cold alcohol. (Gericke, *Ann. Ch. u. Pharm.*, **100.** 213.)

ChloroPlatinate of *bi*AmidoSulphoBenzid. $C_{24}\,H_8\,(N\,H_2)_2\,S_2\,O_4,\,2\,H\,Cl,\,Pt\,Cl_2$ Comports itself towards solvents in the same manner as the (preceding) mono-amido compound.

ChloroPlatinate of Ammonium. $N\,H_4\,Cl,\,Pt\,Cl_2$ Difficultly soluble in cold, more easily soluble in hot water. (Fresenius, *loc. inf. cit.*) Soluble in 150 pts. of cold, and 80 pts. of boiling water. (Fischer. ?) At 15° @ 20° it is soluble in 26535 pts. of alcohol of 97.5%, in 1406 pts. of alcohol of 76%, and in 665 pts. of 55% alcohol. If free chlorhydric acid be present, the salt is soluble in 672 pts. of alcohol, of 76%, at 15° @ 20°. Very slightly soluble in cold, abundantly soluble in boiling ammonia-water. (Fresenius, *Ann. Ch. u. Pharm.*, 1846, **59.** 118.) By a concentrated solution of chloride of ammonium this salt is almost completely precipitated from its aqueous solution. (Bœttger.) Soluble in an aqueous solution of chloride of ammonium. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 99.) Soluble in an aqueous solution of normal succinate of ammonia. (Dœpping.) It is less soluble in an aqueous solution of bichloride of platinum than in pure water. (Rogojski, *Ann. Ch. et Phys.*, (3.) **41.** 452.) Soluble in an aqueous solution of protochloride of tin. (Fischer.) Exceedingly easily soluble, with decomposition, in a warm aqueous solution of sulphocyanide of potassium. (Claus, *Beiträge*, p. 40.) Insoluble in cold chlorhydric acid. Soluble in hot chlorhydric, sulphuric, or nitric acids, separating out again on cooling. (Fischer.)

ChloroPlatinate of AmmoniumChlorPlatin(*ous*)Ammonium. (*BiChlorhydro Chloroplatinate of diplatinamin.*) $N_2H_6PtCl, Cl, PtCl_2 = N\left\{\begin{matrix}H_2\\ PtCl\\ NH_4\end{matrix}\right. . Cl, PtCl_2$ Readily soluble in hot water.. Insoluble, or but sparingly soluble, in alcohol. (Gerhardt.)

ChloroPlatinate of Amylamin. $C_{10}H_{13}N, HCl, PtCl_2$ Tolerably readily soluble in water, especially if this be hot; less soluble in dilute spirit. (Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 494.)

ChloroPlatinate of *di*Amylamin. $C_{20}H_{23}N, HCl, PtCl_2$ Tolerably soluble in water. (Hofmann.)

ChloroPlatinate of *tri*Amylamin. Ppt. $C_{30}H_{33}N, HCl, PtCl_2$

ChloroPlatinate of *tetr*Amylammonium. $N\left\{(C_{16}H_{11})_4Cl, PtCl_2\right.$ Ppt.

ChloroPlatinate of AmylAnilin. Ppt. $C_{24}H_{19}N, HCl, PtCl_2$

ChloroPlatinate of *di*AmylAnilin. $C_{32}H_{27}N, HCl, PtCl_2$ Soluble in alcohol.

ChloroPlatinate of AmylNicotin. Ppt. $NC_{10}H_7(C_{10}H_{11})Cl, PtCl_2$

ChloroPlatinate of AmylPiperidin. $NC_{20}H_{21}, HCl, PtCl_2$ Soluble in weak alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 100.)

ChloroPlatinate of AmylQuinolein. $N\left\{\begin{matrix}C_{18}H_7'''\\ C_{16}H_{11}\end{matrix}\right. . Cl, PtCl_2$ Sparingly soluble in water. Insoluble in a mixture of alcohol and ether. (Gr. Williams.)

ChloroPlatinate of AmylStrychnine.

ChloroPlatinate of Anilin. $C_{12}H_7N, HCl, PtCl_2$ Sparingly soluble in water, and alcohol. (Zinin.) The aqueous solution is easily decomposed by boiling. (Anderson.) Insoluble in pure ether, and almost insoluble in a mixture of alcohol and ether. (Hofmann, *Ann. Ch. et Phys.*, (3.) **9.** 152.) Tolerably easily soluble in water, less soluble in alcohol. Insoluble in absolute ether. (Hofmann.)

ChloroPlatinate of Animin. Sparingly soluble in water. (Unverdorben.)

ChloroPlatinate of Anisamate of Ethyl. $N\left\{\begin{matrix}C_{16}H_7O_4\\ C_4H_5\\ H\end{matrix}\right. . O_2, HCl, PtCl_2$ Easily soluble in alcohol when this is gently heated. Completely insoluble in ether. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 349.)

ChloroPlatinate of Anisamate of Methyl. $N\left\{\begin{matrix}C_{16}H_7O_4\\ C_2H_3\\ H\end{matrix}\right. . O_2, HCl, PtCl_2$ Easily soluble in alcohol, especially when this is warm. (Cahours, *Ibid.*, p. 351.)

ChloroPlatinate of Anisamic Acid. $N\left\{\begin{matrix}C_{16}H_7O_4\\ H_2\end{matrix}\right\}O_2, HCl, PtCl_2$ Tolerably easily soluble in warm water, and alcohol. (Cahours, *Ibid.*, p. 343.)

ChloroPlatinate of Anisin. $C_{48}H_{24}N_2O_6, HCl, PtCl_2$ Sparingly soluble in alcohol. (Bertagnini, *Ann. Ch. u. Pharm.*, **88.** 129.)

ChloroPlatinate of Aricin. $C_{46}H_{26}N_2O_8, HCl, PtCl_2$ Very sparingly soluble in water. Tolerably soluble in alcohol.

ChloroPlatinate of ArsenEthylium. $(C_4H_5)_4AsCl, PtCl_2$ Very difficultly soluble in cold, but somewhat soluble in boiling water. Insoluble in dilute, soluble, with decomposition, in warm concentrated chlorhydric acid.

ChloroPlatinate of ArsenMethylEthylium. $As\left\{\begin{matrix}(C_2H_3)_2\\ (C_4H_5)_2\end{matrix}\right. . Cl, PtCl_2$ Soluble in boiling, less soluble in cold spirit.

ChloroPlatinate of Atropin. Readily soluble in chlorhydric acid. Also soluble in water.

ChloroPlatinate of AzoNaphthylamin. $N_2\left\{\begin{matrix}C_{20}H_6''\\ H_4\end{matrix}\right., 2HCl, 2PtCl_2$ Sparingly soluble in water. (Zinin.)

ChloroPlatinate of Barium. Permanent. $BaCl, PtCl_2 + 4Aq$ Soluble in water. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 251.)

ChloroPlatinate of Bebirin. $C_{38}H_{21}NO_6, HCl, PtCl_2$ Insoluble in water. Almost insoluble in chlorhydric acid. (v. Planta, *Phil. Mag.*, 1851, (4.) **1.** pp. 117, 116.)

ChloroPlatinate of Benzamate of Ethyl. $N\left\{\begin{matrix}C_{14}H_5O_2\\ C_4H_5\\ H\end{matrix}\right. . O_2, HCl, PtCl_2$ Readily soluble in alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 329.)

ChloroPlatinate of Benzamic Acid. $N\left\{\begin{matrix}C_{14}H_5O_2\\ H_2\end{matrix}\right. . O_2, HCl, PtCl_2$ Tolerably easily soluble in alcohol. Also soluble in warm chlorhydric acid. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** pp. 324, 325.)

ChloroPlatinate of Benzidin. $C_{24}H_{12}N_2, 2(HCl, PtCl_2)$ Sparingly soluble in water; is decomposed when boiled therewith, or with spirit. Almost insoluble in alcohol or ether.

ChloroPlatinate of Berberin. $C_{42}H_{19}NO_{10}, HCl, PtCl_2$ Almost insoluble in water.

ChloroPlatinate of *bi*BromAllylamin. $C_{12}H_9Br_2N, HCl, PtCl_2$ Nearly insoluble in absolute alcohol.

ChloroPlatinate of BromAnilin. Ppt. $C_{12}H_6BrN, HCl, PtCl_2$ Somewhat soluble in water, and alcohol.

ChloroPlatinate of *bi*BromAnilin. Ppt.

ChloroPlatinate of BromoCinchonin. $C_{46}H_{23}BrN_2O_2, 2(HCl, PtCl_2)$

ChloroPlatinate of *sesqui*BromoCinchonin. $C_{60}H_{45}Br_3N_4O_4, 4(HCl, PtCl_2)$ Ppt.

ChloroPlatinate of BromoCodein. $C_{36}H_{20}BrNO_6, HCl, PtCl_2$ Insoluble in water or alcohol. (Anderson.)

ChloroPlatinate of *ter*BromoCodein. $C_{36}H_{16}Br_3NO_6, HCl, PtCl_2$ Soluble in water, and alcohol. (Anderson.)

ChloroPlatinate of *bi*BromoMelAnilin. $C_{26}H_{11}Br_2N_3, HCl, PtCl_2$ Insoluble in water. Scarcely at all soluble in ether; somewhat more soluble in alcohol. (Hofmann, *J. Ch. Soc.*, **1.** 301.)

ChloroPlatinate of *ter*BromoMelAnilin. (?) Somewhat soluble in boiling, less soluble in cold alcohol. (Hofmann, *J. Ch. Soc.*, **1.** 302.)

ChloroPlatinate of Brucin. $C_{46}H_{26}N_2O_8, HCl, PtCl_2$ Scarcely at all soluble in water; it is, however, decomposed by continued boiling therewith. (Anderson.)

ChloroPlatinate of Butylamin. (*ChloroPlatinate of Tetrylamin. ChloroPlatinate of Butyliaque.*) $N\left\{\begin{matrix}C_8H_9\\H_2\end{matrix}\right., HCl, PtCl_2$ Soluble in water, and alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **42.** 167.)

ChloroPlatinate of Cacodyl. $C_4H_6AsPtCl_3 = (C_2H_3)_2AsCl, PtCl_2$ Soluble in water, with decomposition.

ChloroPlatinate of Cacothelin. $C_{40}H_{22}N_4O_{18}, HCl, PtCl_2$ Sparingly soluble in water, and in mixed alcohol and ether. (Strecker, *Ann. Ch. u. Pharm.*, **91.** 92.)

ChloroPlatinate of Cadmium. $CdCl, PtCl_2 + 6\,Aq$ Resembles the zinc salt, *q. v.* (v. Bonsdorff, *Pogg. Ann.*, **17.** 259.)

ChloroPlatinate of Caffein. $C_{16}H_{10}N_4O_4, HCl, PtCl_2$ Permanent. Sparingly soluble in water, alcohol, and ether. (Nicholson.)

ChloroPlatinate of Calcium. $CaCl, PtCl_2 + 8\,Aq$ Deliquescent. Soluble in aqueous solutions of chloride of calcium, and bichloride of platinum.

ChloroPlatinate of *tri*Caproylamin. (*ChloroPlatinate of triHexylamin.*) $N(C_{12}H_{13})_3, HCl, PtCl_2$ Easily soluble in ordinary alcohol; less readily soluble in water. Very sparingly soluble in absolute alcohol. Insoluble in ether. (Petersen & Gœssmann, *Ann. Ch. u. Pharm.*, **101.** 312.) Tolerably easily soluble in hot water. Soluble in ordinary alcohol, but difficultly soluble in absolute alcohol. When pure it is almost insoluble in ether. (Petersen, *Ann. Ch. u. Pharm.*, **102.** 316.)

ChloroPlatinate of Caprylamin. *Vid.* ChloroPlatinate of Octylamin.

ChloroPlatinate of Carmindin. Exceedingly soluble in water and in spirit. Ether precipitates it from the alcoholic solution. (Williams, *J. Ch. Soc.*, **7.** 103.)

ChloroPlatinate of Cesium. $CsCl, PtCl_2$ Less soluble than chloroplatinate of potassium in water.

By experiment: —

100 pts. of water at	0°	dissolve	0.021	pt. of it.
"	11°	"	0.072	"
"	40°	"	0.118	"
"	68°	"	0.234	"
"	100°	"	0.382	"

From these results the following table was obtained by interpolation:

100 pts. of water at	0°	dissolve	0.024	pt. of it.
"	10°	"	0.050	"
"	20°	"	0.079	"
"	30°	"	0.110	"
"	40°	"	0.142	"
"	50°	"	0.177	"
"	60°	"	0.213	"
"	70°	"	0.251	"
"	80°	"	0.291	"
"	90°	"	0.332	"
"	100°	"	0.377	"

(Kirchhoff & Bunsen, *Pogg. Ann.*, 1861, **113.** pp. 371, 373, and fig.)

ChloroPlatinate of Cetyl. $C_{96}H_{99}N, HCl, PtCl_2$ Insoluble in water. Sparingly soluble in alcohol.

ChloroPlatinate of *tri*Cetylamin. Insoluble in water. Scarcely at all soluble in alcohol.

ChloroPlatinate of CetylAnilin. $C_{44}H_{39}N, HCl, PtCl_2$ Insoluble in water. Soluble in alcohol.

ChloroPlatinate of *di*CetylAnilin. $C_{76}H_{71}N, HCl, PtCl_2$ Easily soluble in warm alcohol, and ether.

ChloroPlatinate of Chelidonin. $C_{40}H_{19}N_3O_6, HCl, PtCl_2$ Ppt.

ChloroPlatinate of ChlorAnilin. $NC_{12}H_6Cl, HCl, PtCl_2$ Only sparingly soluble in cold, but rather easily soluble in boiling water. Sparingly soluble in alcohol, and ether. (Hofmann.)

ChloroPlatinate of *bi*ChloroCinchonin. $C_{40}H_{22}Cl_2N_2O_2, 2\,(HCl, PtCl_2) + 2\,Aq$ Ppt.

ChloroPlatinate of ChloroCodein. $C_{36}H_{20}ClNO_6, HCl, PtCl_2$ Scarcely at all soluble in water. (Anderson, *Ann. Ch. u. Pharm.*, 1851, **77.** 370.)

ChloroPlatinate of *bi*ChloroMelanilin. $C_{26}H_{11}Cl_2N_3, HCl, PtCl_2$ Insoluble, or nearly insoluble, in ether. (Hofmann, *J. Ch. Soc.*, **1.** 299.)

ChloroPlatinate of ChloroNicine. $C_{20}H_{12}Cl_2N_2, 2\,(HCl, PtCl_2)$ Soluble in water. Insoluble, or but sparingly soluble, in ether. (St. Evre.)

ChloroPlatinate of ChloroNitroHarmin. $C_{26}H_{10}Cl(NO_4)N_2O_2, HCl, PtCl_2$ Soluble in alcohol.

I.) ChloroPlatinate of Cinchonidin (of Wittstein). $N_2\left\{C_{36}H_{20}O_2^{\text{vi}}, 2\,HCl, 2\,PtCl_2\right.$ Rather hygroscopic.

II.) ChloroPlatinate of Cinchonidin (of Pasteur). $N_2\left\{C_{40}H_{24}O_2^{\text{vi}}, HCl, PtCl_2 + 4\,Aq\right.$ Ppt. May be washed with acidulated water. (Leers, *loc. cit.*)

ChloroPlatinate of Cinchonin. $C_{40}H_{24}N_2O_2, 2\,(HCl, PtCl_2) + 2\,Aq$ Sparingly soluble in boiling water. Rather easily soluble in chlorhydric acid.

Sparingly soluble in hot water, alcohol, or ether; more readily soluble in an aqueous solution of bichloride of platinum. (A. Erdmann.)

ChloroPlatinate of Cobalt. $CoCl, PtCl_2 + 6\,Aq$ Resembles the zinc salt, *q. v.* (v. Bonsdorff, *Pogg. Ann.*, **17.** 260.)

ChloroPlatinate of Codein. $C_{36}H_{21}NO_6, HCl, PtCl_2 + 4\,Aq$ Sparingly soluble in cold, more soluble in boiling water, with partial decomposition.

ChloroPlatinate of Collidin. $C_{16}H_{11}N, HCl, PtCl_2$ Readily soluble in water. Insoluble in alcohol or ether.

ChloroPlatinate of Conhydrin. $C_{16}H_{17}NO_2, HCl, PtCl_2$ Insoluble, or but sparingly soluble in ether, or a mixture of alcohol and ether. Soluble in alcohol. (Th. Wertheim.)

ChloroPlatinate of Coniin. $C_{16}H_{15}N, HCl, PtCl_2$ Sparingly soluble in cold water, alcohol, or ether. Very readily soluble in boiling alcohol. (Blyth, *J. Ch. Soc.*, **1.** 354.) Soluble in water, alcohol, and ether. (Ortigosa.)

ChloroPlatinate of Copper. Deliquescent. $CuCl, PtCl_2 + 6 Aq$ (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 260.)

ChloroPlatinate of Cotarnin. Very sparingly soluble in water. $C_{26}H_{13}NO_6, HCl, PtCl_2$

ChloroPlatinate of Cotarnin & of Narcotin. (*ChloroPlatinate of Narcogenin.*) (Gerhardt.) $N\left\{\begin{matrix}C_{26}H_{15}O_6\\C_{20}H_9O_8\\H\end{matrix}\right.. HCl, PtCl_2$; $N\left\{C_{26}H_{13}O_6{}'''\right., HCl, PtCl_2$

ChloroPlatinate of Creatinin. Tolerably easily soluble in water; less soluble in alcohol.

ChloroPlatinate of Cryptidin. Very sparingly soluble in cold, more soluble in boiling water. May be washed with ether or alcohol. (Gr. Williams.) $NC_{22}H_{11}, HCl, PtCl_2$

ChloroPlatinate of Cumaramin. Insoluble in water. $C_{18}H_7NO_4, HCl, PtCl_2$

ChloroPlatinate of Cumidin. Very sparingly soluble in cold water; decomposed when boiled with water. Extremely soluble in alcohol, and ether, but after a short time separates from these solutions as an oil. (Nicholson, *J. Ch. Soc.*, **1.** 8.) $C_{18}H_{13}N, HCl, PtCl_2$

ChloroPlatinate of Cuminamic Acid. Soluble in alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 336.) $N\left\{\begin{matrix}C_{20}H_{11}O_2\\H_2\end{matrix}\right\}O_2, HCl, PtCl_2$

ChloroPlatinate of CyanAnilin. Soluble in water, and alcohol, the solution undergoing decomposition when evaporated. Insoluble in ether. (Hofmann, *J. Ch. Soc.*, **1.** 167.) $N\left\{\begin{matrix}C_4H_5\\H_2\end{matrix}\right.. C_2N, HCl, PtCl_2$

ChloroPlatinate of Cyanethin. Difficultly soluble in water. Soluble in alcohol, the solution undergoing decomposition when boiled. Also soluble in a mixture of alcohol and ether. (Frankland & Kolbe, *J. Ch. Soc.*, **1.** 73.) $C_{16}H_{15}N_3, HCl, PtCl_2$

ChloroPlatinate of CyanoPhenyl*di*Phenyl*bi*amin. Very easily soluble in chlorhydric acid.

ChloroPlatinate of Cyanothelin.

ChloroPlatinate of CyanoToluenyl*bi*ammonium. Insoluble in water or alcohol.

ChloroPlatinate of Cymidin. Sparingly soluble in water; more soluble in alcohol, and still more soluble in ether. (Barlow, *Ann. Ch. u. Pharm.*, **98.** 249.) $C_{20}H_{15}N, HCl, PtCl_2$

ChloroPlatinate of Cystin. Extremely easily soluble in water. Soluble in absolute alcohol. Insoluble in ether; but ether does not precipitate it completely from the alcoholic solution. (Berzelius, in his *Jahresbericht*, 1848, **27.** 631.)

ChloroPlatinate of Emetin. Sparingly soluble in water.

ChloroPlatinate of Ethyl. *Vid.* Ethyl-ChloroPlatinic Acid.

ChloroPlatinate of Ethylamin. Soluble in boiling, less soluble in cold water. Insoluble in alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 481.) $N\left\{\begin{matrix}C_4H_5\\H_2\end{matrix}\right., HCl, PtCl_2$

ChloroPlatinate of *di*Ethylamin. Very soluble in water. (Hofmann.) $N\left\{\begin{matrix}(C_4H_5)_2\\H\end{matrix}\right., HCl, PtCl_2$

ChloroPlatinate of *tri*Ethylamin. Very soluble in water. (Hofmann.) $N\left\{(C_4H_5)_3\right., HCl, PtCl_2$

ChloroPlatinate of *tetra*Ethylammonium. Slightly soluble in boiling water; less soluble in alcohol. Insoluble in ether. (Hofmann.) $N(C_4H_5)_4, Cl, PtCl_2$

ChloroPlatinate of *di*EthylAmylamin. $N\left\{\begin{matrix}C_{10}H_{11}\\(C_4H_5)_2\end{matrix}\right., HCl, PtCl_2$

ChloroPlatinate of *tri*EthylAmylammonium. More soluble in boiling than in cold water. As a precipitate it does not fall very readily, but when once formed it is difficultly soluble. $N\left\{\begin{matrix}(C_4H_5)_3\\C_{10}H_{11}\end{matrix}\right.. Cl, PtCl_2$

ChloroPlatinate of EthylAmylAnilin. $N\left\{\begin{matrix}C_4H_5\\C_{10}H_{11}\\C_{12}H_5\end{matrix}\right., HCl, PtCl_2$

ChloroPlatinate of *tri*EthylAmylPhosphonium. Tolerably soluble in water. Insoluble in alcohol or ether. $P\left\{\begin{matrix}(C_4H_5)_3\\C_{10}H_{11}\end{matrix}\right.. Cl, PtCl_2$

ChloroPlatinate of EthylAnilin. Exceedingly easily soluble in water, and alcohol; less soluble in a mixture of alcohol and ether. (Hofmann.) $NC_{12}H_6(C_4H_5), HCl, PtCl_2$

ChloroPlatinate of *di*EthylAnilin. Not quite as soluble in water or alcohol as the corresponding salt of mono-ethylanilin. (Hofmann.) $NC_{12}H_5(C_4H_5)_2, HCl, PtCl_2$

ChloroPlatinate of EthylBromAnilin.

ChloroPlatinate of EthylBrucin. Soluble in boiling, less soluble in cold water. (Gunning.) $C_{46}H_{25}(C_4H_5)N_2O_6, HCl, PtCl_2$

ChloroPlatinate of EthylChlorAnilin. Soluble in water.

ChloroPlatinate of *di*EthylChlorAnilin. Sparingly soluble, or insoluble, in water. $NC_{20}H_{14}Cl, HCl, PtCl_2$

ChloroPlatinate of EthylCodein. Insoluble in cold, soluble, apparently with decomposition, in hot water. (How, *J. Ch. Soc.*, **6.** 136.) $C_{40}H_{25}NO_6, HCl, PtCl_2 + Aq$

ChloroPlatinate of EthylCollidin. Sparingly soluble in water. (Anderson.) $C_{20}H_{15}N, HCl, PtCl_2$

ChloroPlatinate of EthylConiin. Before crystallizing it is easily soluble in water, and alcohol; but when crystals have once formed they are somewhat sparingly soluble in alcohol. Ether precipitates it from the alcoholic solution. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **89.** pp. 134, 139.) $C_{20}H_{19}N, HCl, PtCl_2$

ChloroPlatinate of *di*EthylConiin. Soluble in water. Sparingly soluble in alcohol. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **89.** 146.) $NC_{16}H_{14}(C_4H_5)_2, Cl, PtCl_2$

ChloroPlatinate of Ethyl*di*Cyan*bi*amin. Scarcely at all soluble in water. Easily soluble in boiling alcohol.

ChloroPlatinate of EthylCyanAnilin. Very soluble, like the cyananilin salt. (Hofmann.)

ChloroPlatinate of Ethyl*di*Ethylene*di*Phenyl*bi*ammonium. $N_2\left\{\begin{matrix}C_4H_5\\(C_4H_4{}'')_2\\(C_{12}H_5)_2\end{matrix}\right.. Cl, PtCl_2$

ChloroPlatinate of *di*Ethylene*di*Phenyl*bi*amin.
$N_2 \left\{ \begin{matrix} (C_4 H_4'')_2 \\ (C_{12} H_5)_2 \end{matrix} \right., 2\,H\,Cl, 2\,Pt\,Cl_2$

ChloroPlatinate of EthylLepidin. Ppt.
$N \left\{ \begin{matrix} C_{20} H_9''' \\ C_4 H_5 \end{matrix} \right. . Cl, Pt\,Cl_2$

ChloroPlatinate of EthylNicotin. Soluble in hot, less soluble in cold water. Almost insoluble in alcohol, even when this is boiling. Insoluble in ether. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **87.** 6.)
$N \left\{ \begin{matrix} C_{10} H_7''' \\ C_4 H_5 \end{matrix} \right. Cl, Pt\,Cl_2$

ChloroPlatinate of EthylNitrAnilin. Sparingly soluble, or insoluble, in cold water.
$N\,C_{12} H_5 (N\,O_4) (C_4 H_5), H\,Cl, Pt\,Cl_2$

ChloroPlatinate of Ethyl*tri*Phenylammonium (or of "Ethyl*bi*Cinnamylamin"). Somewhat soluble in water. When boiled with a quantity of water insufficient for its solution, it melts to a resin. (Gœssmann.)
$C_{40} H_{20} N\,Cl, Pt\,Cl_2$

ChloroPlatinate of *tri*EthylPhenylammonium. Scarcely at all soluble in water. Insoluble in alcohol, and ether.
$C_{24} H_{20} N\,Cl, Pt\,Cl_2$

ChloroPlatinate of *tri*EthylPhosphin. Difficultly soluble in cold water. Insoluble in alcohol or ether. (Hofmann & Cahours.)
$P \left\{ (C_4 H_5)_3 \right., H\,Cl, Pt\,Cl_2$

ChloroPlatinate of *tetra*EthylPhosphonium. Difficultly soluble in boiling water. Insoluble in alcohol or ether.
$P (C_4 H_5)_4 Cl, Pt\,Cl_2$

ChloroPlatinate of EthylPicolin. Readily soluble in water, the solution being decomposed by ebullition. (Anderson.)
$N \left\{ \begin{matrix} C_{12} H_7''' \\ C_4 H_5 \end{matrix} \right. Cl, Pt\,Cl_2$

ChloroPlatinate of EthylPiperidin. Sparingly soluble in water, though more soluble in hot than in cold. Soluble in spirit. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 97.)
$N\,C_{14} H_{15}, H\,Cl, Pt\,Cl_2$

ChloroPlatinate of *di*EthylPiperylammonium. Sparingly soluble in hot, less soluble in cold water. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 98.)
$N\,C_{10} H_{10} (C_4 H_5)_2 Cl, Pt\,Cl_2$

ChloroPlatinate of EthylPyridin. Sparingly soluble in cold water. The solution is very slowly decomposed by ebullition. Insoluble in a mixture of alcohol and ether.
$N\,C_{14} H_{10} Cl, Pt\,Cl_2$

ChloroPlatinate of EthylQuinine. Soluble in boiling, less soluble in cold water. (Strecker, *Ann. Ch. u. Pharm.*, **91.** 168.)
$C_{40} H_{24} N_2 O_4 (C_4 H_5) Cl, Pt\,Cl_2$

ChloroPlatinate of EthylQuinolein. Sparingly soluble in water. (Gr. Williams.)
$C_{22} H_{11} N, H\,Cl, Pt\,Cl_2$

ChloroPlatinate of EthylSinamin. Ppt.
$C_{12} H_{10} N_2, H\,Cl, Pt\,Cl_2$

ChloroPlatinate of EthylStrychnine. Soluble in boiling, less soluble in cold water.
$C_{42} H_{21} (C_4 H_5) N_2 O_4, H\,Cl, Pt\,Cl_2$

ChloroPlatinate of EthylThioSinamin. Permanent. Sparingly soluble in water and in alcohol. (Hinterberger.)
$C_{12} H_{12} N_2 S_2, H\,Cl, Pt\,Cl_2$

ChloroPlatinate of EthylToluenylamin (or of EthylToluidin. Soluble in water. This solution is liable to undergo decomposition. Very soluble in alcohol; less soluble in ether. (Morley & Abel, *J. Ch. Soc.*, **7.** 70.)
$N\,C_{18} N_{13}, H\,Cl, Pt\,Cl_2$

ChloroPlatinate of *di*EthylToluenylamin.

ChloroPlatinate of *tri*EthylToluenylamin. Nearly insoluble in cold, readily soluble in hot water. (Morley & Abel, *J. Ch. Soc.*, **7.** 75.)
$N \left\{ \begin{matrix} (C_4 H_5)_3 \\ C_{14} H_7 \end{matrix} \right\} Cl, Pt\,Cl_2$

ChloroPlatinate of Formicyl*di*Phenyl*bi*amin.

ChloroPlatinate of Fucusin.
$C_{30} H_{12} N_2 O_6, H\,Cl, Pt\,Cl_2$

ChloroPlatinate of Furfurin. Soluble in alcohol.
$N_2 \left\{ (C_{10} H_4 O_2'')_3 \right., H\,Cl, Pt\,Cl_2$

ChloroPlatinate of Glyceramin. Somewhat soluble in alcohol. Very sparingly soluble, or insoluble, in mixed alcohol and ether. (Berthelot & De Luca.)
$C_6 H_9 N\,O_4, H\,Cl, Pt\,Cl_2$

ChloroPlatinate of Glycocoll.

I.) Of the *mono*Chlorhydrate.

II.) Of the *di*Chlorhydrate.
$2\,(C_4 H_5 N\,O_4), H\,Cl, Pt\,Cl_2$

ChloroPlatinate of Guanin. As insoluble as chloroplatinate of ammonium in cold water, but freely soluble in hot water. Soluble, without decomposition, in aqueous solutions of caustic, and carbonated, potash and soda.
$C_{10} H_5 N_5 O_2, H\,Cl, 2\,Pt\,Cl_2 + 4\,Aq$

ChloroPlatinate of Hexylamin. *Vid.* ChloroPlatinate of Caproylamin.

ChloroPlatinate of Harmalin.
$C_{26} H_{14} N_2 O_2, H\,Cl, Pt\,Cl_2$

ChloroPlatinate of Harmin.
$C_{26} H_{12} N_2 O_2, H\,Cl, Pt\,Cl_2$

ChloroPlatinate of IodAnilin. Ppt. Insoluble in ether. (Hofmann, *J. Ch. Soc.*, **1.** 278.)
$N\,C_{12} H_6 I, H\,Cl, Pt\,Cl_2$

ChloroPlatinate of *bin*IodoCodein. Ppt.
$N \left\{ \begin{matrix} C_{36} H_{18} I_2 O_6'' \\ H \end{matrix} \right. . H\,Cl, Pt\,Cl_2 + Aq$

ChloroPlatinate of *bin*IodoMelanilin. Resembles the corresponding bromo and chloromelanilin compounds. (Hofmann, *J. Ch. Soc.*, **1.** 304.)
$C_{26} H_{11} I_2 N_3, H\,Cl, Pt\,Cl_2$

ChloroPlatinate *of protochloride* of Iron. Quickly decomposes in the air. Soluble in water. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 258.)
$Fe\,Cl, Pt\,Cl_2 + 6\,Aq$

ChloroPlatinate of Jervin.

ChloroPlatinate of Lepidin. Ppt.
$N \left\{ C_{20} H_9''' \right., H\,Cl, Pt\,Cl_2$

ChloroPlatinate of Lithium. Soluble in water, and spirit. Difficultly soluble, or insoluble, in strong alcohol.

ChloroPlatinate of Lophin. Easily soluble in alcohol, being more soluble in this menstruum than any other compound of lophin. (Gœssmann & Atkinson.)
$C_{42} H_{16} N_2, H\,Cl, Pt\,Cl_2$

ChloroPlatinate of LuteoCobalt. Very slightly soluble in cold, somewhat more soluble in boiling water. (Gibbs & Genth,
(*ChloroPlatinate of diCobaltinamin.*)
$6\,N\,H_3 . Co_2 Cl_3, 3\,Pt\,Cl_2 + 6\,Aq\ \&\ 21\,Aq$

Smithson. Contrib., Vol. **9.**) Tolerably soluble in warm, less soluble in a cold aqueous solution of bichloride of platinum. (Rogojski, *Ann. Ch. et Phys.*, (3.) **41.** pp. 451, 452.)

ChloroPlatinate of Lutidin. $N\left\{ C_{14}H_9''', HCl, PtCl_2 \right.$ Readily soluble in cold, and still more soluble in hot water. Sparingly soluble, or insoluble, in alcohol or ether. Readily soluble in chlorhydric acid.

ChloroPlatinate of Magnesium.

a = $MgCl, PtCl_2 + 2 Aq$ Absorbs water from the air and forms the 6 Aq salt. Combines with water with evolution of heat, and then dissolves. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 255.)

b = $MgCl, PtCl_2 + 6 Aq$ Permanent. Easily soluble in water. (*Ibid.*)

ChloroPlatinate of Manganese. $MnCl, PtCl_2 + 6 Aq$

ChloroPlatinate of MelAnilin. $C_{28}H_{13}N_3, HCl, PtCl_2$ Slightly soluble in boiling water; less soluble in alcohol; and still less soluble in ether. (Hofmann, *J. Ch. Soc.*, **1.** 295.)

ChloroPlatinate of Menaphthalamin. Insoluble in water or alcohol.

ChloroPlatinate of Mesityl. *Vid.* AceChlorPlatin.

ChloroPlatinate of *tri*MethylAcetos-[Acetoyl]ammonium. $N\left\{ \begin{matrix} (C_2H_3)_3 \\ C_4H_3 \end{matrix} \right. . Cl, PtCl_2$ Very easily soluble in water. Very sparingly soluble in ether.

ChloroPlatinate of Methylamin. $N\left\{ \begin{matrix} C_2H_3 \\ H_2 \end{matrix} \right. , HCl, PtCl_2$ Soluble in boiling, sparingly soluble in cold water. Insoluble in alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 457.)

ChloroPlatinate of *di*Methylamin. $N\left\{ \begin{matrix} (C_2H_{32}) \\ H \end{matrix} \right. , HCl, PtCl_2$ Somewhat difficultly soluble in water; still less soluble in alcohol, and ether. (Petersen, *Ann. Ch. u. Pharm.*, **102.** 323.)

ChloroPlatinate of *tri*Methylamin. $N(C_2H_3)_3, HCl, PtCl_2$

ChloroPlatinate of *tetra*Methylammonium. $N(C_2H_3)_4Cl, PtCl_2$ Slightly more soluble than the corresponding ethyl compound.

ChloroPlatinate of MethylAmylAnilin. $C_{24}H_{19}N, HCl, PtCl_2$ Ppt.

ChloroPlatinate of MethylAnilin. $C_{14}H_7N, HCl, PtCl_2$ Exceedingly easily soluble in water. Sparingly soluble in dilute chlorhydric acid, or alcohol.

ChloroPlatinate of *tri*MethylAmylPhosphonium. $P\left\{ \begin{matrix} (C_{10}H_{11}) \\ (C_2H_3)_3 \end{matrix} \right. . Cl, PtCl_2$ Very soluble in boiling water; somewhat less soluble in cold water.

ChloroPlatinate of *tri*MethylBromEthylammonium. $N\left\{ \begin{matrix} (C_2H_3)_3 \\ C_4H_4Br \end{matrix} \right. . Cl, PtCl_2$ Difficultly soluble in cold, easily soluble in hot water.

ChloroPlatinate of MethylCinchonin. $C_{40}H_{24}N_2O_2(C_2H_3), 2HCl, 2PtCl_2$

ChloroPlatinate of *di*Methyl*di*Ethylammonium. $N\left\{ \begin{matrix} (C_2H_3)_2 \\ (C_4H_5)_2 \end{matrix} \right. . Cl, PtCl_2$ Tolerably easily soluble in water. Difficultly soluble in alcohol, and ether.

ChloroPlatinate of Methyl*tri*Ethylammonium. $N\left\{ \begin{matrix} C_2H_3 \\ (C_4H_5)_3 \end{matrix} \right. . Cl, PtCl_2$ Ppt.

ChloroPlatinate of MethylEthylAmylamin. $N\left\{ \begin{matrix} C_2H_3 \\ C_4H_5 \\ C_{10}H_{11} \end{matrix} \right. , HCl, PtCl_2$ Very soluble in water. (Hofmann.)

ChloroPlatinate of Methyl*di*EthylAmylammonium. $N\left\{ \begin{matrix} (C_2H_3) \\ (C_4H_5)_2 \\ (C_{10}H_{11}) \end{matrix} \right. . Cl, PtCl_2$

ChloroPlatinate of MethylEthylAmylPhenylammonium. $C_{28}H_{24}NCl, PtCl_2$ Ppt.

ChloroPlatinate of MethylEthylAnilin. Very easily soluble in water.

ChloroPlatinate of MethylEthylConiin. $NC_{16}H_{14}(C_2H_3)(C_4H_5)Cl, PtCl_2$ Sparingly soluble in cold, more soluble in boiling water. Insoluble in alcohol, and ether. (v. Planta & Kekulé, *Ann. Ch. u. Pharm.*, **89.** 139.)

ChloroPlatinate of Methyl*tri*EthylPhosphonium. $P\left\{ \begin{matrix} (C_4H_5) \\ C_2H_3 \end{matrix} \right. . Cl, PtCl_2$ Soluble in boiling, less soluble in cold water. Insoluble in alcohol or ether.

ChloroPlatinate of *tri*MethylEthylPhosphonium. $P\left\{ \begin{matrix} (C_4H_5) \\ (C_2H_3)_3 \end{matrix} \right. . Cl, PtCl_2$ Tolerably soluble in water. Insoluble in alcohol or ether.

ChloroPlatinate of Methyl*di*Ethylene*di*Phenyl*bi*ammonium. $N_2\left\{ \begin{matrix} C_2H_3 \\ (C_4H_4'')_2 \\ (C_{12}H_5)_2 \end{matrix} \right. . Cl, PtCl_2$ Ppt.

ChloroPlatinate of MethylLutidin. $C_{14}H_{12}NCl, PtCl_2$

ChloroPlatinate of MethylNicotin. $N\left\{ \begin{matrix} C_{10}H_7''' \\ C_2H_3 \end{matrix} \right. . Cl, PtCl_2$ Soluble in boiling, very sparingly soluble in cold water. Insoluble in alcohol. (Stahlschmidt, *Ann. Ch. u. Pharm.*, **90.** 225.)

ChloroPlatinate of MethylNitroPhenidin. $C_{14}H_8(NO_4)NO_2, HCl, PtCl_2$ Somewhat soluble in hot water, from which it separates as the solution cools. (Cahours.)

ChloroPlatinate of MethylPhenidin. $C_{14}H_9NO_2, HCl, PtCl_2$ Soluble in boiling, less soluble in cold alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 341.)

ChloroPlatinate of *tri*MethylPhosphin. $P\left\{ (C_2H_3)_3, HCl, PtCl_2 \right.$

ChloroPlatinate of *tetra*MethylPhosphonium. Soluble in boiling water.

ChloroPlatinate of MethylPiperidin. $C_{12}H_{13}N, HCl, PtCl_2$ Soluble in water; more soluble in alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 93.)

ChloroPlatinate of MethylQuinolein. $NC_{20}H_9, HCl, PtCl_2$ Sparingly soluble in water. (Gr. Williams.)

ChloroPlatinate of MethylUramin. $C_4H_7N_3, HCl, PtCl_2$

ChloroPlatinate of Metoluidin. $C_{30}H_{17}N_3, HCl, PtCl_2$ Insoluble in water and in alcohol. (Wilson, *J. Ch. Soc.*, **3.** 156.)

ChloroPlatinate of Morphine. Somewhat soluble in warm water.
$C_{34}H_{19}NO_6, HCl, PtCl_2$

ChloroPlatinate of Naphthylamin. Sparingly soluble in water. Still less soluble in alcohol, and ether. (Zinin.)

ChloroPlatinate of Narcein. Ppt.
$C_{46}H_{29}NO_{18}, HCl, PtCl_2$

ChloroPlatinate of Narcotin. Sparingly soluble in hot water; the solution undergoing decomposition when boiled for some time. (Anderson.)
$C_{46}H_{25}NO_{14}, HCl, PtCl_2$

ChloroPlatinate of Nickel. Resembles the zinc salt, *q. v.* (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 260.)
$NiCl, PtCl_2 + 6 Aq$

ChloroPlatinate of Nicotin. Sparingly soluble in cold water. (Ortigosa.) Soluble in boiling water, and very soluble in a slight excess of nicotin. (Barral, *Ann. Ch. et Phys.*, (3.) **7.** 154.) Entirely insoluble in alcohol or ether. Easily soluble in warm dilute chlorhydric acid. (Ortigosa.) Somewhat soluble in nitric acid.
$N_2\left\{(C_{10}H_7''')_2, 2(HCl, PtCl_2)\right.$

ChloroPlatinate of NiNaphthylamin. Rather soluble.
$C_{20}H_6N_2O_2, HCl, PtCl_2$

ChloroPlatinate of *ter*NitrAmarin. Insoluble in alcohol.

ChloroPlatinate of (α)NitrAnilin. Very readily soluble in water, and alcohol. Insoluble, or very sparingly soluble, in ether. (Muspratt & Hofmann.)
$C_{12}H_6(NO_4)N, HCl, PtCl_2$

ChloroPlatinate of (β)NitrAnilin.

I.) *normal.* Soluble in water, alcohol, and ether, especially when in presence of chlorhydric acid. Much more soluble in alcohol than in water. The aqueous, but not the alcoholic, solution is decomposed by evaporation. Decomposed by washing with mixed alcohol and ether. (Arppe, *Ann. Ch. u. Pharm.*, **93.** 363.)
$C_{12}H_6(NO_4)N, HCl, PtCl_2$

II.) *bi.* Somewhat soluble in water. Less soluble than the normal salt in alcohol, and ether. Partially soluble in alkaline liquors. (Arppe, *Ann. Ch. u. Pharm.*, **93.** 363.)
$C_{12}H_6(NO_4)N, HCl, 2PtCl_2$

ChloroPlatinate of NitroCodein. Insoluble in water or alcohol. (Anderson.)
$C_{36}H_{20}(NO_4)NO_6, HCl, PtCl_2 + 4Aq$

ChloroPlatinate of NitroCumidin.

ChloroPlatinate of NitroHarmalin. Ppt.
$C_{26}H_{13}(NO_4)N_2O_2, HCl, PtCl_2$

ChloroPlatinate of NitroHarmin. Sparingly soluble in water.

ChloroPlatinate of *bi*NitroMelAnilin. Insoluble in water or alcohol. Only slightly soluble in ether. (Hofmann, *J. Ch. Soc.*, 1849, **1.** 307.)
$C_{26}H_{11}N_5O_8, HCl, PtCl_2$

ChloroPlatinate of NitroMesidin. Insoluble in water. Soluble in alcohol. (Maule, *J. Ch. Soc.*, **2.** 119.)
$C_{18}H_{12}N_2O_4, HCl, PtCl_2$

ChloroPlatinate of NitroPapaverin. Ppt.
$C_{40}H_{20}(NO_4)NO_6, HCl, PtCl_2$

ChloroPlatinate of Octylamin. (*Chloro Platinate of Caprylamin.*) Somewhat soluble in cold, much more soluble in hot water. Tolerably soluble in alcohol. Very easily soluble in ether. (Squire, *J. Ch. Soc.*, **7.** 109.) Much less soluble in water than the chlor-aurate. Very soluble in alcohol, and ether; less soluble in water. (Bouis, *Ann. Ch. et Phys.*, (3.) **44.** 142.)
$C_{16}H_{19}N, HCl, PtCl_2$

ChloroPlatinate of Olanin (of Unverdorben). Readily soluble in water, and alcohol. Insoluble in ether.

ChloroPlatinate of Papaverin. Insoluble in water or alcohol.
$C_{40}H_{21}NO_6, HCl, PtCl_2$

ChloroPlatinate of ParaNicine. Scarcely at all soluble in ether. (St. Evre [*Ger.*].)
$C_{20}H_{18}N, HCl, PtCl_2$

ChloroPlatinate of Pellutein. Ppt.

ChloroPlatinate of Pelosin. Ppt.
$C_{36}H_{21}NO_6, HCl, PtCl_2$

ChloroPlatinate of Petinin. Easily soluble in water. Also soluble in alcohol.
$C_6H_{11}N, HCl, PtCl_2$

ChloroPlatinate of *di*Phenin.
$C_{24}H_{12}N_4, 2(HCl, PtCl_2)$

ChloroPlatinate of PhenylAcetosamin. (*Chloro Platinate of Acetoylamin.*) Tolerably soluble in boiling, less soluble in cold water. (Natanson.)
$C_{16}H_9N, HCl, PtCl_2$

ChloroPlatinate of *tri*Phenylamin. Permanent. Easily soluble in water and in alcohol of 80%; less soluble in stronger alcohol. Insoluble, or sparingly soluble, in ether. (Gœssmann.)
$N\left\{(C_{12}H_5)_3, HCl, PtCl_2\right.$

ChloroPlatinate of *tri*PhenylEthylammonium. Somewhat soluble in hot, less soluble in cold water. (Gœssmann.)
$C_{40}H_{20}NCl, PtCl_2$

ChloroPlatinate of PhenylSulphoCarbamid.
$N_2\left\{\begin{matrix}C_2S_2'' \\ C_{12}H_5 \\ H_3\end{matrix}\right., HCl, PtCl_2$

ChloroPlatinate of PhenylUrea. Soluble in warm, less soluble in cold water.
$C_{14}H_8N\ O_2, HCl, PtCl_2$

ChloroPlatinate of *di*PhenylUrea. Ppt. Somewhat soluble in water.
$C_2H_2(C_{12}H_5)_2N_2O_2, 2HCl, 2PtCl_2$

ChloroPlatinate of Phtalidin. Ppt. Easily decomposed.

ChloroPlatinate of Picolin. Much more soluble in water than the corresponding salt of anilin.
$N\left\{C_{12}H_7''', HCl, PtCl_2\right.$

Soluble in 4 pts. of water (Unverdorben); in about 4 pts. of boiling water. Readily soluble in alcohol. (Anderson.)

ChloroPlatinate of Piperidin. Very soluble in water; less soluble in alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 82.)
$C_{10}H_{11}N, HCl, PtCl_2$

ChloroPlatinate of Piperin. Very sparingly soluble in water. It appears to undergo partial decomposition when treated with much water. Tolerably soluble in boiling, less soluble in cold alcohol.
$C_{68}H_{38}N_2O_{12}, HCl, PtCl_2$

ChloroPlatinate of Platin(*ous*)*bi*amin. (*Chloro Platinate of di Platosamine.*)

I.) *mono.* Sparingly soluble in water. (Reiset, *Ann. Ch. et Phys.*, (3.) **11.** 429.)
$N_2\left\{H_6 . Pt' Cl, PtCl_2\right.$

II.) *di.* Ppt. (Reiset, *loc. cit.*)
$2\,(N_2\left\{H_6\,.\,Pt'\,Cl\right.),\ Pt\,Cl_2$

ChloroPlatinate of Potassium. Permanent. Difficultly soluble in cold, more easily soluble in hot water. Scarcely at all soluble in absolute alcohol; difficultly soluble in dilute spirit. (Fresenius, *Quant.*, p. 120.) Soluble in 200 pts. of water. (Wittstein's *Handw.*)
$K\,Cl,\ Pt\,Cl_2$

By experiment: —

100 pts. of water at	0.0°	dissolve	0.724	pt. of it.
“	6.8°	“	0.873	“
“	13.8°	“	0.927	“
“	46.5°	“	1.776	“
“	71.0°	“	3.018	“
“	100.0°	“	5.199	“

From these results the following table was obtained by interpolation: —

100 pts. of water at	0°	dissolve	0.74	pt. of it.
“	10°	“	0.90	“
“	20°	“	1.12	“
“	30°	“	1.41	“
“	40°	“	1.76	“
“	50°	“	2.17	“
“	60°	“	2.64	“
“	70°	“	3.19	“
“	80°	“	3.79	“
“	90°	“	4.45	“
“	100°	“	5.18	“

(Kirchhoff & Bunsen, *Pogg. Ann.*, 1861, **113.** 372, and fig.)

At 15° @ 20° it is soluble in 12083 pts. of alcohol of 97.5%, in 3775 pts. of alcohol of 76%, and in 1053 pts. of alcohol of 55%; and if a small amount of free chlorhydric acid is present it dissolves in 1835 pts. of alcohol, of 76%, at 15° @ 20°. (Fresenius, *Ann. Ch. u. Pharm.*, **59.** 117.)

Unacted upon by cold concentrated sulphuric acid. (Lassaigne, *Ann. Ch. et Phys.*, 1832, (2.) **51.** 126.) But sparingly soluble in cold, more easily soluble in hot dilute acids. Soluble in a solution of caustic potash; it does not separate therefrom when the saturated solution is cooled. (H. Rose.) Soluble in an aqueous solution of caustic potash, especially when this is hot, though difficultly in any case; if the boiling is continued, hydrate of platinum separates. (Claus, *Beiträge*, p. 35.) Very easily soluble in a warm aqueous solution of hyposulphite of soda mixed with a little free soda. (Himly.) Soluble in an aqueous solution of normal succinate of ammonia (Dœpping); in an aqueous solution of chloride of ammonium. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 99.) Insoluble in a strong cold aqueous solution of chloride of potassium. (W. Gibbs, *Am. J. Sci.*, (2.) **31.** 70.) Insoluble in aqueous solutions of the alkaline carbonates and bicarbonates, even when these are hot. (H. Rose, *Tr.*)

ChloroPlatinate of Propylamin. Soluble in cold water. Sparingly soluble in alcohol or ether. (Anderson.) Readily soluble in boiling, less soluble in cold water. (Berthelot & De Luca.)
(*ChloroPlatinate of Tritylamine.*)
$N\left\{\begin{matrix}C_6\,H_7\\H_2\end{matrix}\right.,\ H\,Cl,\ Pt\,Cl_2$

ChloroPlatinate of PurpureoCobalt. Much less soluble than the chloride, and may be washed with water. (Claudet, *Phil. Mag.*, (4.) **2.** 257.) Nearly insoluble in cold, very difficultly soluble in hot water. (Gibbs & Genth, *Smithson. Contrib.*, Vol. **9.** p. 28 of the Memoir.)
$5\,N\,H_3\,.\,Co_2\,Cl_3,\ 2\,Pt\,Cl_2$

ChloroPlatinate of Pyridin. Readily soluble in boiling water, but is decomposed by continuous boiling; less soluble in alcohol. Insoluble in ether.
$N\left\{C_{10}\,H_5''',\ H\,Cl,\ Pt\,Cl_2\right.$

ChloroPlatinate of Quinidin.
$N_2\left\{C_{40}\,H_{24}\,O_4,\ 2\,H\,Cl,\ 2\,Pt\,Cl_2 + 4\,Aq\right.$

ChloroPlatinate of Quinine. Soluble in 1500 pts. of cold, and 120 pts. of boiling water, and in 2000 pts. of boiling alcohol.
$C_{40}\,H_{24}\,N_2\,O_4,\ 2\,(H\,Cl,\ Pt\,Cl_2) + 2\,Aq$

ChloroPlatinate of Quinolein. Soluble in 893 pts. of water at 15.5°. (Williams.) Sparingly soluble in cold water, in alcohol, or ether. A mixture of alcohol and ether is well adapted for washing the salt. Sparingly soluble in chlorhydric acid. (Hofmann, *Ann. Ch. et Phys.*, (3.) **9.** 173.)
(*ChloroPlatinate of Leukol.*
ChloroPlatinate of Chinolin.)
$C_{18}\,H_7\,N,\ H\,Cl,\ Pt\,Cl_2$

ChloroPlatinate of Retinin. Tolerably soluble in cold, readily soluble in hot water. Soluble in alcohol.
$C_8\,H_{11}\,N,\ H\,Cl,\ Pt\,Cl_2$

ChloroPlatinate of Rubidium. Much less soluble than chloroplatinate of potassium in water. Completely insoluble in alcohol.
$Rb\,Cl,\ Pt\,Cl_2$

By experiment: —

100 pts. of water dissolve	0.193	pt. of it at	0.0°
“	0.135	“	13.5°
“	0.195	“	48°
“	0.263	“	60°
“	0.641	“	100°

From these results the following table was obtained by interpolation: —

100 pts. of water at	0°	dissolve	0.184	pt. of it.
“	10°	“	0.154	“
“	20°	“	0.141	“
“	30°	“	0.145	“
“	40°	“	0.166	“
“	50°	“	0.203	“
“	60°	“	0.258	“
“	70°	“	0.329	“
“	80°	“	0.417	“
“	90°	“	0.521	“
“	100°	“	0.634	“

(Kirchhoff & Bunsen, *Pogg. Ann.*, 1861, **113.** pp. 352, 373, and fig.)

ChloroPlatinate of Sanguinarin.

ChloroPlatinate of Sarcin. Readily soluble in hot, sparingly soluble in cold water. (Strecker.)
$C_{10}\,H_4\,N_4\,O_2,\ H\,Cl,\ Pt\,Cl_2$

ChloroPlatinate of Sarcosin. Insoluble in alcohol or ether.
$N\left\{C_6\,H_7\,O_4,\ H\,Cl,\ Pt\,Cl_2 + 2\,Aq\right.$

ChloroPlatinate of Silver.
I.) *basic.* Ppt.

ChloroPlatinate of Sinamin.
$C_8\,H_6\,N_2,\ 2\,(H\,Cl,\ Pt\,Cl_2)$

ChloroPlatinate of Sinapin. Ppt.

ChloroPlatinate of Sincalin. Soluble in water. (v. Babo & Hirschbrunn.)
$C_{10}\,H_{13}\,N\,O_2,\ H\,Cl,\ Pt\,Cl_2$

ChloroPlatinate of Sodium. Easily soluble in water, and alcohol. (Mussin-Puschkin.) Soluble in alcohol of 0.837 sp. gr. (Berzelius, *Lehrb.*, **2.** 492.) Soluble in an aqueous solution of chloride of sodium.
$Na\,Cl,\ Pt\,Cl_2 + 6\,Aq$

ChloroPlatinate of Spartein. Insoluble in cold water or alcohol, but is decomposed when boiled therewith. Soluble, without alteration, in warm, less soluble in cold chlorhydric acid. (Stenhouse.)
$N \left\{ C_{16} H_{13}''', H Cl, Pt Cl_2 + 2 Aq \right.$

ChloroPlatinate of StibEthylium. Tolerably easily soluble in water, and alcohol. (Lœwig.)
$2 (C_4 H_5)_4 Sb Cl, 3 Pt Cl_2$

ChloroPlatinate of StibMethylium. Sparingly soluble in cold water, entirely soluble in boiling water. Insoluble in alcohol or ether. Sparingly soluble in solutions of the alkalies; more soluble in chlorhydric acid. It is the least soluble of any of the compounds of stibmethylium. (Landolt.)
$Sb (C_2 H_3)_4 Cl, Pt Cl_2$

ChloroPlatinate of Strontium. Permanent. Exceedingly easily soluble in water. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 252.)
$Sr Cl, Pt Cl_2 + 8 Aq$

ChloroPlatinate of Strychnine. Almost insoluble in water or in ether. Difficultly soluble in weak boiling alcohol. Soluble, with decomposition, in nitric acid. (Abel & Nicholson, *J. Ch. Soc.*, **2.** 254.)
$C_{42} H_{22} N_2 O_4, H Cl, Pt Cl_2$

ChloroPlatinate of Tetrylamin. *Vid.* ChloroPlatinate of Butylamin.

ChloroPlatinate of Thebain. Sparingly soluble in boiling water, apparently with partial decomposition.
$C_{38} H_{21} N O_6, H Cl, Pt Cl_2 + 2 Aq$

ChloroPlatinate of Theobromin. Efflorescent.
$C_{14} H_8 N_4 O_4, H Cl, Pt Cl_2$

ChloroPlatinate of ThiAcetonin. Ppt.

ChloroPlatinate of ThioSinamin. Ppt.
$C_8 H_8 N_2 S_2, H Cl, Pt Cl_2$

ChloroPlatinate of ThioSinEthylamin.

ChloroPlatinate of Toluamic Acid. Soluble in boiling alcohol acidulated with chlorhydric acid. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 333.)
$C_{16} H_9 N O_4, H Cl, Pt Cl_2$

ChloroPlatinate of Toluenylamin (or of Toluidin.) Insoluble in alcohol or ether. (Muspratt & Hofmann.)
$C_{14} H_9 N, H Cl, Pt Cl_2$

ChloroPlatinate of *tri*Toluenylamin.
$N \left\{ (C_{14} H_7)_3, H Cl, Pt Cl_2 \right.$

ChloroPlatinate of Tritylamin. *Vid.* ChloroPlatinate of Propylamin.

ChloroPlatinate of Veratrin. Sparingly soluble in water.

ChloroPlatinate of *tetra*Vinylium. Ppt.
$(C_4 H_3)_4 N Cl, Pt Cl_2$

ChloroPlatinate of XanthoCobalt. Difficultly soluble in water, either hot or cold. Soluble in hot dilute chlorhydric acid.
$N O_2 . 5 N H_3 . C O_2 O, Cl_2 ; 2 Pt Cl_2 + 2 Aq$

ChloroPlatinate of Xylidin. Soluble in water; being more readily soluble than the corresponding salt of cumidin. (Church.)
$C_{16} H_{11} N, H Cl, Pt Cl_2$

ChloroPlatinate of Zinc. Permanent. Soluble in water. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 259.) Deliquesces in moist air. Easily soluble in water, and alcohol. (Huenefeld.)
$Zn Cl, Pt Cl_2 + 6 Aq$

ChloroPlatinous Acid. *Vid. proto*Chloride of Platinum.

ChloroPlatinite of Ammonium. Easily soluble in water. (Vauquelin, Magnus.) Excessively easily soluble in water. Insoluble in alcohol. (Peyrone, *Ann. Ch. et Phys.*, (3.) **16.** pp. 462, 463.)
$N H_4 Cl, Pt Cl$

ChloroPlatinite of Anilin. [Several compounds.]

ChloroPlatinite of *di*EthylPlatin(*ous*) *bi*Amin. Insoluble in water. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 485.)

$C_8 H_{14} N_2 Pt_2 Cl_2 = N_2 \left\{ \begin{matrix} (C_4 H_5)_2 \\ H_3 \\ Pt' \end{matrix} \right. H Cl, Pt Cl$

ChloroPlatinite of *di*MethylPlatin(*ous*) *bi*Amin. Insoluble in water. (Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 462.)

$C_4 H_{10} N_2 Pt_2 Cl_2 = N_2 \left\{ \begin{matrix} (C_2 H_3)_2 \\ H_3 \\ Pt' \end{matrix} \right. H Cl, Pt Cl$

ChloroPlatinite of Nicotin.

I.) *Orange-colored salt.* Insoluble in cold, soluble in boiling water. Insoluble in alcohol or ether. Soluble in nicotin, and in chlorhydric acid without decomposition; also soluble in nitric acid. (Raewsky, *Ann. Ch. et Phys.*, (3.) **25.** 332.)
$C_{20} H_{14} N_2, 2 (Pt Cl, 2 H Cl)$

II.) *Red salt.* Sparingly soluble in cold, more easily soluble in warm water. Insoluble in alcohol or ether. Soluble in cold chlorhydric and nitric acids, also in warm nitric acid. (Raewsky, *Ibid.*, p. 335.)
$C_{20} H_{14} N_2, 2 (Pt Cl, H Cl)$

ChloroPlatinite of *di*Platosamine. *Vid.* Chloride of Platin(*ous*)*bi*amin & of Platinum.

ChloroPlatinite of Potassium. Tolerably easily soluble in water. Insoluble in alcohol. (Magnus.)
$K Cl, Pt Cl$

ChloroPlatinite of Sodium. Easily soluble in water, and alcohol. (Magnus.)
$Na Cl, Pt Cl$

ChloroPlatinite of Tin.

I.) (*Containing less Sn Cl than No. II.*) (*Olive-green compound.*) Deliquescent. Soluble in a small quantity of water, but this solution is decomposed on being diluted with much water. (Kane.)

II.) (*Containing more Sn Cl than No. I.*) (*Red compound.*) Soluble in a small quantity of water, but the solution decomposes when diluted. (Kane.)

ChloroPlatinite of Zinc. Sparingly soluble in cold, more easily soluble in hot water. Insoluble in alcohol. (Huenefeld.)
$Zn Cl, Pt Cl$

ChloroPropionic Acid. Easily soluble in water.
$C_6 H_5 Cl O_4 = C_6 H_4 Cl O_3, H O$

ChloroPropionate of Ethyl.
$C_6 H_4 Cl (C_4 H_5) O_4$

ChloroPropionate of Silver. Tolerably easily soluble in water, the solution undergoing decomposition when boiled or evaporated. It is much more soluble than propionate of silver. (Ulrich.)
$C_6 H_4 Cl Ag O_4$

*Ter*ChloroPropionic Acid. *Vid.* ChloroSuccic Acid.

ChloroPropylene.
$C_6 H_5 Cl$

*Bi*ChloroPropylene.
$C_6H_4Cl_2$

*Ter*ChloroPropylene.
$C_6H_3Cl_3$

*Quadri*ChloroPropylene.
$C_6H_2Cl_4$

*Quinqui*ChloroPropylene.
C_6HCl_5

ChloroPyroCitryl. Decomposed by water, and alcohol. (Gerhardt & Chiozza.)
$C_{10}H_4O_4Cl_2$

ChloroPyroMucate of Ethyl. *Vid.* PyroMucate of Ethyl with Chlorine.

ChloroPyroMucyl. *Vid.* Chloride of PyroMucyl.

ChloroQuinonamic Acid. *Vid.* ChloroKinonamic Acid.

ChloroQuinonamid. *Vid.* ChloroKinonamid.

ChloroQuinone. *Vid.* ChloroKinone.

*Bi*ChloroQuinonic Acid. *Vid.* *bi*ChloroKinonic Acid.

ChlorOrceid. *Vid.* ChlorOrcin.

ChlorOrcein. Insoluble in water. Soluble in alcohol, ether, and ammonia-water. Soluble, with more or less decomposition, in a solution of potash. (Kane.)
"$C_6H_{10}NO_6Cl_2$"

*Ter*ChlorOrcin. Soluble in boiling, less soluble in cold water. Soluble in alcohol and in aqueous solutions of the caustic alkalies. (Schunk.)
$C_{14}H_5Cl_3O_4 = \left.\begin{matrix}C_{14}H_3Cl_3'' \\ H_2\end{matrix}\right\} O_4$

*Ter*ChlorOrcin with Baryta. Insoluble in water. (Schunk.)

ChloroRhodiate of *X*. *Vid.* Chloride of *X* & of Rhodium.

ChloroRutheniate of Ammonium. Insoluble in a cold aqueous solution of chloride of ammonium. (Claus, *Beiträge*, pp. 55, 56.)
$NH_4Cl, RuCl_2$ (?)

ChloroRutheniate of Potassium. Easily soluble in water. Insoluble in alcohol of 70%. Very sparingly soluble in a concentrated aqueous solution of chloride of ammonium. The concentrated aqueous solution is only partially precipitated on the addition of alcohol. (Claus, in *Gm.*) Insoluble in a cold saturated aqueous solution of chloride of potassium. (W. Gibbs, *Am. J. Sci.*, (2.) **31.** 70.)
$KCl, RuCl_2$

ChloroSalhydramid. *Vid.* Hydride of ChlorAzoSalicyl.

ChloroSalicin. Soluble in water, and alcohol. Insoluble in ether. Soluble in concentrated sulphuric acid. Decomposed by warm dilute acids. (Piria, *Ann. Ch. et Phys.*, (3.) **14.** 276.)
$C_{26}H_{17}ClO_{14} + 4\,Aq$

*Bi*ChloroSalicin. Sparingly soluble in boiling, but scarcely at all soluble in cold water. Tolerably soluble in alcohol. Almost insoluble in ether. Much more soluble (without decomposition) in dilute alkaline solutions than in pure water. Decomposed by hot chlorhydric acid. (Piria, *Ann. Ch. et Phys.*, (3.) **14.** 278.)
$C_{20}H_{16}Cl_2O_{14} + 2\,Aq$

*Ter*ChloroSalicin. Almost entirely insoluble in cold, and very sparingly soluble in boiling water. Its best solvent is weak alcohol. (Piria, *Ibid.*, p. 281.)
$C_{26}H_{15}Cl_3O_{14} + 2\,Aq$

ChloroSalicyl. *Vid.* Chloride of Salicyl; and also ChloroSalicylous Acid.

ChloroSalicylic Acid. Sparingly soluble in cold water. Soluble in alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **13.** 108.) Insoluble in water. Easily soluble in alcohol, and ether. Also soluble in alkaline solutions, with combination. (Piria.)
$C_{14}H_5ClO_6$

ChloroSalicylate of Potash. Soluble in water. (Cahours, *loc. cit.*)

*Bi*ChloroSalicylic Acid. Sparingly soluble in boiling, less soluble in cold water. Very easily soluble in 80% alcohol; still more soluble in ether. Soluble in concentrated sulphuric acid, when this is gently heated, from which solution it is deposited on cooling. Soluble in boiling nitric acid. (Cahours, *Ann. Ch. et Phys.*, (3.) **13.** 109.)
$C_{14}H_4Cl_2O_6$

*Bi*ChloroSalicylate of Ammonia. Sparingly soluble in water. (Cahours, *loc. cit.*)

*Bi*ChloroSalicylate of Ethyl. *Vid.* Ethyl*bi*ChloroSalicylic Acid.

*Bi*ChloroSalicylate of Methyl. *Vid.* Methyl*bi*ChloroSalicylic Acid.

*Bi*ChloroSalicylate of Lead. Insoluble in water.

*Bi*ChloroSalicylate of Potash. Soluble in boiling, less soluble in cold water; more soluble in water containing alcohol. Easily soluble in boiling water which has been mixed with ⅓ of its volume of alcohol of 36%; from this solution it separates on cooling. (Cahours, *Ann. Ch. et Phys.*, (3.) **13.** pp. 108, 110.)
$C_{14}H_3KCl_2O_6$

*Bi*ChloroSalicylate of Silver. Insoluble in water.

ChloroSalicylide of *X*. *Vid.* ChloroSalicylite of *X*.

ChloroSalicylimid. *Vid.* Hydride of ChlorAzoSalicyl.

ChloroSalicylous Acid or Hydride of ChloroSalicyl. Insoluble in water. Readily soluble in alcohol, and ether. Soluble in alkaline solutions, and in cold concentrated sulphuric acid, from which it is precipitated unchanged by water. The alkaline chlorosalicylites are less soluble in water (than the salicylites? Gmelin). (Pagenstecher, Lœwig.)
(*Chloride of Salicyl* (improperly). *ChlorSalicyl.* *Chloride of Spiroyl* (improperly). *ChlorSpiroyl*).
$C_{14}H_5ClO_4$

ChloroSalicylite of Ammonia. Soluble in water.

ChloroSalicylite of Baryta.
$C_{14}H_4BaClO_4$

ChloroSalicylite of Copper. Ppt.

ChloroSalicylite of Lead. Ppt.

ChloroSalicylite of Potash. Soluble in water. Insoluble in alcohol. (Piria.)

*Bi*ChloroSalicylous Acid or Hydride of *bi*ChloroSalicyl. Sparingly soluble in water. Readily soluble in alcohol, and ether. (Lœwig & Weidmann.)
$C_{14}H_4Cl_2O_4$

*Bi*ChloroSalicylate of Baryta. Sparingly soluble in water.

ChloroSaligenin. Soluble in water, alcohol, and ether. (Piria, *Ann. Ch. et Phys.*, (3.) **14.** 284.)
$C_{14}H_7ClO_4$

*Bi*ChloroSaligenin. Scarcely soluble in water at ordinary temperatures. (Piria, *Ibid.*, p. 280.)
$C_{14}H_6Cl_2O_4$

*Ter*ChloroSaligenin.
$C_{14}H_5Cl_3O_4$

ChloroSalylic Acid. Abundantly soluble in boiling, sparingly soluble in cold water. (Chiozza, *Ann. Ch. et Phys.*, (3.) **36.** 105.) Soluble in 881 pts. of water at 0°. (Kolbe & Lautemann, *Ann. Ch. u. Pharm.*, **115.** 187 [*K.*].) Readily soluble in alcohol, and ether. (Limpricht & v. Uslar.)

(*ChloroBenzoic Acid*(of Chiozza & Limpricht). *Isomeric with ChloroBenzoic Acid, Chloride of Salicyl, and ChloroSalicylous Acid.*)
$C_{14}H_5ClO_4 = C_{14}H_4ClO_3, HO$

ChloroSalylate of Ammonia. Soluble in water.

ChloroSalylate of Baryta. Very readily soluble in warm, less soluble in cold water. Tolerably soluble in warm alcohol. (Chiozza, *Ann. Ch. et Phys.*, (3.) **36.** 106.)
$C_{14}H_4BaClO_4 + 3Aq$

ChloroSalylate of Lime. Easily soluble in water. (Limpricht & v. Uslar.)
$C_{14}H_4CaClO_4 + 3Aq$

ChloroSalylate of Potash. Very soluble in water. (Limpricht & v. Uslar.)

ChloroSalylate of Silver. Somewhat soluble in water.
$C_{14}H_4AgClO_4$

ChloroSalylate of Soda. Very soluble in water. (Limpricht & v. Uslar.)

ChloroSamid. *Vid.* Hydride of ChlorAzoSalicyl.

ChloroSassafras-Oil. Insoluble in water. (St. Evre.)
$C_{20}HCl_9O_4 = \left.\begin{matrix}C_{20}Cl_9O_2\\H\end{matrix}\right\}O_2$

ChloroSebacic Acid.
$C_{20}H_{17}ClO_8$

***Bi*ChloroSebacic Acid.**
$C_{20}H_{16}Cl_2O_8$

ChlorOsmiate of Potassium. Soluble in water, especially if this be hot. Insoluble in alcohol, or in aqueous saline solutions, but alcohol does not precipitate it completely from the saturated aqueous solution. (Berzelius.) Less soluble in an aqueous solution of caustic potash than in pure water and is not at once decomposed thereby. (Claus, *Beiträge*, p. 28.)
$KCl, OsCl_2$

ChloroStannate of *X*. *Vid.* Chloride of *X* & of Tin.

ChloroStearic Acid. Soluble in alcohol.
(*ChloroBassic Acid.*)
$C_{36}H_{28}Cl_{10}O_4$

ChloroStearate of Baryta. Insoluble in alcohol.

ChloroStearate of Lead. Insoluble in alcohol.

ChloroStearate of Potash. Almost insoluble in cold water. Easily soluble in alcohol. (Hardwick, *J. Ch. Soc.*, **2.** 237.)

ChloroStilbene. Soluble in alcohol, and ether.
(*ChloStilbase.*)
$C_{28}H_{11}Cl$

ChloroStrychnine. Insoluble, or very sparingly soluble, in water. Soluble in dilute chlorhydric acid. (Laurent, *Ann. Ch. et Phys.*, (3.) **24.** 313.)
$C_{42}H_{21}ClN_2O_4$

***Ter*ChloroStrychnine.** Almost insoluble in water. Readily soluble in alcohol, and ether. More soluble in acids than in water.
$C_{42}H_{19}Cl_3N_2O_4$

ChloroStyracin. *Vid.* ChloroCinnamate of *ter*ChloroStyracyl.

ChloroStyrol. *Vid.* ChloroCinnamene; and Chloride of Cinnamene.

ChloroSuccic Acid. Soluble in water, absolute alcohol, and ether. (Malaguti, *Ann. Ch. et Phys.*, (3.) **16.** 68.)
(*TriChloroPropionic Acid. Metacetic Acid biChloré.*)
$C_6HCl_3O_4$? ($C_8H_2Cl_3O_3$ of Malaguti.)

ChloroSuccate of Ammonia. Soluble in water.

ChloroSuccate of Silver. Sparingly soluble in water.
$C_8AgCl_3O_4$

ChloroSuccid.
$C_6Cl_4O_2$

ChloroSuccilamid. Very sparingly soluble in cold, readily soluble in boiling water. Very readily soluble in alcohol, and ether. (Malaguti, *Ann. Ch. et Phys.*, (3.) **16.** pp. 77, 79.)
$C_4H_2NCl_2O$

ChloroSuccilic Acid. Not isolated.

ChloroSuccilate of Baryta. Appears to be soluble in water.

ChloroSuccilate of Copper. Sparingly soluble in water.

ChloroSuccilate of Lead. Sparingly soluble in water.

ChloroSuccilate of Lime. Appears to be soluble in water.

ChloroSuccilate of Magnesia. Appears to be soluble in water.

ChloroSuccilate of Manganese. Appears to be soluble in water.

ChloroSuccilate *of protoxide* of Mercury. Sparingly soluble in water.

ChloroSuccilate of Potash. Soluble in water and in alcohol.

ChloroSuccilate of Silver. Sparingly soluble in water.

ChloroSuccilate of Zinc. Appears to be soluble in water. (Malaguti, *Ann. Ch. et Phys.*, (3.) **16.** pp. 78, 79.)

ChloroSuccinic Acid.
$C_8HCl_3O_4 = C_8Cl_3O_3, HO$

ChloroSuccinate of Ammonia. Soluble in water.

ChloroSuccinate of Silver. Somewhat soluble in water.
$C_6Cl_3AgO_4$

***Quadri*ChloroSuccinic Acid.**
(*BiChlorOxalic Acid.*)
$C_8H_2Cl_4O_8$

***Quadri*ChloroSuccinate of *per*ChlorEthyl.** Insoluble in cold, soluble, with decomposition, in hot alcohol. (Malaguti, *Ann. Ch. et Phys.*, (3.) **16.** 67.) Soluble in alcohol, and ether, especially when these are heated, with alteration. (Cahours, *Ibid.*, (3.) **9.** 209.)
(*Succinate of Ethylperchloré.*)
$C_{18}Cl_{14}O_8 = C_8Cl_4(C_4Cl_5)_2O_8$

***Quadri*ChloroSuccinate of Potash.**
$C_8K_2Cl_4O_8$

ChloroSuccinimid. Almost insoluble in water. Very readily soluble in alcohol, and ether. Soluble, with combination, in ammonia-water. (Malaguti, *Ann. Ch. et Phys.*, (3.) **16.** 74.)
(*ChloroSuccinylamid. ChlorAzoSuccic Acid.*)
$C_8HCl_4NO_4 = N\left\{\begin{matrix}C_8Cl_4O_4''\\H\end{matrix}\right.$

$\left.\begin{matrix}\text{With}\\\text{Ammonia,}\\\text{Baryta,}\\\text{Magnesia,}\\\text{Manganese,}\\\text{and Zinc,}\end{matrix}\right\}$ it forms compounds which appear to be soluble in water.

With Copper, Lime, Mercury, and Silver, its compounds are precipitates.

$\left(=N\left\{\begin{matrix}C_8\,Cl_4\,O_4''\\ Ag\end{matrix}\right.\right)$,

ChloroSulphuric Acid. $S\,Cl\,O_2$ or $S\,Cl_3, 2\,S\,O_3$ *Vid.* *bi*Sulphate of *ter*Chloride of Sulphur.

ChloroSulphate of *X*. *Vid.* Chloride of *X* with Sulphate of *X*.

ChloroSulphate of Acetyl. *Vid.* ChlorAcetylSulphurous Acid.

ChloroSulphate of Ethyl. *Vid.* ChlorEthylSulphurous Acid.

ChloroSulphate of Methyl. *Vid.* ChloroMethylSulphurous Acid.

ChloroSulphate of Phenyl. *Vid.* ChloroSulphoBenzolic Acid.

ChloroSulphate of Sulphide of Nitrogen. *Vid.* Chloride of Sulphur with *bi*Sulphide of Nitrogen.

ChloroSulphide of Antimony. $Sb\,Cl_3\,S_2$ Absorbs water from the air, with decomposition. It is immediately decomposed by water, or chlorhydric acid. (Cloez, *Ann. Ch. et Phys.*, (3.) 30. 375.)

ChloroSulphide of Carbon. $C\,S\,Cl$ Insoluble in water.

ChloroSulphide of Lead.

ChloroSulphide of Nitrogen. *Vid.* Chloride of Sulphur with *bi*Sulphide of Nitrogen.

ChloroSulphide of Phosphorus.

I.) $P\,S_{10}\,Cl_2$ Very slowly decomposed by water.

II.) $P\,S_2\,Cl_3$ Decomposed by water, especially if this be hot.

III.) $P\,S_4\,Cl_5$ Immediately decomposed by water, and still more readily by alkaline solutions. Also decomposed by alcohol, ether, and oil of turpentine. It is miscible with bisulphide of carbon. (Gladstone.)

ChloroSulphide of Silicon. $Si\,Cl_2\,S$ Decomposed by water. (I. Pierre.)

*Bi*ChloroSulphoBenzid. $C_{24}\,H_8\,Cl_2\,S_2\,O_4$ Insoluble in water, or dilute acids, or in dilute aqueous solutions of the caustic and carbonated alkalies. Soluble in alcohol, and ether. (Gericke, *Ann. Ch. u. Pharm.*, 100. 214.)

ChloroSulphoBenzolic Acid. *Vid.* ChloroPhenylSulphurous Acid.

ChloroSulphoBenzoic Acid. *Vid.* Chloride of SulphoBenzoyl.

ChloroSulphoNaphthalic Acid. (*Sulphite of monoChloroNaphtoyl.*) $C_{20}\,H_7\,Cl\,S_2\,O_6$ Easily soluble in water, and alcohol. (Zinin.) The salts of chlorosulphonaphthalic acid are chiefly soluble. (Zinin.) They are less soluble in water than those of sulphonaphthalic acid, but more soluble than those of sulpho-ter-(or quadri-)chloronaphthalic acid. (Laurent, *Chemical Method*, p. 250.)

ChloroSulphoNaphthalate of Ammonia. Very soluble in water. (Zinin.)

ChloroSulphoNaphthalate of Baryta. $C_{26}\,H_6\,Cl\,Ba\,S_2\,O_6$ Difficultly soluble in water. (Zinin.)

ChloroSulphoNaphthalate of Copper ($Cu_2\,O$). Ppt.

ChloroSulphoNaphthalate of Copper ($Cu\,O$). Readily soluble in water. (Zinin.)

ChloroSulphoNaphthalate of Iron($Fe\,O$). Sparingly soluble in water.

ChloroSulphoNaphthalate of Lead. Almost insoluble in water. (Zinin.)

ChloroSulphoNaphthalate of Potash. $C_{26}\,H_6\,Cl\,K\,S_2\,O_6$ Sparingly soluble in water, and alcohol. (Zinin.)

ChloroSulphoNaphthalate of Silver. Slightly soluble in water. (Zinin.)

*Bi*ChloroSulphoNaphthalic Acid. $C_{20}\,H_6\,Cl_2\,S_2\,O_6$ Very easily soluble in water.

*Bi*ChloroSulphoNaphthalate of Ammonia. Exceedingly soluble in water. (Zinin.)

*Bi*ChloroSulphoNaphthalate of Baryta. $C_{20}\,H_5\,Cl_2\,Ba\,S_2\,O_6$ Difficultly soluble in water. (Zinin.)

*Bi*ChloroSulphoNaphthalate of Potash. Sparingly soluble in water. (Zinin.)

*Bi*ChloroSulphoNaphthalate of Silver. $C_{20}\,H_5\,Cl_2\,Ag\,S_2\,O_6$ Less soluble than the potash-salt in water.

*Ter*ChloroSulphoNaphthalic Acid. $C_{20}\,H_5\,Cl_3\,S_2\,O_6$ Very sparingly soluble in cold, somewhat soluble in boiling water. Soluble in boiling alcohol, from which it crystallizes on cooling. The salts of terchlorosulphonaphthalic acid are still less soluble than those of monochlorosulphonaphthalic acid, but they are more soluble than those of quadrichlorosulphonaphthalic acid. (Laurent, *Chemical Method*, p. 251.)

*Ter*ChloroSulphoNaphthalate of Ammonia. Very soluble in water and in ammonia-water.

*Ter*ChloroSulphoNaphthalate of Baryta. $C_{26}\,H_4\,Cl_3\,Ba\,S_2\,O_6$ Soluble in 300 @ 400 pts. of boiling water. (Laurent.)

*Ter*ChloroSulphoNapthalate of Cupr(*ic*) *bi*Amin. $C_{20}\,H_4Cl_3\left(N_2\left\{H_6.Cu\right)S_2O_6+4\,Aq\right.$ Soluble in hot, less soluble in cold ammonia-water. (Laurent.)

*Ter*ChloroSulphoNaphthalate of Lead. Ppt.

*Ter*ChloroSulphoNaphthalate of Lime. Ppt.

*Ter*ChloroSulphoNaphthalate of Magnesia. Ppt.

*Ter*ChloroSulphoNaphthalate of Nickel. Ppt.

*Ter*ChloroSulphoNaphthalate of Potash. Almost insoluble in cold, very soluble in boiling water. Very sparingly soluble in boiling alcohol. (Laurent.)

*Ter*ChloroSulphoNaphthalate of Soda. Ppt.

*Quadri*ChloroSulphoNaphthalic Acid. $C_{26}\,H_4\,Cl_4\,S_2\,O_6$ The salts of quadrichlorosulphonaphthalic acid are scarcely at all soluble in water, being less soluble than those of any of the other chlorosulphonaphthalic acids. (Laurent, *Method, loc. cit.*)

*Quadri*ChloroSulphoNaphthalate of Baryta. Appears to be insoluble in water, and soluble in alcohol.

*Quadri*ChloroSulphoNaphthalate of Potash. $C_{20}\,H_3\,K\,Cl_4\,S_2\,O_6$ Almost insoluble in cold, and only slightly soluble in boiling water. Very soluble in boiling, less soluble in cold alcohol. (Laurent.)

Chloro(or Chlorinated)SulphosoMethylic Acid. *Vid.* ChloroMethylSulphurous Acid.

ChloroSulphoVinic Ether. *Vid.* Oxide of ChloroSulphEthyl.

ChloroTelluric Acid. *Vid.* *bi*Chloride of Tellurium.

ChloroTellurate of Ammonium. Soluble, without decomposition, in a small quantity of water, but is decomposed by much water, and by absolute alcohol. (Berzelius.)

ChloroTellurate of Potassium. Deliquescent. Decomposed by water and by absolute alcohol.

ChloroTellurite of Ammonium. Decomposed by water.

*Bi*ChloroTerebene.
$C_{20} H_{14} Cl_2$

*Quadri*ChloroTerebene.
$C_{20} H_{12} Cl_4$

*Ter*ChloroThymic Acid. (*Hydrate of terChloro Thymyl. Thymoltrichloré.*) $C_{20} H_{11} Cl_3 O_2 = C_{20} H_{10} Cl_3 O, H O$ Insoluble in water. Sparingly soluble in alcohol; more easily soluble in ether. (Lallemand.)

*Quinqui*ChloroThymic Acid. (*Thymolquintichloré.*) $C_{20} H_9 Cl_5 O_2 = C_{20} H_8 Cl_5 O, H O$ Insoluble in water. Soluble in alcohol, and ether. (Lallemand.)

*Quinqui*ChloroThymate of Ammonia. Tolerably easily soluble in boiling, less soluble in cold water.

*Quinqui*ChloroThymate of Potash. Soluble in water.

*Ter*ChloroToluenic Acid. (*TerChloroBenzinol. Toluenoltrichloré.*) $C_{14} H_5 Cl_3 O_2$ Insoluble in water. Soluble in alcohol, and ether. Soluble in aqueous solutions of potash and ammonia, with combination.

*Ter*ChloroToluenate of Ammonia. Tolerably soluble in boiling, less soluble in cold water.

*Ter*ChloroToluenate of Baryta. Somewhat, though sparingly, soluble in water.

*Ter*ChloroToluenate of Copper.
“ *of protoxide* [of Iron.
“ *of sesquioxide* [of Iron.
“ of Lead.
} Ppts.

*Ter*ChloroToluenate of Lime. Somewhat, though sparingly, soluble in water.

*Ter*ChloroToluenate *of protoxide* [of Mercury.
“ *of binoxide* [of Platinum.
} Ppts.

*Ter*ChloroToluenate of Potash. Soluble in water.

*Ter*ChloroToluenate of Silver.
“ of Zinc.
} Ppts. (Lallemand, *Ann. Ch. et Phys.*, (3.) 49. 161.)

ChloroToluene. Indentical with Chloride of Toluenyl, *q. v.* (Cannizzaro.)

*Sexi*ChloroToluene. *Vid.* Hydride of ChloroToluenyl.

*Ter*ChloroToluenol. *Vid.* *ter*ChloroToluenic Acid.

*Quadri*ChloroToluenol. *Vid.* Hydrate of *quadri*ChloroToluenyl.

ChloroToluol. *Vid.* Chloride of Toluenyl; and Hydride of ChloroToluenyl.

*Bi*ChloroTurpentine Oil.
$C_{20} H_{14} Cl_2$

*Quadri*ChloroTurpentine Oil.
$C_{20} H_{12} Cl_4$

*Ter*ChloroValeric Acid. (*Chloro Valerisic Acid.*) $C_{10} H_7 Cl_3 O_4$ Somewhat soluble in water; combining therewith to form a heavy liquor. Soluble in alcohol, and ether. Soluble in cold aqueous solutions of the alkalies. (Dumas & Stas.)

*Quadri*ChloroValeric Acid. (*Chloro Valerosic Acid.*) $C_{10} H_6 Cl_4 O_4 + 2 Aq$ Tolerably soluble in water. Soluble in alcohol, and ether. Its alkaline salts are readily soluble in water, the others are sparingly soluble, or insoluble, therein.

*Quadri*ChloroValerate of Silver. $C_{10} H_5 Ag Cl_4 O_4$ Sparingly soluble in water. Easily soluble in nitric acid. (Dumas & Stas.)

ChloroValerianic Acid. *Vid.* ChloroValeric Acid.

ChloroValerisic Acid. *Vid.* *ter*ChloroValeric Acid.

ChloroValerosic Acid. *Vid.* *quadri*ChloroValeric Acid.

*Bi*ChlorOxalic Acid. *Vid.* *quadri*ChloroSuccinic Acid.

ChlorOxalic Ether. *Vid.* Oxalate of *per*ChlorEthyl.

*Per*ChlorOxaloMethylic Ether. *Vid.* *per*ChlorOxalate of *per*ChloroMethyl.

ChlorOxaloVinic Acid. *Vid.* *quinqui*ChlorEthylOxalic Acid.

ChlorOxamethan. *Vid.* Oxamate of *per*ChlorEthyl.

ChlorOxethamid. *Vid.* Oxamate of *per*ChlorEthyl.

ChlorOxethide. *Vid.* *per*ChlorEthylOxalic Acid(Anhydrous).

ChlorOxethose. (*Oxide of terChlorAcetoyl.*) $C_8 Cl_8 O_2 = \left.\begin{matrix} C_4 Cl_3 \\ C_4 Cl_3 \end{matrix}\right\} O_2$ Decomposes when exposed to the air. Insoluble in, and unacted upon by, water. Soluble in alcohol, and ether. Unacted upon by alkalies, or by common nitric acid; decomposed by hot fuming nitric acid. (Malaguti, *Ann. Ch. et Phys.*, (3.) **16.** 20.)

ChlorOxetic Acid. *Vid. per*ChlorOxalic Acid.

ChlorOxide of Phosphorus. Soluble in water, with decomposition. (Wurtz, *Ann. Ch. et Phys.*, (3.) **20.** 478.) Soluble in bisulphide of carbon. (Pebal.)
$P(Cl_3\,O_2)$

ChlorOxyCarbonic Acid. *Vid.* ChloroCarbonic Acid.

*Hexa*ChlorOxylon. Insoluble in water. Very sparingly soluble in cold alcohol. Soluble in about 171 pts. of boiling alcohol of 0.82 sp. gr. Very soluble in ether. Soluble in boiling acetic acid; also in warm nitric acid.
$C_{16}\,H_4\,Cl_4\,O_4$

*Penta*ChlorOxylon. Insoluble in water. Soluble in boiling spirit. Very soluble in ether.
$C_{16}\,H_5\,Cl_3\,O_4$

ChlorOxyNaphthalic Acid. Insoluble in water. Difficultly soluble in boiling alcohol, and ether. Soluble in concentrated sulphuric acid, from which it is precipitated on the addition of water. (Laurent.) Almost insoluble in water, even when this is acidulated. More soluble, though still somewhat sparingly soluble, in alcohol, and ether. Soluble, without decomposition, in concentrated sulphuric acid. Soluble, with combination, in solutions of the alkalies. (Strecker, *J. Ch. Soc.*, **3.** 250.) Its salts are generally sparingly soluble, or insoluble, in water. (Laurent.)
(*ChloroNaphtisic Acid. ChloroNaphtalic Acid.*)
$C_{20}\,H_5\,Cl\,O_8$

ChlorOxyNaphthalate of Alumina.

ChlorOxyNaphthalate of Ammonia. Soluble in [less than 30 pts. of] water. (Laurent, Strecker.)
$C_{20}\,H_4\,(N\,H_4)\,Cl\,O_8$

ChlorOxyNaphthalate of Baryta. Ppt.
$C_{20}\,H_4\,Ba\,Cl\,O_8$

ChlorOxyNaphthalate of Cadmium. Ppt.

" of Cobalt. Ppt.

" of Copper. Ppt.

" of Iron. Ppt.

" of Lead. Ppt.

" of Lime. Ppt.

" of Mercury. Ppt.

ChlorOxyNaphthalate of Potash. Soluble in water, and alcohol.
$C_{20}\,H_4\,K\,Cl\,O_8 + Aq$

ChlorOxyNaphthalate of Silver. Ppt.

" of Strontia. Ppt.

*Per*ChlorOxyNaphthalic Acid. Soluble in alcohol, and ether.
(*Per ChloroNaphthalic Acid. ChlorOxeNaphtalesic Acid.*)
$C_{20}\,H\,Cl_5\,O_6$

*Per*ChlorOxyNaphthalate of Ammonia. Insoluble in water; or rather, extremely sparingly soluble in boiling water. Sparingly soluble in alcohol.

*Per*ChlorOxyNaphthalate of Potash. Insoluble in water, or rather, extremely sparingly soluble in boiling water. Sparingly soluble in alcohol.

ChlorQuinone. *Vid.* ChloroKinone.

Chlorrubin. Soluble in aqueous solutions of the caustic alkalies. (Schwarz.)
$C_{12}\,H_4\,O_3,\,2\,H\,O$

"Chloryl" (of Laurent). *Vid.* Acetate of *ter*ChloroMethyl.

ChloStilbase. *Vid.* ChloroStilbene.

Cholacrol. Sparingly soluble in water. Readily soluble in alcohol, and ether. Unacted upon by acids or alkalies.
$C_{16}\,H_{10}\,(N\,O_4)_4\,O_{10}$

Cholalic Acid. Efflorescent. Soluble in 4000 pts. of cold, and in 750 pts. of boiling water. 1000 pts. of alcohol, of 70%, dissolve 48 pts. of the dry acid; it is very soluble in boiling alcohol. Soluble in 27 pts. of ether. Soluble in sulphuric acid. Decomposed by boiling chlorhydric, and nitric acids.
(*Cholic Acid*(of Demarçay).)
$C_{48}\,H_{40}\,O_{10} = C_{48}\,H_{39}\,O_9,\,H\,O$

The cholalates are all soluble in alcohol, but only the alkaline salts, the baryta salt, and to a certain extent the lime salt, are soluble in water.

Cholalate of Ammonia. Soluble in water, and alcohol; less soluble in ether than in alcohol. Loses ammonia when its solutions are evaporated.

Cholalate of Baryta. Soluble in 30 pts. of cold, and in 23 pts. of boiling water. More easily soluble in alcohol.
$C_{48}\,H_{39}\,Ba\,O_{10}$

Cholalate of Copper. Ppt.

Cholalate of Lead. Sparingly soluble in water. Soluble in alcohol and in acetic acid.

Cholalate of Lime. Very sparingly soluble in cold, more soluble in hot water. Soluble in alcohol, and, less easily, in ether.
$C_{48}\,H_{39}\,Ca\,O_{10}$

Cholalate of Manganese.

Cholalate *of dinoxide* of Mercury. Somewhat soluble in boiling water.

Cholalate *of protoxide* of Mercury. Somewhat soluble in boiling water.

Cholalate of Potash. Easily soluble in water, and alcohol; less soluble in ether. Insoluble in a solution of caustic potash.
$C_{48}\,H_{39}\,K\,O_{10}$

Cholalate of Silver. Somewhat soluble, with gradual decomposition, in boiling water, less soluble in cold water. Easily soluble in alcohol.

Cholalate of Soda. Soluble in water, and alcohol; less soluble in ether.

Cholanic Acid. Sparingly soluble in water; more easily soluble in alcohol. Sparingly soluble in ether. (Berzelius.)

"Cholic Acid" (of Demarçay). *Vid.* Cholalic Acid.

Cholic Acid. Soluble in 300 pts. of cold, and in 120 pts. of hot water; less soluble in ether. Very abundantly soluble in alcohol, cold concentrated sulphuric acid, chlorhydric and acetic acids, and in aqueous solutions of the alkalies and alkaline earths. When boiled for a long time with water it is converted into an insoluble modification (*paracholic acid*), but this dissolves in alcohol and is thus re-converted into cholic acid. 1000 pts. of cold water dissolve 3.3 pts., and 1000 pts. of boiling water 8.3 pts. of it. Easily soluble in alcohol. Very sparingly soluble in ether. Soluble in acetic acid. Easily soluble in cold chlorhydric acid, and in cold concentrated sulphuric acid.
(*Glycocholic Acid.*)
$C_{52}\,H_{43}\,N\,O_{12} = N \left\{ \begin{matrix} C_{48}\,H_{39}\,O_8 \\ C_2\,O_2'' \\ C_2\,H_3 \end{matrix} \right. .\,O,\,H\,O$

The cholates of the alkalies and alkaline earths are readily soluble in water, those of the heavy metals, excepting silver, are insoluble in water. All the cholates are soluble in alcohol.

Cholate of Ammonia. Readily soluble in

$C_{52}H_{42}(NH_4)NO_{12}$ water; on boiling the aqueous solution ammonia is evolved. Soluble in alcohol, from which it gradually separates after ether has been added.

Cholate of Baryta. Soluble in water; less $C_{52}H_{42}BaNO_{12}$ soluble in alcohol.

Cholate of Copper. Ppt.

Cholate *of sesquioxide* of Iron. Readily soluble in alcohol.

Cholate of Lead.

I.) *normal.* Slightly soluble in water. Rather $C_{52}H_{42}PbNO_{12}$ easily soluble in alcohol.

II.) *basic.* Somewhat soluble in an aqueous solution of acetate of lead, and in alcohol.

Cholate of Lime. Soluble in water, and alcohol.

Cholate of Magnesia. Soluble in water, and alcohol.

Cholate of Potash. Soluble in water, and alcohol. Insoluble in ether.

Cholate of Silver. Somewhat soluble in boiling water and in alcohol.

Cholate of Soda. Very readily soluble in (*Bilin*(of Berzelius).) $C_{52}H_{42}NaNO_{12}$ water, and spirit; less soluble in absolute alcohol. 1000 pts. of alcohol dissolve 39 pts. of it at 15°. (Gerhardt's *Tr.*) Soluble in 2.56 pts. of spirit at 15°. It separates from the alcoholic solution on the addition of ether. (Lehmann's *Physiolog. Chem.*, London, 1851, **1.** 224.)

Cholate of Strontia. Soluble in water, and alcohol.

Choleic Acid. *Vid.* TauroCholic Acid.

Cholephyrrin. Sparingly soluble in water, (Reddish-yellow coloring matter of bile.) and alcohol; more easily soluble in alkaline solutions. (Berzelius.)

"**Cholesteric Acid**" (of Pelletier & Caventou). Is denied by Redtenbacher.

Cholesteric Acid. Hygroscopic. Easily $C_{16}H_{10}O_{10} = C_{16}H_8O_8, 2HO$ soluble in water, alcohol, and acids. (Redtenbacher.) Its alkaline and earthy salts are soluble in water; the metallic salts are precipitates.

Cholesterate of Lime. Readily soluble in $C_{16}H_8Ca_2O_{10}$ cold water, from which solution it is precipitated on *boiling*. It is also precipitated on the addition of alcohol. (Gundelach & Strecker.)

Cholesterate of Silver. Soluble in boil- $C_{16}H_8Ag_2O_{10}$ ing, less soluble in a cold aqueous solution of nitrate of ammonia. (Gundelach & Strecker.)

Cholesterilin. [There are 3 modifications.]
$C_{52}H_{42}''$

Modif. (α.) Insoluble in water. Scarcely at all soluble in alcohol. Very sparingly soluble in ether. Readily soluble in warm oil of turpentine.

Modif. (β.) Insoluble in water or alcohol. Tolerably soluble in warm ether; from which it is precipitated by alcohol.

Modif. (γ.) Insoluble in water. Slightly soluble in alcohol. Readily soluble in ether, from which solution alcohol precipitates it. (Zwenger.)

Cholesterin. Insoluble in water. Sparingly $C_{52}H_{44}O_2 + 2Aq$ soluble in cold ordinary alcohol; soluble in 9 pts. of boiling alcohol of 0. 84 sp. gr.; it is, however, much more soluble in boiling absolute alcohol. 100 pts. of boiling alcohol, of 0.816 sp. gr., dissolve 18 pts., and 100 pts. of 0.840, 11.24 of it, the greater part is deposited again from the alcoholic solution as it cools. (Chevreul, in [T.].) Soluble in 3.7 pts. of ether at 15°, and in 2.2 pts. of boiling ether. Readily soluble in boiling, less soluble in cold wood-spirit. Sparingly soluble in oil of turpentine.

Soluble in creosote. (Reichenbach.) Readily soluble in lignone.

Slightly soluble in soap-water, and more freely in the fatty oils, and taurocholic acid. (Lehmann.) Unacted on by boiling caustic potash.

Cholesterone. [There are 2 modifications.]
$C_{52}H_{42}''$

Modif. (α.) Insoluble in water. Very soluble in alcohol, ether, and the volatile and fatty oils.

Modif. (β.) Scarcely at all soluble in alcohol. Sparingly soluble in ether. (Zwenger.)

Cholestrophan. *Vid.* Parabanate of Methyl.

Choloidanic Acid. Almost insoluble in $C_{32}H_{24}O_{14}$ cold, sparingly soluble in boiling water. Easily soluble in alcohol. Soluble, without alteration, in warm chlorhydric and nitric acids. Its alkaline and earthy salts are difficultly soluble in water, the salts of the metals proper are insoluble in water or nearly so. (Redtenbacher.)

Choloidic Acid. Insoluble in water. Read- $C_{48}H_{38}O_8 + Aq$ ily soluble in alcohol. Very sparingly soluble in ether.

Its alkaline salts are soluble in water, and alcohol, but are insoluble in ether; those of the other metals are soluble in alcohol, but insoluble in water.

Choloidate of Ammonia. Soluble in water, and alcohol. Insoluble in ether.

Choloidate of Baryta. Insoluble in water. $C_{48}H_{37}BaO_8 + 2Aq$ Soluble in alcohol.

Choloidate of Copper. Insoluble in water. Soluble in alcohol.

Choloidate of Lead. Soluble in boiling alcohol.

Choloidate of Potash. Soluble in water, and alcohol. Insoluble in ether.

Choloidate of Silver. Ppt.
$C_{48}H_{37}AgO_8$

Choloidate of Soda. Soluble in water, and alcohol. Insoluble in ether.

Cholonic Acid. Insoluble in water. Solu- $C_{52}H_{41}NO_{10}$ ble in alcohol. Scarcely at all soluble in ether.

Cholonate of Ammonia. Soluble in water. Insoluble in an aqueous solution of chloride of ammonium, and in many other saline solutions.

Cholonate of Baryta. Insoluble in water.

Cholonate of Potash. Soluble in water. Insoluble in an aqueous solution of chloride of ammonium, and in many other saline solutions. Soluble in alcohol. Insoluble in ether.

Cholonate of Soda. Soluble in water, and $C_{52}H_{40}NaNO_{10}$ alcohol. Insoluble in ether.

Chondrin. Swells up in cold water, without $C_{48}H_{40}N_6O_{20}$? dissolving. Entirely soluble in boiling water, but is decomposed by long-continued ebullition. Insoluble in alcohol or ether. Soluble in aqueous solutions of acetate of potash, acetate of soda, and chloride of sodium. Easily soluble in solutions of the caustic alkalies, the solution undergoing decomposition when boiled. Soluble in concentrated sulphuric acid. Its alkaline solution is precipitated by most acids; the precipitate thus formed being soluble in chlorhydric, sulphuric, nitric, phosphoric, phosphorous, chloric, and iodic acids; and insoluble in sulphurous, pyrophosphoric, fluorhydric, carbonic, arsenic, acetic, tartaric, oxalic, citric, lactic, succinic, &c., acids.

CHROMIC ACID. Deliquescent. Very soluble $Cr\,O_3$ in water. Soluble in cold alcohol, the solution undergoing decomposition when exposed to the light or heated. Soluble in ether. (Unverdorben.) When exposed to the rays of direct sunlight, the aqueous solution of chromic acid gradually undergoes decomposition to a slight extent, chromate of chromium being deposited and oxygen evolved. (Berzelius, *Lehrb.*, **2.** 324.) Sparingly soluble in a cold aqueous solution of bisulphate of potash. (Fritzsche.) Abundantly soluble in sulphuric acid of 1.85 sp. gr., but if this solution be diluted with water until the sp. gr. is reduced to 1.55, much of the chromic acid will separate out; if more water be added the chromic acid again dissolves. (Schrœtter.) Less soluble in bihydrated sulphuric acid than in that of any other strength. (Bolley.) Only a few of its salts are soluble in water; they are all soluble, however, in nitric acid.

CHROMATE OF ALUMINA.

I.) *normal.* Insoluble in water. Easily soluble $Al_2\,O_3, Cr\,O_3 + 7\,Aq$ (?) in an aqueous solution of alum. Insoluble in an aqueous solution of chloride of ammonium. Soluble in acetic acid and in ammonia-water. (Fairrie, *J. Ch. Soc.*, **4.** 301.) Insoluble as such in water; but is readily decomposed by water, chromic acid being abstracted, and indefinite basic compounds formed. Soluble in alkaline solutions and in acids. Decomposed, with removal of chromic acid, by aqueous solutions of many salts. (Storer & Eliot, *Proc. Amer. Acad.*, 1860, **5.** 214.)

CHROMATE OF AMMONIA.

I.) *mono.* Permanent. Very soluble in water. $N\,H_4\,O, Cr\,O_3$ Readily soluble, without decomposition, in water. Alcohol precipitates it from the aqueous solution. (Malaguti & Sarzeau, *Ann. Ch. et Phys.*, (3.) **9.** 457.)

II.) *bi.* Permanent. Less soluble in water than hromate $N\,H_4\,O, 2\,Cr\,O_3$ ~~carbonate~~ of ammonia.

III.) $5\,N\,H_4\,O, 4\,Cr\,O_3$ Permanent. (Pohl.)

IV.) $N\,H_4\,O, 6\,Cr\,O_3 + 10\,Aq$ Very efflorescent. (Rammelsberg.)

CHROMATE OF AMMONIA & OF COPPER.

I.) *mono.*

$N\,H_4\,O, Cr\,O_3;\ Cu\,O, Cr\,O_3$

II.) *basic.* Soluble in water. (Malaguti & Sarzeau, *Ann. Ch. et Phys.*, (3.) **9.** 435.)

CHROMATE OF AMMONIA & OF MAGNESIA. $N\,H_4\,O, Cr\,O_3; Mg\,O, Cr\,O_3 + 6\,Aq$ Soluble in water. (Berzelius's *Lehrb.*, **3.** 459.)

CHROMATE OF AMMONIA & OF POTASH. Loses $N\,H_4\,O, Cr\,O_3;\ K\,O, Cr\,O_3$ ammonia in the air.

CHROMATE OF AMMONIA & OF ZINC.

I.) *basic.* Soluble in water. (Malaguti & Sarzeau, *Ann. Ch. et Phys.*, (3.) **9.** 444.)

CHROMATE OF AMMONIA, OF ZINC, & OF ZINC-AMMONIUM. $N\,H_4\,O, Cr\,O_3; Zn\,O, Cr\,O_3; N\left\{\begin{matrix}H_3\\Zn\end{matrix}\right.O, Cr\,O_3 + 8\,Aq$ Soluble in ammonia-water. Insoluble in alcohol. Decomposed by water.

*Bi*CHROMATE OF AMYLSTRYCHNINE. Soluble $C_{42}\,H_{21}\,(C_{10}\,H_{11})\,N_2\,O_4, 2\,H\,O, 2\,Cr\,O_3$ in boiling water.

CHROMATE OF ANTIMONY ($Sb\,O_3$). Ppt. Soluble in a chlorhydric acid solution of terchloride of antimony. (Thomson.)

CHROMATE OF ARGENT*bi*AMIN. Soluble in (*Ammonio Chromate of ~~Zinc~~*) warm, less soluble in sil $N_2\left\{H_6\right.. Ag\,O, Cr\,O_3$ cold ammonia-water. Decomposed by an aqueous solution of caustic potash, with formation of fulminating silver. (Mitscherlich.)

CHROMATE OF BARYTA.

I.) *normal.* Insoluble in water. (Berzelius, $Ba\,O, Cr\,O_3$ *Lehrb.*) Very slightly soluble in water, and even insoluble when other salts are present in solution. (Dumas, *Tr.*) Easily soluble in acids, even when these are dilute. (T. Thomson, *Phil. Trans.*, 1827, Part I. p. 196.) It is not precipitated from solutions containing citrate of soda. (Spiller.) Readily soluble in nitric, chlorhydric, and chromic acids. Insoluble in solutions of the alkalies and in acetic acid.

Somewhat more easily decomposed by solutions of the alkaline carbonates than sulphate of baryta. (H. Rose.)

II.) *bi.* Decomposed by water, with precipita- $Ba\,O, 2\,Cr\,O_3 + 2\,Aq$ tion of the normal salt. Soluble in an aqueous solution of chromic acid. (Bahr.)

*Bi*CHROMATE OF BERBERIN. Sparingly solu- $C_{42}\,H_{19}\,N\,O_{10}, 2\,Cr\,O_3$ ble in water. Readily soluble in dilute chlorhydric and sulphuric acids.

CHROMATE OF BISMUTH. Insoluble in water, $Bi\,O_3, 3\,Cr\,O_3$ even if some free chromic acid be present. Easily soluble in chlorhydric and nitric acids. (Lœwe, cited by Fresenius, *Quant.*, p. 150.) Very slightly soluble in water. (Moser.)

100 pts. of	dissolve pts. of it.
Water	0.00008
Acetic Acid	0.00021
Nitric Acid of 1.03 sp. gr.	0.00024
Potash solution of 1.33 sp. gr.	0.00016

(Pearson, *Phil. Mag.*, (4.) **11.** 206.)

Fresenius (*Quant. Anal.*, 1858, p. 255) remarks, that Pearson's statement that chromate of bismuth is nearly insoluble in dilute nitric acid is erroneous, since this is true only when chromate of potash is present in sufficient quantity.

Far less soluble in a hot solution of caustic soda than chromate of lead. (Storer.) Is not precipitated from solutions containing citrate of soda. (Spiller.)

When one equivalent of $Ba\,O, Cr\,O_3$ is boiled with an equivalent of $K\,O, C\,O_2$ in aqueous solution .2072 of it may be decomposed, and when boiled with an equivalent of $Na\,O, C\,O_2$ .24 of it may be decomposed. While, on the other hand, when an equivalent of $Ba\,O, C\,O_2$ is boiled with one of $K\,O, Cr\,O_3$ .79 of it may be decomposed, and with an equivalent of $Na\,O, Cr\,O_3$ .76 of it may be decomposed. (Malaguti, *Ann. Ch. et Phys.*, (3.) **51.** pp. 336, 348.)

CHROMATE OF CADMIUM.

I.) *mono.* Not absolutely insoluble in water. $Cd\,O, Cr\,O_3 + 5\,Aq$ (Thomson in his *System of Chem.*, London, 1831, **2.** 624.)

II.) *acid.* Soluble in water. Cannot be crystallized. (Berzelius, *Lehrb.*)

III.) $2\,Cd\,O, 3\,Cr\,O_3$ Soluble in water. (Malaguti & Sarzeau, *Ann. Ch. et Phys.*, (3.) **9.** pp. 447, 460.)

IV.) $5\,CdO, 2\,CrO_3 + 8\,Aq$ Exceedingly sparingly soluble in water. Very slowly soluble, with combination, in ammonia-water. (Malaguti & Sarzeau, *Ibid.*, p. 447.)

Chromate of Cadmium*bi*amin. Decomposed by water. Insoluble in alcohol or ether. Soluble in ammonia-water. (Malaguti & Sarzeau, *Ann. Ch. et Phys.*, (3.) **9.** 449.)
(*Ammonio Chromate of Cadmium.*)
$N_2 \} H_6 \cdot CdO, CrO_3 + 3\,Aq$

Chromate *of protoxide* of Cerium.

I.) *mono.* Insoluble in water. (Berzelius, *Lehrb.*)
CeO, CrO_3

II.) *bi.* Easily soluble in water. (*Ibid.*)

"Chromate of Chloride of Ammonium." $NH_4Cl, 2\,CrO_3$ Much more soluble in water than the corresponding potash compound.

"Chromate of Chloride of Calcium." $CaCl, 2\,CrO_3$ Deliquescent.

Chromate of *ter*Chloride of Chromium. *Vid.* ChloroChromic Acid.

Chromate of Chloride of Magnesium. $MgCl, 2\,CrO_3$ Deliquescent. (Pelouze.)

Chromate of Chloride of Potassium. $KCl, 2\,CrO_3$ Permanent. Decomposed by pure water. Soluble, without decomposition, in water acidulated with chlorhydric acid. (Pelouze.)

Chromate of Chloride of Sodium. $NaCl, 2\,CrO_3$ Deliquescent. In other respects, it behaves like the potassium-salt. (Pelouze.)

Chromate of Chromium.
(*Binoxide of Chromium. Brown Oxide of Chromium.*)

I.) Cr_2O_3, CrO_3 Insoluble as such in water, but is gradually decomposed by water, which abstracts chromic acid. Also decomposed by alkaline, and by many saline solutions. Soluble in dilute nitric acid, and in the acids generally; readily if the precipitate is recent, but with difficulty after it has been dried at a somewhat elevated temperature. (T. Thomson, *Phil. Trans.*, 1827, Part I. p. 186; Maus, *Pogg. Ann.*, **9.** 127; Storer & Eliot, *Proc. Amer. Acad.*, 1860, **5.** 192.)

II.) ? Several basic compounds, which had been described as definite salts, have been shown by Storer & Eliot (*loc. cit.*) to be mere mixtures. In solubility they resemble the normal salt, excepting the fact that water removes the chromic acid from them more slowly in proportion as they are more basic. The so-called "neutral" and "acid" salts have not been obtained.

III.) *acid.* Not isolated. Soluble in water.

Chromate of Chromium & of Manganese. $3\,Mn_2O_3, Cr_2O_3, 3\,CrO_3 + 6\,Aq$ Soluble, with decomposition, in chlorhydric acid, also in dilute sulphuric and nitric acids. (Warington.) Sparingly soluble in water. (Reinsch.)
[Same as the $2\,MnO, CrO_3 + 2\,Aq$ of Warington & Reinsch. (Fairrie, *J. Ch. Soc.*, **4.** 300.)]

Chromate of Cinchonin. Decomposed by boiling water, and alcohol. (Elderhorst.)

Chromate of Cobalt.

I.) *mono.* Ppt. [T.]
$CoO, CrO_3 + 2\,Aq$

II.) *bi.* Soluble in water. Cannot be crystalized. (Berzelius, *Lehrb.*)

III.) *basic.* Ppt. Decomposes, with oxidation, when washed with water. Decomposed, with partial solution, by ammonia-water. (Malaguti & Sarzeau, *Ann. Ch. et Phys.*, **97.** (3.) **9.** 453.)
$3\,CoO, CrO_3 + 4\,Aq$

Chromate of Codein.

Chromate of Copper.

I.) *mono.* Ppt. Somewhat soluble in water. (Thomson.)
$CuO, CrO_3 + 2\,Aq$

The "normal Chromate of Copper" of Kopp proved to be a basic sulphate of copper.

II.) *basic.* Insoluble in water. (Persoz, *Ann. Ch. et Phys.*, (3.) **25.** 281.) Insoluble in water. Soluble, with combination, in ammonia-water. (Malaguti & Sarzeau, *Ann. Ch. et Phys.*, (3.) **9.** 434.) Easily soluble in ammonia-water, and in dilute nitric acid. Decomposed by solutions of the alkalies.
$4\,CuO, CrO_3 + 5\,Aq$ (Malaguti & Sarzeau).
$3\,CuO, CrO_3 + 2\,Aq$ (Persoz).

*Bi*Chromate of Copper. Deliquescent. $CuO, 2\,CrO_3 + 2\,Aq$ Easily soluble in water. The aqueous solution is partially decomposed by boiling. Soluble in alcohol, and in ammonia-water. (Drœge, *Ann. Ch. u. Pharm.*, **101.** 40.) The aqueous solution is decomposed by evaporation. (Malaguti & Sarzeau, *Ann. Ch. et Phys.*, (3.) **9.** 456.)

Chromate of Copper & of Lead. Soluble in nitric acid.
$2\,PbO, CuO, 2\,CrO_3$

Chromate of Copper & of Potash.

I.) $3\,CuO, 2\,CrO_3; KO, CrO_3 + 3\,Aq$ Almost entirely insoluble in water. Soluble in aqueous solutions of caustic and carbonated ammonia. (A. Knop.)

II.) $KO, 4\,CuO, 4\,CrO_3 + Aq$ Decomposed by boiling water. (Gerhardt.)

*Bi*Chromate of EthylStrychnine. Readily soluble in boiling, less soluble in cold water.
$C_{42}H_{21}(C_4H_5)N_2O_4, 2\,HO, 2\,CrO_3 + 2\,Aq$

Chromate of Glucina.

I.) *mono.* Insoluble in water. (Berzelius's *Lehrb.*, **3.** 496.)
Gl_2O_3, CrO_3

II.) *with excess of acid.* Soluble in water. (John.)

Chromate of Glucina with Sulphate of Glucina. (John.)

Chromate of Glycocoll & of Potash. Soluble in water; less soluble in alcohol. (Horsford.)

Chromate of Harmalin.

I.) *mono.* Very sparingly soluble in water.

II.) *bi.*
$C_{26}H_{14}N_2O_2, HO, 2\,CrO_3$

Chromate of Harmin.

I.) *mono.*

II.) *bi.*
$C_{26}H_{12}N_2O_2, HO, 2\,CrO_3$

Chromate *of sesquioxide* of Iron. Insoluble as such in water, but is decomposed, with abstraction of chromic acid, by water, indefinite basic compounds being formed. Also decomposed by saline solutions. Easily soluble in acids. (Storer & Eliot, *Proc. Amer. Acad.*, 1860, **5.** 216; compare T. Thomson, *Phil. Trans.*, 1827, Part I. p. 218.) Soluble in chromic acid. When the chromic acid solution is evaporated to dryness the residue obtained is soluble in water. (Maus.)
Fe_2O_3, CrO_3

Chromate of Lead. PbO, CrO_3 Permanent. Insoluble in water or in acetic acid. Scarcely at all soluble in dilute nitric acid. Easily soluble in potash lye. Easily decomposed by hot concentrated chlorhydric acid. (Fresenius, *Quant.*, p. 158.) Readily and completely soluble in a solution of caustic potash. (Berzelius, *Lehrb.*; Pearson.) Soluble in a solution of caustic potash. (Vauquelin.) Insoluble in an aqueous solution of chloride of ammonium. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 97.) Soluble in a solution of bichromate of potash. As good as insoluble in a dilute solution of acetate and nitrate of ammonia, slightly acidulated with acetic acid.

Soluble to a bright yellow solution even in dilute sulphuric acid. (Storer.) Soluble, with decomposition, in hot sulphuric and chlorhydric acids.

Only slightly soluble in acids. (Dumas, *Tr.*) It is precipitated from nitrate of lead in presence of 70,000 pts. of water. (Harting.) It is not precipitated from solutions which contain citrate of soda. (Spiller.)

[The statements of several of the text-books of analysis (*e. g.* H. Rose's *Traité*, I. 132), to the effect that chromate of lead is "insoluble" in dilute nitric acid, being manifestly erroneous, I suggested, in 1859, to Dr. F. H. Brown, at that time assistant in Harvard College Laboratory, the propriety of a few experiments upon this point. In carrying out these tests Dr. Brown mixed together solutions of weighed (equivalent) portions of bichromate of potash and acetate of lead, and then added nitric acid of known strength by small portions to the precipitate formed until this was completely dissolved; the mixture being meanwhile constantly agitated. The experiments were all made at the ordinary temperature of the air. The amount of acid used was determined by measuring off an excess of it before the experiment, and subtracting therefrom the amount which remained after the precipitate had been dissolved.

1.512 grms. of $KO, 2\,CrO_3$ in 50 c.c. of water being mixed with 3.8 grms. of $C_4H_3PbO_4$ in 50 c.c. of water, 1650 c.c. of nitric acid of 1.120 sp. gr. were required to dissolve the resulting 3.28 grms. of PbO, CrO_3. Hence, in round numbers, 1 pt. of PbO, CrO_3 dissolves in about 560 pts. of nitric acid of 1.12 sp. gr.

1.512 grms. of $KO, 2\,CrO_3$ in 30 c. c. of water being mixed with 3.8 grms. of $C_4H_3PbO_4$ in 30 c.c. of water, 400 c.c. of nitric acid of 1.225 sp. gr. were required to dissolve the 3.28 grms. of PbO, CrO_3. Hence, in round numbers, 1 pt. of PbO, CrO_3 dissolves in about 150 pts. of nitric acid of 1.225 sp. gr.

1.512 pts. of $KO, 2\,CrO_3$ in 50 c. c. of water being mixed with 3.8 grms. of $C_4H_3PbO_4$, also in 50 c. c. of water, 330 c. c. of nitric acid of 1.265 sp. gr. were required to dissolve the resulting 3.28 grms. of PbO, CrO_3. Hence, in round numbers, 1 pt. of PbO, CrO_3 dissolves in 130 pts. of nitric acid of 1.265 sp. gr.

1.512 grms. of $KO, 2\,CrO_3$ in 50 c.c. of water being mixed with 3.8 grms. of $C_4H_3PbO_4$ in 50 c.c. of water, 190 c.c. of nitric acid of 1.395 sp. gr. were required to dissolve the resulting 3.28 grms. of PbO, CrO_3. Hence, in round numbers, 1 pt. of PbO, CrO_3 dissolves in about 80 pts. of nitric acid of 1.395 sp. gr. F. H. S.]

II.) *Di*Chromate of Lead. $2\,PbO, CrO_3$ Insoluble in water. When digested in nitric acid, one equivalent of oxide of lead is removed, monochromate of lead being formed. (T. Thomson, *Phil. Trans.*, 1827, Part I. p. 221.) Less soluble in water than the monochromate. Soluble in potash-lye.

III.) *sesqui.*
$3\,PbO, 2\,CrO_3$

*Bi*Chromate of Lepidin. $C_{20}H_9N, 2\,(CrO_3, HO)$ Soluble in warm water.

Chromate of Lime.

I.) *mono.* $CaO, CrO_3 + 2\,Aq$ Easily soluble in water. Insoluble in alcohol.

II.) *basic.*

III.) *bi.* $CaO, 2\,CrO_3 + 3\,Aq$ Deliquescent. Soluble in chromic acid. (Bahr.) Very easily soluble in water. (Jacquelain, *Ann. Ch. et Phys.*, (3.) **21.** 481.)

Chromate of Lime & of Potash.

I.) $KO, CrO_3;\ CaO, CrO_3 + 2\,Aq$ Easily soluble in water (Schweizer); even after ignition. (Duncan.)

II.) $3\,(KO, CrO_3);\ 7\,(CaO, CrO_3) + 5\,Aq$ After ignition, this compound is insoluble in water, but is soluble before having been ignited. (Duncan.)

Chromate of Lithia. LiO, CrO_3 Readily soluble in water. (C. G. Gmelin.)

Chromate of LuteoCobalt. $6\,NH_3 \cdot Co_2O_3, 3\,CrO_3 + 5\,Aq$ Soluble in hot water.

Chromate of Magnesia. $MgO, CrO_3 + 7\,Aq$ Readily soluble in water. (Vauquelin.)

Chromate of Magnesia & of Potash. $MgO, CrO_3;\ KO, CrO_3 + 2\,Aq$ Permanent. Tolerably easily soluble in water. (T. Thomson, *Phil. Trans.*, 1827, p. 224.) 100 pts. of water dissolve 26.7 pts. of it. Insoluble in alcohol. (Anthon, *Berzelius's Lehrb.*, **3.** 459.)

"*Di*Chromate of Manganese." *Vid.* Chromate of Chromium and of Manganese.

*Mono*Chromate of Manganese. Soluble in water.

Chromate *of dinoxide* of Mercury.

I.) *mono.* Hg_2O, CrO_3 Insoluble in water. Soluble in hot dilute nitric acid, from which it separates out again as the solution cools. (Darby, *J. Ch. Soc.*, **1.** 24.) Insoluble in water. Soluble in nitric acid, which converts it into chromate of protoxide of mercury. (Berzelius, *Lehrb.*, **3.** 891.)

II.) *basic.* $4\,Hg_2O, 3\,CrO_3$ Very sparingly soluble in cold, more freely soluble, with partial decomposition, in boiling water. (H. Rose.) Slightly soluble in aqueous solutions of chloride of ammonium and nitrate of ammonia. (Brett.) Slightly soluble in nitric acid. (Hayes.) Decomposed by chlorhydric acid.

Chromate *of protoxide* of Mercury.

I.) *mono.* HgO, CrO_3 Soluble in an aqueous solution of nitrate of protoxide of mercury, and, more easily, in a solution of protochloride of mercury. (Gmelin.) Partially soluble in water. Soluble in acids. (Vauquelin.) Soluble in warm aqueous solutions of chloride of ammonium and nitrate of ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 97.)

II.) *basic.* $3\,HgO, CrO_3$ Sparingly soluble in water. (Millon, *Ann. Ch. et Phys.*, (3.) **18.** 364.)

III.) *tetra.* $4\,HgO, CrO_3$ Sparingly soluble in water. (Millon, *Ann. Ch. et Phys.*, (3.) **18.** 364.)

CHROMATE *of binoxide* OF MOLYBDENUM.

I.) *normal*. Soluble in water.
$\mathrm{Mo\,O_2, 2\,Cr\,O_3}$

II.) *acid*. Soluble in water.

III.) *basic*. Insoluble in water.

CHROMATE OF MOLYBDIC ACID. Soluble in water.

CHROMATE OF NICKEL.

I.) *mono*. Ppt. (Thomson.) Deliquescent.
$\mathrm{Ni\,O, Cr\,O_3 + 4\,Aq}$ Soluble, without decomposition, in cold alcohol. (Dumas, *Tr.*)

II.) *tetra*. Insoluble [or very sparingly soluble] in water. Decomposed and partially dissolved by ammonia-water. (Malaguti & Sarzeau, *Ann. Ch. et Phys.*, (3.) **9.** 450.)
$\mathrm{4\,Ni\,O, Cr\,O_3 + 6\,Aq}$

III.) *bi*. Soluble in water. (Malaguti & Sarzeau, *Ibid.*, pp. 450, 461.)
$\mathrm{Ni\,O, 2\,Cr\,O_3}$

CHROMATE OF NICKEL*ter*AMIN. Decomposed by water. Insoluble in alcohol or ether. Very sparingly soluble in water which contains ammonia. (Malaguti & Sarzeau, *Ann. Ch. et Phys.*, (3.) **9.** 451.)
(*Ammonio-Chromate of Nickel.*)
$\mathrm{N_3} \left\} \mathrm{H_9 . Ni\,O, Cr\,O_3 + 4\,Aq} \right.$

*Bi*CHROMATE OF NITROHARMALIN. Very sparingly soluble in cold, but readily soluble in boiling water or alcohol.

CHROMATE OF NITROHARMIN.

I.) *mono*.

II.) *bi*.

CHROMATE OF PELOSIN.
$\mathrm{C_{36}\,H_{21}\,N\,O_6, Cr\,O_3 + 2\,Aq}$

CHROMATE OF PLATIN(*ous*)*bi*AMIN.

I.) *mono*. Soluble in water, and in an aqueous solution of caustic potash.
$\mathrm{N_2} \left\{ \mathrm{H_6 . Pt' O, Cr\,O_3} \right.$

II.) *bi*. Sparingly soluble in cold, more readily soluble in hot water. Insoluble in alcohol. Soluble in an aqueous solution of caustic potash. (Buckton, *J. Ch. Soc.*, **5.** 220.)
$\mathrm{N_2} \left\{ \mathrm{H_6 . Pt' O, 2\,Cr\,O_3} \right.$

CHROMATE OF PLATINOPYRIDIN. Ppt.
$\mathrm{C_{10}\,H_3\,Pt\,N, H\,O, Cr\,O_3}$

CHROMATE *of binoxide* OF PLATINUM. Ppt.

CHROMATE OF *di*PLATOSAMIN. *Vid.* Chromate of Platin(*ous*)*bi*amin.

CHROMATE OF POTASH. Permanent. More soluble in water than the bichromate.
$\mathrm{K\,O, Cr\,O_3}$

Soluble in 2.07 pts. of water at 15.5°
" 1.75 " 17.5°
" 1.67 " 100°
(Thomson.)

100 pts. of water at 15.5° dissolve 48.368 pts. of it. Soluble in all proportions in boiling water. [T.] Soluble in 1.6 pts. of water at 19.5°; or, 100 pts. of water at 19.5° dissolve 62.3 pts. of it; or, the aqueous solution saturated at 19.5° contains 38.4% of it, and is of 1.3787 sp. gr. (H. Schiff, *Ann. Ch. u. Pharm.*, 1859, **109.** 326.) Soluble in 2 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) The aqueous solution saturated at 15° is of 1.303257 sp. gr. and contains dissolved in every 100 pts. of water at least 43.857 pts. of the salt. (Michel & Krafft, *Ann. Ch. et Phys.*, (3.) **41.** pp. 478, 482.) The sp. gr. of a solution saturated at 8° = 1.368. (Anthon, *Ann. der Pharm.*, 1837, **24.** 210.) The saturated aqueous solution boils at 107°. (Kremers, *Pogg. Ann.*, **99.** 43.)

An aqueous solution of sp. gr., at 19.5° (sp. gr. of water at 19.5° = 1),	Contains Per Cent of $\mathrm{K\,O, Cr\,O_3}$	Contains Pts. of $\mathrm{K\,O, Cr\,O_3}$ dissolved in 100 pts. of water.
1.0886	10.566	11.84
1.1669	19.094	23.60
1.2463	26.959	36.91

" 0.98	" 100°

(Kremers, *Pogg. Ann.*, **92.** 499.)

100 pts. of water at 17.2° dissolve 10.44 pts. of it. (T.) The aqueous solution saturated at 15° is of 1.061805 sp. gr., and contains dissolved in every 100 pts. of water at least 9.126 pts. of the salt. (Michel & Krafft, *Ann. Ch. et Phys.*, (3.) **41.** pp. 478, 482.) It is liable to form supersaturated solutions. (Ogden.)

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of the anhydrous salt dissolved in 100 pts of water.
1.0405	6.08
1.0848	13.10

(Kremers, *Pogg. Ann.*, **95.** 120.)

The aqueous solution saturated at 8° is of 1.065 sp. gr. (Anthon, *Ann. der Pharm.*, 1837, **24.** 210.) Insoluble in alcohol. The saturated aqueous solution boils at 104. (Kremers, *Pogg. Ann.*, **92.** 499.)

*Ter*Chromate of Potash. $KO, 3CrO_3$ Easily soluble in water, and alcohol. The alcoholic solution soon undergoes decomposition. (Rothe.)

Chromate of Potash & of Soda.

I.) $KO, CrO_3; NaO, CrO_3$ Soluble in water. (T. Thomson, *Phil. Trans.*, 1827, Part I. p. 223.)

II.) $2(KO, CrO_3); NaO, CrO_3$ Soluble in hot, less soluble in cold water. (H. Rose.)

Chromate of Potash & of Zinc. Slightly soluble in cold water; but when treated with boiling water a portion (probably as a basic salt) separates out in an insoluble condition. (Wœhler.)

Chromate of Potash with Cyanide of Mercury. $2(KO, CrO_3); 3HgCy + Aq$ Permanent. Soluble in water, especially when this is hot. (Caillot.) Readily soluble in water. (Darby, *J. Ch. Soc.*, **1.** 23.)

*Bi*Chromate of Potash with Glycocoll. Soluble in water; less soluble in alcohol. (Horsford, *Am. J. Sci.*, (2.) **4.** 69.)

Chromate of Potash with Sulphate of Copper. $KO, CrO_3; CuO, SO_3$ Decomposed by water. (Persoz, *Ann. Ch. et Phys.*, (3.) **25.** 282.)

Chromate of Potash with Sulphate of Potash. $KO, CrO_3; 6(KO, SO_3)$ Very soluble in water. (Thomson, in his *System of Chem.*, London, 1831, **2.** 802.) Easily soluble in water, either hot or cold, though somewhat less readily in the latter. (Boutron-Chalard.)

*Bi*Chromate of Potash with Sulphate of Potash. $KO, 2CrO_3; KO, SO_3$ Easily soluble in cold water. (Reinsch.)

Chromate of Potash with Sulphate of Soda. Soluble in hot, less soluble in cold water. (H. Rose.)

*Bi*Chromate of Quinolein. $C_{18}H_7N, HO, 2CrO_3$ Soluble in boiling water, from which it separates as the solution cools. (Gr. Williams.)

Chromate of Silver.

I.) *mono.* AgO, CrO_3 Insoluble in water. Soluble in an aqueous solution of monochromate of potash, in acids, and in ammonia-water. (Fischer.)

When an equivalent of AgO, CrO_3 is boiled with an equivalent of NaO, CO_2, in aqueous solution, $\frac{35}{100}$ of it may be decomposed. (Malaguti, *Ann. Ch. et Phys.*, (3.) **51.** 336.) It is not precipitated from solutions which contain citrate of soda. (Spiller.)

II.) *bi.* $AgO, 2CrO_3$ Insoluble in water. Somewhat soluble in dilute nitric acid. (T. Thomson, *Phil. Trans.*, 1827, Part I. p. 222.) Sparingly soluble in water. Decomposed by boiling water. Easily soluble in ammonia-water and in nitric acid. (Warington.)

*Bi*Chromate of Silver with Cyanide of Mercury. $AgO, 2CrO_3; 2HgCy$ Scarcely at all soluble in cold, more readily soluble in hot water. Soluble in hot nitric acid, from which it separates as the solution cools. (Darby, *J. Ch. Soc.*, **1.** 24.)

Chromate of Soda. $NaO, CrO_3 + 10Aq$ Efflorescent. (Brooke.) Permanent. (Moser.) Deliquescent. (Kopp.) Very readily soluble in water. (John, Moser.) Sparingly soluble in alcohol. (John, Moser.)

*Bi*Chromate of Soda. $NaO, 2CrO_3$ More soluble than the monochromate. (Moser.) More soluble than bichromate of potash. (Dumas, *Tr.*) Very easily soluble in water. (Berzelius, *Lehrb.*)

Chromate of Solanin.

Chromate of Strontia. SrO, CrO_3 Slightly soluble in water. Insoluble in alcohol. Readily soluble in chlorhydric, nitric, and chromic acids.

Chromate of Strychnine. $C_{42}H_{22}N_2O_4, CrO_3, HO$ Sparingly soluble in boiling, less soluble in cold water. Sparingly soluble in alcohol. (Abel & Nicholson, *J. Ch. Soc.*, **2.** 252.)

Chromate of ThiAcetonin. Ppt.

Chromate of Thoria. ThO, CrO_3 Insoluble in water. Soluble in chromic acid. (Berzelius.)

Chromate *of protoxide* of Tin. Soluble in dilute acids.

Chromate *of binoxide* of Tin. $SnO_2, 2CrO_3$ Insoluble in water.

Chromate *of protoxide* of Uranium. Soluble in an aqueous solution of protochloride of uranium. (Rammelsberg.)

Chromate *of sesquioxide* of Uranium.

I.) *mono.* Ur_2O_3, CrO_3 Soluble in water. (John.)

II.) *acid.* Mostly soluble in water. (John.)

Chromate of Vanadium. Partially soluble in water. (Berzelius.)

Chromate of Yttria.

I.) *mono.* YO, CrO_3 Deliquescent. Readily soluble in water. (John.)

II.) *basic.* Sparingly soluble in water.

Chromate of Zinc.

I.) *mono.* $ZnO, CrO_3, + 7Aq$ Easily soluble in water. (Kopp.)

II.) *tetra.* $4ZnO, CrO_3 + 5Aq$ Insoluble in water. Soluble in hot chromic acid. Slowly soluble, with combination, in ammonia-water. (Malaguti & Sarzeau, *Ann. Ch. et Phys.*, (3.) 9. pp. 441, 458.)

III.) *acid.* $2ZnO, 3CrO_3$ Known only in solution. (M. & S., *loc. cit.*, p. 458.)

Chromate of Zinc*bi*amin. (*Ammonio-Chromate of Zinc.*) $\left.N_2\right\} H_6 \cdot ZnO, CrO_3 + 5Aq$ Efflorescent. Decomposed by water. Insoluble in alcohol, though slightly altered thereby. Insoluble in ether. Soluble in ammonia. (Malaguti & Sarzeau, *Ann. Ch. et Phys.*, (3.) 9. 444.)

ChromiCyanhydric Acid. (*HydroChromidCyanic Acid.*) $3HCy, Cr_2Cy_3$ Soluble in water. (Bœckmann.)

ChromiCyanide of Ammonium. Soluble in water.

ChromiCyanide of Cobalt. Ppt.

ChromiCyanide of Iron. $3FeCy, Cr_2Cy_3$ (?) Ppt.

ChromiCyanide of Lead. Ppt.

ChromiCyanide of Potassium. $3KCy, Cr_2Cy_3$ Easily soluble in water. Insoluble in alcohol. (Berzelius.) Not decomposed by dilute acids. (Bœckmann.)

ChromiCyanide of Silver. $3AgCy, Cr_2Cy_3$ Ppt.

ChromiCyanide of Zinc. Ppt.

Chromide of Manganese. Insoluble in chlorhydric or nitric acid. It dissolves only after long boiling in aqua-regia. (Bachmann.)

Chromite of Ammonia.

Chromite *of protoxide* of Iron. (*ChromIron Ore.*) FeO, Cr_2O_3 Gives up traces of iron to boiling acids.

Chromite *of sesquioxide* of Iron. Partially soluble in nitric acid. (Vauquelin.)

Chromite of Lime. $2CaO, Cr_2O_3$ Insoluble in water, or in an aqueous solution of sugar. Insoluble in solutions of caustic potash or ammonia. Very slowly decomposed by an aqueous solution of carbonic acid, and by solutions of the alkaline carbonates. (Pelouze, *Ann. Ch. et Phys.*, (3.) 33. 9.)

Chromite of Magnesia. MgO, Cr_2O_3 Insoluble in acids or alkaline solutions. (Schweizer.)

Chromite of Manganese. MnO, Cr_2O_3 Entirely insoluble in acids. (Ebelmen, *Ann. Ch. et Phys.*, (3.) 33. 44.)

Chromite of Potash. $(KO)x, Cr_2O_3$ Insoluble in cold water. (Berthier.) Soluble in cold alkaline liquors, the solution undergoing decomposition when boiled.

Chromite of Soda. $(NaO)x, Cr_2O_3$ Readily soluble in cold alkaline liquors, the solution undergoing decomposition when boiled.

Chromite of Zinc. ZnO, Cr_2O_3 Entirely unacted on by acids. (Ebelmen, *Ann. Ch. et Phys.*, (3.) 33. 46.)

Chromium. Cr There are two allotropic modifications of metallic chromium.

Modif. α. Soluble in chlorhydric and nitric acids.

Modif. β. Not readily acted upon by other bodies. Neither dissolved nor oxidized by aqua-regia. Soluble in fluorhydric acid. (Berzelius, *Lehrb.*, 2. pp 312, 313.)

Chriyiodamid. $C_{28}H_8N_3O_{13}$ Insoluble in water, or ammonia-water. (Mulder.)

Chriyiodamid with Ammonia. $C_{28}H_{10}N_4O_{13}$ Insoluble in pure water.

Chriyiodin. $C_{56}H_8N_3O_{28}$ Partially soluble in ammonia-water. Soluble in a dilute solution of caustic potash. (Mulder.)

Chriyiodide of Ammonia. $C_{28}H_{10}NO_{13}$ (?) Insoluble in water. Soluble in dilute ammonia-water. (Mulder.)

Chrysaminamid. *Vid.* Chrysammid.

Chrysammic Acid. (*Aloetic Acid, q. v. Artificial Bitter of Aloes. PolyChromatic Acid.*) $C_{14}H_2N_2O_{12} = C_{14}H(NO_4)_2O_3, HO$ Very sparingly soluble in cold, somewhat more soluble in boiling water. (Mulder.) Soluble in 800 pts. of cold, and in less hot water. (Liebig.) More readily soluble in alcohol, and ether, than in water. (Schunck.) More soluble in dilute acids, and in saline solutions, than in water. (Mulder.) Easily soluble in boiling nitric acid, without decomposition, also soluble in the other mineral acids. Decomposed by boiling concentrated sulphuric acid, also by boiling caustic potash.

Most of its salts are very sparingly soluble, or insoluble, in water; they are more soluble in solutions of the metallic acetates.

Chrysammate of Ammonia. Easily decomposed.

Chrysammate of Baryta. $C_{14}HBa(NO_4)_2O_4 + 2Aq$ Insoluble in water. (Schunck, Mulder.)

Chrysammate of Cadmium. Soluble in water. (Mulder.)

Chrysammate of Chromium. Sparingly soluble in water.

Chrysammate of Cobalt. Sparingly soluble in water.

Chrysammate of Copper. $C_{14}HCu(NO_4)_2O_4 + 4Aq$ Sparingly soluble in cold, more soluble in boiling water. (Schunck.)

Chrysammate of Gold. Soluble in hot, but nearly insoluble in cold water. (Mulder.)

Chrysammate *of protoxide* of Iron. Tolerably soluble in water.

Chrysammate *of sesquioxide* of Iron. Tolerably soluble in water.

Chrysammate of Lead.

I.) *normal.* $C_{14}HPb(NO_4)_2O_4$ Insoluble in water. (Mulder.)

II.) *basic.* $C_{14}HPb(NO_4)_2O_4;\ PbO, HO$ Ppt.

Chrysammate of Lime. $C_{14}HCa(NO_4)_2O_4 + 6Aq$ Insoluble in water.

Chrysammate of Magnesia. $C_{14}HMg(NO_4)_2O_4 + 6Aq$ Tolerably soluble in hot water.

Chrysammate of Manganese. $C_{14}HMn(NO_4)_2O_4 + 5Aq$ Tolerably easily soluble in water. (Mulder.)

Chrysammate *of dinoxide* of Mercury. Sparingly soluble in water.

Chrysammate of Nickel. Sparingly soluble in water.

Chrysammate of Platinum. Insoluble in water.

Chrysammate of Potash. $C_{14}HK(NO_4)_2O_4 + 3Aq$ Soluble in 1250 pts. of cold water. Easily soluble in boiling water. (Schunck.)

Chrysammate of Silver. Not entirely insoluble in boiling water. (Schunck.) Insoluble in water. (Mulder.)

Chrysammate of Soda. Has the same solubility as the potash-salt. (Mulder.)
$C_{14} H Na (N O_4)_2 O_4 + 3 Aq$

Chrysammate of Strontia. Sparingly soluble in water. (Mulder.)

Chrysammate of Zinc. Very sparingly soluble in water. (Mulder.)

Chrysammidic Acid. Soluble in water, from which solution it is precipitated on the addition of strong acids. Decomposed by boiling with concentrated sulphuric or nitric acid. Also decomposed by alkaline solutions. (Schunk.)
(*Amido Chrysammic Acid. Chrysammidinic Acid.*)
$C_{14} H_5 N_3 O_{12} = N \left\{ \begin{matrix} C_{14} H (N O_4)_2 O_2 \\ H_2 \end{matrix} \right. \cdot H O, H O$

Chrysammidate of Baryta. Ppt.
$C_{14} H_4 Ba (N O_4)_2 N O_4$

Chrysammidate of Potash. Soluble in boiling, very sparingly soluble in cold water.

Chrysammid. Readily soluble in water, and still more readily in alcohol, and ether. Soluble in concentrated sulphuric acid, from which water precipitates a portion of it. (Schunk.)
(*Chrysamminamid.*)
$C_{14} H_3 N_3 O_{10} = N \left\{ \begin{matrix} C_{14} H (N O_4)_2 O_2 \\ H_2 \end{matrix} \right.$

Chrysammid with Baryta. Soluble in water.

Chrysammid with Copper. Soluble in water.

Chrysammid with Lead. Nearly insoluble in water. (Mulder.)

Chrysammid with Lime.
" Manganese.
" Silver.
" Soda.
" Zinc.
Soluble in water.

Chrysanilic Acid. Very sparingly soluble in water. Readily soluble in alcohol, and ether. Soluble in alkaline solutions, but is easily decomposed by an excess of alkali. Decomposed by boiling with dilute mineral acids. (Fritsche.)
$C_{28} H_{11} N_2 O_6$ (?)

Chrysanilate of Ammonia. Soluble in alcohol.

Chrysanilate of Lead. Ppt.
$C_{28} H_{10} Pb N_2 O_6$ (?)

Chrysanilate of Potash. Easily soluble in water.

Chrysanilate of Zinc. Ppt.

ChrysAnisic Acid. Not sensibly soluble in cold, sparingly soluble in boiling water. Scarcely at all soluble in cold, tolerably readily soluble in boiling alcohol. Soluble in ether, especially when this is hot. Easily soluble, with combination, in dilute ammonia-water. (Cahours, *Ann. Ch. et Phys.*, (3.) **27.** 456.)
[Isomeric with Phenate of *ter*NitroMethyl.]
$C_{14} H_5 (N O_4)_3 O_2 = C_{14} H_4 N_3 O_{13}, H O$

ChrysAnisate of Ammonia. Soluble in water.
$C_{14} H_4 (N H_4) (N O_4)_3 O_2$

ChrysAnisate of Cobalt. Ppt.

ChrysAnisate of Copper. Ppt.

ChrysAnisate of Ethyl. Insoluble in water. Soluble in boiling alcohol. Soluble in boiling, much less soluble in cold ether. (Cahours, *Ann. Ch. et Phys.*, (3.) **27.** 459.)
$C_{14} H_4 (C_4 H_5) (N O_4)_3 O_2$

ChrysAnisate *of peroxide* of Iron. Ppt.

ChrysAnisate of Lead. Ppt.

ChrysAnisate *of protoxide* of Mercury. Ppt.

ChrysAnisate of Potash. Very easily soluble in water. (Cahours, *loc. cit.*, p. 456.)

ChrysAnisate of Silver. Insoluble, or very sparingly soluble in water. (Cahours.)
$C_{14} H_4 Ag (N O_4)_3 O_2$

ChrysAnisate of Zinc. Ppt.

Chrysatric Acid. Soluble in water, and in dilute acids, but is precipitated by concentrated acids. Its alkaline and alkaline-earthy salts are soluble in water.
(*Aleo Resinic Acid* of Schunck.)

Chrysatrate of Baryta. Insoluble, or very sparingly soluble in water. (Schunck.)
$C_{12} H_4 Ba N_2 O_{10}$

Chrysatrate of Lead. Ppt.
$4 Pb O, C_{24} H_6 N_3 O_{15}$

Chrysatrate of Silver. Insoluble in water.

Chrysene. Insoluble in water, or alcohol. Scarcely at all soluble in ether. Soluble in boiling, less soluble in cold oil of turpentine, and naphtha.
$C_{32} H_4''$

Chrysindamid.
$C_{28} H_9 N_5 O_{18}$

Chrysindin with Ammonia. Insoluble in water.
$C_{28} H_8 N_5 O_{13}$

Chrysolepic Acid. *Vid.* Picric Acid.

Chrysophanic Acid. Sparingly soluble in cold water. Soluble in alcohol, and ether, especially when these liquids are warm. Soluble, without decomposition, in concentrated sulphuric acid, from which solution it is precipitated on the addition of water. Soluble in cold, decomposed by boiling nitric acid. Soluble, with combination, in solutions of the caustic alkalies.
(*Parietinic Acid. Rhein. Rheinic Acid. Rheic Acid. Rhabarbin. Rhabarbic Acid. Rhubarbin. Rhubarbaric Acid. Rheumin. Rhaponticin. Rumicin. Chrysophane.*)
$C_{20} H_8 O_6$

Sparingly soluble in alcohol; less soluble in dilute alcohol. Soluble in 1125 pts. of alcohol of 86% at 30°, and in 224 pts. of this alcohol at boiling. Readily soluble in glacial acetic acid, amyl-alcohol, oil of turpentine, coal tar naphtha, and especially in benzin or the light oils of Burmese naphtha. Soluble, with feeble combination, in solutions of the caustic alkalies. (De la Rue & Mueller, *J. Ch. Soc.*, **10.** 298.)

Chrysophane. *Vid.* Chrysophanic Acid.

Chrysoretin. Sparingly soluble in water. Easily soluble in alcohol, and ether. Also soluble in alkaline solutions. (Bley.)

Chrysorhamnin. Very sparingly soluble in cold, decomposed by boiling water. Soluble in alcohol; the solution is partially decomposed when evaporated. Abundantly soluble in ether. Soluble, with partial decomposition, in solutions of the alkalies. (Kane, *Proc. Roy. Irish Acad.*, **2.** 223.)
(*Rhamnin.*)
$C_{23} H_{11} O_{11}$

Chrysorhamnin with Oxide of Lead.
$\left. \begin{matrix} \text{I.) } C_{23} H_{11} O_{11} ; 2 Pb O \\ \text{II.) } C_{23} H_{11} O_{11} ; 3 Pb O \end{matrix} \right\}$ Ppts.

Chysammid. *Vid.* Chrysammid.

Cicutin (from *Cicuta virosa*).

CIMIFUGIN. Soluble in alcohol. (Parrish's *Pharm.*, p. 192.)
(*Macrotin.*) (Resinoid from black snake-root.)

CINACROL. Permanent. Sparingly soluble in water. Soluble in alcohol, ether, and acetic acid; in any quantity in aqueous solutions of the caustic alkalics and alkaline earths, the carbonated alkalies, and ammonia-water. (Hirzel.)
$C_{26}H_{18}O_4$

CINCHONICIN. Nearly insoluble in water. Very soluble in ordinary and in absolute alcohol.
$C_{40}H_{24}N_2O_2$

CINCHONIDIN.

I.) *Cinchonidin*(of Wittstein.) [From *China pseudo-regia.*] More difficultly soluble in alcohol, and ether, than the cinchonidin of Pasteur (No. 2). Soluble in about 3287 pts. of cold, and in 596 pts. of boiling water; in 88 pts. of cold alcohol of 0.833 sp. gr.; and in 19 pts. of the same alcohol at boiling; in 398 pts. of cold ether of 0.74. Soluble, without change, in concentrated sulphuric, chlorhydric, and nitric acids. (Wittstein.)
$C_{36}H_{20}N_2O_2 = N_2\left\{C_{36}H_{20}O_2{}^{\text{vi}}\right.$

II.) *Cinchonidin*(of Pasteur & Gerhardt.) Soluble in 2580 pts. of water at 17°, and in 1858 pts. at 100°; and in 12 pts. of alcohol, of 0.835 sp. gr., at 17°. (Leers *Ann. Ch. u. Pharm.*, 1852, **82.** pp. 149, 150.)
Chinidin(of Winckler, Leers, and Stahlschmidt.) (*Isomeric with Cinchonin.*)
$C_{40}H_{24}N_2O_2 = N_2\left\{C_{40}H_{24}O_2{}^{\text{vi}}\right.$

100 pts. of ether, of 0.728 sp. gr. dissolve 0.7 pts. of it at 17°. (Leers, *loc. cit.*) More soluble in ether than cinchonin, but less so than quinine.

Its salts are generally more easily soluble in water than those of quinine. They are very easily soluble in spirit, but are almost completely insoluble in ether. (Leers, *loc. cit.*, p. 152.)

Very sparingly soluble in water. Almost as readily soluble as hydrate of quinine in cold alcohol of 80%; soluble in all proportions in boiling alcohol of 80%. Less soluble than quinine in ether, 100 pts. of the latter dissolving 0.69 pt. of it, or 1 pt. in 144.5 of ether. Slowly soluble, with combination, in dilute acids. Readily soluble in sulphuric acid of 1.84 sp. gr., and nitric acid of 1.23 sp. gr. (Winckler, from *Buchn. Rep.*, (2.) **49.** 1, in *Pharm. Central-B.*, 1848, **19.** 309.) Soluble in 45 pts. of cold, and 3.7 pts. of boiling absolute alcohol; in 105 pts. of cold alcohol of 90%, and in 158 pts. of cold ether. (Bussy & Guibourt, *Journ. de Pharm. et Chim.*, 1852, (3.) **22.** pp. 414, 412, 409 *note.*)

CINCHONIN. Permanent. Insoluble in cold, very sparingly soluble in boiling water.
(*Huanokin.*)
$C_{40}H_{24}N_2O_2 = N_2\left\{C_{40}H_{24}0_2{}^{\text{vi}}\right.$

Soluble in 7000 pts. of cold, and in 2500 pts. of boiling water. (Duflos.)

W. Schwabe distinguishes two modifications of cinchonin: the ordinary α and another designated as β; according to him, 1 pt. of α dissolves in 2500 pts. of hot water, while β is scarcely at all soluble therein, both being insoluble in cold water. (*Kopp & Will's J. B. für* 1860, p. 363.) Insoluble, or nearly insoluble, in water. Soluble in 400 pts. of alcohol, of 80%, at 17°, and in 110 pts. at the temperature of boiling; in 600 pts. of ether at 17°, and in 470 pts. at the temperature of boiling. (A. Erdmann, *Ann. Ch. u. Pharm.*, **100.** 345.) Soluble in 33.3 pts. of strong alcohol. It is more soluble in alcohol in proportion as this is strong and hot; but is much less soluble than quinine in this menstruum. (Duflos.) Soluble in 115.78 pts. of alcohol of 90% at about 15°, and in 126.5 pts. of absolute alcohol at about 15°. (Bussy & Guibourt, *Journ. de Pharm. et Chim.*, 1852, (3.) **22.** 413.) 1 pt. of α is soluble in 30 pts. of hot alcohol, while 1 pt. of β is soluble in 43 pts. of hot, and in 1.73 pts. of cold alcohol. β is also soluble in 378 pts. of ether, while α is insoluble therein. (W. Schwabe, *Kopp & Will's J. B. für* 1860, p. 363.)

Sparingly soluble in neutral solvents. Only traces of it being dissolved by water or by ether. Soluble in about 176 pts. of alcohol at ordinary temperatures. Readily soluble at the ordinary temperature, with combination, in alcohol or water acidulated with chlorhydric or nitric acid. (Bouchardat, *Ann. Ch. et Phys.*, (3.) **9.** pp. 233 – 236.) Soluble in 830 pts. of ether at 15°. (Bussy & Guibourt, *Journ. de Pharm. et Chim.*, 1852 (3.) **22.** 409 *note.*) Almost insoluble in ether. Sparingly soluble in chloroform, and the fatty and essential oils.

100 pts. of chloroform dissolve 2.5 pts. of it. (Schlimpert, *Kopp & Will's J. B. für* 1859, p. 405.) 100 pts. of chloroform dissolve 4 31 pts. of it. (Michael Pettenkofer, *Kopp & Will's J. B. für* 1858, p. 363.) α is soluble in 40 pts. of chloroform, while β is soluble in 268 pts. (W. Schwabe, *Kopp & Will's J. B. für* 1860, p. 363.) 100 pts. of olive-oil dissolve 1 pt. of it. (Pettenkofer, *loc. cit.*) Insoluble in benzin. (Mansfield, *J. Ch. Soc.*, **1.** 262.) Slowly and difficultly soluble in an aqueous solution of carbonic acid. (Langlois, *Ann. Ch. et Phys.*, (3.) **41.** 89.) Sparingly soluble in aqueous solutions of caustic lime, potash, and ammonia; also in solutions of chloride of calcium, chloride of potassium, chloride of ammonium, carbonate of potash, and carbonate of soda; but is insoluble in solutions of caustic soda, or of chloride of sodium. (Calvert.) Easily soluble in dilute acids. Its salts are generally more soluble in water, and alcohol, than those of quinine, but are insoluble, or very difficultly soluble, in ether.

"**CINCHOVATIN.**" } *Vid.* Aricin.
"**CINCHOVIN.**" }

CINEBENE. Insoluble in water. Readily soluble in alcohol, and ether. (Hirzel.)
$C_{20}H_{16}$

CINEPHANE. Soluble in chloroform. Insoluble in alcohol or ether. (Hirzel.)
$C_{20}H_8$

CINEPHENE. Insoluble in water. Sparingly soluble in cold alcohol. Easily soluble in hot alcohol, ether, and volatile oils. (Hirzel.)
$C_{20}H_{16}$, or $C_{40}H_{32}$

CINEPHONE. Insoluble in water, alcohol, or aqueous solutions of the caustic alkalies. Readily soluble in chloroform, ether, and wormseed-oil. (Hirzel.)
$C_{20}H_{12}$

CINHYDRAMID. *Vid.* CinnamylHydramid.

CINNAMIC ACID(Anhydrous). Insoluble in water. It is acidified by boiling with water. Sparingly soluble in boiling, but almost insoluble in cold alcohol. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** 303.)
(*Cinnamic Anhydride. Cinnamate of Cinnamyl. CinnamicCinnamate.*)

$C_{36}H_{14}O_6 = \left.\begin{matrix}C_{18}H_7O_2\\C_{18}H_7O_2\end{matrix}\right\}O_2$

CINNAMIC ACID. Very sparingly soluble in cold, easily soluble in boiling water. Less soluble than benzoic acid in water.
(*Cinnamylic Acid. Zimmtsæure.*)
$C_{18}H_8O_4 = C_{18}H_70_3,HO$

Readily soluble in alcohol, from which it is precipitated by water. (Dumas & Peligot.) Soluble in 4.3 pts. of absolute alcohol at 20°. (Mitscherlich.) Very easily soluble in ether. (Herzog.)

The alkaline cinnamates are readily soluble in water; those of the alkaline earths are sparingly soluble, while the rest are insoluble in water. Those cinnamates which are difficultly soluble in water dissolve more readily in water which contains nitrates or chlorides in solution.

CINNAMATE OF ALUMINA. Sparingly soluble in cold, easily soluble in hot water. (Herzog.)

CINNAMATE OF AMMONIA.

I.) *normal*. Permanent. Sparingly soluble in cold, easily soluble in hot water. On boiling the aqueous solution a less soluble acid salt is formed. (Herzog.)
$C_{18}H_7(NH_4)O_4 + Aq$

II.) *acid*. Less soluble in water than the normal salt.

CINNAMATE OF ANTIMONY & OF POTASH.

CINNAMATE OF BARYTA. Readily soluble in boiling, difficultly soluble in cold water. (Herzog.)
$C_{18}H_7BaO_4 + 2\ Aq$

CINNAMATE OF BISMUTH. Ppt.

CINNAMATE OF CADMIUM. Insoluble in water. Sparingly soluble in hot ordinary alcohol. (Schiff.)
$C_{18}H_7CdO_4 + 2\ Aq$

CINNAMATE OF COBALT. Rather difficultly soluble. Soluble in alcohol.

CINNAMATE OF COPPER. Sparingly soluble in cold water. Decomposed by boiling water, an acid and a basic salt being formed. (Herzog.)

CINNAMATE OF ETHYL. Permanent. Scarcely at all soluble in water. Readily soluble in ether and in alcohol; even in weak spirit. (Herzog.)
(*Cinnamic Ether.*)
$C_{18}H_7(C_4H_5)O_4$

CINNAMATE *of protoxide* OF IRON. Sparingly soluble in water.

CINNAMATE *of sesquioxide* OF IRON. Sparingly soluble in water. (Herzog.)

CINNAMATE OF GLUCINA. Sparingly soluble in cold, easily soluble in hot water. (Herzog.)

CINNAMATE OF LEAD. Very sparingly soluble in water. Insoluble in alcohol. (Herzog.)
$C_{18}H_7PbO_4$

CINNAMATE OF LIME. Sparingly soluble in cold, very soluble in boiling water.
$C_{18}H_7CaO_4 + 2\ Aq$
Less easily soluble in water than benzoate of lime. (E. Kopp.)

CINNAMATE OF MAGNESIA. Soluble in water, and alcohol.

CINNAMATE OF MANGANESE. Difficultly soluble in cold, slowly soluble in hot water. (Herzog.)

CINNAMATE *of dinoxide* OF MERCURY. Sparingly soluble in water. (Herzog.)

CINNAMATE *of protoxide* OF MERCURY. Ppt.

CINNAMATE OF METHYL. Insoluble, or but sparingly soluble, in water. (E. Kopp.)
$C_{18}H_7(C_2H_3)O_4$

CINNAMATE OF NICKEL. Insoluble in water. Easily soluble in alcohol. (Herzog.)

CINNAMATE OF POTASH.

I.) *normal*. Permanent. Easily soluble in hot water; more soluble in water than the acid salt. (Herzog.) Very soluble in water, though less soluble than the corresponding benzoate. (H. Deville.) Tolerably soluble in alcohol.
$C_{18}H_7KO_4 + Aq$

II.) *acid*. Very sparingly soluble in water.

CINNAMATE OF SILVER. Is the least soluble in water of any of the cinnamates. Insoluble in pure water, but soluble when in presence of small quantities of soluble salts. (Herzog.) Somewhat soluble in water. (Mulder.)
$C_{18}H_7AgO_4$

CINNAMATE OF SODA. Soluble in water.
$C_{18}H_7NaO_4 + Aq$

CINNAMATE OF STRONTIA. Soluble in hot, difficultly soluble in cold water. (Herzog.)

CINNAMATE OF STYRACYL (OR OF STYRACIN). Completely insoluble in cold water. Somewhat sparingly soluble in cold, but readily soluble in hot alcohol. Only sparingly soluble in alcohol of 33°, but tolerably easily soluble in alcohol of 40°. (Lepage.) Soluble in 21 [22?] pts. of cold alcohol of 0.825 sp. gr., and in 3 pts. of the same alcohol at the temperature of boiling. (Simon.) Only sparingly soluble in cold alcohol of 90° (Tr.); the hot saturated alcoholic solution deposits it on cooling. (Scharling.) The alcoholic solution becomes milky on the addition of water. (Lepage.) Styracin does not combine directly with acids, but is rendered more soluble by them; thus, the solution of 1 pt. of it in 8 pts. of boiling alcohol, which becomes turbid on cooling, clears up again immediately on the addition of sulphuric, glacial acetic, or cinnamic acids. (Simon.) Soluble in 3 pts. of ether. (Simon.) Soluble in a mixture of alcohol and ether. Insoluble in aqueous solutions of caustic potash, soda, or ammonia (Lepage); or of carbonate of potash.
(*Meta Cinnamein*(of Fremy). *Styracin. Cinnamyl-Styrol. Cinnamyl-Styrone.*)
$C_{36}H_{16}O_4 = C_{18}H_7(C_{18}H_9)O_4$

CINNAMATE *of binoxide* OF TIN. Insoluble in water.

CINNAMATE OF TOLUENYL. Scarcely at all soluble in water. Easily soluble in alcohol, even when this is cold, and in ether. Also soluble in bisulphide of carbon, and naphtha. It sometimes occurs in an amorphous modification, which is only soluble in boiling spirit.
(*Cinnamein. Balsam of Peru. MetaCinnamein*(of Scharling).)
$C_{32}H_{14}O_4 = C_{18}H_7(C_{14}H_7)O_4$

CINNAMATE *of sesquioxide* OF URANIUM. Sparingly soluble in boiling water.

CINNAMATE OF ZINC. Tolerably easily soluble in water. (Herzog.)

CINNAMENE. Insoluble in water. Easily soluble in alcohol, ether, essential oils, and bisulphide of carbon.
(*Cinnamomime. Cinnamol.*) ["Cinnamene is probably identical with Styrol." (Gmelin's *Handbook*, **13. 1.**)]

CitrAnilic Acid. *Vid.* PhenylCitramic Acid.

CitrAnilimid. *Vid.* PhenylCitrimid.

Citric Acid. Permanent. Deliquesces in moist air. 1 pt. of the 2 Aq. salt is soluble in 0.513 pt. of water at 15°. (Gerlach's determination, see his table of
$C_{12} H_8 O_{14} = C_{12} H_5 O_{11}, 3 H O \ \& + Aq \ \& \ 2 Aq$

sp. grs., below.) Soluble in 0.75 pt. of cold, and in 0.5 pt. of hot water (Vauquelin); in 1.143 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) The saturated cold solution, therefore, contains 57.14% of it, and the saturated boiling solution 66.66%; or 100 pts. of water at 15.5° dissolve 133 pts., and at 100°, 200 pts. of it. The aqueous solution gradually decomposes on standing. Citric acid exhibits a remarkable tendency to form supersaturated solutions, when its hot aqueous solution is cooled. (Gerlach, *loc. cit.*, p. 26, note.)

Percentage of Crystallized Citric Acid ($C_{12}H_5O_{11}$, 3 H O + 2 Aq) *in Aqueous Solutions, at* 15°.

(Richter.)

An aqueous solution containing 25% of crystallized citric acid boils at 101.8°; one of 50% boils at 105 8°. (Gerlach's *Sp. Gew. der Salzlœsungen*, p. 111.)

Soluble in 1.15 pts. of alcohol, of 80% at 15°; or 100 pts. of alcohol of 80% dissolve 87 pts. of it at 15°; or, the solution in alcohol of 80%, saturated at 15° contains 46.5% of it, and is of 1.059

sp. gr. (H. Schiff, *Ann. Ch. u. Pharm.*, 1860, **113.** 191.) Readily soluble in alcohol, more in hot than in cold, but not so readily as in water. Readily and abundantly soluble in ether. (Wackenroder.) Insoluble in ether. (Berzelius's *Lehrb.*, **4.** 136.) Melts at 150°, and is then soluble in anhydrous ether, from which solution crystals separate after the lapse of several hours, but these crystals are completely insoluble in ether, being unaltered citric acid. (Robiquet.) Soluble in wood-spirit. (St. Evre.) Abundantly soluble in boiling creosote, the solution solidifying on cooling. (Reichenbach.) Soluble in glycerin. Insoluble in caoutchin, but is decomposed when boiled with it. (Himly.)

The normal (terbasic) citrates of the alkalies, and some others, are soluble in water; these solutions are liable to change on keeping. Many of the citrates insoluble in water are soluble in aqueous solutions of the alkaline citrates.

CITRATE OF ALUMINA.

I.) *di*, or *tri?* Insoluble in water.

II.) *mono.* Very soluble in water. (Richter.)

CITRATE OF AMMONIA.

I.) *tri.* Very soluble in water. Soluble in boiling, less soluble in cold alcohol. (Heldt.)

$C_{12}H_5(NH_4)_3O_{14}$

II.) *di.* Deliquescent. Easily soluble in water. Soluble in boiling, less soluble in cold alcohol.

$C_{12}H_6(NH_4)_2O_{14}$

III.) *mono.* Soluble in water.

$C_{12}H_7(NH_4)O_{14}$

IV.) Compound of Nos. II. & III.

$$\left.\begin{matrix} C_{12}H_7(NH_4)O_{14} \\ C_{12}H_6(NH_4)_2O_{14} \end{matrix}\right\}$$

CITRATE OF AMMONIA & *of sesquioxide* OF IRON. Hygroscopic. Easily soluble in water. Nearly insoluble in alcohol. (Haidlen.) Insoluble in strong alcohol; but tolerably soluble in 40% alcohol. (Wittstein.)

$$C_{72}H_{68}N_5Fe_8O_{101} = \left.\begin{matrix} C_{12}H_5O_8''' \\ (NH_4)_3 \end{matrix}\right\}O_6\,;$$

$$\left.\begin{matrix} C_{12}H_5O_8''' \\ H\,.\,(NH_4)_2 \end{matrix}\right\}O_6\,;\left.\begin{matrix} (C_{12}H_5O_8''')_4 \\ (Fe_2''')_4 \end{matrix}\right\}O_{24} + 17\,Aq$$

CITRATE OF AMMONIA & OF LEAD. Soluble in water. (Berzelius.)

CITRATE OF AMMONIA & *of dinoxide* OF MERCURY. Insoluble in water. Soluble in acetic acid. (Harff.)

CITRATE OF AMMONIA & *of protoxide* OF MERCURY.

I.) *normal.* Deliquescent. Soluble in water, with separation of a portion of basic salt. Soluble in nitric acid. (Burckhardt.)

II.) *basic.* Insoluble in water. Readily soluble in chlorhydric and nitric acids, in ammonia-water, and in aqueous solutions of nitrate of ammonia, and citrate of ammonia. (Burckhardt.)

CITRATE OF AMMONIA & OF POTASH. Very deliquescent.

$C_{12}H_5K_3O_{14}, C_{12}H_6(NH_4)_2O_{14}$

CITRATE OF AMMONIA & OF SODA.

CITRATE OF AMMONIUMCHLORPLATIN(*ous*)-AMMONIUM. (*Gros's Citrate.*) Somewhat soluble in water. (Gros, *Ann. der Pharm.*, 1838, **27.** 256.)

CITRATE OF AMYL. *Vid.* AmylCitric Acid.

CITRATE OF ANILIN.

I.) *acid.* Easily soluble in alcohol, and still more readily in water. (Pebal.)

$C_{12}H_7\left(N\left\{C_{12}H_7\,.\,H\right)O_{14}\right.$

CITRATE OF ANTIMONY & OF POTASH. Soluble in water. (Thaulow.)

$C_{12}H_5K_3O_{14}, C_{12}H_5Sb'''O_{14} + 5\,Aq$

CITRATE OF ANTIMONY & OF SILVER. Insoluble in water.

$C_{12}H_3Ag_2Sb'''O_{14} + 2\,Aq$

CITRATE OF ARGENTAMMONIUM & OF SILVER.

$C_{12}H_5\left(N\left\{\begin{matrix} H_3 \\ Ag \end{matrix}\right.\right)Ag_2O_{14} + 3\,Aq$

CITRATE OF BARYTA.

I.) *tri.* When precipitated in the cold, it dissolves in water; but when it has been precipitated from a hot solution, it is nearly or quite insoluble in water. (Liebig.) Very sparingly soluble in water; readily soluble in citric acid. (Scheele.) Easily soluble in dilute acids.

$C_{12}H_5Ba_3O_4 + 7\,Aq$

Soluble in a cold solution of citrate of soda. (Heldt, Spiller.)

II.) $\frac{5}{2}$ *basic.* Insoluble in alcohol.

$C_{12}H_5Ba_3O_4, C_{12}H_6Ba_2O_{14} + 7\,Aq$

III.) *mono?* Readily soluble in water. Soluble in ammonia-water.

CITRATE OF CADMIUM. Nearly insoluble in water. (Stromeyer.)

CITRATE OF CAFFEIN. Soluble in water. (Audry.) Does not exist. (Geuther.)

CITRATE OF CERIUM. Insoluble in water. Soluble in citric acid. (Berzelius.)

CITRATE *of protoxide* OF CHROMIUM. Slowly soluble in cold, more quickly soluble in a hot aqueous solution of normal citrate of soda. (Moberg.)

CITRATE *of sesquioxide* OF CHROMIUM. Soluble in water. (Brandenburg.)

CITRATE OF CHROMIUM & OF POTASH.

$C_{12}H_5KCr_2O_{14} + 4\,Aq$

CITRATE OF CINCHONIDIN (of Pasteur). Difficultly soluble in water. (Leers, *Ann. Ch. u. Pharm.*, **82.** 160.)

CITRATE OF COBALT.

I.) *tri.* Readily soluble in water. Insoluble in alcohol. (Heldt.)

$C_{12}H_5Co_3O_{14} + 14\,Aq$

II.) *di.* Soluble in water. (Heldt.)

III.) *mono.* Soluble in water. (Heldt.)

CITRATE OF COBALT & OF SODA. Soluble in water.

CITRATE OF COPPER.

I.) *basic.* Soluble in ammonia-water, from which it is precipitated by alcohol. (Heldt.)

$C_{12}H_5Cu_3O_{14}, CuO, HO + 3\,Aq$

CITRATE OF ETHYL.

I.) *tri.* Sparingly soluble in water; the aqueous solution gradually decomposes on standing, — more quickly if heated. Readily soluble in alcohol, even in dilute, and in ether. Soluble in cold concentrated sulphuric acid and in concentrated chlorhydric acid, from both of which solutions it is precipitated unchanged on the addition of water. It is also soluble in nitric acid, but water does not cause it to separate from this solution. (Malaguti.)

$C_{12}H_5(C_4H_5)_3O_{14}$

CITRATE OF GLUCINA. Soluble in water. (Vauquelin.)

CITRATE OF GLYCERYL.

I.) *normal.* Insoluble in water, alcohol, or ether. A small quantity of it dissolves after long-continued boiling with water. Slowly soluble in warm concentrated chlorhydric acid. Immediately solu-

$C_{18}H_{10}O_{14} = C_{12}H_5(C_6H_5''')O_{14}$
(*Citrin. Citromonoglycerin.*)

ble, with decomposition, in concentrated sulphuric acid. Gradually soluble in a cold aqueous solution of caustic potash. (v. Bemmelen.)

II.) *basic.* Resembles the normal salt.
$C_{24}H_{18}O_{20} = C_{12}H_5(C_6H_5''')O_{14}$; $C_6H_5O_3, 3\,HO$
(*Citro bi Glycerin.*)

Citrate *of protoxide* of Iron. Deliquescent. Soluble in water. (Béral.) Abundantly, but very slowly, soluble in water. (W. Procter, in *Mohr, Redwood & Procter's Pract. Pharm.*, p. 468.) Alcohol precipitates it from the aqueous solution. (Heldt.) Soluble in an aqueous solution of sugar. (Parrish's *Pharm.*, p. 516.)

Citrate *of sesquioxide* of Iron.

I.) *normal.* Tolerably permanent. Very readily soluble in hot water, and is retained in solution when the liquor has become cold, but is only sparingly soluble in cold water when treated therewith directly. (Mohr, Redwood & Procter's *Pharmacy*, p. 242.) Slightly soluble in cold, readily soluble in boiling water. It is more readily soluble in water when freshly prepared than when old, being in the latter case only slowly and imperfectly soluble. (Parrish's *Pharm.*, pp. 514, 515.) Easily soluble in water. (Vauquelin.) Alcohol precipitates it from the aqueous solution. (Heldt.) Insoluble in alcohol of 90%; but is sparingly soluble in alcohol of from 20 @ 40%. (Wittstein.) Soluble in aqueous solutions of the alkaline citrates. (H. Rose.)
$C_{12}H_5Fe_2'''O_{14} + 3\,Aq$

II.) *basic.* Almost completely soluble in water. (Wittstein.)
$6\,Fe_2O_3$; $5\,C_{12}H_5O_{11} + 16\,Aq$,
i. e. $5\,(C_{12}H_5Fe_2'''O_{14})$; $Fe_2O_3 + 16\,Aq$

Citrate *of protoxide & of sesquioxide* of Iron.
$2\,C_{12}H_5Fe_3O_{14}$; $3\,C_{12}H_5Fe_2'''O_{14}$; $C_{12}H_6O_{14} + 15\,Aq.$

Citrate *of sesquioxide* of Iron & of Magnesia. Soluble in water. (Parrish's *Pharm.*, p. 516.)

Citrate of Iron(Fe_2O_3)& of Quinine. Soluble in water. (Squibb, *Parrish's Pharm.*, p. 402.)
[Of variable composition]

Citrate of Iron(Fe_2O_3)& of Soda. Deliquescent. Soluble in water. (Heldt.)

Citrate of Iron(Fe_2O_3)& of Strychnine. Soluble in water. (Parrish's *Pharm.*, p. 515.)

Citrate of Iron(Fe_2O_3)& of Zinc. Very soluble in water. (Parrish's *Pharm.*, p. 515.)

Citrate of Lead.

I.) *tri.* Insoluble in alcohol. (Berzelius.) Very soluble in an aqueous solution of citrate of ammonia; also soluble in a solution of tri-citrate of soda and in hot solutions of chloride of ammonium, nitrate of ammonia, and succinate of ammonia; incompletely soluble in a solution of carbonate of ammonia. (Wittstein.) Readily soluble in nitric acid and in ammonia-water. (Berzelius.) Soluble in nitric acid. (Persoz, *Chim. Moléc.*, p. 354 *note.*)
$C_{12}H_5Pb_3O_{14}$

II.) *di.* Soluble in water. (Heldt.) Decomposed by water. (Berzelius.) Soluble in ammonia-water. (Berzelius.)
$C_{12}H_6Pb_2O_{14} + 2\,Aq$

III.) $\frac{5}{2}$ *basic.* Insoluble in water. (Heldt.)
$C_{12}H_5Pb_3O_{14}, C_{12}H_6Pb_2O_{14} + Aq$

IV.) *tetra.*
$C_{12}H_5Pb_3O_{14}, PbO, HO$

V.) *penta.* Insoluble in water. (Heldt.)
$C_{12}H_5Pb_3O_{14}, 2\,PbO + 3\,Aq$

VI.) *hexa.* Insoluble in water. (Heldt.)
$C_{12}H_5Pb_3O_{14}, 3\,PbO + Aq$

Citrate of Lead & of Soda.

Citrate of Lime.

I.) *tri.* Less soluble in *boiling* than in *cold* water; the aqueous solution being precipitated on boiling, — the precipitate dissolves, for the most part, when the solution becomes cold. (Heldt.) When prepared by precipitation from cold solutions it is soluble in cold water, but when prepared by precipitation from hot solutions it is insoluble or nearly insoluble. (Liebig.) Soluble in cold aqueous solutions of chloride of calcium and of tri-citrate of soda. (Berzelius.) Easily soluble in acetic acid, and in the mineral acids, from which it is not precipitated on the addition of ammonia; it is precipitated, however, from these solutions on boiling them. Easily soluble in warm citric acid.
$C_{12}H_5Ca_3O_{14} + Aq$ & $4\,Aq$

Citrate of lime is only sparingly precipitated when a neutral aqueous solution of hyposulphite of lime is mixed with citrate of alumina, a portion of each of these salts remaining undecomposed in the solution. (Herschel, *Edin. Phil. Journ.*, 1819, 1. 22.)

II.) *di.* Partially decomposed by water. Soluble in citric acid. Insoluble in spirit.
$C_{12}H_6Ca_2O_{14} + 2\,Aq$

III.) *mono.* Soluble in citric acid.

Citrate of Lime & of Methyl. *Vid.* MethylCitrate of Lime.

Citrate of Lime & of Silver. Insoluble, or very sparingly soluble in water. (Chodnew.)
$C_{12}H_5Ag_2CaO_{14}, CaO$

Citrate of Lime & of Soda. Soluble in water, from which it is not precipitated by boiling the solution. (Spiller.)

Citrate of Lithia. Soluble in water.
$C_{12}H_5Li_3O_{14}$

Citrate of Magnesia.

I.) *tri.* Soluble in water, from which alcohol precipitates it.
$C_{12}H_5Mg_3O_{14} + 14\,Aq$

When citric acid is saturated with carbonate of magnesia, and the solution evaporated to a paste, it solidifies on cooling to a sort of glass, which is still very easily soluble in water. But this soon loses a portion of its water and becomes porcelaneous, and is now difficultly soluble in water. This sparingly soluble modification has the composition $C_{12}H_5Mg_3O_{14} + 11\,Aq.$, and requires 75 pts. of cold water and 28 pts. of boiling water for its solution. When heated to 100°, this salt loses 3 equivs. of water, and after this requires 92 pts. of water to dissolve it. (Wittstein.)

II.) *di.*

Citrate of Manganese.

I.) *di.* Insoluble in water. Sparingly soluble in acetic acid, and readily soluble in chlorhydric acid. (Heldt.) Soluble in an aqueous solution of dicitrate of soda.
$C_{12}H_6Mn_2O_{14} + 2\,Aq$

Citrate of Manganese & of Soda.

Citrate *of dinoxide* of Mercury. Insoluble in water; decomposed by boiling water, a subsalt being formed. Soluble in citric and acetic acids; also soluble in concentrated sulphuric acid. (Burckhardt.) Readily soluble in nitric acid. (Scheele.)

Citrate *of protoxide* of Mercury. Sparingly soluble in boiling water.

Decomposed by water. Soluble in 1300 pts. of alcohol, and in 1000 pts. of ether. Soluble in a warm aqueous solution of citrate of ammonia. Easily soluble in nitric, acetic, and citric acids;

also soluble in a warm aqueous solution of citrate of soda. (Burckhardt.)

Citrate of Methyl.
I.) *normal.*
$C_{18} H_{14} O_{14} = C_{12} H_5 (C_2 H_3)_3 O_{14}$
II.) *di.* *Vid.* *di*MethylCitric Acid.
$C_{12} H_6 (C_2 H_3)_2 O_{14}$
III.) *mono.* *Vid.* MethylCitric Acid.
$C_{12} H_7 (C_2 H_3) O_{14}$

Citrate of Nickel.
I.) *tri.* Soluble in water, from which alcohol
$C_{12} H_5 Ni_3 O_{14} + 14 Aq$ precipitates it. (Heldt.)
II.) *di.* Soluble in water. (Heldt.)
III.) *mono.* Soluble in water. (Heldt.)

Citrate of Palladium. Ppt.

Citrate of Potash.
I.) *tri.* Very deliquescent. Soluble in water.
[*Ordinary Citrate of the apothecaries.*] (Heldt.) Solu-
$C_{12} H_5 K_3 O_{14} + 2 Aq$ ble in 2 pts. of water. (Parrish's *Pharm.*, p. 449.) Insoluble in absolute, but soluble in hydrated alcohol. (Heldt.)
II.) *di.* Soluble in water. Insoluble in absolute,
$C_{12} H_6 K_2 O_{14}$ soluble in hydrated alcohol. (Heldt.)
III.) *mono.* Permanent. Soluble in water.
$C_{12} H_7 K O_{14} + 4 Aq$ Sparingly soluble in boiling, less soluble in cold alcohol. (Heldt.) Melts in its water of crystallization at 100°.

Citrate of Potash & of Soda. Permanent.
$\left.\begin{matrix} C_{12} H_5 Na_3 O_{14} \\ C_{12} H_5 K_3 O_{14} \end{matrix}\right\} + 11 Aq$ Soluble in water.

Citrate of Quinine. Soluble in 820 pts. of
$C_{12} H_6 \left(N_2 \left\{ C_{40} H_{24} O_4^{vi} . H \right)_2 O_{14} + 10 Aq\right.$ cold, and 30 pts. of boiling water; in 44 pts. of cold, and 3 pts. of boiling alcohol of 0.833. (Wittstein.)

Citrate *of dinoxide* of Silver. Slowly solu-
$C_{12} H_5 Ag_6 O_{14} + Aq$ ble in water. (Wœhler.)

Citrate *of protoxide* of Silver.
I.) *tri.* Somewhat soluble in boiling, nearly
$C_{12} H_5 Ag_3 O_{14} + Aq$ insoluble in cold water. (Liebig.) Soluble in ammonia-water.
It is not precipitated from solutions which contain citrate of soda. (Spiller.)

Citrate of Soda.
I.) *tri.* Very slowly soluble in water. The
$C_{12} H_5 Na_3 O_{14} + 4 Aq \;\&\; 11 Aq$ crystals containing 11 equivalents of water are soluble in 1.75 pts. of water. (Vauquelin.) Sparingly soluble in alcohol. (Heldt.)
II.) *di.* Permanent. Soluble in water, and in
$C_{12} H_6 Na_2 O_{14} + 2 Aq$ boiling alcohol. (Berzelius.)
III.) *mono.* Difficultly soluble in water. Slight-
$C_{12} H_7 Na O_{14} + 2 Aq$ ly soluble in boiling alcohol.

Citrate of Soda & of Yttria. Readily soluble in water. (Berzelius.)

Citrate of Soda & of Zinc. Permanent.

Citrate of Soda with Tartrate of Soda. Soluble in water.

Citrate of Solanin. Soluble in water.

Citrate of Strontia.
I.) *tri.* Sparingly soluble in water. Soluble
$C_{12} H_5 Sr_3 O_{14} + 5 Aq$ in warm citric acid. Partially soluble in acetic acid. Easily soluble in dilute mineral acids.
II.) *di.* Permanent. Soluble in citric acid.
$C_{12} H_6 Sr_2 O_{14} + 2 Aq$ Insoluble in alcohol. (Heldt.)

Citrate *of binoxide* of Tellurium. Easily soluble in water. (Berzelius.)

Citrate of Thoria.
I.) *tri.* Insoluble in water. Readily soluble in alcohol. Soluble in ammonia-water; the residue left on evaporating this solution is soluble in water. (Berzelius.)
II.) *acid.* Soluble in water, and in ammonia-water.

Citrate of Titanium($Ti O_2$). Soluble in water.

Citrate *of sesquioxide* of Uranium. Slightly soluble in water. (Richter.)

Citrate of Urea.
$C_2 H_4 N_2 O_2, 2 H O, C_{12} H_5 O_{11}$

Citrate of Vanadium. Slowly soluble in cold water. Soluble in ammonia-water. (Berzelius.)

Citrate of Yttria.
I.) *tri.* Soluble in ammonia-water; the residue left on evaporating this solution is soluble in water. Soluble in aqueous solutions of the yttrium salts; also in a solution of citrate of soda, and in citric acid. (Berlin.)

Citrate of Zinc.
I.) *tri.* Soluble in 100 pts. of cold water, and
$C_{12} H_5 Zn_3 O_{14} + 2 Aq$ in less hot water. (Vauquelin.) Soluble in an aqueous solution of tri-citrate of potash.
II.) $\frac{5}{2}$ *basic.* Soluble in an aqueous solution of
$C_{12} H_5 Zn_3 O_{14}, C_{12} H_6 Zn_2 O_{14} + 2 Aq$ di-citrate of soda.

Citrate of Zirconia. Soluble in water. (Berzelius.)

Citrene. Insoluble in water. Warm alcohol
(*Citronyl.*) dissolves traces of it, which separate out
$C_{20} H_{16}$ as a jelly when the solution becomes cold. Somewhat soluble in acidulated water. Soluble in ether, and in essential and fatty oils.

Citribic Acid(of Baup). *Vid.* Citraconic Acid.

Citricic Acid. *Vid.* Itaconic Acid.

Citridic Acid. *Vid.* Aconitic Acid.

Citrilene.
(*Citryl*) (of Blanchet & Sell).

Citrimid.
$C_{12} H_8 N_2 O_8$

Citro*bi*amic Acid.
$C_{12} H_{10} N_2 O_{10}$

Citrin. *Vid.* Citrate of Glyceryl.

Citro*bi*Anil. *Vid.* PhenylCitrimid.

Citro*bi*Anilic Acid. *Vid.* PhenylCitrobiamic Acid.

CitroGlycerin. *Vid.* Citrate of Glyceryl.

*Mono*CitroMannitan. Insoluble in cold wa-
$C_{24} H_{14} O_{18}$ ter, alcohol, or ether. Decomposed by long-continued boiling with water or alcohol, and by alkaline solutions. (v. Bemmelen.)

*Bi*CitroMannitan. Dissolves in water only
$C_{36} H_{20} O_{30}$ after long-continued boiling. Easily decomposed by alkaline solutions.

Citro*bi*Methylic Acid. *Vid.* *di*MethylCitric Acid.

Citronyl. *Vid.* Citrene.

"Citryl"(of Blanchet & Sell). *Vid.* Citrilene.

Citryl. Not isolated.
$C_{12} H_5 O_8'''$

Clematidin(from the root of *Aristolochia Cle-*

$C_9 H_5 O_6$ *matitis.*) Soluble in 200 pts. of cold, and in 50 pts. of boiling water. Easily soluble in alcohol. Insoluble in ether. More soluble in saline solutions than in pure water. (Walz.)

Cnicin. Scarcely at all soluble in cold, much (*Centaurin.*) more soluble in boiling water. Easily $C_{40} H_{26} O_{14}$ soluble in alcohol, and wood-spirit. Almost insoluble in ether.

Cobalt. Permanent. Unacted upon by water. Co Slowly dissolved by chlorhydric acid; more readily if it be in powder, and in proportion as the acid is more concentrated and hotter. Slowly soluble in warm dilute sulphuric acid. Also soluble in concentrated sulphuric acid. Quickly soluble in nitric acid.

Cobaltic Acid.

Cobaltate of Potash. Insoluble in water. $K O, 3 Co_3 O_5 + 2 Aq$ & $3 Aq$ Easily soluble in concentrated acids. Unacted upon by dilute chlorhydric acid. (Schwarzenberg, *Ann. Ch. u. Pharm.*, **97.** 214.)

CobaltiCyanhydric Acid. Deliquescent. $C_6 H_3 N_3, C_6 N_3 Co_2 = 3 H Cy, Co_2 Cy_5 + Aq$ Very easily soluble in water, the solution suffering scarcely any decomposition when boiled. Soluble in alcohol. Insoluble in ether. Soluble in chlorhydric acid, without being decomposed, even on boiling. Scarcely at all soluble in strong, more soluble in weak nitric acid. Decomposed by strong boiling nitric acid or aqua-regia. Insoluble in concentrated, somewhat soluble in dilute sulphuric acid.

Cobalticyanide of Ammonium. Very soluble in $3 N H_4, C_{12} H_6 Co_2 + Aq = 3 N H_4 Cy, Co_2 Cy_3$ water. Sparingly soluble in alcohol.

Cobalticyanide of Barium. Effloresces in $3 Ba Cy, Co_2 Cy_3$ warm air. Very readily soluble in water. Insoluble in alcohol. (Zwenger.)

Cobalticyanide of Cadmium. Ppt. Soluble in an aqueous solution of cobalticyanide of potassium, and in acids. (Rammelsberg.)

Cobalticyanide of Cobalt. Insoluble in $3 Co Cy, Co_2 Cy_3 + 12 Aq$ water and in acids. Partially soluble in ammonia-water.

Cobalticyanide of Copper. Insoluble in $3 Cu Cy, Co_2 Cy_3 + 7 Aq$ water, and in acids. Soluble in ammonia-water. (Zwenger.)

Cobalticyanide of Iron. Ppt.
$3 Fe Cy, Co_2 Cy_3$

Cobalticyanide of Lead. Very readily sol- $3 Pb Cy, Co_2 Cy_3 + 4 Aq$ uble in water. Insoluble in alcohol. (Zwenger.)

Cobalticyanide of LuteoCobalt. Insolu- $6 N H_3 . Co_2 Cy_3, Co_2 Cy_3 + Aq$ ble in cold, readily decomposed by boiling water. (Gibbs & Genth, *Smithson. Contrib.*, Vol. **9.**)

Cobalticyanide of Manganese & of Zinc. Ppt.

Cobalticyanide of Mercury(Hg_2). Ppt.

Cobalticyanide of Nickel. Insoluble in $C_6 N_3 Ni_3, C_6 N_3 Co_2 = 3 Ni Cy, Co_2 Cy_3$ water and in acids. Soluble in ammonia-water. Decomposed by a solution of caustic potash. (Zwenger.) Unacted upon by boiling chlorhydric acid.

Cobalticyanide of Potassium. Sparingly $C_6 N_3 K_3, C_6 N_3 Co_2 = 3 K Cy, Co_2 Cy_3$ soluble in water. From the concentrated aqueous solution cobalticyanhydric acid is precipitated on the addition of an excess of sulphuric or nitric acid. Insoluble in alcohol.

Cobalticyanide of RoseoCobalt. Insol- $5 N H_3 . Co_2 Cy_3, Co_2 Cy_3 + 3 Aq$ uble in cold, readily decomposed by hot water. (Gibbs & Genth, *Smithson. Contrib.*, Vol. **9.**)

Cobalticyanide of Silver. Insoluble in $3 Ag Cy, Co_2 Cy_3$ water and in acids. Easily soluble in ammonia-water. (Zwenger.)

Cobalticyanide of Sodium. Very soluble $C_6 N_3 Na_3, C_6 N_3 Co_2 = 3 Na Cy, Co_2 Cy_3$ in boiling water. Insoluble in alcohol. (Zwenger.)

Cobalticyanide *of protoxide* of Tin. Ppt.

*Di*Cobaltinamin. *Vid.* LuteoCobalt.

Cobaltous Acid. *Vid. sesqui*Oxide of Co- $Co_2 O_3$ balt.

Cobaltite of Cobalt. *Vid.* Oxide of Co- $(Co\ O)x, Co_2 O_3$ balt.

Cobaltite of Magnesia. Insoluble in water, ammonia-water, or a solution of carbonate of ammonia. Easily soluble in an aqueous solution of chloride of ammonium, from which it may be precipitated again by caustic potash. (Berzêlius.)

Cobaltite of Soda. Soluble in an aqueous solution of caustic soda, but a precipitate is formed when this solution is diluted with water.

Coccinonic Acid.

Coccinonate of Ammonia. Soluble in an aqueous solution of carbonate of ammonia.

Coccinonate of Potash. Sparingly soluble in water. Insoluble in an aqueous solution of carbonate of ammonia.

Coccognic Acid(from *Daphne Gnidium*). Soluble in water, and alcohol. (Gœbel.)

Cocculin. *Vid.* Picrotoxin.

Cochineal(coloring matter of). *Vid.* Carminic Acid.

Cocinic Acid. Insoluble in water. Easily (*CacoStearic Acid.*) soluble in alcohol of 36°, and in $C_{26} H_{26} O_4$ ether. (Saint-Evre, *Ann. Ch. et Phys.*, (3.) **21.** 444.) The normal alkaline cocinates are soluble, the other cocinates, even the acid salts of the alkalies, are insoluble in water. The normal and acid salts of the alkalies are soluble in alcohol.

Cocinate of Baryta. Soluble in boiling $C_{26} H_{25} Ba O_4$ alcohol.

Cocinate of Ethyl. Insoluble in water.
$C_{26} H_{25} (C_4 H_5) O_4$

Cocinate of Glycerin. *Vid.* Cocinin.

Cocinate of Lead. Insoluble in alcohol or ether.

Cocinate of Lime.

Cocinate of Silver. Sparingly soluble in $C_{26} H_{25} Ag O_4$ alcohol. Soluble in ether.

Cocinate of Soda. Soluble in absolute al- $C_{26} H_{25} Na O_4$ cohol. (Saint-Evre, *Ann. Ch. et Phys.*, (3.) **20.** 98, & **21.** 446.)

Cocin. *Vid.* Cocinin.
(*Stearoptene of Cocoa-nut oil.*)

Cocinin. Insoluble in water. Very sparingly

(*Coco Stearin. Cocinate of Glycerin.*) $C_{84}H_{80}O_{12} = C_{78}H_{75}(C_6H_5''')O_{12}$ soluble in cold spirit of 75%; but much more soluble in boiling than in cold. 100 pts. of absolute alcohol dissolve 2.4 pts. of it at 20°, and 8 pts. at 44°. Readily soluble in anhydrous ether; but in ordinary ether only 80 pts. of it dissolve at 18°.

Cocinone. Soluble in absolute alcohol. Readily soluble in ether.
$C_{50}H_{50}O_2$

Codein. Soluble in 100 pts. of cold, and in 50 pts. of hot water. (Wittstein's *Handw.*)
$C_{36}H_{21}NO_6 + 2\,Aq = N\left\{\begin{matrix}C_{36}H_{20}O_6''\\H\end{matrix}\right. + 2\,Aq$

100 pts of water at
15° dissolve 1.26 pts. of it.
43° " 3.7 "
boiling " 5.9 "

It is much more soluble than morphin.

Soluble in 80 pts. of cold, and 87 pts. of boiling water; the saturated cold solution containing 1.25% of it, and the saturated boiling solution 5.5%. (Mohr, Redwood, & Procter's *Pharmacy.*) Readily soluble in alcohol and in ordinary ether; much less soluble in anhydrous ether. It is soluble in ammonia-water, but no more so than in pure water. Very sparingly soluble in a concentrated solution of caustic potash. Soluble, without change, in concentrated sulphuric acid. Easily soluble, with combination, in acids.

II.) "*amorphous*" or "*modified*" [*by sulphuric acid*] *codein.* Insoluble in water. Easily soluble in alcohol, from which it is precipitated by ether. Easily soluble in acids, forming amorphous salts.

Colchicein. Permanent. Almost insoluble in cold, somewhat more soluble in boiling water. Soluble in alcohol, ether, wood-spirit, and chloroform. Soluble in acetic acid, and in concentrated nitric, chlorhydric, and sulphuric acids; also soluble in aqueous solutions of caustic potash and ammonia. (Oberlin, *Ann. Ch. et Phys.*, (3.) **50.** 111.)
$C_{35}H_{22}NO_{11}$

Colchicin. Hygroscopic. Very soluble in water, alcohol, and ether. (Oberlin, *Ann. Ch. et Phys.*, (3.) **50.** 110) Easily soluble in water, and alcohol; less soluble in absolute ether. Soluble in concentrated sulphuric acid. (Parrish's *Pharm.*, p. 414.) Easily soluble in chloroform. Its salts are mostly permanent, and easily soluble in water, and alcohol. (Oberlin.)

Colletiin (from *Colletia spinosa*). Insoluble in cold, difficultly soluble in boiling water. Easily soluble in alcohol. Insoluble in ether. (Reuss.)

Collidin. Insoluble in water; but itself dissolves a small quantity of water. Readily soluble in alcohol, ether, and the fatty and essential oils. Readily soluble, with combination, in dilute acids.
$N\left\{C_{16}H_{11}''\right.$

Its salts are generally deliqucscent and soluble in water, and alcohol, but insoluble in ether. (Anderson.)

Colocynthein. Insoluble in water. Soluble in absolute ether. (Walz.)
$C_{42}H_{32}O_{13}$

Colocynthin. Soluble in water. alcohol, and ether. Soluble in alkaline solutions and dilute acids.
$C_{56}H_{42}O_{23}$

Colocynthinin. Insoluble in water and in cold alcohol. Soluble in hot alcohol and in ether. (Parrish's *Pharm.*, p. 422.)

Colophene(from Camphor). Insoluble in water, or in weak alcohol. Soluble in strong alcohol, in ether, oil of turpentine, rock-oil, and camphin. (Claus.)

Colophene(of Deville).
$C_{40}H_{32}$

Colophilene.
$C_{40}H_{32}$

Colopholic Acid(of Unverdorben). (The least soluble in alcohol of the resins which compose colophany or rosin.) Only slightly soluble in alcohol of 67%, more easily soluble in presence of pinic acid.

Coloring Matters. Many of them are soluble in alcohol acidulated with sulphuric acid (Heller); in creosote (Reichenbach); in benzin, and in concentrated acetic acid.

In general those coloring matters which are soluble in water are less soluble in solutions of chloride of sodium and of salts generally. (Robinet, cited in *Schweigger's Journ. für Ch. u. Phys.*, 1825, **45.** 240.)

Columbic Acid. Almost insoluble in water. Readily soluble in alcohol. Sparingly soluble in cold ether; more readily soluble in acetic acid. Soluble, without alteration in concentrated sulphuric acid, and is not altered by cold nitric acid.
(*Colombic Acid.*) $C_{42}H_{23}O_{13}$

Columbate of Copper. Appears to be soluble in alcohol.

Columbate of Lead. Ppt., in alcohol.

Columbate of Lime.

Columbate of Potash. Soluble in water.

Columbin. Sparingly soluble in cold water, alcohol, ether, or essential oils; and still more sparingly soluble in a solution of potash. Soluble in 30 @ 40 pts. of boiling alcohol of 0.835 sp. gr. Soluble in 40 or 50 pts. of acetic acid of 1.04 sp. gr. Soluble in concentrated sulphuric acid, in which solution the addition of water occasions a precipitate.
(*Colombin.*) $C_{42}H_{22}O_{14}$

Comenamic Acid. Effloresces in dry air. Very sparingly soluble in cold water. Soluble in boiling spirit, but scarcely at all soluble in absolute alcohol. Readily soluble in chlorhydric and other strong mineral acids; also in alkaline solutions. (How.)
$C_{12}H_5NO_8 + 4\,Aq = N\left\{\begin{matrix}C_{12}H_2O_6''\\H_3\end{matrix}\right. .\,O_2 + 4\,Aq$

Comenamate of Ammonia. Soluble in boiling, nearly insoluble in cold water; more soluble in ammonia-water.
$C_{12}H_4(NH_4)NO_8$

Comenamate of Baryta.

I.) *mono.* Sparingly soluble in cold, more soluble in boiling water.
$C_{12}H_4BaNO_8 + 2\,Aq$

II.) *di.* Insoluble in boiling water. (How.)
$C_{12}H_3Ba_2NO_8 + 2\,Aq$

Comenamate of Copper. Ppt.

Comenamate of Ethyl. Sparingly soluble in cold, readily soluble in hot water, and mineral acids. Sparingly soluble in absolute alcohol. (How.)
$C_{12}H_4(C_4H_5)NO_8$

Comenamate of Lead. Insoluble in water.

Comenamate of Lime.

I.) *mono.*

II.) *di.*

Comenamate of Potash.

Comenamate of Silver. Partially decomposed by boiling water. (How.)

Comenamate of Soda.

Comenic Acid. Permanent. Soluble in something more than 16 pts. of boiling water; much less soluble in cold water. (Robiquet.) Sparingly soluble in hydrated, insoluble in absolute, alcohol. (How.) Decomposed by dilute nitric acid. The salts of comenic acid are difficultly soluble, or insoluble, in water.

(*Komenic Acid. Parameconic Acid. Metameconic Acid. Anhydrous Meconic Acid.*)
$C_{12}H_4O_{10} = C_{12}H_2O_8, 2\,HO$

Comenate of Ammonia.

I.) *normal.*

II.) *mono.* Easily soluble in boiling water; much less soluble than the soda salt in cold water. More soluble in water than meconic acid. Sparingly soluble in alcohol. (How.)
$C_{12}H_3(NH_4)O_{10} + 3\,Aq$

Comenate of Baryta.

I.) *normal.* Insoluble in boiling water, by which, however, it is partially converted into a sub-salt. (How.)
$C_{12}H_2Ba_2O_{10} + 10\,Aq$

II.) *mono.* Readily soluble in boiling water.
$C_{12}H_3BaO_{10} + 6\,Aq$

Comenate of Copper.

I.) *normal.* Insoluble in water.
$C_{12}H_2Cu_2O_{10} + 2\,Aq$

Comenate of Ethyl. *Vid.* EthylComenic Acid.

Comenate *of sesquioxide* **of Iron.** Slowly soluble both in cold and in boiling water. (Stenhouse.)
$Fe_2O_3, 2\,C_{12}H_4O_{10} + 3\,Aq$

Comenate of Lead.

I.) *normal.* Insoluble in water. Soluble in comenic, but insoluble in acetic acid. (Stenhouse.)
$C_{12}H_2Pb_2O_{10} + 2\,Aq$

Comenate of Lime.

I.) *normal.* Insoluble in cold water, but is decomposed, with formation of a basic salt, when boiled with water. (How.)
$C_{12}H_2Ca_2O_{10} + 2\,Aq$ & $11\,Aq$ & $5\,Aq$

II.) *mono.* Readily soluble in boiling, less soluble in cold water. (How.)
$C_{12}H_3CaO_{10} + 7\,Aq$

III.) *basic.* Insoluble in water.

Comenate of Magnesia.

I.) *normal.* Insoluble in boiling water. (How.)
$C_{12}H_2Mg_2O_{10} + 3\,Aq$ & $8\,Aq$

II.) *mono.* Readily soluble in hot water. (How.) Much more soluble in water than the normal comenates of baryta, and lime.
$C_{12}H_3MgO_{10} + 2\,Aq$

Comenate of Potash.

I.) *normal.* Sparingly soluble in water; less soluble in water than the monobasic salt. (Robiquet.)

II.) *mono.* Soluble in boiling, less soluble in cold water. (How.)
$C_{12}H_3KO_{10}$

Comenate of Silver.

I.) *normal.* Insoluble in water.
$C_{12}H_2Ag_2O_{10}$

II.) *mono.* Insoluble in water.
$C_{12}H_3AgO_{10}$

Comenate of Soda.

I.) *mono.* Readily soluble in water. More soluble in water than the comenates of ammonia or of potash. (How.)
$C_{12}H_3NaO_{10}$

Comenate of Strontia.

I.) *normal.* }
II.) *mono.* } More soluble than the comenates of baryta.

ComenoVinic Acid. *Vid.* EthylComenic Acid.

Conchiolin. Insoluble even in boiling water. Insoluble in alcohol or ether. Unacted upon by weak acids. Very slowly dissolved by concentrated acids or by alkaline solutions. (Fremy, *Ann. Ch. et Phys.*, (3.) **43.** 96.)

Conhydrin. Tolerably readily soluble in water. Soluble in alcohol, and ether. (Th. Wertheim.)
$C_{16}H_{17}NO_2 = N\left\{\begin{matrix} C_{16}H_{16}O_2{}'' \\ H \end{matrix}\right.$

Coniin. Slightly soluble in water. (Charland & Henry.) The solution in 100 pts. of *cold* water becomes turbid when *heated*, and clear again on cooling. (Geiger.) At ordinary temperatures coniin takes up one third part of its weight of water, and at a low degree of cold one part of water, whereby it becomes more fluid. If this solution be heated it becomes turbid, owing to the separation of water. (Geiger.) Very readily soluble in alcohol. 1 pt. of coniin in 4 pts. of alcohol mixes with water in every proportion. A solution of 1 pt. of coniin in 1 pt. of absolute alcohol mixes with 1 pt. of water, but if more water be added, the liquid becomes permanently turbid.

(*Cinicin. Cicutin.*)
$C_{16}H_{15}N = N\left\{\begin{matrix} H \\ C_{16}H_{14}{}'' \end{matrix}\right.$

Quite soluble in alcohol, ether, acetone, and oils. Sparingly soluble in bisulphide of carbon. (Blyth, *J. Ch. Soc.*, **1.** 349.) Slightly soluble in bisulphide of carbon. (Berzelius.) Miscible in all proportions with alcohol, ether, and the fatty and essential oils. (Geiger.)

Its salts are mostly soluble in water, and alcohol, as well as in a mixture of alcohol and ether, but they are insoluble in pure ether.

Convolvulic Acid. Very hygroscopic. Soluble in all proportions in water, and alcohol. Insoluble in ether. Decomposed by boiling with chlorhydric or sulphuric acid.

(*Rhodeoretic Acid.*)
$C_{62}H_{53}O_{35} = \left.\begin{matrix} C_{26}H_{21}{}''' \\ (C_{12}H_9O_8)_3 \end{matrix}\right\} O_8 + 5\,Aq$

Convolvulate of Baryta.

I.) *mono.* Easily soluble in water, and alcohol.
$C_{62}H_{52}BaO_{35}$

II.) *di.* Readily soluble in water, and alcohol.
$C_{62}H_{51}Ba_2O_{35}$

Convolvulate of Lead.
$C_{82}H_{50}Pb_3O_{35}$

Convolvulate of Lime. Soluble in water.

I.) $C_{62}H_{51}Ca_2O_{35}$

Convolvulate of Potash.

I.) *mono.*
$C_{62}H_{52}KO_{33}$

II.) *acid.* Readily soluble in water. Sparingly soluble in alcohol.
$C_{62}H_{52}KO_{35}, C_{62}H_{53}O_{35}$

Convolvulin. Scarcely at all soluble in water. Easily soluble in alcohol, and in acetic acid. Insoluble in ether. Easily soluble, with decomposition in warm, less readily soluble in cold aqueous solutions of caustic ammonia, potash, soda, and baryta. Very slowly soluble in cold dilute nitric acid, the solution undergoing decomposition when heated; it is also decomposed by cold concentrated nitric acid. Soluble in concentrated sulphuric acid, with subsequent decomposition.

(*Jalapin. = ō resin of Jalap. Rhodeoretin. Glucosid of Convolvulinolic Acid.*)
$C_{62}H_{50}O_{32} = \left.\begin{matrix} C_{26}H_{21}{}''' \\ (C_{12}H_9O_8)_3 \end{matrix}\right\} O_6 + 2\,Aq$

Convolvulinol. Soluble in alcohol, and ether.
$C_{26}H_{25}O_7 = \left.\begin{matrix} C_{26}H_{21}{}''' \\ H_3 \end{matrix}\right\} O_6 + Aq$

Convolvulinolic Acid. Very sparingly soluble in pure water; more readily soluble in acidulated water. Readily soluble in alcohol; less soluble in ether.

(*Rhodeo Retinolic Acid. Rhodeo Retinol.*)

$C_{26}H_{24}O_6 = \left.\begin{matrix}C_{26}H_{21}{}''' \\ H_3\end{matrix}\right\} O_6$

Its compounds with the alkalies are readily soluble in water, and alcohol; those of the alkaline earths are sparingly soluble in water, and alcohol; while the salts of copper, lead, and silver are insoluble in water, and very sparingly soluble in alcohol.

Convolvulinolate of Ammonia. Soluble in water.

Convolvulinolate of Baryta. Sparingly soluble in cold, more soluble in boiling water. Soluble in alcohol. It is more soluble in all solvents than jalapate of baryta.

$C_{26}H_{23}BaO_6$

Convolvulinolate of Copper. Insoluble in water. Scarcely soluble in alcohol.

$C_{26}H_{23}CuO_6 + Aq$

Convolvulinolate of Lead. Ppt.

$C_{26}H_{23}PbO_6$

Convolvulinolate of Silver. Insoluble in water. Very sparingly soluble in alcohol.

Copaibi. See under Resins.

Copaivic Acid. See Resins of Copaiba, under Resins.

Copal. See under Resins.

Copper. Unacted upon by water at any temperature. When out of contact with the air, it is unacted upon by dilute, and scarcely at all attacked by boiling concentrated chlorhydric acid; but when exposed to the air, chlorhydric acid dissolves a little of it; on the other hand, concentrated iodhydric acid quickly dissolves it, though when dilute it has no action upon it. Soluble in concentrated, but only slowly or even not at all attacked by very dilute sulphuric acid. Readily soluble in nitric acid.

Cu

The oxidation and solution of copper by nitric acid depends upon the state of concentration of the latter, upon its temperature, upon the presence of binoxide of nitrogen, and upon the solubility of the products which may be formed. *Pure* dilute nitric acid has no action upon copper in the cold; but nitric acid contaminated with nitrous acid corrodes it at once:— thus, pure nitric acid of 1.07 sp. gr. or less, does not attack copper at 20°; but if a current of binoxide of nitrogen is passed into the acid, or better, if a few drops of a concentrated solution of nitrite of potash be added to it, an action commences at once, and when once commenced persists during several hours, provided the quantity of acid and of metal are sufficient; when the action flags, it may be renewed by a new addition of nitrite. By more concentrated nitric acid copper is attacked, excepting at low temperatures like those produced by a mixture of ice and chloride of sodium, but the temperatures at which the action commences vary with the concentration of the acid; thus an acid of 1.217 sp. gr. begins to act at —10°, and acid of 1.108 sp. gr. at —2°. Nitric acid of 1.512 sp. gr. attacks copper violently at 20°, but the action soon ceases on account of a crust of nitrate of copper which is formed upon the metal. This crust does not form with acids of 1.419 sp. gr. and less. (Millon, *Ann. Ch. et Phys.*, (3.) 6. pp. 95–98.) Soluble in a warm concentrated aqueous solution of iodide of potassium. (H. Rose, *Tr.*) When finely divided it dissolves readily in a hot solution of perchloride of iron. When in contact with the air it is soon oxidized by acids, alkaline solutions, especially those of ammonia, and fatty bodies.

Copper & Silver (alloys). Soluble in nitric acid, but a mixture of nitric and sulphuric acid dissolves very little copper, so long as there is any silver present to be dissolved. (Grove.)

Cornin (from *Cornus florida*). Easily soluble in water, and alcohol. Difficultly soluble in ether. (Geiger.)

Corydalin. Almost insoluble in cold, more soluble in hot water. Readily soluble in alcohol, especially in absolute alcohol. Readily soluble in ether, and in dilute acids. More soluble in solutions of the caustic alkalies than in pure water. Its salts are soluble in water.

$C_{68}H_{44}NO_{21}(?)$

Cotarnin. Sparingly soluble in cold, somewhat more soluble in boiling water. Soluble in alcohol. Easily soluble in ether, and in ammonia-water. Scarcely at all soluble in an aqueous solution of caustic potash. Decomposed by nitric acid. Its salts are in general very soluble in water.

$C_{26}H_{13}NO_6 + 2\,Aq$

Coumarin, &c. *Vid.* Cumarin.

Cratinin. *Vid.* Creatinin.

Creatin. Soluble in 83 pts. of water at 18°. (Chevreul.) Soluble in 74.4 pts. of water at 18°, and very soluble in boiling water. (Liebig.) The saturated boiling solution solidifies on cooling. Soluble in 2000 pts. of alcohol of 0.81 sp. gr., at 15° (Chevreul); in 9410 pts. of cold absolute alcohol; more soluble in spirit. (Liebig.) Nearly or quite insoluble in ether. (Heintz.) Soluble, without alteration, in cold alkaline liquors, even baryta-water, and in feeble acids. Decomposed by strong acids.

(*Kreatin.*)

$C_8H_9N_3O_4 + 2\,Aq = N_3\left\{\begin{matrix}(C_2O_2{}'')_2 \\ C_4H_5 \\ H_4\end{matrix}\right. + 2\,Aq$

Creatinin. Much more soluble than creatin in water, and alcohol. 1000 pts. of water dissolve 87 pts. of creatinin, *i. e.* it is soluble in 11.5 pts. of water, at 16°. It is much more soluble in boiling water. (Liebig.) 1000 pts. of alcohol dissolve 9.8 pts. of it at 16°. Soluble in 102 pts. of absolute alcohol at 16°; much more abundantly soluble in hot alcohol. (Liebig.) Slightly soluble in ether.

(*Cratinin. Kreatinin.*)

$C_8H_7N_3O_2 = N_2\left\{\begin{matrix}C_2O_2{}'' \\ C_4H_5 \\ C_2N \\ H_2\end{matrix}\right.$

The salts of creatinin are soluble in water.

Crenic Acid. Very easily soluble in water, and spirit. Soluble in absolute alcohol. The normal and acid crenates of the alkalies are soluble in water, but insoluble in absolute alcohol. The crenate of protoxide of iron is soluble in water, but the salt of sesquioxide of iron is insoluble. The copper and lead salts are insoluble in water. The silver salt is soluble in ammonia-water. (Berzelius.)

$C_{24}H_{12}O_{16}(?)$

Creosol. Scarcely at all soluble in water. Easily soluble in alcohol, ether, glacial acetic acid, and in alkaline lyes.

(*Oil from Creosote.*)

$C_{16}H_{10}O_4 = C_{16}H_9O_3, HO$

Creosolate of Baryta.

$C_{16}H_9BaO_4 + 3\,Aq$

Creosolate of Benzoyl.

$C_{16}H_9(C_{14}H_5O_2)O_4$

Creosolate of Ethyl.

$C_{16}H_9(C_4H_5)O_4$

Creosolate of Potash.

I.) *normal.* Soluble in water, alcohol, and ether.
$C_{16} H_9 K O_4 + 4 Aq$

II.) *acid.* Soluble in spirit, and ether.
$C_{16} H_9 K O_4 ; C_{18} H_{10} O_4 + 2 Aq$

Creosote. (*Kreosote.*) Sparingly soluble in water. Miscible in all proportions with alcohol, ether, bisulphide of carbon, naphtha, eupion, acetic ether, and acetic acid of 1.07 sp. gr. It is only partially soluble in ordinary acetic acid. (Gorup-Besanez.) When pure, it is entirely soluble in ordinary acetic acid. (Vœlckel.) Soluble in sulphuric acid, with combination. No more soluble in dilute chlorhydric acid than in water. Soluble in 80 pts. of cold, and 24 pts. of hot water.

Soluble in 80 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 75.) Creosote dissolves, especially when warm, phosphorus, sulphur, selenium; oxalic, tartaric, citric, boracic, and stearic acids; the fats, resins, and coloring matters (as cochineal, dragon's-blood, santal-red, santal-yellow, orchil, madder-red, and saffron). When warm, it dissolves indigo. When hot, it dissolves many salts, which separate out again as the solution cools; for example, many acetates and chlorides.

Cresotic Acid. (*Kresotinsæure.*) $C_{18} H_8 O_0 = C_{18} H_7 O_5, H O$ Somewhat more difficultly soluble in cold water than salicylic acid. Readily soluble in hot water. Easily soluble in alcohol, and ether. (Kolbe's *Lehrb.*, **2.** 349.)

Cresylic Alcohol. *Vid.* Hydrate of Cresyl.

Crocic Acid. *Vid.* Safranin.

Croconic Acid. $C_{10} H_2 O_{10} = C_{10} O_8, 2 H O$ Soluble in water. (L. Gmelin.) Easily soluble in alcohol, and ether. Its alkaline salts are all soluble in water. All of its salts are soluble, with decomposition, in nitric acid. (L. Gmelin.) Some of them are also soluble in alcohol, and ether. (Heller.)

Croconate of Alumina. Easily soluble in water, and alcohol. (Heller.)

Croconate of Ammonia. $C_{10} (N H_4)_2 O_{10} + 4 Aq$ Soluble in water, and alcohol. (Heller.)

Croconate of Antimony. Soluble in a chlorhydric acid solution of chloride of antimony. (L. Gmelin.)

Croconate of Baryta. Insoluble in hot water. (L. Gmelin.) Insoluble in alcohol or ether. (Heller.) Sparingly soluble in hot chlorhydric acid. (L. Gmelin.)

Croconate of Bismuth. Insoluble in water, or alcohol. (Heller.) Soluble in a solution of nitrate of bismuth. (L. Gmelin.)

Croconate of Cadmium. Soluble in water, and alcohol. (Heller.)

Croconate of Cerium. Ppt.

Croconate of Cobalt. Soluble in water, and alcohol. (Heller.)

Croconate of Copper. $C_{10} Cu_2 O_{10} + 6 Aq$ Very sparingly soluble in cold, more soluble in boiling water. Soluble in alcohol. Soluble in solutions of caustic potash and ammonia. (L. Gmelin.)

Croconate of Glucina. Easily soluble in water, and alcohol. (Heller.)

Croconate *of protoxide* **of Iron.** Soluble in water, and alcohol. (Heller.)

Croconate *of sesquioxide* **of Iron.** Soluble in water, and alcohol. (Heller.)

Croconate of Lead. Insoluble in water or alcohol. (Heller.) Soluble, with decomposition, in nitric acid. (L. Gmelin.)

Croconate of Lime. Slightly soluble in water, and alcohol. (Heller, L. Gmelin.)

Croconate of Lithia. Soluble in water, and alcohol. (Heller.)

Croconate of Magnesia. Soluble in water. (Heller.)

Croconate of Manganese.

Croconate *of dinoxide* **of Mercury.** $C_{10} Hg_4 O_{10}$ Insoluble in water. Soluble in nitric acid. (L. Gmelin.)

Croconate *of protoxide* **of Mercury.** Ppt.
$C_{10} Hg_2 O_{10}$

Croconate of Morphine.

Croconate of Nickel. Soluble in water, and alcohol. (Heller.)

Croconate of Potash.

I.) *normal.* $C_{10} K_2 O_{10} + 4 Aq$ Tolerably soluble in cold, much more readily soluble in hot water. Insoluble in absolute, and very sparingly soluble in hydrated alcohol. Insoluble in ether. (L. Gmelin.)

II.) *acid.* $C_{10} H K O_{10}, C_{10} K_2 O_{10} + 4 Aq$ Sparingly soluble in water. (L. Gmelin.)

Croconate of Silver. $C_{10} Ag_2 O_{10}$ Sparingly soluble in water. (Heller.)

Croconate of Soda. Very sparingly soluble in water. Slightly soluble in alcohol. (Heller.)

Croconate of Strontia. Easily soluble in water, and alcohol. (Heller.)

Croconate of Strychnine.

Croconate *of protoxide* **of Tin.** Sparingly soluble in water. (Heller.)

Croconate of Uranium. Easily soluble in water, and alcohol. (Heller.)

Croconate of Yttria. Easily soluble in water. (Berlin.)

Croconate of Zinc. Soluble in water, and alcohol.

Croconate of Zirconia. Soluble in water, and alcohol.

Crotonic Acid. $C_8 H_0 O_4 = C_8 H_5 O_3, H O$ Easily soluble in water, but only sparingly soluble in saturated saline solutions, as of chloride of sodium. Soluble in alcohol, and ether. The alkaline croconates are easily soluble in water.

Crotonate of Baryta. Easily soluble in water, and alcohol.

Crotonate *of sesquioxide* **of Iron.** Ppt.

Crotonate of Lead. Appears to be insoluble in water.

Crotonate of Magnesia. Very sparingly soluble in water.

Crotonate of Mercury. Appears to be insoluble in water.

Crotonate of Potash. Deliquescent. Easily soluble in water. Difficultly soluble in alcohol of 0.85 sp. gr.

Crotonate of Silver. $C_8 H_5 Ag O_4$ Somewhat soluble in hot, less soluble in cold water.

Crotonate of Soda. Deliquescent. Easily soluble in water.

Crotonin (from *Croton tiglium*). Almost insoluble in water. Easily soluble in hot alcohol. (Brandes.)

CROTONOL. Insoluble, or but sparingly soluble in water. Soluble in absolute alcohol and in ether. (Th. Schlippe.)
$C_{18} H_{14} O_4$

CRYPTIDIN.
$C_{22} H_{11} N = N \} C_{22} H_{11}'''$

CRYSTALLIN. *Vid.* Anilin. Also Globulin.

CUBEBENE. Compare Oil of Cubebs.
(*Cubebenœl.*)
$C_{30} H_{24}''$

CUBEBIN. Sparingly soluble in cold water. 100 pts. of absolute alcohol dissolve 1.31 pts. of it at 12°. [100 pts. of] alcohol of 0.82° dissolve 0.70 pt. of it [at 12°]; it is much more soluble in hot alcohol. 100 pts. of ether dissolve 3.75 pts. of it at 12°; more soluble in hot ether. Soluble in acetic acid, and in the fatty and essential oils.
$C_{34} H_{16} O_{10}$

CUMANILID. *Vid.* PhenylCuminamid.

CUMARAMIN. Very sparingly soluble in cold, easily soluble in boiling water. More readily soluble in a saturated aqueous solution of acetate of iron than in cold water. Easily soluble in boiling alcohol; the saturated solution coagulating on cooling. Almost insoluble in ether. (Frappoli & Chiozza, *Ann. Ch. u. Pharm.*, **95.** 254.)
(*Coumaramin. Cumaramid.*)
$C_{18} H_7 N O_4 = N \left\{ \begin{matrix} C_{18} H_5 O_4 \\ H_2 \end{matrix} \right.$

CUMARIC ACID. Soluble in boiling water, from which it separates on cooling. (Bleibtreu; Delalande, *Ann. Ch. et Phys.*, (3.) **6.** 346.) Easily soluble in alcohol, and ether. (Bleibtreu.)
(*Coumaric Acid.*)
$C_{18} H_8 O_6 = C_{18} H_7 O_5, H O$

CUMARATE OF AMMONIA. Soluble in water.
$C_{18} H_7 (N H_4) O_6$

CUMARATE OF BARYTA. Soluble in water.

CUMARATE OF LEAD. Ppt. Somewhat soluble in water. (Bleibtreu.)
$C_{18} H_7 Pb O_6$

CUMARATE OF SILVER. Ppt.
$C_{18} H_7 Ag O_6$

CUMARIN. Scarcely at all soluble in cold, tolerably readily soluble in boiling water. Soluble in alcohol of 36°. Soluble in dilute acids, without alteration, even on boiling. Concentrated chlorhydric acid, whether hot or cold, has no action upon it. Concentrated sulphuric acid decomposes it immediately. Monohydrated nitric acid combines with it in the cold, but on boiling decomposes it. Unacted upon by ammonia-water. Soluble, without decomposition, in an aqueous solution of caustic potash, when this is gently heated, but is decomposed on boiling therewith. (Delalande, *Ann. Ch. et Phys.*, (3.) **6.** 344.)
(*Coumarin.*)
$C_{18} H_6 O_4$

A solution of 1 pt. of cumarin in 45 pts. of boiling water becomes milky on cooling; a solution of 1 pt. of cumarin in 200 pts. of water remains clear at 25°; but when slowly cooled to 15° it deposits crystals; a solution of 1 pt. of cumarin in 400 pts. of water remains unchanged, even in the cold. (Buchner.) Soluble in weak acids, even boiling; but is decomposed by concentrated acids. (Buchner.) Readily soluble in strong alcohol, and in the fatty oils which occur with it in the tonka bean. (Buchner.) Readily soluble in fatty and in essential oils. (Boullay & Charlard.) Sparingly (Leroy), abundantly (Guillemette) soluble in concentrated sulphuric acid, from which water precipitates it. Much more readily soluble in acetic acid (Buchner), and in tartaric acid (Guillemette), than in water. Soluble in concentrated, or in warm dilute, phosphoric acid. (Guillemette.) Insoluble in cold ammonia-water. (Guillemette.) Easily soluble in a cold aqueous solution of caustic potash, but is decomposed when boiled therewith. (Buchner.)

CUMENE. Insoluble in water. (Gerhardt & Cahours.) Readily soluble in alcohol, ether, wood-spirit, and the essential oils. It combines [? mixes] with oils, fats, and most of the resins. (Pelletier & Walter.) Soluble in naphtha.
(*Cumol. Retinyl. Hydride of Cumenyl.*)
(Isomeric with Mesitylene.)
$C_{18} H_{12} = C_{18} H_{11}, H$

CUMENYL. Not isolated.
Cumyl(of Kolbe).
$C_{18} H_{11}$

CUMENYLSULPHUROUS ACID. Known only in aqueous solution. (Gerhardt & Cahours.)
(*Sulphocumenic Acid. Sulphocumolic Acid.*)
$C_{18} H_{12} S_2 O_6 = C_{18} H_{11} O, H O, S_2 O_4$

CUMENYLSULPHITE OF BARYTA. Readily soluble in water, especially when this is hot. Soluble in alcohol (even in absolute) and in ether.
$C_{18} H_{11} Ba S_2 O_6$

CUMEUGENYL. *Vid.* CuminEugenic Acid.

CUMICYL. Not isolated.
Cymyl(of Kolbe).
$C_{20} H_{13}$

CUMICYLAMIN. *Vid.* Cymidin.

CUMIDIN. Very sparingly soluble in water. Very soluble in alcohol, ether, wood-spirit, bisulphide of carbon, and the fatty oils. Soluble in concentrated nitric acid, in which solution water occasions a precipitate. Its salts are soluble in water, and still more soluble in alcohol; they are partially decomposed by boiling water. (Nicholson, *J. Ch. Soc.*, **1.** 4.)
(*Cumin. Cumenylamin.*)
$C_{18} H_{13} N = N \left\{ \begin{matrix} C_{18} H_{11} \\ H_2 \end{matrix} \right.$

CUMIN ALCOHOL. *Vid.* Hydrate of Cumicyl.

CUMINAMIC ACID. Sparingly soluble in cold, much more soluble in boiling water. Still more soluble in alcohol, and ether. Combines both with acids and bases. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 334.)
(*Amido Cuminic Acid.*)
$C_{20} H_{13} N O_4 = N \left\{ \begin{matrix} C_{20} H_{11} O_2 \\ H_2 \end{matrix} \right. . O_2$

CUMINAMATE OF ETHYL. Soluble in alcohol, from which it is precipitated on the addition of water. Soluble in chlorhydric, bromhydric, nitric, and sulphuric acids, forming compounds which are easily soluble. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 339.)
$C_{20} H_{12} (C_4 H_5) N O_4$

CUMINAMID. Insoluble in cold, but soluble in hot water. Soluble in all proportions in alcohol, and ether, whether hot or cold. (F. Field.) Insoluble in cold (Field), very sparingly soluble in boiling ammonia-water. (Gerhardt.)
(*Cumylamid.*)
$C_{20} H_{13} N O_2 = N \left\{ \begin{matrix} C_{20} H_{11} O_2 \\ H_2 \end{matrix} \right.$

CUMINANILID. *Vid.* PhenylCuminamid.

CUMINIC ACID(Anhydrous). Acidified by exposure to moist air. Soluble in ether. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **37.** 305.)
$C_{40} H_{22} O_6 = \left. \begin{matrix} C_{20} H_{11} O_2 \\ C_{20} H_{11} O_2 \end{matrix} \right\} O_2$

CUMINIC ACID. Almost insoluble in cold, somewhat more soluble in boiling water. Easily soluble in alcohol, and ether, and in water acidulated with nitric acid. Soluble in concentrated sulphuric acid. Soluble in all proportions in warm glacial acetic acid. The alkaline cuminates and those of the alkaline earths are soluble in
$C_{20} H_{12} O_4 = C_{20} H_{11} O_3, H O$

water; those of the metals are sparingly soluble or insoluble.

Cuminate of Ammonia.

Cuminate of Baryta. Soluble in water. $C_{28} H_{11} Ba O_4$ Easily soluble in alcohol, and ether.

Cuminate of Copper. Insoluble in water.

Cuminate of Ethyl. Insoluble in water. *(Cuminic Ether.)* $C_{24} H_{16} O_4 = C_{20} H_{11} (C_4 H_5) O_4$ Miscible in all proportions with alcohol, and ether. (Gerhardt & Cahours.)

Cuminate of Lead. Insoluble in water.

Cuminate of Lime. Tolerably soluble in water.

Cuminate of MethylSalicyl. Insoluble in water. $C_{80} H_{18} O_8 = C_{20} H_{11} [C_{14} H_4 (C_2 H_3) O_2] O_6$ Sparingly soluble in cold, more soluble in hot alcohol. Very soluble in ether. (Gerhardt, *Ann. Ch. et Phys.*, (3.) **45.** 95.)

Cuminate of Phenyl. Insoluble in water. $C_{32} H_{16} O_4 = C_{20} H_{11} (C_{12} H_5) O_4$ Easily soluble in alcohol, and ether.

Cuminate of Potash. Deliquescent. Easily soluble in water.

Cuminate of Silver. Ppt. $C_{20} H_{11} Ag O_4$

CuminEugenic Acid (Anhydrous). Insoluble *(CumEugenyl.)* $C_{40} H_{22} O_6 = \left.\begin{matrix} C_{20} H_{11} O_2 \\ C_{20} H_{11} O_2 \end{matrix}\right\} O_2$ in water. Soluble in boiling alcohol. Decomposed by strong sulphuric acid, and by potash lye. Unacted upon by boiling chlorhydric acid. (Cahours.)

Cuminic Alcohol. *Vid.* Hydrate of Cumicyl.

Cuminic Benzoate. *Vid.* BenzoCuminic Acid.

CuminŒnanthylic Acid (Anhydrous). $C_{34} H_{24} O_6 = \left.\begin{matrix} C_{14} H_{13} O_2 \\ C_{20} H_{11} O_2 \end{matrix}\right\} O_2$

Cuminol. *Vid.* Hydride of Cumyl.

CuminoNitryl. *Vid.* Cyanide of Cuminyl.

Cuminuric Acid. Soluble in alcohol, especially when this is warm. $C_{24} H_{15} N O_6$ Decomposed by boiling with chlorhydric acid. (Cahours, *Ann. Ch. et Phys.*, (3.) **53.** 356.)

Cumol. *Vid.* Cumene.

Cumonitril. *Vid.* Cyanide of Cumenyl.

CumoSalicyl. Insoluble in cold, sparingly $C_{34} H_{16} O_6$ soluble in boiling water; more soluble in alcohol, especially if this be warm; and still more readily in ether. (Cahours, *Ann. Ch. et Phys.*, (3.) **52.** 198.)

Cumoyl. Not isolated. $C_{20} H_{11}$

"Cumyl" (of Kolbe). *Vid.* Cumenyl. $C_{18} H_{11}$

Cumyl. Very sparingly soluble in cold, tolerably soluble in boiling alcohol. *(Cumylide of Cumyl.)* $C_{40} H_{22} O_4 = \left.\begin{matrix} C_{20} H_{11} O_2 \\ C_{20} H_{11} O_2 \end{matrix}\right\}$ (Chiozza, *Ann. Ch. et Phys.*, (3.) **39.** 220.)

CumylBenzoylSulphoPhenylamid. Scarcely at all soluble *(SulphoPhenylBenzoylCuminamid.)* $C_{40} H_{21} N S_2 O_8 = N \left\{\begin{matrix} C_{20} H_{11} O_2 \\ C_{14} H_5 O_2 \\ C_{12} H_5 S_2 O_4 \end{matrix}\right.$ in water. More readily soluble in alcohol than salicylbenzamic acid. Sparingly soluble in cold, more soluble in boiling ether. Difficultly soluble in ammonia-water. (Gerhardt & Chiozza.)

Cumylide of Potassium. *(Cuminol potassée.)* $C_{20} H_{11} K O_2$

CumylSalicylamid. *Vid.* SalicylCumylamic Acid.

CumylSulphoPhenylamid. Insoluble in $C_{32} H_{17} N S_2 O_6 = N \left\{\begin{matrix} C_{20} H_{11} O_2 \\ C_{12} H_5 S_2 O_4 \\ H \end{matrix}\right.$ boiling water. Easily soluble in boiling ammoniacal water. Tolerably soluble in cold, very soluble in warm alcohol.

CumylSulphoPhenylArgentamid. Almost $C_{32} H_{10} Ag N S_2 O_6 = N \left\{\begin{matrix} C_{20} H_{11} O_2 \\ C_{12} H_5 S_2 O_4 \\ Ag \end{matrix}\right.$ insoluble in boiling water; but easily soluble in ammonia-water.

CumylSulphoPhenylArgent*bi*amid. Very $C_{32} H_{19} Ag N_2 S_2 O_6 = N_2 \left\{\begin{matrix} C_{20} H_{11} O_2 \\ C_{12} H_5 S_2 O_4 \\ Ag \\ H_3 \end{matrix}\right.$ sparingly soluble in boiling water; more readily soluble in alcohol. (Gerhardt & Chiozza.)

*Tri*Cupr(*ic*)amin. Slowly soluble in chlorhy- *(Nitride of Copper.)* $N \left\{ Cu_3 \right.$ dric acid. Insoluble in a mixed aqueous solution of caustic and carbonated ammonia. (Berzelius, *Lehrb.*)

CuproCyanide of *X*. *Vid.* *di*Cyanide of Copper and of *X*.

Curarin. Deliquescent. Soluble in all proportions in water, and alcohol. Insoluble in ether or oil of turpentine.

Curcumin. Insoluble, or but slightly soluble, *(Curcumic Acid.)* $C_9 H_6 O_2$ in water. Readily soluble in alcohol, ether, and oils. Soluble in concentrated acetic acid. Soluble in concentrated sulphuric, chlorhydric, and phosphoric acids; on the addition of water a precipitate is produced in these solutions. Soluble in solutions of the caustic alkalies.

Cusconin. *Vid.* Aricin.

Cusparin (from *Cusparia febrifuga*). Sparingly *(Angusturin. Galipein.)* soluble in water. Tolerably easily soluble in alcohol. Insoluble in ether or essential oils. Easily soluble in acids. (Saladin.) Soluble in 200 pts. of water. Soluble in acids, and in alkaline solutions. (Parrish's *Pharm.*, p. 421.)

Cyamelid. Insoluble either in hot or in cold *(Carbonylamid. Insoluble Cyanuric Acid.)* $C_2 H N O_2 = N \left\{\begin{matrix} C_2 O_2'' \\ H \end{matrix}\right.$ water; but when boiled with water for some time it is converted into a hydrate which is sparingly soluble in hot water. Insoluble in alcohol, ether, or weak boiling chlorhydric, or nitric acid, or in aqua-regia. Tolerably readily soluble in solutions of the alkalies, and ammonia. (Liebig.)

Cyameluric Acid. Very difficultly soluble in $C_{12} H_3 N_7 O_0 = N \left\{ Cy_3 ;\ 3 H O, 3 Cy O \right.$ cold, more soluble in boiling water. Soluble in 420 pts. of water at 17°. (Henneberg.)

Cyamelurate of Ammonia. Efflorescent. Very soluble in water.

Cyamelurate of Baryta. Very difficultly $C_{12} Ba_3 N_7 O_6 + Aq$ soluble in water.

Cyamelurate of Copper. Ppt. Soluble in ammonia-water.

Cyamelurate *of sesquioxide* of Iron. Ppt.

Cyamelurate of Magnesia. Insoluble in water. Soluble in an aqueous solution of chloride of ammonium.

Cyamelurate of Potash.

I.) *normal.* Very easily soluble in boiling water. Soluble in 7.4 pts. of water at 18°, and 1 @ 2 pts. of boiling water. (Henneberg.) Insoluble in alcohol. On the addition of acetic or nitric acid to the aqueous solution scales of the acid salt are precipitated. (Liebig.)
$C_{12}K_3N_7O_6+6\,Aq$

II.) *acid.* Sparingly soluble in water. Somewhat more soluble in water than cyameluric acid.
$C_{12}KH_2N_7O_6+4\,Aq$

Cyamelurate of Silver. Insoluble in water. Sparingly soluble in weak nitric acid.
$C_{12}Ag_3N_7O_6+2\,Aq$

Cyamelurate of Soda. Very soluble in water.

Cyanamid. Easily soluble in water; but on evaporating the aqueous solution an insoluble modification, probably melamin, is formed. Soluble, without decomposition, in alcohol, and ether.
$C_2H_2N_2=N\left\{\begin{matrix}Cy\\H_2\end{matrix}\right.$

***Di*Cyanamid.** (*Mellone* of Gerhardt & others.) Insoluble in water, alcohol, ether, cold dilute acids, or alkaline solutions.
$C_4HN_3=N\left\{\begin{matrix}Cy_2\\H\end{matrix}\right.$

***Tri*Cyanamid.** (*Mellone* of Liebig.) Insoluble in water, alcohol, ether, cold dilute acids, or alkaline solutions. (Liebig.)
$C_6N_4=N\left\{Cy_3\right.$

CyanAmyl. *Vid.* Cyanide of Amyl.

CyanAmylamin. (*CyanAmylamid.*) Soluble in ether. (Cahours & Cloez.)
$C_{12}H_{12}N_2=N\left\{\begin{matrix}C_{10}H_{11}\\C_2N\\H\end{matrix}\right.$

Cyan*di*Amylamin.
$C_{22}H_{22}N_2=N\left\{\begin{matrix}(C_{10}H_{11})_2\\C_2N\end{matrix}\right.$

CyanAnilid. (*Cyanilid. PhenylCyanamid.*) Insoluble in water. Readily soluble in alcohol, and ether. (Cahours & Cloez.)
$C_{14}H_6N_2=N\left\{\begin{matrix}C_2N\\C_{12}H_5\\H\end{matrix}\right.$

CyanAnilin. (*Cyanilin. Cyanide of Anilin.*) Completely insoluble in water. Nearly insoluble in cold, sparingly soluble in boiling alcohol; from which solution it separates out as soon as the temperature has fallen a few degrees below the boiling-point. It is not any more soluble in ether, wood-spirit, bisulphide of carbon, benzin, or the fatty or essential oils, than in alcohol. Soluble in cold concentrated sulphuric acid, the solution undergoing decomposition when heated. Very easily soluble in dilute chlorhydric acid, also soluble in dilute sulphuric and other acids, with combination. (Hofmann, *J. Ch. Soc.*, **1.** pp. 160, 163.)
$C_{14}H_7N_2=N\left\{\begin{matrix}C_{12}H_5\\H_2\end{matrix}\right..C_2N$

Cyanic Acid. Very soluble in water; but the aqueous solution soon undergoes decomposition. Soluble in alcohol.
$C_2HNO_2=Cy\,O,HO$

Cyanate of Allyl. (*Acrylic Cyanate.*) Readily soluble, with decomposition, in water, ammonia-water, and other alkaline solutions.
$C_8H_5NO_2=C_2(C_6H_5)NO_2$

Cyanate of Ammonia. Very soluble in water; the aqueous solution soon undergoes decomposition, — immediately if it be boiled, with formation of urea, with which it is isomeric.
$C_2H_4N_2O_2=NH_4O,Cy\,O$

Cyanate of Amyl. Soluble, with decomposition, in ammonia-water.
$C_{10}H_{11}O,Cy\,O$

Cyanate of Anilin (abnormal). *Vid.* PhenylCarbamid.

Cyanate of Baryta. Soluble in water, the solution undergoing decomposition when evaporated. Alcohol precipitates it from the aqueous solution. (Berzelius, *Lehrb.*)
$Ba\,O,Cy\,O$

Cyanate of Copper. Ppt.

Cyanate of Ethyl. Instantly decomposed by water. Slowly decomposed by alcohol at 100°. Soluble, with decomposition, in ammonia-water. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **42.** 47.) [Compare Allophanate of Ethyl.)
$C_2N(C_4H_5)O_2=C_4H_5O,Cy\,O$

Cyanate of EthylPiperidin. (*EthylPiperyl Urea.*) Soluble in alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 86.)
$C_{12}H_{11}(C_4H_5)N_2O_2=N\left\{\begin{matrix}C_{10}H_{10}''\\C_4H_5\end{matrix}\right..HO,Cy\,O$

Cyanate *of protoxide* **of Iron.** Very instable.

Cyanate of Lead. Sparingly soluble in boiling water. (Wœhler.) Insoluble, or but sparingly soluble, in alcohol.
$Pb\,O,Cy\,O$

Cyanate of Lime. Soluble in water.

Cyanate *of dinoxide* **of Mercury.** Ppt.

Cyanate of Methyl. Decomposed by water. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **42.** 61.)
$C_2N(C_2H_3)O_2$

Cyanate of MethylPiperidin. (*MethylPiperyl Urea.*) Easily soluble in boiling alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 85.)
$C_2N[C_{10}H_{11}(C_2H_3)N]O_2$

Cyanate of Naphthyl. *Vid.* NaphtoylCarbamid.

Cyanate of Phenyl. (*PhenylCarbimid. Carbanile. AniloCyanic Acid.*) Decomposed by water; especially when heated therewith. Soluble, with evolution of heat and apparent combination, in alcohol, wood-spirit, fusel-oil, and carbolic acid; the resulting compounds are insoluble in water, but are soluble in all proportions in alcohol, and ether. Decomposed by acids and by alkaline solutions. (Hofmann, *J. Ch. Soc.*, **2.** 316.)
$C_2N(C_{12}H_5)O_2$

Cyanate of Piperidin. (*Piperyl Urea. Piperidic Urea.*) Soluble in water and in strong alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 84.)
$C_2N(C_{10}H_{12}N)O_2$

Cyanate of Potash. Readily soluble in water. (Wœhler.) Very easily soluble in water, but the solution soon undergoes decomposition on standing, and at once, if it be heated. If the concentrated solution is treated with acetic acid or with a dilute mineral acid, cyanurate of potash separates out. As good as insoluble in absolute alcohol. (Berzelius, *Lehrb.*) Insoluble in absolute alcohol. Sparingly soluble in cold, more easily soluble in hot spirit. Alcohol of 82% is best suited to dissolve it, for it is very difficultly soluble in stronger alcohol, and undergoes decomposition when boiled with weaker spirit. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **42.** 44.)
C_2NKO_2

Cyanate of Silver. Insoluble in cold, sparingly soluble in boiling water. Readily soluble in ammonia-water. Readily soluble, with decomposition, in dilute nitric acid. Decomposed by a solution of cyanide of potassium. (Wœhler.)
C_2NAgO_2

Cyanate of Soda.

Cyanate of Yttria. Insoluble in water or alcohol. (Berlin.)

CyanAuric Acid. *Vid. ter*Cyanide of Gold.
(*Auro Cyanic Acid.*)
$Au\ Cy_3$

CyanAurate of Ammonium. Very readily
$NH_4Cy, AuCy_3 + 2\ Aq$ soluble in water, and alcohol. As good as insoluble in ether. (Himly, *Ann. Ch. u. Pharm.*, 1842, **42.** 344.)

CyanAurate of Potassium. Efflorescent.
$KCy, AuCy_3 + Aq$ Soluble in water. Insoluble in absolute alcohol. (Himly, *Ann. Ch. u. Pharm.*, **42.** pp. 340, 341.)

CyanAurate of Silver. Completely insol-
$AgCy, AuCy_3$ uble in water. Soluble in ammonia-water. Insoluble in nitric acid. (Himly, *Ann. Ch. u. Pharm.*, **42.** pp. 337, 341.)

Cyanethin. Very slightly soluble in cold,
$C_{18}H_{15}N_3$ tolerably soluble in boiling water. Soluble in almost all proportions in alcohol. Very easily soluble in acids, forming salts which are all soluble in water, and alcohol. (Kolbe & Frankland, *J. Ch. Soc.*, **1.** 71.)

Cyanetholin. Insoluble in water. Soluble

$C_6H_5NO_2 = N\left\{\begin{matrix}C_2O_2''\\ C_4H_5\end{matrix}\right.$ in all proportions in alcohol, and ether. Soluble in most acids, with combination. (Cloez.)

CyanEthylamid. *Vid.* EthylCyanamin.

CyanEthylAnilin. *Vid.* EthylCyanAnilin.

Cyanhydramylic Ether. *Vid.* Cyanid of Amyl.

Cyanhydric Acid. Mixes in all proportions
(*HydroCyanic Acid.*) with water. Also with alco-
$C_2HN = HCy$ hol, wood-spirit, ether, volatile oils, and a few other organic compounds. Soluble in oil of copaiba. (Gerber.) Abundantly soluble in caoutchouc. (Himly.)

An aqueous solution of sp. gr.	Contains Per cent of H Cy.	Per cent of acid of 0.957 sp. gr.
0.9570 . . .	16.0 . . .	100
0.9768	10.6	66.6
0.9815	9.1	57.0
0.9840	8.0	50.0
0.9870	7.3	44.4
0.9890	6.4	40.0
0.9900	5.8	36.4
0.9914	5.3	33.3
0.9923	5.0	30.0
0.9930	4.6	28.6
0.9940	4.0	25.0
0.9945	3.6	22.2
0.9952	3.2	20.0
0.9958	3.0	18.2
0.9964	2.7	16.6
0.9967	2.5	15.4
0.9970	2.3	14.3
0.9973	2.1	13.3
0.9974	2.0	12.5
0.9975	1.77	11.8
0.9978	1.68	10.5
0.9979 . . .	1.60 . . .	10.0

(Ure, *Quar. J. Sci.*, **13.** 321; *Schw. J.*, **36.** 282 [*Gm.*].)

According to Trautwein, a solution of 0.982 sp. gr. at 12.5° contains 10.53% of anhydrous cyanhydric acid.

Cyanhydrate of Benzil. Unacted upon by
$C_{28}H_{10}O_4, 2\ C_2HN$ boiling water, solutions of salts, or concentrated chlorhydric acid. Easily soluble in boiling alcohol, and ether. (Zinin.) Decomposed by warm ammonia-water, and nitric acid.

Cyanhydrate of Brucin with Cyanide of Iron.
$2(N_2\left\{C_{46}H_{26}O_8^{vi}, HCy\right); FeCy + 2\ Aq$

Cyanhydrate of Butyrene. *Vid.* Cyanide of Butyl.

Cyanhydrate of Chloride of Antimony.
$SbCl_5, 3\ HCy$ Deliquescent. Decomposed by water. (Klein.)

Cyanhydrate of Chloride of Cyanogen.
$2\ CyCl, HCy$ Somewhat soluble in water. Decomposed by much water.

Cyanhydrate of *sesqui*Chloride of Iron.
$Fe_2Cl_3, 2\ HCy$ Deliquescent. (Klein.)

Cyanhydrate of *bi*Chloride of Tin. De-
$SnCl_2, HCy$? composes in moist air; also decomposed by water, with evolution of heat. (Klein.)

Cyanhydrate of *bi*Chloride of Titanium.
$TiCl_2, HCy$ Soluble in water, with evolution of heat. If but little water be used cyanhydric acid is evolved. (Wœhler.)

Cyanhydrate of *di*CyanNaphtyl*bi*amin.
(*DiCyanNaphtylamin.*) Insolu-

$C_{46}H_{17}N_5 = N_2\left\{\begin{matrix}(C_{20}H_7(C_2N))_2''\\ H_2\end{matrix}\right\}, HC_2N$ ble in water.

Tolerably easily soluble in alcohol, and ether.

Cyanhydrate of CyanoCodein. Soluble in
(*biCyanide of Codein.*) absolute alcohol, and in a

$N\left\{\begin{matrix}C_{36}H_{20}O_6''\\ C_2N\end{matrix}\right., HC_2N$ mixture of alcohol and ether. Also soluble in dilute alcohol, but with decomposition.

Cyanhydrate of Harmalin. Permanent.
(*HydroCyanHarmalin.*) Decomposed by boiling with
$C_{26}H_{14}N_2O_2, HCy$ water or alcohol. Soluble in warm alcohol. Soluble in most acids; but almost insoluble in acetic acid. (Fritzsche.)

Cyanhydrate of Hydride of Benzoyl.
$C_{14}H_6O_2, HCy$ Very sparingly soluble in water. Readily soluble in alcohol, and ether. (Vœlkel, *Pogg. Ann.*, **62.** 444 [K.].)

Cyanhydrate of Methylene. *Vid.* Cyanide of Methyl.

Cyanhydrate of NitrAzoPhenylamin
$2(C_{12}H_7(NO_4)N_2, HCy, PtCy) + 5\ Aq$ with *proto*Chloride of Platinum. Soluble in water, with partial decomposition.

Cyanhydrate of NitrAzoPhenylamin

$2(N_2\left\{\begin{matrix}C_{12}H_3(NO_4)''\\ H_4\end{matrix}\right\}HCy; PtCy) + 5\ Aq$ with *proto* Cyanide of Platinum.

Cyanhydrate of NitroHarmalin. Perma-
$C_{26}H_{13}(NO_4)N_2O_2, HCy$ nent. Decomposed by boiling with water; also decomposed by ammonia-water, and by an aqueous solution of potash. Soluble in concentrated sulphuric acid.

Cyanhydrate of NitroHarmin with *proto*Cyanide of Mercury.

Cyanhydrate of Platosamin. *Vid.* Cyanide of Platin(*ous*)ammonium.

Cyanhydrate of Solanin. Soluble in water.

"Cyanic Ether" (formerly). *Vid.* Allophanate of Ethyl.

Cyanic Ether. *Vid.* Cyanate of Ethyl.

Cyanides. The alkaline cyanides are all soluble in water, the cyanides of the alkaline earths and protocyanide of mercury are also soluble, but the other metallic cyanides are insoluble in water. (Gerhardt, *Tr.*)

Cyanide of Aluminum & *proto Cyanide* of Platinum. Easily deliquesces. Soluble in alcohol. (Quadrat.)

Cyanide of Ammonium. Very soluble in water, and alcohol. The aqueous solution soon undergoes decomposition.
NH_4Cy

Cyanide of Ammonium & of Copper(Cu_2).

I.) $NH_4Cy; Cu_2Cy$ Sparingly soluble in water; decomposed by long ebullition therein. Soluble in cyanhydric acid. (Dufau.)

II.) $NH_4Cy; 2Cu_2Cy + Aq$ Ppt. Decomposed by acids.

Cyanide of Ammonium & of Gold.

I.) $NH_4Cy; AuCy$ Very easily soluble in water, and alcohol. Almost completely insoluble in ether. (Himly, *Ann. Ch. u. Pharm.*, 1842, **42.** 342.)

II.) $NH_4Cy; AuCy_3 + 2Aq$ *Vid.* CyanAurate of Ammonium.

Cyanide of Ammonium & of Mercury(Hg). Very soluble in water. (Pean de St. Gilles, *Ann. Ch. et Phys.*, (3.) **36.** 93.)

Cyanide of Ammonium & of Nickel. Easily decomposed.
$2NH_4Cy; NiCy$

Cyanide of Ammonium & *proto Cyanide* of Platinum.

I.) $NH_4Cy; PtCy$ Quickly efflorescent. Soluble in absolute alcohol.

II.) *white hydrate.*
$NH_4Cy; PtCy + Aq$

III.) *yellow hydrate.* Soluble in about 1 pt. of water; more readily soluble in alcohol. (Schafarik.)
$NH_4Cy; PtCy + 2Aq$

IV.) $6NH_4Cy; 5PtCy$ Soluble in water. (Quadrat.) Does not exist. (Schafarik.)

Cyanide of Ammonium & of Zinc. Efflorescent. Imperfectly soluble in cold water, cyanide of zinc separating out. Very sparingly soluble in spirit of 40° B. Completely soluble in ammonia-water. (Corriol & Berthemot, *J. de Pharm.*, 1830, **16.** 446.)
$NH_4Cy; ZnCy$

Cyanide of Amyl. Sparingly soluble in water. Less soluble than cyanide of ethyl in water. Soluble in all proportions in alcohol. (Frankland & Kolbe.)
$C_{12}H_{11}N = C_{10}H_{11}, Cy$

Cyanide of Anilin. *Vid.* CyanAnilin.

Cyanide of Antimony. Soluble in an aqueous solution of cyanide of potassium. (Gore.)

Cyanide of Argentammonium & of Silver. Decomposes in the air.
$N\left\{\begin{matrix}H_3\\Ag\end{matrix}\right..Cy; AgCy$

Cyanide of Argentammonium & of Platinum. Insoluble in water. Slowly soluble in a large quantity of ammonia-water. Unacted on by boiling mineral acids. (Knop & Schnedermann.)
$N\left\{\begin{matrix}H_3\\Ag\end{matrix}\right..Cy, PtCy$

Cyanide of Arsenic & of Iron? Insoluble in water. (Ittner.)

Cyanide of Barium. Somewhat difficultly soluble in water.
BaC_2N

Sparingly soluble in water. (Schulz.) Very soluble in water. Also soluble in boiling rectified spirit. (F. & E. Rodgers, *Phil. Mag.*, 1834, (3.) **4.** 96.) The aqueous solution suffers decomposition when boiled.

Cyanide of Barium & of Copper(Cu_2). Soluble in water. (Meillet.)

Cyanide of Barium & of Nickel.
$2BaCy; NiCy$

Cyanide of Barium & *proto Cyanide* of Platinum. Soluble in water, and alcohol. (Schafarik.) Quadrat gives the composition of this salt as $6BaCy; 5PtCy + 22Aq.$, and says that it is soluble in 33 pts. of cold, and more readily in hot water.
$BaCy; PtCy$

Cyanide of Barium & of Zinc. Very slowly soluble in water. (Rammelsberg.)
$BaCy; 2ZnCy$

Cyanide of Benzoyl. Insoluble in water; but is slowly decomposed when in contact with either hot or cold water. (Liebig & Wœhler.)
$C_{14}H_5O_2, Cy$

Cyanide of Benzyl. *Vid.* Cyanide of Toluenyl.

Cyanide of Bismuth. Ppt. Insoluble in an aqueous solution of cyanide of potassium, but soluble in acids. (H. Rose, *Tr.*)

Cyanide of Bismuth & of Copper(Cu_2). Ppt. Decomposed by acids. (Ittner.)

Cyanide of Bismuth & of Iron. Ppt. Insoluble in aqueous solutions of the ammonia salts. Soluble in nitric acid, from which it is precipitated by water.

Cyanide of Bismuth & *proto Cyanide* of Platinum. Ppt.

Cyanide of Butyl. Soluble in about 4 vols. of water, and in all proportions in alcohol, and ether. (Guckelberger.) Tolerably soluble in water. (Schlieper.) Scarcely at all soluble in water. (Schwanert.)
(*Valeronitril. Cyanhydrate of Butyrene. Cyanide of Tetryl.*)
$C_{10}H_9N = C_6H_9, C_2N$

Cyanide of Cacodyl. Sparingly soluble in water. Very readily soluble in alcohol, and ether.
$C_6H_6AsN = C_4H_6As, Cy$

Cyanide of Cadmium. Permanent. Very sparingly soluble in water. Easily soluble in an aqueous solution of cyanide of potassium; and, with decomposition, in acids. (Schueler, *Ann. Ch. u. Pharm.*, **87.** 47.) Soluble in warm ammonia-water, but insoluble in solutions of the ammoniacal salts. (Wittstein.)
$CdCy$

The above is the ordinary normal salt, but Rammelsberg describes another cyanide of cadmium, which is soluble in water: this is probably an acid salt.

Cyanide of Cadmium & of Copper(Cu). Very unstable. (Schueler.)
$2CdCy; CuCy$

Cyanide of Cadmium & of Copper(Cu_2). Permanent. Very sparingly soluble in cold, more soluble in boiling water.
$2CdCy; Cu_2Cy$

Insoluble in water. Soluble in warm concentrated chlorhydric acid, and is destroyed only after long-continued boiling therewith; it is but slightly acted upon by cold chlorhydric acid. Insoluble in solutions of the ammoniacal salts, or in boiling ammonia-water. (Schueler, *Ann. Ch. u. Pharm.*, **87.** 49.)

Cyanide of Cadmium & of Iron. Ppt.
$Cd Cy ; Fe Cy_2$?

Cyanide of Cadmium & of Lead. Ppt.
$Cd Cy ; 2 Pb Cy$

Cyanide of Cadmium & of Mercury(Hg). Permanent. Readily soluble in cold water. Decomposed by dilute acids. (Schueler, *Ann. Ch. u. Pharm.*, **87.** 54.)
$2 Cd Cy ; 3 Hg Cy$

Cyanide of Cadmium & of Nickel. Soluble in an aqueous solution of cyanide of potassium, and in acids. (Rammelsberg.)

Cyanide of Cadmium & of Potassium. Permanent. Soluble in 3 pts. of cold, and 1 pt. of boiling water. Not perceptibly soluble in absolute alcohol. (Rammelsberg.)
$Cd Cy ; K Cy$

Cyanide of Cadmium & of Silver. Ppt. Soluble in an aqueous solution of mixed cyanide of cadmium and cyanide of potassium.

Cyanide of Calcium. Soluble in water, the solution undergoing decomposition when evaporated.
$Ca C_2 N$

Cyanide of Calcium & of Gold. Soluble in an aqueous solution of cyanide of calcium. (Scheele.)

Cyanide of Calcium & of Nickel. Soluble in water. (Wœhler.)
$2 Ca Cy ; Ni Cy$

Cyanide of Calcium & *proto Cyanide* of Platinum. Easily soluble in water. (Quadrat.)
$Ca Cy, Pt Cy + 5 Aq$

Cyanide of Calcium & of Silver. Soluble in an aqueous solution of nitrate of silver; in this solution neither chloride of ammonium nor chlorhydric acid produces any precipitate. (Scheele.)

Cyanide of Calcium & of Zinc. Tolerably soluble in water. (Schindler.)

Cyanide of Cerium. Ppt.
$Ce C_2 N$

Cyanide of Cetyl. Insoluble in water. Easily soluble in hot ordinary alcohol and in ether. (Becker, *Ann. Ch. u. Pharm.*, **102.** 213.)
$C_{32} H_{33} C_2 N$

Cyanide of *ter*ChloroMethyl.
(Isomeric with *ChlorAcetonitrile.*)
$C_4 Cl_3 N = C_2 Cl_3, C_2 N$

Cyanide of ChloroPhenyl. Insoluble in water. Easily soluble in alcohol, and ether.
(*ChloroBenzoNitril.*)
$C_{14} H_4 Cl N = C_{12} H_4 Cl, C_2 N$

*Proto*Cyanide of Chromium. Ppt. Insoluble in an aqueous solution of cyanide of potassium.
$Cr, C_2 N$

*Sesqui*Cyanide of Chromium. Insoluble in water, alcohol, or an aqueous solution of cyanide of potassium; but soluble in an excess of a solution of sesquichloride of chromium. When recently precipitated it is soluble in dilute acids, even in acetic acid. (Berzelius.) Insoluble in water. Slowly soluble in cold water acidulated with nitric acid. (F. & E. Rodgers, *Phil. Mag.*, 1834, (3.) **4.** 101.)
$Cr_2''', (C_2 N)_3$

Cyanide of Cinnamyl. Decomposed by water.
$C_{18} H_7 O_2, C_2 N$

Cyanide of Cobalt.

I.) *normal.* Insoluble in water.

$Co C_2 N + 2 Aq$ Soluble, with combination, in an aqueous solution of cyanide of potassium. (F. & E. Rodgers, *Phil. Mag.*, 1834, (3.) **4.** 100; Haidlen & Fresenius.) Readily soluble in ammonia-water, and in aqueous solutions of carbonate of ammonia and succinate of ammonia; but insoluble in solutions of sulphate or nitrate of ammonia or chloride of ammonium. (Wittstein.)

II.) *sesqui.* Known only in combination.

III.) $\frac{6}{5}$ *basic.* Ppt. (Gmelin.)
$3 Co Cy ; Co_2 Cy_3$

Cyanide of Cobalt & of Copper(Cu). Ppt.

Cyanide of Cobalt & of Nickel. Ppt. Unacted upon by boiling chlorhydric acid (?)
$Co Cy ; Ni Cy$

Cyanide of Cobalt & of Silver. Ppt.
$Co Cy ; Ag Cy$

Cyanide of Cobaltammonium & *protocyanide* of Platinum. Insoluble in pure water; but soluble in water which contains ammonia, on boiling.
$N \left\{ \begin{matrix} H_3 \\ Co \end{matrix} \right. . Cy ; Pt Cy$

*Proto*Cyanide of Copper. Easily decomposed. Insoluble in water. Readily soluble in aqueous solutions of cyanide of potassium, carbonate of ammonia, and caustic ammonia. (Gore.) Soluble in chlorhydric acid, from which it is reprecipitated on the addition of water. Soluble in an aqueous solution of cyanide of potassium. (F. & E. Rodgers, *Phil. Mag.*, 1834, (3.) **4.** 100.)
$Cu, C_2 N$

*Di*Cyanide of Copper. Permanent. Insoluble in water. Soluble in chlorhydric acid, from which solution it is precipitated on the addition of water (L. Gmelin), or of potash. (Vauquelin.) Insoluble in warm dilute sulphuric acid. Decomposed by nitric acid.
$Cu_2, C_2 N$

Soluble in dilute acids. (Gerhardt.) Soluble in ammonia-water (Vauquelin), and in aqueous solutions of the alkaline cyanides.

Also in aqueous solutions of carbonate and succinate of ammonia, and in hot solutions of sulphate and nitrate of ammonia and chloride of ammonium. (Wittstein.)

*Proto*Cyanide of Copper & *di*Cyanide of Copper.

I.) $Cu Cy ; Cu_2 Cy + 5 Aq$ Decomposed when boiled with water. Easily soluble in aqueous solutions of cyanide of potassium, carbonate of ammonia, and in hot solutions of other ammoniacal salts, also in ammonia-water. (Wittstein.) Soluble in cold chlorhydric acid; in this solution water produces a precipitate. Decomposed by hot chlorhydric and nitric acids.

II.) $Cu Cy ; 2 Cu_2 Cy + Aq$ Ppt.

Cyanide of Copper & of Cupr(*ic*)ammonium.

I.) $C_4 H_3 N_3 Cu_3 + Aq = Cu_2 Cy ; N \left\{ \begin{matrix} Cu \\ H_3 \end{matrix} \right. , Cy + Aq$ Permanent. Slightly soluble in cold, decomposed by boiling water. Readily soluble in ammonia-water. (Dufau.)

II.) $C_6 H_3 N_4 Cu_5 + Aq = 2 Cu_2 Cy ; N \left\{ \begin{matrix} Cu \\ H_3 \end{matrix} \right. , Cy + Aq$ Ppt.

III.) $C_6 H_6 N_4 Cu_3, \& + Aq = Cu_2 Cy ; N_2 \left\{ \begin{matrix} Cu \\ H_5 \end{matrix} \right. . H, Cy$ Insoluble in cold, decomposed by boiling water. Soluble in aqueous solutions of carbonate of ammonia and caustic ammonia. Decomposed by dilute acids and by solutions of the caustic alkalies. (Liebig & Hilkenkamp, *Ann. Ch. u. Pharm.*, **97.** 218.)

IV.) $C_6 H_6 N_5 Cu_5$ & $+ 2 Aq =$ $2 Cu_2 Cy ; N_2 \left\{\begin{matrix} Cu \\ H_5 \end{matrix}\right. . H, Cy$

V.) $C_4 H_9 N_5 Cu_3 = Cu_2 Cy ; N_3 \left\{\begin{matrix} Cu \\ H_8 \end{matrix}\right. . H, Cy$

*Proto*Cyanide of Copper & of Gold. Ppt.

*Di*Cyanide of Copper & *proto Cyanide* of Iron. Ppt. Decomposed by acids, which dissolve out the dicyanide of copper. (Ittner.)

*Di*Cyanide of Copper & *proto Cyanide* of Lead. Ppt. Decomposed by acids. (Ittner.)

*Di*Cyanide of Copper & *proto Cyanide* of Manganese. Ppt.

*Di*Cyanide of Copper & *sesqui Cyanide* of Manganese. Ppt.

*Di*Cyanide of Copper & *proto Cyanide* of Nickel. Ppt.

*Proto*Cyanide of Copper & of Nickel. Ppt. Soluble in ammonia-water. (F. & E. Rodgers.)

*Proto*Cyanide of Copper & of Platinum. $Cu Cy, Pt Cy$ Insoluble in water. Soluble in ammonia-water. (Quadrat.) Unacted upon by dilute acids. (Schafarik.)

*Di*Cyanide of Copper & *proto Cyanide* of Potassium.
(*Cupro Cyanide of Potassium.*)

I.) $Cu_2 Cy ; K Cy$ Sparingly soluble in water, with separation of some dicyanide of copper. Rammelsberg supposes this solvent action of the water to depend entirely on the presence of No. 2, in a hot solution of which the compound now under consideration is soluble to a considerable extent. From such a solution it crystallizes out before any of compound No. 2 separates.

Neither decomposed nor altered by alkaline solutions. Acids decompose it, precipitating dicyanide of copper, which is finally re-dissolved, with decomposition, when more acid is added.

II.) $Cu_2 Cy ; 3 K Cy$ Permanent. Readily soluble in water. The solution is decomposed on the addition of acids.

III.) $3 Cu_2 Cy ; 2 K Cy$

*Di*Cyanide of Copper & *proto Cyanide* of Silver.

I.) $Cu_2 Cy ; Ag Cy$ Ppt.

II.) $Cu_2 Cy ; 3 Ag Cy$ Ppt. Soluble in an excess of a solution of dicyanide of copper with protocyanide of potassium (No. 2.) (Rammelsberg.)

*Proto*Cyanide of Copper & of Silver. Ppt. $Cu Cy ; Ag Cy$ Sparingly soluble in ammonia-water. Decomposed by acids. (Ittner.)

*Di*Cyanide of Copper & of Sodium. Permanent. Soluble in water. (Meillet.)

*Di*Cyanide of Copper & *proto Cyanide* of Tin. Ppt.

*Di*Cyanide of Copper & *proto Cyanide* of Uranium. Ppt.

*Di*Cyanide of Copper & *proto Cyanide* of Zinc. Ppt. Decomposed by acids. (Ittner.)

Cyanide of Copper with Nitrate of Silver. Insoluble in water. (Wœhler.)

Cyanide of Cumenyl. Insoluble in water.
(Isomeric, or identical with *Cumonitril.*)
$C_{20} H_{11} N = C_{18} H_{11}, C_2 N$ Soluble in all proportions in alcohol, and ether. (Field.)

Cyanide of Cupr(*ic*)ammonium & of Cupr(*eous*)ammonium.

I.) $C_4 H_6 N_4 Cu_3 = (N H_3 Cu) Cy; (N H_3 Cu_2) Cy$ Permanent. Insoluble in water. Readily soluble in warm ammonia-water. (Dufau.)

*Proto*Cyanide of Cupr(*ic*)ammonium & of Platinum. $N \left\{\begin{matrix} H_3 \\ Cu \end{matrix}\right. . Cy, Pt Cy + Aq$

*Proto*Cyanide of Cupr(*ic*)ammonium & of Platin(*ous*)ammonium. $N \left\{\begin{matrix} H_3 \\ Cu \end{matrix}\right. . Cy, N \left\{\begin{matrix} H_3 \\ Pt \end{matrix}\right. . Cy + Aq$ Very soluble in water, alcohol, and ether. Decomposed by acids. (Quadrat.)

Cyanide of Ethyl. Rather soluble in water.
(*Metacetonitrile.*)
(Isomeric with *Proprionitrile.*)
$C_6 H_5 N = C_4 H_5, Cy$ Insoluble in a saturated aqueous solution of chloride of sodium. (Frankland & Kolbe.) Soluble in all proportions in alcohol and ether. (Pelouze.)

Cyanide of Ethyl & of Platinum. Very $C_8 H_7 N_2 Pt O_2 = C_4 H_5, C_2 N ; Pt C_2 N + 2 Aq$ easily decomposed by water. Soluble in hot, less soluble in cold alcohol. Partially soluble in ether. (v. Thann.)

Cyanide of Ethylammonium & of Platinum. $N \left\{\begin{matrix} H_3 \\ C_4 H_5 \end{matrix}\right. . Cy, Pt Cy$ Very readily soluble in water, and alcohol. (v. Thann.)

Cyanide of Ethylammonium & of Silver. $C_4 H_5, C_2 N ; Ag C_2 N$ Soluble in boiling, less soluble in cold water. (E. Meyer.)

*Proto*Cyanide of Iron & of Gold. Ppt.

*Proto*Cyanide of Gold. Permanent. Insol- $Au C_2 N$ uble in water, alcohol, or ether. (Figuier.) Soluble in an aqueous solution of cyanide of potassium. Unacted upon by sulphuric, chlorhydric, or nitric acids, or by aqua-regia, even when these are boiling. (Figuier.) Soluble in ammonia-water, and in an aqueous solution of hyposulphite of soda. (Glassford & Napier.)

Completely insoluble in water, alcohol, or ether. Neither dissolved nor altered by the strongest acids. Unacted upon in the cold, but is dissolved, with partial decomposition, by long-continued boiling, in concentrated potash-lye. Soluble in aqueous solutions of cyanide of potassium and the other soluble cyanides, with combination. Slowly dissolved by an aqueous solution of sulphide of ammonium. (Himly, *Ann. Ch. u. Pharm.*, 1842, **42.** pp. 158, 161.) When recently precipitated, it is slightly soluble in sulphuric, chlorhydric, and nitric acids. (Glassford & Napier.) Unacted upon by cold, partially decomposed by boiling caustic potash.

*Ter*Cyanide of Gold. Permanent. Soluble
(*Auro Cyanhydric Acid.*)
$Au Cy_3 + 6 Aq$ in all proportions in water; and almost as readily in absolute alcohol, and ether. Melts in its water of crystallization, at 50°. The aqueous solution undergoes partial decomposition when evaporated. (Himly, *Ann. Ch. u. Pharm.*, 1842, **42.** 338.)

*Proto*Cyanide of Gold & of Lead. Ppt.

*Proto*Cyanide of Gold & of Manganese. Ppt.

*Proto*Cyanide of Gold & of Potassium.

$Au\,Cy;\ K\,Cy$ Permanent. Soluble in 7 pts. of cold, and in less than 0.5 pt. of boiling water. (Himly, *Ann. Ch. u. Pharm.*, 1842, **42.** pp. 160, 161.) Soluble in 4 pts. of cold, and in 0.8 pt. of boiling water. (Glassford & Napier.) Only sparingly soluble in cold, somewhat more soluble in boiling alcohol; being the more soluble in alcohol in proportion as this contains more water. Insoluble in ether. Decomposed by warm chlorhydric acid. (Himly, *loc. cit.*, p. 161.) Also decomposed by sulphuric and nitric acids, and even by oxalic, tartaric, and acetic acids at a boiling heat. (G. & N.)

*Ter*CYANIDE OF GOLD & *protoCyanide* OF POTASSIUM. $K\,Cy, Au\,Cy_3$ *Vid.* CyanAurate of Potassium.

*Proto*CYANIDE OF GOLD & OF SILVER. Ppt. $Au\,Cy;\ Ag\,Cy$

*Ter*CYANIDE OF GOLD & *protoCyanide* OF SILVER. $Ag\,Cy, Au\,Cy_3$ *Vid.* CyanAurate of Silver.

*Proto*CYANIDE OF GOLD & OF TIN. Ppt.

*Proto*CYANIDE OF GOLD & OF ZINC. Ppt.

CYANIDE OF HYDRARGETHYL. *Vid.* Cyanide of Mercur(*ous*)Ethyl.

CYANIDE OF *bin*IODOMETHYL. $C_4\,H\,I_2\,N = C_2\,H\,I_2, Cy$

*Proto*CYANIDE OF IRIDIUM.

I.) *normal.* $Ir\,Cy$ Insoluble in water. (Dœbereiner.)

II.) *acid.* $Ir\,Cy, H\,Cy$ Soluble in water, and alcohol. (Dœbereiner, in *Berzelius's Lehrb.*, **3.** 1003.)

CYANIDE OF IRIDIUM & OF MERCURY. $Ir\,Cy, Hg\,Cy$ Insoluble in water, or in warm dilute nitric acid. (Dœbereiner, in *Berzelius's Lehrb.*, **3.** 1003.)

*Proto*CYANIDE OF IRON. $Fe\,Cy$ Ppt. Insoluble in, and unacted upon by, dilute chlorhydric or sulphuric acids. Decomposed by boiling with concentrated chlorhydric acid. Soluble, with combination, in alkaline liquors.

*Sesqui*CYANIDE OF IRON.

a = *ordinary modification.* Known only in aqueous solution, which is decomposed when evaporated to dryness.

b = *green modification.* $Fe_2\,Cy_3 + 3\,Aq$ Insoluble in water, or alcohol. (Posselt.)

*Proto*CYANIDE OF IRON & OF NICKEL. Ppt.

*Proto*CYANIDE OF IRON & OF PLATINUM. Ppt.

*Sesqui*CYANIDE OF IRON & *protoCyanide* OF PLATINUM. Ppt.

CYANIDE OF IRON & OF TIN. Fe, Sn, Cy_3 (?) Insoluble in ammonia-water, and in solutions of ammoniacal salts. (Wittstein.)

CYANIDE OF LEAD. $Pb\,Cy$ Insoluble in water. (Scheele.) Sparingly soluble in cold, more soluble in hot water. Soluble in nitric acid. (F. & E. Rodgers, *Phil. Mag.*, 1834, (3.) **4.** 100.) Insoluble in an aqueous solution of cyanide of calcium. (Scheele.) Soluble in an aqueous solution of cyanide of potassium.

Insoluble in a solution of cyanide of potassium. (H. Rose, *Tr.*) Soluble, with decomposition, in nitric and acetic acids. Partially soluble in ammonia-water, and in aqueous solutions of carbonate and nitrate of ammonia, more soluble in solutions of chloride of ammonium and succinate of ammonia. (Wittstein.) It is not precipitated from solutions which contain citrate of soda. (Spiller.)

*Proto*CYANIDE OF LEAD & OF MERCURY(Hg). $Pb\,Cy;\ Hg\,Cy$ (?) Ppt.

*Proto*CYANIDE OF LEAD & OF NICKEL. $2\,Pb\,Cy;\ Ni\,Cy$ Soluble in nitric acid. (F. & E. Rodgers.)

*Proto*CYANIDE OF LEAD & OF SILVER. Ppt.

*Proto*CYANIDE OF LEAD & OF ZINC. Ppt. $Pb\,Cy;\ 2\,Zn\,Cy$ Decomposed by washing.

CYANIDE OF MAGNESIUM. $Mg\,C_2\,N$ Soluble in water, but the solution cannot be evaporated by the aid of heat without decomposition. (F. & E. Rodgers, *Phil. Mag.*, 1834, (3.) **4.** 93.)

*Proto*CYANIDE OF MAGNESIUM & OF PLATINUM. $Mg\,Cy, Pt\,Cy + 7\,Aq$ Soluble in water. Tolerably soluble in hot, less soluble in cold alcohol. (Quadrat.)

*Proto*CYANIDE OF MANGANESE. $Mn\,Cy$ Insoluble in water. Soluble in aqueous solutions of the alkaline cyanides. (Ittner.)

*Sesqui*CYANIDE OF MANGANESE. $Mn_2\,Cy_3$ Known only in combination with other cyanides.

*Proto*CYANIDE OF MANGANESE & OF POTASSIUM. $Mn\,Cy;\ 2\,K\,Cy$

*Proto*CYANIDE OF MANGANESE & OF SILVER. $Mn\,Cy;\ Ag\,Cy$ Ppt. Decomposed by chlorhydric acid. (Ittner.)

CYANIDE OF MERCUR(*ous*)ETHYL. $C_4\,H_5\,Hg_2, C_2\,N$ Sparingly soluble in alcohol, and ether. (Dunhaupt.)

*Proto*CYANIDE OF MERCURY.

I.) *normal.* $Hg\,Cy$ Permanent. 100 pts. of the aqueous solution saturated at its boiling temperature (101.1°) contains 35 pts. of the dry salt; or 100 pts. of water dissolve 53.846 pts. of it at 101.1°; or 1 pt. of the dry salt is soluble in 1.8571 pts. of water at 101.1°. (T. Griffiths, *Quar. J. Sci.*, 1825, **18.** 90.) Soluble in 8 pts. of water at 15.5°; the saturated solution containing 12% of it. Soluble in 8 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) Tolerably soluble in water; less easily soluble in spirit, and nearly insoluble in absolute alcohol.

Soluble in 11 pts. of cold, and in 2.5 pts. of boiling water; in 20 pts. of cold, and in 5 pts. of boiling alcohol. It is not decomposed by any of the oxygen acids, excepting hot concentrated sulphuric acid, or by aqueous solutions of the caustic alkalies. The hydrogen acids decompose it. (Wittstein's *Handw.*) Soluble in an aqueous solution of cyanide of potassium. Soluble, with combination, in aqueous solutions of the alkaline chlorides.

Soluble, without decomposition, in nitric acid. (Berzelius, *Lehrb.*)

II.) *basic.* *Vid.* OxyCyanide of Mercury.

CYANIDE OF MERCURY & OF *X*. *Vid.* Cyano-Mercurate of *X*.

CYANIDE OF MERCURY with FERROCYANIDE OF POTASSIUM. $3\,Hg\,Cy;\ K_2\,Fe\,Cy_3 + 4\,Aq$ Readily soluble in water. (Kane.)

CYANIDE OF MERCURY with FORMIATE OF AMMONIA. $Hg\,Cy;\ C_2\,H\,(N\,H_4)\,O_4$

CYANIDE OF MERCURY with FORMIATE OF POTASH. $Hg\,Cy;\ C_2\,H\,K\,O_4$ Easily soluble in water. (Winkler.)

CYANIDE OF MERCURY with HYPOSULPHITE OF POTASH. $Hg\,Cy;\ K\,O, S_2\,O_2$ Permanent. Soluble in water. (Kessler.)

CYANIDE OF MERCURY with IODIDE OF BARIUM. $2\,Hg\,Cy;\ Ba\,I + 4\,Aq$ Slowly deliquesces. Soluble in 16.5 pts. of cold water, and very easily soluble in boiling water. Soluble in 22.5 pts. of cold, and in 1.6 pts. of hot alcohol of 90%. On boiling, the solutions turn yellow, and a little carbonate of baryta separates out. (Custer, in *Wittstein's Handw.*)

Cyanide of Mercury with Iodide of Calcium. $2\,HgCy;\,CaI + 5\,Aq$ Slightly efflorescent. Very soluble in water. (Poggiale.) More permanent than either the barium or strontium salt. More readily soluble than the strontium salt. (Custer.)

Cyanide of Mercury with Iodide of Potassium. $2\,HgCy;\,KI$ Permanent. Soluble in 16 pts. of cold water, and in less hot water. (Caillot.) Soluble in 96 pts. of cold alcohol of 34° B. (Caillot.) Slightly soluble in ether. (Souville.) Decomposed by acids.

Cyanide of Mercury with Iodide of Sodium. $2\,HgCy;\,NaI + 4\,Aq$ Soluble in 4.5 pts. of cold water; very easily soluble in boiling water. Soluble in 6.5 pts. of cold, and in 2 pts. of hot alcohol of 90%. (Custer.)

Cyanide of Mercury with Iodide of Strontium. $2\,HgCy;\,SrI + 6\,Aq$ Much more soluble in water than the corresponding barium salt. (Custer.)

Cyanide of Mercury with Nitrate *of dinoxide* of Mercury. $HgCy;\,Hg_2O,NO_5$ Readily soluble in water. (Johnston.)

Cyanide of Mercury with Nitrate *of protoxide* of Mercury. $HgCy;\,HgO,NO_5 + 2\,Aq$ (Desfosses.)

Cyanide of Mercury with Nitrate of Silver. $2\,HgCy;\,AgO,NO_5 + 8\,Aq$ Sparingly soluble in cold, much more readily soluble in hot water. About as soluble in alcohol as in water. Soluble, without decomposition, in boiling nitric acid. Decomposed by chlorhydric acid. (Wœhler.)

Cyanide of Mercury with Oxalate *of dinoxide* of Mercury. $4(HgC_2N);\,Hg_2O,C_2O_3$ Sparingly soluble in cold, very soluble in boiling water. The aqueous solution is decomposed by long-continued ebullition. (Saint-Evre, *Ann. Ch. et Phys.*, (3.) **41.** 461.)

Cyanide of Mercury with Strychnine. $2\,HgCy;\,C_{42}H_{22}N_2O_4$ Somewhat soluble in water, and in alcohol. Insoluble in ether. (Abel & Nicholson, *J. Ch. Soc.*, **2.** 260.)

Cyanide of Mercury with SulphoCyanide of Barium. $2\,HgCy;\,\left.\begin{matrix}Cy\\Ba\end{matrix}\right\}S_2$ Very easily soluble in boiling water, from which it crystallizes out as the solution cools. (Bœckmann, *Ann. der Pharm.*, 1837, **22.** pp. 153, 156.)

Cyanide of Mercury with SulphoCyanide of Calcium. $2\,HgCy;\,\left.\begin{matrix}Cy\\Ca\end{matrix}\right\}S_2$ Very easily soluble in boiling water, from which it crystallizes on cooling. (Bœckmann, *Ann. der Pharm.*, 1837, **22.** pp. 153, 157.)

Cyanide of Mercury with SulphoCyanide of Magnesium. $2\,HgCy;\,\left.\begin{matrix}Cy\\Mg\end{matrix}\right\}S_2$ Very easily soluble in boiling water, from which it crystallizes out on cooling. (Bœckmann, *Ann. der Pharm.*, 1837, **22.** pp. 153, 155.)

Cyanide of Mercury with SulphoCyanide of Potassium. $2\,HgCy;\,\left.\begin{matrix}Cy\\K\end{matrix}\right\}S_2$ Sparingly soluble in cold, very soluble in hot water. (Porrett, *Phil. Trans.*, 1814, p. 552.) Very easily soluble in boiling water, from which it crystallizes out on cooling. (Bœckmann, *Ann. der Pharm.*, 1837, **22.** 153.)

Cyanide of Methyl. (*Nitride of Acetyl. Cyanhydrate of Methylene. Isomeric* with *Acetonitril.*) $C_4H_3N = C_2H_3,Cy$ Miscible with water in all proportions. (Dumas; Malaguti & Leblanc.)

Cyanide of Nickel. $NiCy$ Insoluble in water. Soluble in ammonia-water; in aqueous solutions of cyanide of potassium (F. & E. Rodgers, *Phil. Mag.*, 1834, (3.) **4.** 100); of carbonate of ammonia and in warm solutions of sulphate and succinate of ammonia. Imperfectly soluble in solutions of chloride of ammonium, and nitrate of ammonia. Insoluble in concentrated sulphuric, nitric, or chlorhydric acids; but is decomposed when heated therewith. (Wittstein.)

Cyanide of Nickel & of Potassium. $NiCy;\,KCy + Aq$ Soluble in water. Decomposed by sulphuric, nitric, and chlorhydric acids, cyanide of nickel being precipitated. (Compare F. & E. Rodgers, *Phil. Mag.*, 1834, (3.) **4.** 97.)

Cyanide of Nickel & of Silver. $NiCy;\,AgCy$ Soluble in ammonia-water. Insoluble in nitric acid. (F. & E. Rodgers.)

Cyanide of Nickel & of Sodium.
$NiCy;\,NaCy + 3\,Aq$

*Proto*Cyanide of Nickelammonium & of Platinum.

a = anhydrous.

$N\left\{\begin{matrix}H_3\\Ni\end{matrix}\right.Cy,\,PtCy$

b = hydrated.

$N\left\{\begin{matrix}H_3\\Ni\end{matrix}\right.Cy,\,PtCy + Aq$

Cyanide of NitroPhenyl. (*NitroBenzoNitril.*) $C_{14}H_4N_2O_4 = C_{12}H_4(NO_4),Cy$ Tolerably soluble in boiling, less soluble in cold water. Soluble in concentrated acids, from which solution it is precipitated on the addition of water.

Cyanide of Palladammonium. $N\left\{\begin{matrix}H_3\\Pd\end{matrix}\right..\,Cy$ Soluble in boiling, less soluble in cold water. Soluble in ammonia-water.

Cyanide of Palladium. $PdCy$ Insoluble, or very slightly soluble, in water. Soluble in an aqueous solution of cyanide of potassium, in dilute acids, and in ammonia-water.

*Bi*Cyanide of Palladium.
$PdCy_2$

Cyanide of Palladium & of Potassium. $PdCy;\,KCy + 3\,Aq$ Efflorescent.

Cyanide of Palladium with Nitrate of Palladium. Ppt.

Cyanide of Phenyl. (*Benzonitril.*) $C_{14}H_5N = C_{12}H_5,Cy$ Soluble in 100 pts. of water at 100°; less soluble in cold water. Easily soluble in alcohol, and ether.

Cyanide of Phosphorus. Soluble in water with decomposition. (Cenedella.)

Cyanide of Platin(*ous*)*bi*amin & of Platinum. (*Cyanide of Platosammonium* (of Reiset). *Cyanide of Platinum & of diPlatosammonium.*) $N_2\left\{H_6.\,Pt',\,Cy;\ PtCy\right.$ Insoluble in water. Dissolves slowly in boiling ammonia-water, and crystallizes therefrom without alteration. (Reiset, *Ann. Ch. et Phys.*, (3.) **11.** 426.) Slightly soluble in cold, much more readily soluble in boiling water. Soluble, without decomposition in an aqueous solution of caustic potash, in chlorhydric acid, and in dilute sulphuric acid. Decomposed by concentrated nitric, or sulphuric, acid. (Buckton, *J. Ch. Soc.*, **4.** pp. 27, 33.)

Cyanide of Platin(*ous*)ammonium. Much more soluble in water, and in ammonia-water, than the cyanide of platin(*ous*)*bi*amin & of platinum. (Buckton, *J. Ch. Soc.*, **4.** 34.)
(*Cyanide of Platosammonium. Ammonio protoCyanide of Platinum. Cyanhydrate of Platosamine.*)
$\mathrm{N}\left\{\begin{matrix}\mathrm{H_3}\\\mathrm{Pt'}\end{matrix}\right.\mathrm{, Cy}$

*Proto*Cyanide of Platinum.

I.) *normal.* Insoluble in water, in solutions of the alkalies, or in acids. (Dœbereiner.)
$\mathrm{Pt\ Cy}$
When recently prepared, some samples of it are soluble in ammonia-water and in a solution of cyanide of ammonium; other samples are insoluble in these liquids. (Knop & Schnedermann.)

II.) *acid.* Deliquescent. Easily soluble in water and in absolute alcohol. (Reiset, in *Berzelius's Lehrb.*, **3.** 983.)
$\mathrm{Pt\ Cy, H\ Cy}$

*Sesqui*Cyanide of Platinum. *Vid.* PlatinoSesquiCyanhydric Acid.
$\mathrm{Pt_2\ Cy_3}$

*Sesqui*Cyanide of Platinum with *X*. *Vid.* PlatinoSesquiCyanide of *X*.

*Bi*Cyanide of Platinum. Known only in combination with other cyanides. *Vid.* CyanoPlatinates.

*Proto*Cyanide of Platinum & of Potassium. Efflorescent. Abundantly soluble in warm, much less soluble in cold water. Soluble in sulphuric acid. Decomposed by nitric acid. Soluble in alcohol, and ether. (L. Gmelin.)
$\mathrm{Pt\ Cy, K\ Cy + 3\ Aq}$

*Proto*Cyanide of Platinum & of Silver. Insoluble in water. Soluble in ammonia-water. (Buckton.)
$\mathrm{Pt\ Cy, Ag\ Cy}$

*Proto*Cyanide of Platinum & of Quinine.
$\mathrm{C_{40}\ H_{24}\ N_2 O_4, 2\ (H\ Cy, Pt\ Cy) + 2\ Aq}$

*Proto*Cyanide of Platinum & of Sodium. Soluble in water, and alcohol. (Quadrat.)
$\mathrm{Pt\ Cy\ ;\ Na\ Cy + 3\ Aq}$

*Proto*Cyanide of Platinum & of Strontium. Soluble in water.
$\mathrm{Pt\ Cy\ ;\ Sr\ Cy + 5\ Aq}$

*Proto*Cyanide of Platinum & of Tin. Ppt.

*Proto*Cyanide of Platinum & of Zinc. Ppt.

*Proto*Cyanide of Platinum & of Zincammonium.
$\mathrm{N}\left\{\begin{matrix}\mathrm{H_3}\\\mathrm{Zn}\end{matrix}\right.\mathrm{.\ Cy\ ;\ Pt\ Cy + Aq}$

Cyanide of Platosammonium. *Vid.* Cyanide of Platin(*ous*)ammonium.

Cyanide of Platosammonium(of Reiset). *Vid.* Cyanide of Platin(*ous*)*bi*amin & of Platinum.

Cyanide of Potassium. Deliquescent. Very soluble in water. 100 pts. of the aqueous solution saturated at its boiling temperature (103.3°) contains 55 pts. of the dry salt; or, 100 pts. of water dissolve 122.222 pts. of it at 103.3°; or 1 pt. of the dry salt is soluble in 0.8182 pt. of water at 103.3°. (T. Griffiths, *Quar. J. Sci.*, 1825, **18.** 90.) Almost insoluble in absolute alcohol. Soluble in 80 pts. of boiling spirit of 95%; more readily soluble in spirit of 78%; and abundantly soluble in spirit of 35%. Alcohol of 95% precipitates it from the aqueous solution. (Geiger.) Not very soluble in alcohol. (F. & E. Rodgers, *Phil. Mag.*, 1834, (3.) **4.** 94)
$\mathrm{K\ Cy}$

Cyanide of Potassium & of Silver. Permanent. Soluble in 8 pts. of cold, and in 1 pt. of boiling water. (Glassford & Napier.) Soluble in 4.7 pts. of water at 15°, in 4 pts. at 20°, and much more soluble as the temperature is more elevated. "The solubility given by Glassford & Napier (in 8 pts. of water) is too low." (Baup, *Ann. Ch. et Phys.*, (3.) **53.** 464.) Soluble in 25 pts. of 85% alcohol at 20°. (Baup, *loc. cit.*) Soluble in boiling alcohol. Decomposed by acids. (Glassford & Napier.)
$\mathrm{K\ Cy\ ;\ Ag\ Cy}$

Cyanide of Potassium, of Silver, & of Sodium. Soluble in 4.4 pts. of water at 15°, and in 22 pts. of alcohol, of 85%, at 17°. (Baup, *Ann. Ch. et Phys.*, (3.) **53.** 466.)
(*Hydrated Cyanide of Potassium & of Silver, or Salt "b" of Glassford & Napier.*)
$\mathrm{3\ (K\ Cy, Ag\ Cy)\ ;\ Na\ Cy, Ag\ Cy}$

Cyanide of Potassium & of Tellurium. Decomposed by water. (Berzelius.)
(*Telluro Cyanide of Potassium.*)

Cyanide of Potassium & of Zinc.

I.) $\mathrm{K\ Cy\ ;\ Zn\ Cy}$ Permanent. Readily soluble in cold water, and not much more abundantly in hot water. (L. Gmelin.) Decomposed by alcohol.

II.) $\mathrm{2\ K\ Cy\ ;\ Zn\ Cy}$

Cyanide of Potassium with Iodide of Silver. (Liebig.)

Cyanide of Propyl. Decomposed by a boiling solution of caustic potash.
(*Butyronitrile. Cyanide of Trityl.*)
$\mathrm{C_8\ H_7\ N = C_6\ H_7, Cy}$

Cyanide of Silver. Insoluble in water and in dilute nitric acid. (Fresenius, *Quant.*, p. 142.) Sparingly soluble in dilute nitric acid; more readily in boiling than in cold. (Thaulow.) Unacted upon by other dilute oxygen acids. Decomposed by strong acids. (Ittner.) Not soluble to a perceptible extent in commercial cyanhydric acid. (Gore.) Soluble in aqueous solutions of the cyanides of ammonium, potassium, sodium, calcium, barium, and strontium.
$\mathrm{Ag\ C_2\ N = Ag\ Cy}$

Very readily soluble in aqueous solutions of the cyanides of potassium and of sodium, of chloride of ammonium, and of hyposulphite of soda. (Gore.) Soluble in boiling aqueous solutions of the chlorides of potassium, sodium, calcium, barium, and magnesium; but at ordinary temperatures this solution takes place very slowly. Also soluble in solutions of hyposulphite of soda, ferrocyanide of potassium, carbonate, sulphate, nitrate, and succinate of ammonia, and in a large excess of a hot solution of chloride of ammonium. Soluble in ammonia-water. (Wittstein.) Easily soluble in ammonia-water, but is not decomposed by solutions of the caustic alkalies. (Berzelius, *Lehrb.*) Soluble in a strong boiling solution of nitrate of silver. (Wœhler.) Slightly soluble in an aqueous solution of citrate of soda. (Spiller.) Soluble in an aqueous solution of nitrate of protoxide of mercury, from which it is precipitated on the addition of cyanhydric acid, but it is not precipitated either by nitric acid or by a solution of nitrate of silver. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 317.) Easily soluble in ammonia-water. Not decomposed by the fixed alkalies.

*Bi*Cyanide of Silver? Soluble in water. (Meillet.)
(*ArgentoPrussic Acid.*)
$\mathrm{H\ Cy, Ag\ Cy}$

Cyanide of Silver & of Iron. Ppt. Decomposed by chlorhydric acid, but insoluble in other acids. (Ittner.) Soluble in ammonia-water. (Monthiers.)

Cyanide of Silver & of Sodium. Much more soluble in hot than in cold water, and alcohol. Soluble in 5
$\mathrm{Ag\ Cy\ ;\ Na\ Cy}$

pts. of water at 20°; and in 24 pts. of alcohol, of 85%, at 20°. (Baup, *Ann. Ch. et Phys.*, (3.) **53.** 468.)

Cyanide of Silver & of Zinc. Ppt.

Cyanide of Silver with Nitrate of Silver. $2\,Ag\,Cy;\ Ag\,O,\ N\,O_5$ Decomposed by water. (Wœhler.)

Cyanide of Sodium. $Na\,C_2\,N$ Soluble in water, and alcohol, especially if these be hot.

Easily soluble in water. Insoluble in alcohol. (Berzelius's *Lehrb.*, **3.** 218.) May be dissolved in boiling rectified spirit, from which it crystallizes on cooling, but is not very soluble in alcohol. (F. & E. Rodgers, *Phil. Mag.*, 1834, (3.) **4.** pp. 95, 96.) [Mixed cyanide of sodium and of potassium, such as is often met with in commerce, is much less readily soluble in water, than pure cyanide of potassium. (I. D. Fisher, private communication.)]

Cyanide of Sodium & of Zinc. $Na\,Cy;\ 2\,Zn\,Cy + 5\,Aq$ Much more readily soluble in water than the cyanide of potassium and of zinc. (Rammelsberg.)

Cyanide of StibEthyl.
$(C_4\,H_5)_3\,Sb\,Cy_2$

Cyanide of StibEthyl with *prot*Iodide of Mercury.

Cyanide of StibMethyl.

Cyanide of StibMethylEthylium. Soluble in water.

Cyanide of SulphoBenzoyl. $C_{16}\,H_5\,N\,S_2 = C_{14}\,H_5\,S_2,\ C_2\,N$ Insoluble in water. Soluble with decomposition, in alcohol, and ether.

Cyanide of Tetryl. *Vid.* Cyanide of Butyl.

Cyanide of Titanium. $Ti\,Cy_2$ Easily soluble in water. (Dœbereiner, in *Berzelius's Lehrb.*)

Cyanide of Toluenyl. Soluble in alcohol.
(*Cyanide of BenzEthyl.*
Cyanide of Toluonitrile.)
$C_{16}\,N\,H_7 = C_{14}\,H_7,\ N\,C_2$

Cyanide of Trityl. *Vid.* Cyanide of Propyl.

*Sesqui*Cyanide of Uranium.

I.) *basic.* $Ur_2\,Cy_3;\ 2\,Ur_2\,O_3$ Insoluble in water. Soluble in nitric acid. Very sparingly soluble in an aqueous solution of cyanide of potassium. (F. & E. Rodgers, *Phil. Mag.*, 1834, (3.) **4.** 99.)

Cyanide of Vanadium. $Va\,Cy_2$ Insoluble in water. Soluble in an aqueous solution of cyanide of potassium.

Cyanide of Yttrium. $Yr\,N\,C_2$ Efflorescent. Easily soluble in water, and alcohol. (Berlin.)

Cyanide of Zinc. $Zn\,N\,C_2$ Insoluble in water, or in an aqueous solution of cyanide of calcium. (Scheele.) Insoluble in water, or alcohol. Soluble in dilute mineral acids, and in aqueous solutions of caustic potash and ammonia, and of carbonate of ammonia and in hot solutions of other ammoniacal salts. (Wittstein.) Easily soluble in solutions of the alkaline cyanides. About one half as soluble as protocyanide of copper in an aqueous solution of cyanide of potassium. Readily soluble in a solution of sesquicarbonate of ammonia. (Gore.)

Cyanide of Zinc with Iodide of Potassium. $K\,I;\ 2\,Zn\,Cy$ Easily deliquescent. (Rammelsberg.)

CyanicAnilid. *Vid.* CyanAnilid.

Cyanilic Acid. $C_6\,H_3\,N_3\,O_6$ Efflorescent. Somewhat more soluble than cyanuric acid in water. (Liebig.)

Cyanilate of Silver. Ppt.
$C_6\,H_2\,Ag\,N_3\,O_6$

Cyanilide. *Vid.* CyanAnilid.

Cyanilin. *Vid.* CyanAnilin.

*Di*Cyanimid. Sparingly soluble in cold, more easily soluble in boiling water, alcohol, or ether, oils (fixed or volatile), acids, and weak solutions of the alkalies. Soluble, with decomposition, in concentrated sulphuric acid, and in nitric acid.
HydroMellon(of Liebig).
$N\,H\,Cy_2$

Cyanin. (*Anthokyan.*) Soluble in water, and alcohol. Insoluble in ether. (Fremy & Clocz.)

Cyano*bi*BromoPicrin. *Vid.* *di*BromoNitrAcetonitril.

CyanoCodein. $C_{40}\,H_{21}\,N_3\,O_6 = C_{36}\,H_{21}\,N\,O_6,\ 2\,N\,C_2$ Sparingly soluble in water. Soluble in boiling absolute alcohol, and in a mixture of alcohol and ether. It is also soluble in weak spirit, but this solution undergoes decomposition when evaporated.

CyanoCumidin. $C_{40}\,H_{26}\,N_4 = 2\,(C_{18}\,H_{13}\,N,\ N\,C_2)$ Far more soluble in boiling alcohol than cyanilin. Water precipitates it from the cold alcoholic solution. (Hofmann, *J. Ch. Soc.*, **1.** 170.)

Cyanoform. Soluble in water, alcohol, and ether. (Bonnet.)

Cyanogen. $N\,C_2$ or $N_2\,C_4 = \left.\begin{matrix}Cy\\Cy\end{matrix}\right\}$ Water absorbs 4.5 times its own volume at 20°, and alcohol 23 times its volume of cyanogen gas. Ether absorbs 5 volumes of it. (Gay-Lussac.) It is also absorbed by the essential oils, and a few other organic liquids. Alcohol absorbs 40 vols. of it. (Johnston.) 1 vol. of oil of turpentine absorbs 5 vols. of it. (Gay-Lussac.) It is absorbed in large quantity by solutions of dichloride of copper. (Le Blanc.) Insoluble in caoutchin.

(*Solid*) Cyanogen. *Vid.* ParaCyanogen.

Cyanogen with Sulphydric Acid.

I.) $C_4\,H_2\,N_2\,S_2$ Soluble in water, and alcohol. Very soluble in ether.

II.) $C_4\,H_4\,N_2\,S_4$ Very sparingly soluble in cold, more soluble in boiling water, and still more soluble in alcohol, and ether.

No. II. with Oxide of Lead. $C_4\,H_2\,Pb_2\,N_2\,S_4$ Decomposed by boiling water.

*Bi*CyanoMelAnilin. $C_{30}\,H_{13}\,N_5 = C_{26}\,H_{13}\,N_3,\ Cy_2$ Insoluble in water. Soluble, with decomposition, in cold dilute acids. Sparingly soluble in cold, rather easily soluble in boiling alcohol. (Hofmann, *J. Ch. Soc.*, **1.** 308.) Remarkably easily soluble in cold dilute mineral acids as well as in vegetable acids. These solutions soon undergo decomposition, however (Hofmann, *Ibid.*, **1.** 310, & **2.** 308.)

*Bi*CyanoMenaphthylamin. (*DiCymenaphthalamin.*) $C_{46}\,H_{17}\,N_5$ Insoluble in water. Tolerably soluble in alcohol, and ether. Readily soluble in dilute acids, but the solutions thus obtained soon decompose. (Perkin.)

CyanoMercurate of Barium. 100 pts. of water dissolve 17 pts. of it at the ordinary temperature Somewhat soluble in alcohol. (Berzelius's *Lehrb.*)

CyanoMercurate of Berberin. Permanent. Insoluble in cold, soluble in boiling water, or dilute spirit. (Kohl & Swoboda.)
$C_{42}H_{19}NO_{10}, HCl, HgCy$

CyanoMercurate of Calcium. Soluble in water.

CyanoMercurate of Copper. Ppt.

CyanoMercurate of Ethylamin. Permanent. Soluble in water. Sparingly soluble in cold alcohol. (Kohl & Swoboda.)
$N\left\{\begin{matrix}C_4H_5\\H_2\end{matrix}\right. . HCl, HgCy$

CyanoMercurate of Iron. Ppt.

CyanoMercurate of Lead. Ppt.

CyanoMercurate of Magnesium. Soluble in water.

CyanoMercurate of Methyl. Decomposed by moist air. (Hesse.)
$C_2H_3Cy; 4 HgCy$

CyanoMercurate of Platinum. Insoluble in water. Soluble in hot chlorhydric acid. (Dœbereiner.)
$PtCy, HgCy$

CyanoMercurate of Platinum with Nitrate *of dinoxide* of Mercury. Ppt. (Rammelsberg.)
$5(HgCy, PtCy); Hg_2O, NO_5$

CyanoMercurate of Potassium. Permanent. Soluble in 4.4 pts. of cold water. Somewhat soluble in alcohol. Decomposed by acids. (L. Gmelin.)
$KCy, HgCy$

CyanoMercurate of Silver. Ppt.
$AgCy, HgCy$

CyanoMercurate of Silver with Nitrate *of protoxide* of Mercury.
$AgCy, HgCy; HgO, NO_5 + 4 Aq$

CyanoMercurate of Silver with Sulphate *of protoxide* of Mercury.
$AgCy, HgCy; HgO, SO_3 + Aq$

CyanoMercurate of Sodium. Soluble in water.

CyanoMercurate of Strontium. About as soluble in water as the barium salt. (Berzelius's *Lehrb.*)

CyanoMercurate of Strychnine.

I.) More soluble than the corresponding chloromercurate in water, and alcohol. Insoluble in ether.
$C_{42}H_{22}N_2O_4, HgCy$

II.) Sparingly soluble in cold water. Tolerably soluble in boiling water, and alcohol.
$C_{42}H_{22}N_2O_4, HCy, HgCl$

III.) $C_{42}H_{22}N_2O_4, HCl, 4 HgCy$

CyanoMercurate of Zinc. Ppt.
$ZnCy, HgCy$?

CyanoPhenylamin. *Vid.* CyanAnilid.

CyanoPhenyl*di*Phenyl*bi*amin. Insoluble in water. Difficultly soluble in boiling alcohol. Soluble in ether.
(*CyanotriPhenylbiamine.*)
$C_{36}H_{17}N_3 = N_2\left\{\begin{matrix}C_{12}H_4(C_2N)\\(C_{12}H_5)_2\\H_3\end{matrix}\right.$

CyanoPlatinic Acid. *Vid.* BiCyanide of Platinum.

CyanoPlatinate of Quinine.
$C_{40}H_{24}N_2O_4, 2(HCy, PtCy_2)$

CyanoPlatinate of *X*. *Vid.* Cyanide of *X* & of Platinum.

CyanoSalicyl. Soluble in alcohol. (Cahours.)
$C_{16}H_5NO_4$

CyanoToluidin. Less soluble in alcohol and ether than cyanilin. Soluble in dilute chlorhydric acid. (Hofmann, *J. Ch. Soc.*, **1.** 170.)
$C_{32}H_{18}N_4 \equiv 2 C_{14}H_9N, Cy_2$

*Insoluble*Cyanuric Acid. *Vid.* Cyamelid.

Cyanuric Acid. Effloresces in warm air. Soluble in 40 pts. of cold water, more soluble in hot water. Difficultly soluble in cold water. Soluble in 24 pts. of boiling water, (Wittstein's *Handw.*) Readily soluble in boiling, less soluble in cold alcohol of 36° B. (Chevallier & Lassaigne.) Soluble in boiling concentrated sulphuric acid, from which solution water precipitates cyanilic acid. (Liebig.) Also soluble in hot nitric acid. (Sérullas.) The cyanurates are, for the most part, but sparingly soluble in water.
(*Pyruric Acid.*)
$C_6H_3N_3O_6 + 4 Aq$

Cyanurate of Ammonia. Effloresces, with loss of ammonia. Even cold water, in which it is difficultly soluble, abstracts a portion of its ammonia. (Berzelius's *Lehrb.*) Easily soluble in water containing free ammonia. (Knapp, *Ann. der Pharm.*, 1837, **21.** 247.)
$C_6H_2(NH_4)N_3O_6 + 2 Aq$

Cyanurate of Ammonia & of Copper. Insoluble in cold water. Slightly soluble in ammonia-water.
$C_6HCu(NH_4)N_3O_6$

Cyanurate of Ammonia & of Silver.
$C_6(NH_4)_3N_3O_6; C_6Ag_3N_3O_6 + 2 Aq$

"Cyanurate of Amyl" (of Schlieper). *Vid.* Allophanate of Amyl.

Cyanurate of Argentammonium.
$C_6H(NH_3Ag)_2N_3O_6$

Cyanurate of Baryta.

I.) *mono.* Almost insoluble in water.
$C_6H_2BaN_3O_6 + 2 Aq$

II.) *di.* Sparingly soluble in water. (Chevallier & Lassaigne.)
$C_6HBa_2N_3O_6 + 3 Aq$

Cyanurate of Cinchonin. Sparingly soluble in water. Insoluble in alcohol or ether. (Elderhorst.)

Cyanurate of Cupr(*ic*)ammonium.

I.) *mono.* Insoluble in cold, very sparingly soluble in hot water. Insoluble in ammonia-water. (Wiedemann.)
$C_6(NH_3Cu)H_2N_3O_6$

II.) *di.* Permanent. Sparingly soluble in water. Nearly insoluble in ammonia-water. (Wœhler.)
$C_6(NH_3Cu)_2HN_3O_6 + 2 Aq$

"Cyanurate of Ethyl" (of Liebig & Wœhler). *Vid.* Allophanate of Ethyl.

Cyanurate of Ethyl.

I.) *di.* Tolerably readily soluble in water, alcohol, and ether. (Limpricht.)
$C_{14}H_{11}N_3O_6 = Cy_3(C_4H_5)_2HO_6$

II.) *tri.* Sparingly soluble in water, though more soluble in hot than in cold. Easily soluble in alcohol, especially if this be concentrated. Soluble in ether. Sparingly soluble, without decomposition, in ammonia-water at 100°, less soluble in the cold. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **42.** 57.) Sparingly soluble in water. Readily soluble in alcohol, and ether. Readily soluble, without decomposition, in acids, even in concentrated nitric acid. (Habich & Limpricht.)
(*Cyanuric Ether.*)
$C_{18}H_{15}N_3O_6 = Cy_3(C_4H_5)_3O_6$

*Di*Cyanurate of Ethyl & of Silver. Ppt.
$C_{14}H_{10}N_3AgO_6 = Cy_3(C_4H_5)_2AgO_6$

Cyanurate of Lead. Ppt.
$C_6Pb_3N_3O_6 + 3 Aq$

Cyanurate of Lead & of Silver. Ppt.
$C_6PbAg_2N_3O_6 + 2 Aq$

Cyanurate of Lime. Readily soluble in water.

"Cyanurate of Methyl"(of Richardson). *Vid.* Allophanate of Methyl.

Cyanurate of Methyl. Insoluble in cold water. Somewhat sparingly soluble in boiling water. Soluble in alcohol. Sparingly soluble in cold, more soluble in hot spirit. (Wurtz, *Ann. Ch. et Phys.*, (3.) **42.** 62.)
$C_{12}H_9N_3O_6 = (C_2H_3)_3Cy_3O_6$

Cyanurate of Morphine.

Cyanurate of Phenyl. Soluble in alcohol.
$C_{42}H_{15}N_3O_0 = (C_{12}H_5)_3Cy_3O_6$

Cyanurate of Potash.

I.) *mono.* Very difficultly soluble in cold water. Insoluble in acetic, nitric, or chlorhydric acids. (Liebig.)
("*acid.*")
$C_6KH_2N_3O_6$

II.) *di.* Easily soluble in dilute alkaline solutions. Decomposed by pure water, with separation of No. I. Insoluble in alcohol. (Liebig & Wœhler.)
("*neutral.*")
$C_6K_2HN_3O_6$

Cyanurate of Potash & of Silver.

Cyanurate of Quinine. Soluble in water, and alcohol. (Elderhorst.)

Cyanurate of Silver.

I.) *mono.* Insoluble in water, or acetic acid. Soluble, with decomposition, in nitric acid. (Wœhler.)
$AgH_2Cy_3O_6$

II.) *di.* Insoluble in water. Soluble in nitric acid.
$Ag_2HCy_3O_6$

III.) *tri.* Insoluble in water. Very sparingly soluble in dilute nitric acid.
$Ag_3Cy_3O_6 + Aq$

Cyanurate of Soda. Readily soluble in water. (Chevallier & Lassaigne.)

Cyanurate of Urea. Soluble in hot, less soluble in cold water. Also soluble in alcohol. (Berzelius's *Lehrb.*, **3.** 345.)
$C_2H_4N_2O_2, H_3Cy_3O_6$

Cyanurenic Acid. *Vid.* Kynurenic Acid.

Cyanylic Acid. *Vid.* Cyanilic Acid.

Cyclamin. *Vid.* Arthanitin.

*Di*CyMeNaphthalamin. *Vid.* *bi*CyanoMe-Naphthylamin.

Cymene. Permanent. Insoluble in water. Easily soluble in alcohol, ether, and the essential oils. (Gerhardt & Cahours.)
(*Cymol. Camphogene. Hydride of Thymyl.*)
(Isomeric or identical with *Hydride of Cumicyl.*)
$C_{20}H_{14}''$

CymeneSulphurous Acid. *Vid.* Thymyl-Sulphurous Acid.

Cymidin. Somewhat soluble in water. Easily soluble in alcohol, and ether. (Barlow, *Ann. Ch. u. Pharm.*, **98.** 249.)
(*Cumicylamin.*)
$C_{20}H_{15}N = N\left\{\begin{matrix}C_{20}H_{13}\\H_2\end{matrix}\right.$

Cyminic Acid. Insoluble in water, alcohol, ether, and most other liquids. (Persoz.)

"Cymyl"(of Kolbe). Same as Cumicyl.
$C_{20}H_{13}$

Cynapin(from *Æthusa cynapium*).

Cynene. Permanent. Insoluble in water. Readily soluble in alcohol, and ether. Insoluble in concentrated sulphuric acid; soluble, with combination, in fuming sulphuric acid. Unacted upon by dilute nitric acid. (Vœlckel, *Ann. Ch. u. Pharm.*, **89.** 359.)
$C_{24}H_{16}''$

Cynodin(from *Cynodon dactylon*).

Cystic Oxide. *Vid.* Cystin.

Cystin. Insoluble in water or alcohol. Soluble in chlorhydric, sulphuric, nitric, oxalic, and phosphoric acids. Soluble in solutions of the fixed alkalies and the alkaline carbonates. (Wollaston.) Also soluble in ammonia-water and in solutions of the bicarbonates of potash and of soda. (Cloetta.) Insoluble in a solution of bicarbonate of ammonia. It is not precipitated from alkaline solutions by sulphuric, chlorhydric, or nitric acids; but is precipitated by acetic, tartaric, and citric acids. Insoluble in aqueous solutions of acetic, tartaric, or citric acids. (Wollaston.)
$C_6H_7NS_2O_4 = N\left\{\begin{matrix}C_6H_5S_2O_4\\H_2\end{matrix}\right.$

D.

Dadyl. *Vid.* Camphilene.

Damaluric Acid. Somewhat soluble in water.
$C_{14}H_{12}O_4 = C_{14}H_{11}O_3, HO$

Damalurate of Baryta. Soluble in water. (Stædeler.)
$C_{14}H_{11}BaO_4$

Damalurate of Lead. Ppt.

Damalurate of Silver. Ppt.
$C_{14}H_{11}AgO_4$

Dammarane. Insoluble in weak alcohol. Soluble in absolute alcohol and in oil of turpentine. (R. D. Thomson.)
$C_{40}H_{31}O_6$

Dammaric Acid. Insoluble in water. Easily soluble in ordinary alcohol, ether, the fatty oils, concentrated sulphuric acid, and aqueous solutions of caustic potash and ammonia.
$C_{80}H_{60}O_{12}$?

Dammarate of Silver. Ppt.
$C_{60}H_{59}AgO_{12}$

Dammarin. *Vid.* β resin of Dammara Resin; under Resins.

Dammarole.
$C_{40}H_{31}O_6$

Dammarone.
$C_{38}H_{30}O$

Damolic Acid.
$C_{26}H_{23}O_3, HO$ (?)

Damolate of Baryta. Soluble in water, though less so than the damalurate of baryta. (Stædeler.)

Daphnin(from *Daphne gnidium*, and *mezereum*). Sparingly soluble in cold, more easily soluble in hot water. Also soluble in alcohol, and ether.
(*Daphin.*)

Datiscetin. Almost insoluble in water. Sparingly soluble in cold, easily soluble in hot alcohol. Soluble in almost all proportions in ether. Soluble in alkaline solutions. (Stenhouse, *J. Ch. Soc.*, **9.**)
$C_{30}H_{10}O_{12}$

Datiscetin with Oxide of Lead. Insoluble in water or alcohol.
$C_{30}H_6Pb_2O_{12}$

Datiscin(of Braconnot and Stenhouse). Sparingly soluble in cold, tolerably soluble in boiling water. Very readily soluble in cold alcohol, and in almost all proportions in boiling alcohol. Sparingly soluble in ether. Soluble in aqueous solutions of ammonia, potash, soda, lime, and baryta. (Stenhouse, *J. Ch. Soc.*, **9.** 228.)
$C_{42}H_{22}O_{24}$

Daturin. *Vid.* Atropin.

Delphin, or Delphinin(from *Delphinium Staphisagria*). Insoluble, or but sparingly soluble in pure water. Soluble in absolute alcohol and in ether. Soluble in dilute acids.

Delphinin(of Chevreul). Consists, according to Berthelot, of a mixture of mono, bi, & ter-Valerin, *q. v.*

Delphinic Acid. *Vid.* Valeric Acid.

Delphinone. *Vid.* Valerone.

DeutOxide (&c.) **of** *X*. See under Oxide (&c.) of *X*.

Dextrin.
$C_{12} H_{10} O_{10}$

I.) *Dextrin proper.* [*Starch which has been rendered fluid by the action of diastase, or sulphuric acid.*] Insoluble in cold water, forming a jelly therewith. Soluble in boiling water, from which it separates on cooling. Alcohol precipitates it from the aqueous solution. Boiling acids, even when weak, but especially if concentrated, convert it into glucose.

1 pt. of dextrin, in the condition of a granular powder, obtained from potato-starch by means of malt in the ordinary way, and purified from sugar by means of alcohol, then dried until it ceased to lose weight at 100°, being treated with 1000 pts. of alcohol of 0.837 sp. gr., at first at the ordinary temperature, and then at the boiling temperature, suffered no alteration of volume, lustre, or transparency; with alcohol of 0.880 sp. gr. the quantity of the dextrin was not lessened, but it softened, became cloudy, and finally formed a single lump: the boiling alcohol deposited nothing on cooling; with alcohol of 0.910 sp. gr. the separate grains of the dextrin cohered to a single lump, the volume of which, at the ordinary temperature, appeared to be equal to that of its component grains, or nearly so, but on heating the spirit to boiling the greater part of the dextrin dissolved, although the solution was not complete. When 10 pts. of dextrin (instead of 1 pt., as above) were taken, to 1000 pts. of the alcohol, and the mixture kept hot for some time, and constantly agitated, more of it dissolved, although, as before, complete solution could not be obtained, and the solution become cloudy on cooling. When 100 pts. of dextrin were added to 1000 pts. of the alcohol and the mixture maintained for a time at the temperature of boiling the volume of the dextrin decreased about ⅓, and the undissolved portion lay as a thick fluid beneath the solution. The latter became cloudy on cooling, depositing viscid drops of dextrin, and after having stood for six days [at the ordinary temperature] it contained 0.9% of dextrin.

7 pts. of the dextrin being gently heated in 1000 pts. of alcohol of 0.950, complete solution ensued; on cooling, the solution became cloudy, and so much dextrin separated that but 3.6% of it (anhydrous) remained in solution. 340 pts. of dextrin being boiled with 1000 pts. of the same alcohol, dissolved completely after long-continued agitation, but separated again for the most part on cooling, the cold solution having retained 19% of it (anhydrous).

Hence it appears that dextrin is entirely insoluble in cold or boiling alcohol of 0.837 @ 0.880 sp. gr., although it combines with a portion of the water of the latter and becomes soft; that alcohol of 0.910 begins to dissolve it, though only sparingly and incompletely, being incapable of dissolving completely so much as $\frac{1}{10}$ of a per cent of it, although the same alcohol is capable of dissolving about 3% of dextrin at the boiling heat, when an excess of the latter is present, depositing 2.1% on cooling, so that the cold solution contains only 0.9%; that dextrin dissolves in considerable quantity (about ⅓) and completely in alcohol of 0.950, from which solution about ½ of the dissolved matter is deposited again on cooling, both from strong and from more dilute solutions: from which it would seem to follow that the dextrin is decomposed by alcohol of 0.950 sp. gr. into two different substances which are present in about equal quantities, and of which one is only soluble in hot alcohol of 0.950 sp. gr., while the other is soluble both in hot and in cold alcohol of this strength. (C. F. Anthon, *Dingler's polyt. J.*, 1860, **155.** pp. 458–460.) Insoluble in very strong alcohol, but soluble to no inconsiderable extent in weak alcohol; being incomparably more soluble than soluble starch in ordinary alcohol. (Bèchamp, *Ann. Ch. et Phys.*, (3.) **48.** 492.) Dextrin is easily soluble in water. Also soluble in alcohol of 30%, but insoluble in alcohol of 80%, and in ether. (Wittstein's *Handw.*)

II.) *Dextrin Gum.* [*Product of the longer-continued action of sulphuric acid upon No.* 1.] Easily soluble in cold or hot water. Alcohol, when added in sufficient quantity, precipitates it from the aqueous solution.

III.) *Leïocome.* [*Roasted Starch.*] (*British Gum. Gum Substitute.*) Soluble in cold water. [The term *British gum* is ordinarily applied to roasted wheat-starch, while roasted potato-starch is called *gum substitute,* and the distinction is said to be founded on a real difference as great as that between the starches themselves. (Ordway, *Am. J. Sci.*, (2.) **31.** 451.)]

DextroRacemic Acid. Identical with Tartaric Acid (*right*), *q. v.*

Di or DinAcetate (&c.) **of** *X*. See under Acetate (&c.) of *X*, as *din*Acetate of *X*, *di*Chloride of *X*, and the like.

Dialuramid. (*Murexan. Uramil.*)
$C_8 H_5 N_3 O_6$
Insoluble in cold, sparingly soluble in boiling water. It requires more than 10,000 pts. of water to dissolve it. (Prout.) Insoluble in alcohol or ether, or in acetic, tartaric, or citric acids. Not perceptibly soluble in dilute phosphoric, sulphuric, or chlorhydric acids. (Prout.) Soluble in cold concentrated sulphuric acid, from which it is precipitated unchanged on the addition of water.

Easily soluble in aqueous solutions of the fixed alkalies, and ammonia, without neutralizing them. (Liebig & Wœhler.)

Dialuric Acid. Tolerably easily soluble in water. Soluble in chlorhydric acid.
$C_8 H_4 N_2 O_8 = C_8 H_3 N_2 O_7, H O$

Dialurate of Ammonia.

I.) *mono.* Sparingly soluble in cold, very soluble in boiling water. (Gregory.)
$C_8 H_3 (N H_4) N_2 O_8$

II.) *acid.* (*Uramilic Acid.*) (Liebig & Wœhler.) Soluble in 6 @ 8 pts. of cold, and in 3 pts. of hot water. Soluble in cold concentrated sulphuric and nitric acids. (Liebig & Wœhler.)
$C_{16} H_7 (N H_4) N_4 O_{16}$

Dialurate of Baryta. Scarcely at all soluble in water. (Gregory.)
$C_8 H_3 Ba N_2 O_8 + Aq$

Dialurate of Lead. Ppt.

Dialurate of Potash. Sparingly soluble either in hot or in cold water. Insoluble in acetic acid. Soluble in weak potash-lye. (Gregory.)
$C_8 H_3 K N_2 O_8$

Diastase. Soluble in water and in weak alcohol. Insoluble in strong alcohol.

Didymium. When fused, it does not decom-

D pose water; but appears to do so when in the pulverulent state. Readily soluble in acids. (Marignac.)

Diethylin. *Vid. di*Ethylin.

Diffluan. Deliquescent. Very soluble in water. Insoluble in alcohol. (Schlieper.)
$C_6 H_4 N_2 O_5$

Digestive Salt. *Vid.* Chloride of Potassium.

Digitalic Acid. Very soluble in water; the solution subsequently undergoing partial decomposition. Tolerably soluble in alcohol; less soluble in ether. Many of its salts are soluble, but are prone to undergo decomposition when in solution.

Digitalate of Baryta. Very soluble in water. Insoluble in alcohol or ether.

Digitalate of Copper.

Digitalate of Iron. Ppt.

Digitalate of Lead. Ppt.

Digitalate of Lime. Very soluble in water. Insoluble in alcohol or ether.

Digitalate of Magnesia. Soluble in water.

Digitalate of Potash. Exceedingly soluble in water.

Digitalate of Silver. Soluble in nitric acid.

Digitalate of Soda. Soluble in water.

Digitalate of Zinc.

Digitalicrin. Insoluble in water. Easily soluble in alcohol. Sparingly soluble in ammonia-water. Soluble in strong mineral acids. (Walz, in *Wittstein's Handw.*)
$C_{22} H_{20} O_6$

Digitalin. Very sparingly soluble in water. Soluble in alcohol; more readily in dilute than in concentrated; more readily in hot than in cold. Very little acted upon by ether. Soluble in concentrated sulphuric, nitric, and chlorhydric acids. (Lebourdais, *Ann. Ch. et Phys.*, (3.) **24.** 61.) Very sparingly soluble in water. Soluble in 2000 pts. of cold, and in 1000 pts. of boiling water. Readily soluble in alcohol.
$C_{20} H_{18} O_8$

Soluble in 1920 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 75.) Soluble in 288 pts. of ether of 0.748 sp. gr., and in 1250 pts. of 0.726 sp. gr. Soluble in concentrated chlorhydric, and in acetic acid. According to Walz, the digitalin of previous observers, as cited above, was contaminated with several other substances. He finds that 1 pt. of pure digitalin is soluble in 1000 pts. of cold, and in 250 pts. of hot water; in 3 pts. of cold, and in 2 pts. of hot alcohol. Easily soluble in ammonia-water, and in concentrated sulphuric, chlorhydric, and nitric acids. (Wittstein's *Handw.*) 100 pts. of chloroform dissolve 1.25 pts. of it. (Schlimpert, *Kopp & Will's J. B. für* 1859, p. 405.)

Digitaloic Acid. Insoluble in water. Soluble in hot, less soluble in cold alcohol. Insoluble in aqueous solutions of caustic potash or ammonia. (Walz.)
$C_{22} H_{22} O_4$

Digitoleic Acid. Very sparingly soluble in water. Readily soluble in alcohol, and ether. The alkaline digitoleates are soluble in water; the other salts are insoluble.

Digitoleate of Baryta.

Digitoleate of Cobalt.
Digitoleate of Copper. } Ppts.
Digitoleate of Iron.

Digitoleate of Lead.
I.) *basic.* Insoluble in ether.
II.) *acid.* Soluble in ether.

Digitoleate of Lime.
Digitoleate of Mercury (Hg). } Ppts.
Digitoleate of Nickel.

Digitoleate of Potash. Soluble in water, and alcohol.

Digitoleate of Silver. Ppt.

Digitoleate of Soda. Soluble in water.

Digitoleate of Zinc. Ppt.

Digitolosin. Soluble in 125 pts. of cold, and in 42 pts. of boiling water; and in about 2 pts. of alcohol. Soluble in ammonia-water and in the strong mineral acids. (Walz, in *Wittstein's Handw.*)
$C_{38} H_{32} O_{18}$

Digitolosmin (from *Digitalis purpurea*). Insoluble in cold water. Readily soluble in alcohol, from which it is precipitated on the addition of water. Very easily soluble in ether. (Walz.)

Dilituric Acid. Nearly insoluble in cold, sparingly soluble in hot water. Soluble in a dilute solution of potash. Readily soluble, without decomposition, in concentrated sulphuric acid, from which it is precipitated on the addition of water. Unacted upon by strong nitric acid.

Diliturate of Potash.
I.) *normal.* Tolerably soluble in water; insoluble in alcohol.
II.) *acid.* Sparingly soluble in cold, more readily soluble in hot water. Soluble in concentrated sulphuric acid, from which it is precipitated unchanged on the addition of water. (Schlieper.)

Diliturate of Silver. Ppt.

Diosmin (from *Diosma crenata*). Insoluble in water. Soluble in alcohol, ether, essential oils, and dilute acids. (Landerer.)

DiPhanine. *Vid. di*Phenin.

Disacryl. Insoluble in water, alcohol, ether, bisulphide of carbon, fatty or essential oils, acids, or alkaline solutions. (Redtenbacher.)
$C_{10} H_7 O_4$ (?)

Disacryl Resin. Insoluble in water. Easily soluble in alcohol, ether, and alkaline solutions. (Redtenbacher.)
$C_{20} H_{13} O_6$ (?)

*Di*SulphoMetholic Acid. *Vid.* Methionic Acid.

Dœglinic Acid. Easily soluble in 1 pt. of alcohol of 0.826 sp. gr. (Scharling.)
(*Dæglingsæure.*)
$C_{38} H_{36} O_4 = C_{38} H_{35} O_3, HO$

Dœglinate of Baryta. Soluble in boiling alcohol.

Dœglinate of Lead. Soluble in ether.

Dracic Acid. } *Vid.* Anisic Acid.
Draconic Acid.

Dracol. *Vid.* Phenate of Methyl.

Draconyl. *Vid.* MetaStyrol.

Dracyl. *Vid.* Hydride of Toluenyl.

Dragonic Acid. *Vid.* Anisic Acid.

Dragonyl. *Vid.* Essence of Anise.

Dulcamarin. Permanent. Soluble in 1075 pts. of water; in 10 pts. of cold alcohol, more soluble in hot alcohol; and in 1440 pts. of ether. Tolerably abundantly soluble in acetic acid. Swells up to a jelly in ammonia-water, but does not dissolve therein. Soluble in concentrated chlorhydric and sulphuric acids. Strong nitric acid also dissolves it rapidly. (Wittstein.)
$C_{65} H_{50} N O_{29}$

Dulcose or Dulcin. Easily soluble in boil-

(*Dulcit.*)
$C_{12}H_{14}O_{12}$
ing, less soluble in cold water. Very sparingly soluble in boiling, and still less soluble in cold alcohol. Soluble, apparently without decomposition, in a warm dilute solution of caustic potash; decomposed by a concentrated solution of potash.

Dumasin(of Kane). Insoluble in water. Soluble in all proportions in alcohol, and ether.
[Not identical with *Oxide of Mesityl.*] (Zittig.)
$C_{12}H_{10}O_2$

Dutch Liquid. *Vid.* Chloride of Ethylene.

Dyslysin. Insoluble in water, and in cold alcohol. Sparingly soluble in boiling alcohol; more soluble in boiling ether. Insoluble in aqueous solutions of potash or ammonia, or in acids.
$C_{48}H_{36}O_6$

Dyslyte. Soluble in 24000 pts. of water at 10°. Soluble in about 2200 pts. of alcohol of 88% at 10°; and in about 1500 pts. of 97% at 10°. Soluble in ether, and in concentrated sulphuric acid. (Baup, *Ann. Ch. et Phys.*, (3.) **33.** 198.)

E.

Eblanin. *Vid.* PyroXanthin.

Elaene. *Vid.* Nonylene.

Elaic Acid. *Vid.* Oleic Acid.

Elaidic Acid. Insoluble in water. Easily soluble in alcohol, and, though less so, in ether.
$C_{36}H_{34}O_4 = C_{36}H_{33}O_3, HO$

The metallic elaidates, excepting those of the alkalies, are insoluble in water; they are, however, decomposed by an excess of water.

Elaidate of Ammonia. Sparingly soluble in ether.

Elaidate of Baryta. Sparingly soluble in water, alcohol, and ether.

Elaidate of Ethyl. Insoluble in water. Soluble in about 8 pts. of absolute alcohol. Scarcely at all soluble in ordinary alcohol. Soluble in all proportions in ether.
$C_{36}H_{33}(C_4H_5)O_4$

Elaidate of Glyceryl. *Vid.* Elaidin.

Elaidate of Lead. Sparingly soluble in water, alcohol, or ether.

Elaidate of Methyl.
$C_{36}H_{33}(C_2H_3)O_4$

Elaidate of Potash.

Elaidate of Silver. After having become dry it is sparingly soluble in water, alcohol, and ether. When recently precipitated it is more readily soluble. Easily soluble in warm ammonia-water.
$C_{36}H_{33}AgO_4$

Elaidate of Soda. Soluble in alcohol, and in warm ether. The alcoholic solution is decomposed by water, a bisalt crystallizing out.

Elaidinamid. Easily soluble in alcohol.
$N \left\{ \begin{matrix} C_{36}H_{33}O_2 \\ H_2 \end{matrix} \right.$

Elaidin. Insoluble in water. Almost insoluble in alcohol. Readily soluble in ether.

Elaierin. 1000 pts. of alcohol, of 0.805 sp. gr. dissolve 7 pts. of it at 15°. Only very slowly attacked by potash-lye. (Chevreul.)

Elain. *Vid.* Olein.

Elaldehyde. Soluble in water.
$C_4H_4O_2$

Elaone. *Vid.* Oleone.

Elaterin. Insoluble in water. Readily soluble in alcohol. Sparingly soluble in ether. Insoluble in dilute acids or alkalies, or in concentrated chlorhydric acid. Soluble in concentrated sulphuric and nitric acids, from which solutions it is precipitated unchanged, on the addition of water. Almost entirely soluble in water, alkaline solutions, or dilute acids. Soluble in 5 pts. of cold, and in 2 pts. of hot alcohol; and in 118 pts. of ether. Also soluble in hot oil of turpentine, and in fatty oils. (Wittstein's *Handw.*)
$C_{60}H_{24}O_{18}$

Elathin(from the action of sulphur and ammonia upon acetone). Insoluble in water. Soluble in alcohol; and ether. (Zeise.)

Elayl. *Vid.* Ethylene.

ElaylOxalate of Silver(of Plantamour).

Elemi. See under **Resins.**

Ellagic Acid. Not entirely, but nearly insoluble in water. Sparingly soluble in alcohol. Insoluble in ether. Soluble in alkaline solutions, and in warm concentrated sulphuric acid, from which it is precipitated unchanged on the addition of water.
(*Bezoaric Acid. Bezoardic Acid.*)
$C_{28}H_6O_{16} + 4Aq$

Ellagate of Ammonia. Insoluble, or but sparingly soluble, in water.

Ellagate of Baryta. Decomposes when exposed to the air. Insoluble in boiling water.
$C_{28}H_4Ba_2O_{16}, BaO, HO$ (?)

Ellagate of Lead(basic).
$C_{28}H_4Pb_2O_{16}, 2PbO$

Ellagate of Lime.

Ellagate of Manganese. Insoluble in water.

Ellagate of Potassium.

I.) $C_{28}H_4K_2O_{16}$ Sparingly soluble in cold water.

II.) $C_{28}H_4K_2O_{16} + KO, HO$ (?) Very soluble in water. Sparingly soluble, or insoluble in alcohol.

Ellagate of Soda.

I.) $C_{28}H_4Na_2O_{16}$ Less soluble than the corresponding potash-salt in water.

II.) *basic.* Decomposed when exposed to the air. Readily soluble in water.

Emetin(from *Cephaëlis ipecacuanha*). Difficultly soluble in cold, more easily soluble in warm water. Very soluble in alcohol, and in dilute acids. Almost insoluble in ether and the oils. Most of its salts are easily soluble in water. The salt of emetin, which exists naturally in the root of ipecacuanha, is soluble in water, wine, and diluted alcohol. (Parrish's *Pharm.*, p. 408.)

Emodin. Readily soluble in boiling alcohol, and in fusel oil (amylalcohol). Somewhat soluble in hot, less soluble in cold benzin. Soluble in glacial acetic acid, and in solutions of the caustic alkalies.
$C_{40}H_{15}O_{13}$

Emulsin. *Vid.* Synaptase.

Emydin. Very soluble in weak solutions of caustic potash. Soluble in boiling chlorhydric acid. Swells up in acetic acid, without dissolving therein. (Fremy, *Ann. Ch. et Phys.*, (3.) **50.** 161.)

***DiEpi*BromHydrophosphoryl.** Sparingly soluble in ether. (Berthelot & De Luca.)
$C_{12}H_9Br_2P$

Equisetic Acid. *Vid.* Maleic Acid.

Equisetic Acid. *Vid.* Aconitic Acid.

Ergotin. Insoluble in water. Easily soluble in alcohol. Insoluble in ether. Soluble in concentrated acetic acid, from which it is precipitated by water. Insoluble in weak mineral acids. Soluble in concentrated sulphuric acid, from which it is precipitated by water. Decomposed by nitric acid. Soluble in a solution of caustic potash.

Erucic Acid. Soluble in hot alcohol.
$C_{44} H_{42} O_4 = C_{44} H_{41} O_3, H O$

Erucate of Baryta. Ppt., in alcohol.
$C_{44} H_{41} Ba O_4$

Erucate of Lead. Insoluble in ether.
$C_{44} H_{41} Pb O_4$

Erucate of Silver. Ppt., in alcohol.
$C_{44} H_{41} Ag O_4$

Erucate of Soda. Soluble in alcohol.

Erucin(from *Sinapis alba*). Insoluble in water, or alkaline solutions. Difficultly soluble in boiling alcohol. Easily soluble in ether, bisulphide of carbon, and oils. (E. Simon.)

Eryglucin. *Vid.* ErythroMannite.

Erythrarsin. $C_4 As_3 H_8 O_3$ Insoluble in water, alcohol, ether, or potash-lye.

"Erythric Acid." *Vid.* Alloxan.

Erythric Acid. (*Erythrin. Erythrylin.*) $C_{32} H_{18} O_{16}$ Very sparingly soluble in cold water. Soluble in 240 pts. of boiling water (Schunck); in 170 (174?) pts. of boiling water, separating out again as soon as the temperature of the solution has fallen a few degrees. (Heeren.) More soluble in alcohol, especially when this is boiling, than in water. (Schunck.) Soluble in 2.29 pts. of boiling alcohol, of 0.81 sp. gr., and in 32.5 pts. of the same alcohol at 12°. Insoluble in ether. (Heeren.) Sparingly soluble in oil of turpentine. Easily soluble in ether. (Schunck.) Soluble, with tolerable facility, in boiling acetic acid. Easily soluble, without alteration, in cold aqueous solutions of the caustic and carbonated alkalies. Insoluble in concentrated boiling chlorhydric acid. (Heeren.)

Erythrate of Ethyl. *Vid.* Orsellate of Ethyl.

Erythrate of Lead. Ppt.

Erythrate of Methyl. *Vid.* Orsellate of Methyl.

Erythrate of Silver. Ppt.

Erythrelic Acid. Somewhat less soluble than orsellic acid in water. Soluble in alcohol.

Erythrelate of Baryta. Very soluble in water.

Erythric Ether. *Vid.* Orsellate of Ethyl.

Erythrilin. $C_{22} H_{16} O_6$ Insoluble in water. Decomposed by boiling with water. Soluble in alcohol, and ether. Readily soluble in ammonia-water, and in alkaline liquors. (Kane.)

Erythrischic Acid. *Vid.* Alloxan.

Erythrobetic Acid(from the red beet). Slowly deliquescent. Very easily soluble in water. Insoluble in absolute alcohol, or in ether. Sparingly soluble in alcohol of 80%, tolerably easily soluble in alcohol of 60%. (L. Meier.)

Erythrin. *Vid.* Orsellate of Ethyl.

Erythrin. *Vid.* Erythric Acid.

Erythrogene. Insoluble in water, ether, or aqueous alkaline solutions. Easily soluble in alcohol and oils. (Bizio.)

Erythroglucin. *Vid.* ErythroMannite.

Erythroleic Acid. $C_{26} H_{22} O_8$ Nearly insoluble in water. Soluble in alcohol, and ether. Insoluble in oil of turpentine. Soluble in solutions of the alkalies. With metallic oxides it forms precipitates. (Kane.)

Erythrolein. $C_{20} H_{22} O_4$ Nearly insoluble in water. Soluble in alcohol, and ether. Insoluble in oil of turpentine. Soluble in ammonia-water. (Kane.)

ErythroLitmin. $C_{22} H_{22} O_{12} + Aq$ Very sparingly soluble in water. Abundantly soluble in hot, somewhat less soluble in cold alcohol. Very sparingly soluble in ether. Soluble in strong solutions of caustic potash. (Kane.)

ErythroMannite. (*Phycite. ErythroGlucin. Pseudo Orcin.*)
$C_{24} H_{30} O_{24} = \left.\begin{matrix} C_{24} H_{24} O_{14}{}^{IV} \\ H_4 \end{matrix}\right\} O_8 + 2 Aq$
Extremely soluble in water, even when this is cold. Very sparingly soluble in cold, strong, or absolute alcohol; more readily soluble at the temperature of boiling, and more readily soluble in dilute alcohol. Insoluble in cold, somewhat soluble in boiling ether. Soluble, with combination, in cold concentrated sulphuric acid. Unacted upon by ammonia-water or by solutions of the caustic or carbonated alkalies. (Stenhouse; Lamy, *Ann. Ch. et Phys.*, (3.) **35.** 139.)

Erythrophylle. (*Red coloring matter of autumn leaves.*) Soluble in water, and alcohol. Soluble in solutions of the caustic alkalies. (Berzelius, *Ann. der Pharm.*, **21.** 265.)

Erythroretin. $C_{19} H_9 O_7$ Almost insoluble in water. Easily soluble in alcohol. Somewhat difficultly soluble in ether, or acetic acid. Insoluble in chlorhydric, or in dilute sulphuric, acid. Soluble in cold concentrated sulphuric acid, and in aqueous alkaline solutions. (Schlossberger & Dœpping.) 'Readily soluble in alcohol, ether, and benzin.

Erythrosin. Soluble in acidulated spirit and in aqueous solutions of caustic potash and soda. Also soluble in concentrated sulphuric acid. (Stædeler.)

Erythrylin. *Vid.* Erythric Acid.

Esculic Acid. *Vid.* Kinovic Acid.

Esculetin. $C_{18} H_8 O_8$ or $C_{64} H_{22} O_{28} + 5 Aq$ Very sparingly soluble in cold, a little more soluble in hot water. Almost insoluble in cold, easily soluble in boiling alcohol. Almost insoluble in ether. Soluble, with alteration, in concentrated chlorhydric acid. Decomposed by warm concentrated sulphuric acid, and by nitric acid. Easily soluble in solutions of the alkalies. (Zwenger, *Ann. Ch. u. Pharm.*, **90.** 69.)

Esculetin with Oxide of Lead. $C_{64} H_{15} O_{21}; 7 Pb O$ After having become dry, it is insoluble in water; but when recently precipitated, it is very sparingly soluble therein, a portion of it being re-precipitated from the solution after this has stood for a long time. Insoluble in spirit. (Zwenger, *Ann. Ch. u. Pharm.*, **90.** 74.)

Esculin. (*Polychrome. Bicolorin.*) $C_{76} H_{41} O_{47} + 5 Aq$ Soluble in 600 pts. of cold, and in 13 pts. of boiling water; the saturated hot solution solidifying on cooling. (Wittstein's *Handw.*) Soluble in 24 pts. of boiling, less soluble in cold alcohol of 0.798 sp. gr. Very sparingly soluble in absolute ether. Soluble in solutions of the alkalies. Decomposed by boiling dilute sulphuric or chlorhydric acid.

Esculin with Oxide of Lead. Ppt. Decomposed by washing with warm or cold water, and by spirit. (Zwenger, *Ann. Ch. u. Pharm.*, **90.** 66.)

Esenbeckin(from *Esenbeckia febrifuga*).

The Essences; Essential Oils; or Volatile Oils, as they are often called, are mostly soluble in water to a very limited extent. They in turn dissolve a small proportion of water, which separates out again at low temperatures. They are generally soluble to an unlimited extent in absolute alcohol, ether, naphtha, and the fixed oils. Those composed solely of carbon and hydrogen, *i. e.* those containing no oxygen, are as a class the least soluble in alcohol, and water. (Parrish's *Pharm.*, pp. 335, 336.) Many of them are soluble in benzin (Mansfield, *J. Ch. Soc.*, **1.** 261); in concentrated acetic acid, and in oil of turpentine. In oil of ocotea (Hancock); and in oil of mandarin (De Luca).

For the solid essences, see under Camphors.

Oleum absinthii. *Vid.* Oil of Wormwood.

Oleum acori. *Vid.* Oil of Calamus.

Oil of Acorns. (From the fruit of *Quercus robur* and *Q. pedunculata.*) Appears to consist of an oil soluble in ether, and another oil soluble in alcohol of 0.85 sp. gr. (Bley.)

Oil [empyreumatic] of Amber. (*Amber Eupion.*) $C_{20}H_{16}$ Insoluble in water. Soluble in 15 pts. of alcohol of 0.85 sp. gr. (Zeller); in 2 pts. of alcohol of 0.800 sp. gr. (Anthon); in 50 pts. of alcohol of 0.855 sp. gr., at the temp. of the hand. Readily soluble in ether (Elsner, Dœpping); in 2 pts. of ether (Anthon). Soluble in fixed and volatile oils. (Elsner.)

Oleum amomi. *Vid.* Oil of Pimento.

Oleum anethi. *Vid.* Oil of Dill.

Oil of Angelica(from the root of *Angelica archangelica*). Soluble to a considerable extent in water.

Oil of Angustura(from the bark of *Galipea officinalis*).

Oil of Animé(from the resin of *Hymenæa Courbaril*). Soluble, without turbidity, in alcohol. (Paoli.)

Oil of Anise(from the seeds of *Pimpinella Anisum*). Soluble in 2 4 pts. of alcohol, of 0.84 sp gr., at 24°, and in all proportions in cold alcohol of 0.806 sp. gr. (Saussure.) Soluble in 5 pts. of alcohol of 0.85 sp. gr. (Parrish's *Pharm.*, p. 347.) [Compare Anethol.]

Oleum anthemidis. *Vid.* Oil of Chamomile.

Oleum anthos. *Vid.* Oil of Rosemary.

Oil of Ants(in the red ant, *Formica rufa*). Insoluble in water. Sparingly soluble in absolute alcohol. (Marggraf, Nolle.)

Oil of Aristolochia(*Clematitis*). $C_{22}H_{16}O_6$ Soluble in 15 @ 28 pts. of alcohol, of 0.85 sp. gr. (Walz.)

Oil of Arnica.

a = (from the flowers of *Arnica montana.*) Soluble in 100 pts. of alcohol of 0.85 sp. gr., becoming turbid and flocculent; with 10 @ 60 pts. of absolute alcohol it forms a turbid liquid, which becomes clear only when heated. (Zeller.)

b = (from the roots of *Arnica montana.*) Soluble in 2 pts. of alcohol of 0.85 sp. gr., and in all proportions in absolute alcohol. (Zeller.)

Oil of Artemesia(*Santonica*). $C_{10}H_{10}O$ Insoluble in water. Easily soluble in alcohol, and ether. Soluble in concentrated sulphuric acid, the solution subsequently undergoing decomposition. (Vœlcker, *Ann. Ch. u. Pharm.*, **87.** 314.)

Oil of Artemisia *vulgaris*. *Vid.* Oil of Mugwort.

Oil of Asarum(from the root of *Asarum europæum*). (*Essence de Cabaret.*) Only sparingly soluble in water. Readily soluble in alcohol, ether, and the fixed and volatile oils. (Græger, Sell & Blanchet.)

Oil of Assafœtida. Soluble to no inconsiderable extent in water. Very easily soluble in alcohol, and ether. (Hlaziwetz.)

Oleum asphalti. Soluble in 30 pts. of alcohol of 0 85 sp. gr. (Parrish's *Pharm.*, p. 346.)

Oil of Athamanta. *Vid.* Oil of Peucedanum.

Oleum aurantiorum. *Vid.* Oil of Orange.

Oil of Auricula(from *Primula auricula*). (*Aurikel Camphor. Stearoptene of Auricula.*) Insoluble in water. Soluble in alcohol. (Huenefeld.)

Oleum badiani. *Vid.* Oil of StarAnise.

Oil of Balm(in the herb *Melissa officinalis*). Soluble in 5 @ 6 pts. of alcohol of 0.856 sp. gr. (Zeller.)

Oil of Basil(from *Ocymum basilicum*).

I.) *liquid.*

II.) *solid.* (*Basil Camphor.*) $C_{20}H_{16} + 6\,Aq$ Sparingly soluble in cold, easily soluble in hot water. Imperfectly soluble in cold, easily soluble in hot alcohol. Scarcely any of it is dissolved by six pts. of ether. Easily soluble in acetic and nitric acids, and in ammonia-water. (Bonastre.)

Oil of Bay(from the berries of *Laurus nobilis*). (*Oil of Laurel.*) Easily soluble in alcohol. The least volatile portion of the oil dissolves but partially in alcohol, or in aqueous solutions of caustic potash or ammonia, leaving a brown oil, while the alcoholic solution contains a crystalline substance. Readily soluble in ether, and in fixed and volatile oils. (Brandes.)

Oil of Beans(in dry beans, *Phaseolus communis*).

Oil of Bergamot(in cells in the rind of *Citrus Bergamia*). Does not take up water, even when boiled with it for a considerable time. (Soubeiran & Capitaine.)

Soluble in 0.5 pt. of alcohol of 0.85 sp. gr.
" 2. " 0.951 "
" 28. " 0.966 "
(Vauquelin.)

Soluble in ether, and in concentrated acetic acid.

An opaque emulsion, formed by agitating a certain quantity of oil of bergamot with alcohol having been subjected to a pressure of 1100 atmospheres for a few minutes became perfectly transparent, the solution of the oil in the alcohol being now complete. (Perkins, *Ann. Ch. et Phys.*, 1823, (2.) **23.** 411.) [See also Bergaptene]

Oleum betulæ. *Vid.* Oil of Birch.

Oil of Birch-leaves(from *Betula alba*).

I.) Insoluble, or very sparingly soluble, in water. Soluble in 8 pts. of alcohol, of 0.85 sp. gr., at 12.5°, forming a clear liquid, which becomes turbid at 0°. Slowly soluble in ether, separating out again slowly at 0°. (Grassmann.)

II.) (From *Betula lenta.*) Identical with oil of winter-green, *q. v.* (Procter.)

Oil[empyreumatic] of Birch. (*Essence de bouleau.*) Sparingly soluble in water. Easily soluble in alcohol, and ether. (Sobrero.)

Oil of Cajeput(from the leaves of *Malaleuca Cajeputi, etc.*). Readily soluble in alcohol. (Guibourt, Zeller.) Soluble in 1 pt., or less, of alcohol of 0.85 sp. gr. (Parrish's *Pharm.*, p. 347.)

Oil of Calamus(from the root of *Acorus calamus*, sweet flag). (*Essence d'acore.*) Scarcely at all soluble in water. Soluble in all proportions in absolute alcohol.

Soluble, without turbidity, in absolute alcohol, and in 1 pt. of alcohol of 0.85 sp. gr. According to Schnedermann, it contains several different oils, the most volatile of which is most probably of composition $C_{20}H_{16}$.

Oil of Camomile. *Vid.* Oil of Chamomile.

Oil of Camphor.

a = fluid camphor from Dryobalanops camphora. Vid. Borneene.

b = fluid camphor from Laurus camphora. Insoluble in water. Miscible in all proportions with alcohol, ether, and oils. Also soluble in concentrated acetic, and sulphuric acids.

Oil of Caoutchouc. *Vid.* Caoutchin.

Oil of Caranna. *Vid.* Oil of Gomart.

Oil of Caraway(from the seeds of *Carum carvi*). (*Oleum carvi.*) The crude oil is a mixture of *carvene* and *carvol, q. v.* It is somewhat soluble in water, and easily soluble in alcohol, and ether. (Schweizer.) Soluble in 1 pt., or less, of alcohol of 0.85 sp. gr. (Parrish's *Pharm.*, p. 347.)

Oil of Cardamom(from the seeds of *Elettaria Cardamomum*). (*Oleum Cardamomi.*) Soluble in alcohol, ether, oils, acetic acid, and potash-lye. (Dumas & Péligot.) Soluble in 1 pt. of alcohol of 0.85 sp. gr. (Parrish's *Pharm.*, p. 347.)

Oil of Carrot(from the roots of *Daucus Carota*). Sparingly soluble in water. Readily soluble in alcohol, and ether. (Wackenroder.)

Oleum Caryophylli. Vid. Oil of Cloves.

Oil of Cascarilla(from the bark of *Croton Elateria*). Sparingly soluble in water. Easily soluble in 1 @ 2 pts. of alcohol of 0.85 sp. gr., the solution becoming opalescent on the addition of 3 or more pts. of alcohol. (Zeller.) Readily soluble in alcohol. (Trommsdorff.)

Oil of Cassia. *Vid.* Oil of Cinnamon.

Oil of Castoreum. Sparingly soluble in water. Readily soluble in alcohol. (Bohn.) Soluble in ether. (Brandes.)

Oil of Cedar. *Vid.* Oil of Juniper.

Oleum Cedro. Vid. Oil of Lemon.

Oil of Celery(from *Apium graveolens*). Sparingly soluble in water. Readily soluble in alcohol, and ether. (Vogel, Tietzmann.)

Oil of Chamomile [Roman](from the flowers of *Anthemis nobilis*). (*Oleum anthemidis.*) Is a mixture of a hydrocarbon ($C_{20}H_{16}$) with hydride of angelicyl ($C_{10}H_7O_2, H$), and a small quantity of angelic acid. It is easily soluble in alcohol, ether, and oils.

Oil of Chamomile[wild](from the flowers of *Matricaria Chamomilla*). Soluble in 8 @ 10 pts. of alcohol of 0.85 sp. gr. Easily soluble in ether. (Zeller.)

Oil of Checkerberry. *Vid.* Oil of Wintergreen.

Oil of Chenopodium(*Ambrosioïdes*). (*Oil of Mexican Wormseed.*) Sparingly soluble in water. Easily soluble in alcohol, ether, and the fixed and volatile oils. (Bley.) Soluble in 30 pts. of water and in 3 pts. of alcohol. (Becker.)

Oil of Cinnamon(from *Laurus cinnamomum*).

I.) *Oleum cinnamomi veri.* When freshly prepared it is sparingly soluble in water; and easily soluble in alcohol.

Soluble in 1 pt. of alcohol of 0.85 sp. gr.; and in glycerin. (Parrish's *Pharm.*) Soluble in concentrated acetic acid. When old, essence of cinnamon contains two resins:

a.) Soluble in cold alcohol.

β.) Very sparingly soluble in cold, but more soluble in hot alcohol.

II.) *Chinese oil of Cinnamon*(from *Laurus cassia*). (*Oil of Cassia.*) Sparingly soluble in water. Very easily soluble in alcohol, and ether.

Soluble in 1 pt. of alcohol of 0.85 sp. gr. (Parrish's *Pharm.*, p. 347.)

Oleum citri. Vid. Oil of Lemon.

Oil of *Citrus Lumia.* $C_{20}H_{18}$ Slightly soluble in alcohol. Very easily soluble in ether, and bisulphide of carbon. (De Luca.)

Oil of Cloves(from the buds or flower-stalks of *Eugenia caryophyllata*). (*Oleum Caryophylii.*) [Contains eugenic acid, *q. v.*, and a neutral oil, $C_{20}H_{16}$.]

Soluble in 1 pt. of alcohol of 0.85 sp. gr. (Parrish's *Pharm.*, p. 347.) Completely soluble in alcohol, ether, and concentrated acetic acid. (Bonastre.) Insoluble in acetic acid of 1.05 sp. gr. (Jahn.) Soluble in glycerin. The indifferent oil, $C_{20}H_{16}$ ("Camphene of Oil of Cloves") is much less soluble in alcohol than oil of turpentine. (Gr. Williams.)

Oil of Coffee. Soluble in ether. (Payen.)

Oil of Convolvulus (*scoparius*). (*Huile de bois de Rhode. Rosenholzœl.*)

Oil of Copaiba(from the balsam which exudes from various species of *Copaïfera*).

I.) $C_{20}H_{16}$ Insoluble in water. Soluble in all proportions in absolute alcohol (Stoltze); soluble in 2.5 pts. of absolute alcohol; in 25 @ 30 pts. of alcohol of 0.85 sp. gr. at 25° (Blanchet); in 8 pts. of the most highly rectified spirit (Schœnberg). Soluble in all proportions in absolute ether (Stoltze); in less than 0.5 pt. of common ether (Blanchet). Soluble in all proportions in bisulphide of carbon. (Gerber.) Soluble in acetic acid.

II.) *Para-copaiba Oil*(in a variety of balsam copaiba from Brazil). $C_{20}H_{16}$ Soluble in all proportions in ether; less easily soluble in absolute alcohol, and still less in common alcohol.

Oil of Coriander(from the fruit of *Coriandrum sativum*). $C_{20}H_{18}O_2$ Readily and abundantly soluble in alcohol, ether, glacial acetic acid, and the fixed oils. (Trommsdorff.)

Oil of Courbaril. *Vid.* Oil of Animé.

Oil of Cubebs(from *Piper cubeba*). Contains Cubebene, *q. v.*; and Camphor of Cubeb-Oil, *q. v.* It dissolves to an opalescent solution, in 27 pts. of alcohol of 0.85 sp. gr. (Parrish's *Pharm.*, p. 346.)

Oil of Culilawan(from the bark of *Cinnamomum Culilawan*).
(*Oleum culilabani.*)

Oil of Cumin(from *Cuminum Cyminum.*) Contains Cymene, and Cuminol, *q. v.* It is soluble in 3 pts. of alcohol of 0.85 sp. gr. (Parrish's *Pharm.*, p. 347.)

Oil of Curcuma(from the root of *Curcuma longa*).

Oil of Dahlia(from the roots of several species of *Dahlia*). Forms a turbid emulsion with water. Soluble in alcohol. (Payen.)

Oil of Dill(from the seeds of *Anethum graveolens*). Slightly soluble in water.
(*Oleum anethi.*)
Easily soluble in alcohol, and ether. Soluble in all proportions in alcohol of 0.85 sp. gr. (Parrish's *Pharm.*, p. 347.)

Oil of Elder-flowers(from *Sambucus nigra*). Soluble in absolute alcohol, and ether. Sparingly soluble in alcohol of 0.85 sp. gr., in oil of rosemary, and in water. (Eliason.)

Oil of Elemi(in the resin of *Icica Icicariba, etc.*). Insoluble in water. Sparingly soluble in weak alcohol. Easily soluble in alcoholic ether. (Stenhouse.)

Oil of Ergot. Soluble in alcohol, ether, and alkaline solutions.

Oil of Fennel(from the seeds of *Anethum Fœniculum*). Consists almost entirely of two oils, a light oil, volatile between 185° and 190°, isomeric with oil of turpentine, and anethol, *q. v.* (Cahours.) Soluble in from 2 to 4 pts. of alcohol of 0.85 sp. gr. (Parrish's *Pharm.*, p. 347.)

Oil of Fennel with Nitric Oxide. Sparingly soluble in absolute alcohol, but searcely at all soluble in spirit of 0.80. Soluble in ether; also in strong potash-lye, from which it is re-precipitated on the addition of acids. (Cahours.)
$C_{60}\,H_{48}\,N_8\,O_{16} = 3\,C_{20}\,O_{16}'', 8\,N\,O_2$ (?)

Oil of Galanga(from the roots of *Alpinia Galanga*). Partially soluble in an aqueous solution of caustic potash; completely and readily soluble in alcohol, and ether. (Vogel.)

Oil of Gale(from *Myrica Gale*). Soluble in 40 pts. of alcohol of 0.875 sp gr., at 15°; more abundantly soluble in ether. (Rabenhorst.)

Oleum Gaultheriæ. *Vid.* Oil of Winter-green.

Oil of Geranium.

Oil of *Geum urbanum.* Readily soluble in alcohol, and ether. (Trommsdorff.)

Oil of Ginger(from the roots of *Zinziber officinalis*).
(*Ingwerœl. Essence de gingembre.*)
$C_{80}\,H_{64} + 5\,Aq$

Oil of Gomart(from the resin of *Bursera gummifera*).
(*Bursera Oil.*)
$C_{20}\,H_{16}$

Oil of Hedwigia(from the balsam of *Hedwigia balsamifera*). It dissolves completely at first in more than 4 pts. of alcohol and in all proportions in ether. (Bonastre.)

Oil of Hemp(from *Cannabis sativa*).

Oil of Hops. Soluble in 10,000 pts. of water. (Payen & Chevallier); in more than 600 pts. of water. (Wagner.)
$C_{20}\,H_{16}$

Oil of Hyssop(from *Hyssopus officinalis*). Easily soluble in absolute alcohol. Forms a clear solution in from 1 @ 4 pts. of alcohol of 0.85 sp. gr., a slightly opalescent solution with a larger quantity of this alcohol. (Zeller.)

Oil of Imperatoria. *Vid.* Oil of Masterwort.

Oil of Jasmin. Compare Jasmin Camphor, under **Camphor.**

Oil of Jonquil(from *Narcissus Jonquilla*). Soluble in ether. (Robiquet.)

Oil of Juniper(from *Juniperus communis*). The oil from ripe berries, *i. e.* ordinary oil of juniper, is sparingly soluble in alcohol of 0.85 sp. gr.; but is soluble in 8 pts. of absolute alcohol, and is miscible in all proportions with ether. (Blanchet.) The oil from unripe herries is a mixture of two oils, the less volatile of which is identical with the oil of ripe berries. The more volatile oil is sparingly soluble in alcohol of 0.85 sp. gr., is miscible with 1 pt. of absolute alcohol, but separates out on the addition of more alcohol. Soluble in absolute ether in all proportions. (Blanchet.) Soluble in 10 @ 12 pts. of alcohol of 0.85 sp. gr., forming a turbid solution. (Parrish's *Pharm.*, p. 346.) Very sparingly soluble in water. Very soluble in warm, less soluble in cold alcohol.
(*Oil of Cedar.*)
$C_{20}\,H_{16}$

Oil of juniper forms a clear solution with 0.5 pt. of absolute alcohol, and a turbid solution with from 1 to 10 pts. (Zeller.)

Oil of Laurel. *Vid.* Oil of Bay.

Oil of Guiana Laurel. *Vid.* Oil of Ocotea.
(*Essence de Laurier.*)

Oil of LançonBalsam. Soluble in from 10 to 12 pts. of alcohol of 0.85 sp. gr., forming a somewhat turbid liquid; and in all proportions in ether, forming a clear solution. (Bonastre.)

Oil of Lavender(from the flowers and leaves of *Lavandula angustifolia*). Contains an oil isomeric with oil of turpentine, and a camphor similar to or identical with common camphor. It is soluble in all proportions in absolute alcohol, and in alcohol of 0.85 sp. gr. (Zeller); of 0.83 sp. gr. (Saussure). Soluble in 2.5 pts. of alcohol of 0.887 sp. gr., at 20°. (Saussure.) Oil of spike dissolves in alcohol like oil of lavender. (Zeller.) Soluble in acetic acid. (See under *Acetic Acid.*)
(*Oil of Spike.*)

Oil of Lemon(from the rind of *Citrus limonum*, or *medica*). Slightly soluble in water. Soluble in all proportions in absolute alcohol (Saussure, Zeller); in 7.14 pts. of alcohol, of 0.837 sp. gr., at 16° (Saussure); with turbidity in 10 pts. of alcohol of 0.85 sp. gr. (Zeller.) Soluble in alcohol, and in glacial acetic acid. (Berthelot, *Ann. Ch. et Phys.*, (3.) **37.** 226.) Easily soluble in ether. Easily miscible with essential and fatty oils.
(*Oleum citri. Essence de Citron. Huile de Cedro. Citronenœl. Cederœl.*)
$C_{20}\,H_{16}$

Oil of Lilac(from the flowers of *Syringa vulgaris*). Soluble in ether.

Oil of Lime(from the rind of *Citrus limetta*). Resembles oil of lemon.
$C_{20}\,H_{16}$

Oil of Lime-flower(from the flowers of *Tilia Europea*). Soluble in alcohol. (Landerer.) Soluble in ether. (Herberger.)

Oleum macis (or *macidis*). *Vid.* Oil of Nutmeg-flowers.

Oil of Mandarin(from the rind of *Citrus bigaradia sinensis* and *myrtifolia*). Insoluble in water, to which, however, it imparts its odor. Soluble in 10 pts. of alcohol, in
$C_{20}\,H_{16}$

ether, glacial acetic acid, and in every proportion in bisulphide of carbon. (Luca.)

Oil of Marjoram(from *Origanum majorana*). Soluble, without turbidity, in 1 pt. of alcohol of 0.85 sp. gr., and with opalescence in 2 or more pts. (Zeller.)

Oil of [Wild] Marjoram. *Vid.* Oil of Origanum.

Oil of Massoy(from the bark of *Cinnamomum Kiamis*).

a = *light oil.* Readily soluble in alcohol, ether, and strong acetic acid, and is separated from the latter by the addition of 3 pts. of water. (Bonastre.)

b = *heavy oil.* Soluble in all proportions in alcohol, ether, and strong acetic acid, from which last it is precipitated by water.

Oil of Masterwort(from the root of *Imperatoria Ostruthium*). (*Essence d'Imperatoire.*)

Oil of Matico(from the leaves of *Piper asperifolium*). Readily soluble in alcohol, and ether. Insoluble in aqueous solutions of caustic potash or ammonia. Soluble in oil of vitriol, the solution becoming milky on the addition of water. (Hodges.)

Oil of Meadow-Sweet. *Vid.* Oil of Spirea.

Oil of Mecca-Balsam(from *Balsamodendron gileadense*). Soluble, with turbidity, in 12 pts. of alcohol. (Bonastre.) Soluble in all proportions in ether, forming a clear solution. Easily soluble in rock-oil, and the fixed oils. Insoluble in aqueous solutions of caustic soda or ammonia. (Bonastre.) Easily soluble in strong acetic acid. Insoluble in an aqueous solution of caustic potash. (Trommsdorff.)

Oleum melissæ. *Vid.* Oil of Balm.

Oleum Menthæ crispæ. *Vid.* Oil of Mint.

Oleum Menthæ piperitæ. *Vid.* Oil of Peppermint.

Oleum Menthæ viridis. *Vid.* Oil of Spearmint.

Oil of Mignonette(from the flowers of *Reseda odorata*). Soluble in ether. (Buchner.)

Oil of Millefoil(from *Achillea millefoliam*).

I.) Readily soluble in alcohol, and ether. (Bley.) Soluble, without turbidity, in 1 pt. of alcohol of 0.85 sp. gr.; with a larger quantity of the alcohol, even with 40 pts., it forms a turbid solution. Absolute alcohol dissolves it in all proportions. (Zeller.)

II.) **Oil of Noble Millefoil**(from *A. nobilis*). Soluble in alcohol, ether, and the fixed and volatile oils. (Bley.)

Oil of Mint. (*Oleum Menthæ crispæ.*) Soluble in 1 pt. of alcohol of 0.85 sp. gr.

Essence de Mirbane. *Vid.* NitroBenzin.

Oleum Monardæ.
(*Oil of Horsemint.*)

Oil of Mugwort(from the root of *Artemisia vulgaris*). (*Beifussœl.*) Readily soluble in alcohol, ether, and the oils of rosemary, turpentine, and poppy. (Bretz & Eliason.) Insoluble in aqueous alkaline solutions.

Essence of Mustard. *Vid.* SulphoCyanide of Allyl.

Oil of Myrrh(from *Balsamodendron*, *Myrrha*, and *B. Kalaf*). $C_{20}H_{14}O_2$ Soluble in alcohol, and ether. (Ruickholdt.)

Oleum myristicæ. *Vid.* Oil of Nutmeg.

Oil of Nasturtium(from *Tropæolum majus*).
(*Essence de Capucine.*)

Oil of Neroli(from the flowers of *Citrus Aurantium*). (*Oil of Orange-flower. Oleum aurantiorum florum.*) Dissolves to a clear solution in 1 @ 3 pts. of alcohol of 0.85 sp. gr., and with turbidity in a larger quantity. (Zeller.) One portion of the crude oil is easily soluble in water, the other sparingly soluble. (Soubeiran.) Ether, almond-oil, and castor-oil, abstract the whole of the volatile oil from orange-flower water. (Ader.)

Oil of Nigella(from the seeds of *Nigella sativa*). Soluble in alcohol, and ether. (Reinsch.)

Oil of Nutmeg(from the seed of *Myristica aromatica*). (*Oleum macis* (or *macidis*). *Oleum myristicæ.*) Readily soluble in alcohol, the solution becoming milky on the addition of water. (Hasse.) It unites with aqueous solutions of the caustic alkalies, forming a soapy mass. (Bley.) Soluble in 6 pts. of alcohol of 0.85 sp. gr. Soluble in ether.

Oil of Ocotea(from several species of *Ocotea*). (*Laurel oil of Guiana. Essence de Laurier.*) $C_{20}H_{16}$ Insoluble in water. Soluble in alcohol, and ether, and the fatty and volatile oils. (Hancock.)

Oil of Olibanum(in frankincense, the gum resin of *Boswellia floribunda*, and *B. serrata*). $C_{35}H_{28}O$ Soluble in all proportions in absolute alcohol, and ether; less soluble in weaker alcohol. (Stenhouse.)

Oil of Orange-peel(from the rind of *Citrus Aurantium*). (*Oleum aurantiorum. Oleum portugallo.*) $C_{20}H_{16}$ Soluble in absolute alcohol, and with turbidity in 7 @ 10 pts. of alcohol of 0.85 sp. gr. (Zeller.)

Oil of Origanum(from *Origanum vulgare*). (*Oil of Wild Marjoram.*) Soluble in 12 @ 16 pts. of alcohol of 0.85 sp. gr., forming a turbid liquid, and in all proportions in absolute alcohol. (Zeller.) Soluble in hot ether.

Oil of Osmitopsis(from *Osmitopsis asteriscoides*). $C_{20}H_{18}O_2$ Insoluble, or exceedingly sparingly soluble in water. Soluble in all proportions in alcohol, and ether. (Gorup-Besanez, *Ann. Ch. u. Pharm.*, 89. 214.)

Oil of Parsley(from the seeds of *Apium petroselinum*). (*Oleum petroselini. Essence de persil.*) $C_{20}H_{16}$ Soluble in 2.5 pts. of alcohol of 0.85 sp. gr. (Zeller.) Tolerably easily soluble in ether, and oils.

"**Pear Oil**" of the Confectioners. *Vid.* Acetate of Amyl.

Oil of Pelargonium(from various species of *Pelargonium*). Readily soluble in alcohol of 0.85 sp. gr. (Simonnet.)

Oil of Pennyroyal(European)(from *Mentha pulegium*). (*Oleum pulegii.*) $C_{20}H_{16}O_2$ Miscible with oil of turpentine. (Kane.)

Oil of Pennyroyal(American)(from *Hedeoma pulegioides*).

Oil of Pepper(from *Piper nigrum*).
$C_{20}H_{16}$

Oil of Peppermint(from *Mentha piperita*). (*Oleum Menthæ piperitæ.*) Slightly soluble in water. Soluble in 1 @ 3 pts. of alcohol of 0.85 sp. gr., forming a clear solution. With a larger quantity of alcohol it forms an opalescent solution. (Zeller.) Soluble in all proportions in alcohol of 0.815 sp. gr., and in 10 pts.

of alcohol of 0.868 sp. gr. (Bley.) Soluble with turbidity in bisulphide of carbon. (Bley.) Readily soluble, even in cold wood-spirit, alcohol, ether, and bisulphide of carbon; less soluble in oil of turpentine.

Oleum petræ. *Vid.* Petroleum.

OIL OF PIMENTO (from the fruit of *Myrtus pimenta*). Completely soluble in alcohol, and ether. (Bonastre.)

OIL OF PIMPINELLA.

a = from the root of Pimpinella Saxifraga. Slightly soluble in water. Easily soluble in alcohol, and ether. (Bley.)

b = from the root of Pimpinella nigra. Slightly soluble in water. Easily soluble in alcohol, ether, and the fixed and volatile oils.

Oleum bini-semen. *Vid.* Templin Oil.

OIL OF POPLAR-BUDS (from the buds of *Populus nigra*). Insoluble in water. Sparingly soluble in alcohol. Very soluble in ether. (Pellerin.)

Oleum pulegii. *Vid.* Oil of Pennyroyal.

OIL OF PULEGIUM (*micranthum*). Readily soluble in alcohol, ether, and oils. (Butlerow.)
$C_{20}H_{16}O_2$

OIL OF PYRETHRUM. *Vid.* Oil of Feverfew.

OIL OF ROMAN CAMOMILE. *Vid.* Oil of Chamomile.

OIL OF ROSEMARY (in *Rosmarinus officinalis*). *(Oleum anthos. Oleum rosmarini.)* Soluble in all proportions in alcohol of 0.85 sp. gr. (Zeller.) Soluble in 40 pts. of alcohol of 0.887 sp. gr. at 18°. (Saussure.) Soluble in oil of turpentine.

OIL OF ROSES (from the flowers of various species of *Rosa*). Sparingly soluble in water. Soluble in 160 pts. of alcohol, of 0.815 sp. gr., at 18.7° (Gœbel); in 143 pts. of alcohol, of 0.806 sp. gr., at 14°, and in 33 pts. of this alcohol at 22°. (Saussure.) The oil is not separated from its alcoholic solution by water. (Blanchet.)

OIL OF RUE (from *Ruta graveolens*). *(Oleum rutæ.)* *Vid.* Hydride of Rutyl.

OIL OF SAFFRON (from *Crocus sativus*). Easily soluble in water. (Bouillon.)

OIL OF SAGE (from *Salvia officinalis*). *(Oleum salviæ.)* Soluble in all proportions in alcohol of 0.85 sp. gr. (Zeller.)

OIL OF SASSAFRAS (from the wood and bark of the roots of *Laurus Sassafras*). $C_{18}H_{10}O_4$ (?) Soluble in 4 @ 5 pts. of alcohol of 0.85 sp. gr. Sparingly soluble in aqueous solutions of the caustic alkalies. (Zeller, Bonastre.) Decomposed by concentrated sulphuric, and nitric acids.

OIL OF SAVIN (from the leaves, &c., of *Juniperus Sabina*). *(Oleum Sabinæ.)* Soluble in all proportions in absolute alcohol; to a clear liquid in 2 pts. of alcohol of 0.85 sp. gr., with opalescence in 3 pts. or more of this alcohol. (Zeller.)

OIL OF SEMEN-CONTRA. *Vid.* Oil of Wormseed.

Oleum Serpylli. *Vid.* Oil of Wild Thyme.

OIL OF SPEARMINT. Soluble in alcohol.
(Oleum Menthæ viridis.)

OIL OF SPIKE (from *Lavendula latifolia*). *(Oleum Spicæ.)* Resembles Oil of Lavender, *q. v.*

OIL OF SPIRÆA. *(Oil of Meadow-sweet.)* Readily soluble in alcohol, and ether. (Ettling.)

OIL OF SQUILL (from *Scillus Maritimus*). Soluble in alcohol. (Landerer.)

OIL OF STAR-ANISE (from the seeds of *Illicium anisatum*). *(Oleum badiani.)* Readily soluble in alcohol, and ether. (Meissner, *Alman.*, 1818, p. 63 [Gm.].) Soluble in 5 pts. of alcohol of 0.85 sp. gr. (Parrish's *Pharm.*, p. 347.) [Compare Anethol.]

OIL OF SWEET SEDGE (or SWEET FLAG). *Vid.* Oil of Calamus.

"OIL OF SYRINGA" (*vulgaris*). *Vid.* Oil of Lilac.

OIL OF SYRINGA (from *Philadelphus coronarius*). Soluble in ether. (Buchner.)

OIL OF TANSY. Readily soluble in alcohol.
(Oleum tanaceti.)

OIL OF TARRAGON (from *Artemisia Dracunculus*). *(Esdragonæl.)* *Vid.* Anethol.

OIL OF TEA. Insoluble, or very sparingly soluble, in water. Soluble in ether. (Mulder.)

TEMPLIN OIL (from the cones on *Pinus picea*). *(Oleum pini-semen.)* Soluble in 10 pts. of alcohol of 0.85 sp. gr. (Parrish's *Pharm.*, p. 346.) Resembles oil of turpentine in solubility. (Flueckiger.)

OIL OF THUJA (from the twigs of *Thuja occidentalis*) (Arbor-vitæ). Only slightly soluble in water. Very easily soluble in alcohol, and ether. (Schweizer.)

OIL OF THYME (from *Thymus vulgaris*). *(Ol. thymi. Thymen.)* $C_{20}H_{16}$ Soluble in 1 pt. of alcohol of 0.85 sp. gr. (Parrish's *Pharm.*, p. 348.) Soluble in concentrated acetic acid.

OIL [empyreumatic] OF TOBACCO. See under Oils, fatty.

OIL OF TROPÆOLUM. *Vid.* Oil of Nasturtium.

OIL OF TURPENTINE. *(Spirits of Turpentine. Essence of Turpentine. Camphene (of Deville).)* $C_{20}H_{16}''$ Almost entirely insoluble in water. Soluble in all proportions in absolute alcohol; and in 12 pts. of alcohol of 0.858 sp. gr., at 10° (Blanchet & Sell); in 7.4 pts. of alcohol, of 0.84 sp. gr., at 22° (Saussure); in 4 vols. alcohol of 0.83 sp. gr.; in 5 vols. alcohol. (Auduard.) 5 vols. of oil of turpentine are miscible with 1 vol. of alcohol, and the mixture is not clouded by water, the water only slowly removing the alcohol. (Vauquelin.) Does not dissolve well in alcohol unless this be free from water: 100 pts. of alcohol, of 0.84 sp. gr. dissolve 13.5 pts. of it at 16.6°. [T.] Soluble in strong alcohol, in benzin, and in strong wood-spirit. After alcohol or wood-spirit have been so much diluted with water that they can no longer dissolve oil of turpentine, the addition of some benzin restores their solvent power. Far more readily soluble in acetone than in ordinary alcohol. (Mansfield, *J. Ch. Soc.*, **1**. 263.) Soluble in wood-spirit in all proportions, the solution being rendered turbid on the addition of water. (Gmelin.) Soluble in alcohol, ether, and glacial acetic acid. (Berthelot, *Ann. Ch. et Phys.*, (3.) **37**. 225.) Insoluble in glacial acetic acid. (Deville.) Soluble in most of the volatile oils. Miscible with bisulphide of carbon (Lampadius), with chloroform (Huraut & Larocque) and the fatty oils (Wittstein's *Handw.*). Easily soluble in ether. (*Ib.*) Soluble in most of the volatile oils. (Braconnot.) Its solubility in alcohol is not increased, but, on the contrary, somewhat diminished, by the presence of nitric acid. (Deville, *Ann. Ch. et Phys.*, (3.) **27**. 82.) Decomposed by concentrated mineral acids. Soluble in acetate of ethyl, butyric acid, and fusel oil. (Berthelot, *Gm.*, **14.** 258.)

Oil of Valerian (from *Valeriana officinalis*). (*Ol. Valerianæ. Baldrianœl.*) Soluble in 1 pt. of alcohol of 0.85 sp. gr., and in all proportions in absolute alcohol. (Zeller.) Contains *valerole* ($C_{12}H_{10}O_2$), and borneene ($C_{20}H_{16}$), *q. v.* (Gerhardt, *Ann. Ch. et Phys.*, (3.) **7.** 275.)

Oil of Vitiveria. Soluble in ether. (Cap.)

Oil of Water Horehound(from *Lycopus Europœus*).

Oil of Wild Thyme(from *Thymus serphyllum*). (*Oleum serphylli.*) Soluble in all proportions in alcohol of 0.85 sp. gr. (Herberger, Zeller.)

Oil of Winter-green(from the leaves, &c. of *Gaultheria procumbens*). (*Oil of Checkerberry. Oleum Gaultheriæ.*) Sparingly soluble in water. Easily soluble in alcohol, and ether.

Oil of Wormseed(from the buds of various species of *Artemisia*). (*Oil of Semen-contra. Oleum cinæ.*) $C_{24}H_{20}O_2$ Soluble in 1000 pts. of water. Readily soluble in alcohol, and ether. (Trommsdorff.) Soluble in 1 pt. of alcohol of 0.85 sp. gr., and in all proportions in absolute alcohol. (Zeller.) [Compare Oil of Chenopodium.]

Oil of Wormwood(from *Artemisia absinthum*). (*Oleum absinthii.*) Soluble in all proportions in alcohol of 0.85 sp. gr., and in absolute alcohol. (Zeller.)

Oil of Zedoariæ. Easily soluble in alcohol, and ether.

Ethal. *Vid.* Hydrate of Cetyl.

Ethalic Acid. *Vid.* Palmitic Acid.

EthamAnilin. *Vid.* EthylAmylAnilin.

Ethamin. *Vid.* Ethylamin.

Ethene. *Vid.* Ethylene.

Ether. *Vid.* Oxide of Ethyl.

Ether Chlorosulfuré. *Vid.* Oxide of ChloroSulphEthyl.

"Etherin." *Vid.* Ethylene.

Etherin. (*Ætherin. Stearoptene of Wine-oil.*) $C_{16}H_{16}''$ Insoluble in water. Soluble in alcohol, and with especial ease in ether, and in etherol (oil of wine). (Sérullas.) Insoluble in chlorhydric acid, in aqueous solutions of the caustic alkalies, or in hot acetic acid. Soluble in cold nitric acid, and in warm concentrated sulphuric acid, from which water precipitates it.

Etherol. *Vid.* Oil of Wine.

Etherone. (*Ætheron.*) Soluble in water, alcohol, and ether. (Marchand.)

EtheroPhosphorous Acid. *Vid.* EthylPhosphorous Acid.

Ether *sulfuré* (of Malaguti). *Vid.* Oxide of *bi*SulphEthyl.

Ethionic Acid(Anhydrous). (*SulphAcetylic Acid. Sulfate de Carbyle. Carbylsulfat.*) $C_4H_4S_4O_{12} = C_4H_4, 2S_2O_6$ Deliquescent. Very soluble in water, with evolution of heat, and in alcohol, with formation of the hydrated acid. Soluble in ether.

Ethionic Acid. (*CarbylSulphuric Acid. Æthionic Acid.*) $C_4H_6S_4O_{14} = C_4H_4, 4SO_3, 2HO$ Known only in solution. The metallic ethionates are soluble in water; many of them are precipitated from the aqueous solution on the addition of alcohol. (Magnus.)

Ethionate of Ammonia. Soluble in water.

Ethionate of Baryta. $C_4H_4Ba_2S_4O_{14} + Aq$ Soluble in 10 pts. of water at 20°. The concentrated, but not the dilute, aqueous solution is decomposed by ebullition. Very slowly soluble in alcohol. Absolute alcohol precipitates it from the aqueous solution. (Magnus.)

Ethionate of Copper.

Ethionate of Lead. Resembles the baryta salt.

Ethionate of Lime. Resembles the baryta salt.

Ethionate of Potash. Soluble in water.
$C_4H_4K_2S_4O_{14} + Aq$

Ethionate of Soda. Soluble in water.
$C_4H_4Na_2S_4O_{14} + 2\ Aq$

Ethokirrin. *Vid.* Anthokirrin.

Ethyl. Insoluble in water. (Frankland.)
C_4H_5, or $\left\{\begin{matrix} C_4H_5 \\ C_4H_5 \end{matrix}\right.$

(Bunsen's *Gasometry*, pp. 288, 128, 152.)

At 18° C. and the ordinary pressure, 100 vols. of	Absorb vols. of $C_4 H_4$.
Water,	15.5
Alcohol of 0.84 sp. gr.,	127.0
Rectified naphtha of 0.784 sp. gr.,	261.0
Oil of lavender (freshly distilled) of 0.880 sp. gr.,	209.0
Olive oil of 0.915 sp. gr.,	122.0
A saturated aqueous solution of chloride of potassium (containing 26% K Cl) of 1.168 sp. gr.,	10.

(Th. de Saussure, *Gilbert's Ann. Phys.*, 1814, **47**. pp. 167, 169.)

1 vol. of alcohol absorbs 2 vols., and 1 vol. of ether 2 vols. of it at the ordinary temperature; but one half of the gas is given off again when water is added to the alcoholic solution.

1 vol. of oil of turpentine absorbs from 2.1 @ 2.6 vols. of it. (Saussure, in *Gm.*, **14**. 270.) 1 volume of oil of turpentine absorbs 2.5 vols., and 1 vol. of olive oil 1 vol. of it. (Faraday.) 1 vol. of concentrated sulphuric acid absorbs 1.4 vols. of it. (Liebig.) 1 vol. of ether absorbs 1 vol. of it. (Kolbe's *Lehrb.*, **1**. 112.)

Sparingly soluble in water. Tolerably soluble in alcohol, in most inflammable liquids, and in a chlorhydric acid solution of dichloride of copper at the ordinary temperature; it is evolved from its solutions when these are boiled. (Berthelot, *Ann. Ch. et Phys.*, (3.) **51**. 67.) Very slowly absorbed by oil of vitriol. (Berthelot, *loc. cit.*) According to Berthelot, the statements of Faraday and others, that olefiant gas is easily soluble in oil of vitriol, are erroneous. 100 grammes of monohydrated sulphuric acid can absorb 61.7 grms. (120 vols.) of olefiant gas. It is, however, best to use twice this amount of acid, if one desires to obtain a complete absorption. (Berthelot, *Ann. Ch. et Phys.*, (3.) **43**. 391, *note*.)

1 volume of	Dissolves vols. of $C_4 H_4$ (containing 2 per cent of impurity).
Water,	0.11
Ordinary alcohol,	1
Absolute alcohol,	1
Amyl alcohol,	1.5
Olein, about	1
Glacial acetic acid,	1.25
Oil of turpentine, nearly	2
Dichloride of copper (in H Cl), at least	5
Ether, about	3
Bisulphide of carbon, nearly	2
Chloroform,	3.33
Benzin (crystallizable),	3

(Berthelot & De Luca, *Ann. Ch. et Phys.*, (3.) **43**. 276.)

Largely soluble in naphtha. (Hess.) Insoluble in caoutchin.

Ethylene*bromé*. *Vid.* BromEthylene.

Ethylene*chloré*. *Vid.* ChlorEthylene.

Ethylene*iodé*. *Vid.* IodEthylene.

EthylenePhenylamin. Very easily soluble in alcohol, with subsequent decomposition.
(Isomeric with *AcetoylPhenylamin*, and *Phtalidin.*)
$C_{16} H_9 N = N \left\{ \begin{matrix} C_4 H_4'' \\ C_{12} H_5 \end{matrix} \right.$

*Di*Ethylene*di*Phenyl*bi*amin. Insoluble in water. Scarcely at all soluble in cold, and difficultly soluble in boiling alcohol. Easily soluble in ether.

EthylMellitic Acid. Not isolated.
(*EthylMellic Acid.*
Mellovinic Acid.
Vinomelletic Acid.)
$C_8 H (C_4 H_5) O_8$

EthylMellitate of Baryta. Readily soluble in water. (Erdmann & Marchand.)
$C_8 Ba (C_4 H_5) O_8$

*Tri*EthylMercur(*ic*)Ethylammonium.
$C_{18} H_{19} N Hg = N \left\{ \begin{matrix} (C_4 H_5)_3 \\ C_4 H_4 Hg \end{matrix} \right.$

EthylMethyl, &c. *Vid.* MethylEthyl, &c.

EthylMucic Acid. Tolerably soluble in water. Very sparingly soluble in alcohol. (Malaguti.)
(*Mucovinic Acid.*)
$C_{16} H_{14} O_{16} = C_{12} H_9 (C_4 H_5) O_{16}$

EthylMucate of Ammonia. Very readily soluble in water.
$C_{16} H_{13} (N H_4) O_{16}$

EthylMucate of Baryta
EthylMucate of Copper
EthylMucate of Lead
EthylMucate of Lime
Precipitates; all soluble in acetic acid.

EthylMucate of Magnesia. Appears to be soluble in water.

EthylMucate of Silver
EthylMucate of Strontia
Precipitates; soluble in acetic acid.

EthylMucate of Zinc. Appears to be soluble in water. (Malaguti.)

EthylNaphthylamin. Not isolated.
$N \left\{ \begin{matrix} C_{20} H_8'' \\ H \end{matrix} \right.$

EthylNicotin. *Vid.* Hydrate of EthylNicotin.

EthylNitrAnilin. Easily soluble in alcohol, and ether; less easily soluble in boiling water.
$C_{16} H_{10} N_2 O_4 = N \left\{ \begin{matrix} C_{12} H_4 (N O_4) \\ C_4 H_5 \\ H \end{matrix} \right.$

Its salts are as readily, if not more soluble than the corresponding compounds of nitranilin. (Hofmann.)

EthylNitroPhenidin. Soluble in alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **27.** 467.)
(*Oxide of EthylNitrAnilin. NitroPhenetidin. Phenetidine nitrique.*)
$C_{18} H_{10} (N O_4) N O_2 = N \left\{ \begin{matrix} C_{12} H_4 (N O_4) \\ C_4 H_5 \\ H \end{matrix} \right. . O_2$

Ethyl*bi*NitroPhiloretic Acid. Very slightly soluble in cold water. Readily soluble in alcohol, and ether. (Hlasiwetz.)
$C_{22} H_{12} N_2 O_{14}$

EthylNitroSalicylic Acid. Somewhat soluble in boiling, less soluble in cold water. Readily soluble in boiling, less soluble in cold alcohol. Soluble, with combination, in cold solutions of potash and soda; these alkaline solutions are decomposed by boiling. Insoluble in ammonia-water, but is slowly decomposed thereby. (Cahours, *Ann. Ch. et Phys.*, (3.) **10.** 362.)
(*NitroSalicylate of Ethyl. Indigotic Ether.*)
$C_{18} H_9 N O_{10} = C_4 H_5 O, C_{14} H_4 (N O_4) O_5$

EthylNitroSalicylate of Potash. Soluble in water.

EthylNitroSalicylate of Soda. Soluble in water.

Ethyl*bi*NitroSalicylic Acid. Sparingly soluble in water. Tolerably soluble in boiling, less soluble in cold alcohol. (Cahours, *Ann. Ch. et Phys.*, (3.) **25.** 19, & **27.** 462.)
(*BiNitroSalicylate of Ethyl. Salicylic Ether binitré.*)
$C_{18} H_8 N_2 O_{14} = C_4 H_5 O, C_{14} H_3 (N O_4)_2 O_5$

Ethyl*bi*NitroSalicylate of Ammonia. Soluble in water. (Cahours.)

Ethyl*bi*NitroSalicylate of Potash. Soluble in water. (Cahours.)

Ethyl*bi*NitroSalicylate of Soda. Soluble in water. (Cahours.)

EthyloChloride of Platinum. *Vid.* EthylChloroPlatinic Acid.

is soluble in	29 41	pts. of water at	0°
“	30.30	“	5°
“	14.88	“	20°
“	10.68	“	40°
“	12.56	“	50°
“	11.25	“	55°
“	12.38	“	60°
“	22.27	“	80°
“	35.71	“	100°

The solubility of this salt is remarkable in not increasing rapidly as the temperature rises; it attains its maximum at about 40°, above as well as below which point a portion of it is precipitated. The salt which separates from the aqueous solution at 100° contains the same quantity of water of crystallization as that which separates out at the ordinary temperature. Insoluble in alcohol or ether, both of which precipitate it immediately from the aqueous solution. (Pelouze, *Ann. Ch. et Phys.*, 1833, (2.) **52.** 42, and fig. on p. 43.)

EthylPhosphate of Copper(CuO). Appears to be soluble in water. (Pelouze, *loc. cit.*, p. 44.)

EthylPhosphate of Gold. Appears to be soluble in water. (Pelouze, *loc. cit.*, p. 44.)

EthylPhosphate of Iron(both FeO & Fe_2O_3). Appear to be soluble in water. (Pelouze, *Ibid.*)

EthylPhosphate of Lead. Is the least soluble in water of any of the ethylphosphates. Easily soluble in dilute acids. (Pelouze, *loc. cit.*, pp. 44, 45.)
$C_4H_5Pb_2PO_8$

EthylPhosphate of Lime. Very sparingly soluble in water. Easily soluble in water acidulated with acetic or phosphovinic acids. (Pelouze, *Ann. Ch. et Phys.*, 1833, (2.) **52.** 45.)
$C_4H_5Ca_2PO_8 + 4\,Aq$

EthylPhosphate of Magnesia. Soluble in water. (Pelouze, *loc. cit.*, p. 45.)

EthylPhosphate of Manganese. Appears to be soluble in water. (Pelouze, *loc cit.*, p. 44.)

EthylPhosphate of Mercury. Ppt. Soluble in dilute acids. (Pelouze, *loc. cit.*, p. 44.)

EthylPhosphate of Nickel. Appears to be soluble in water. (Pelouze, *loc. cit.*, p. 44.)

EthylPhosphate of Platinum. Appears to be soluble in water. (Pelouze, *loc cit.*, p. 44.)

EthylPhosphate of Potash. Very deliquescent, and soluble in water. Melts readily in its water of crystallization. (Pelouze, *loc. cit.*, p. 45.)

EthylPhosphate of Silver. Ppt. Only sparingly soluble in water. Soluble in dilute acids. (Pelouze, *loc. cit.*, pp. 44, 45.)
$C_4 H_5 Ag_2 P O_8 + x\,Aq$

EthylPhosphate of Soda. Like the potash salt, it is very deliquescent and soluble in water. (Pelouze, *loc. cit.*, p. 45.)

EthylPhosphate of Strontia. Much less soluble in boiling than in lukewarm water. Alcohol precipitates it from the aqueous solution. (Pelouze, *Ann. Ch. et Phys.*, 1833, (2.) **52.** 45.)

EthylPhosphate *of protoxide* of Tin. Ppt. Soluble in dilute acids. (Pelouze, *loc. cit.*, p. 44.)

***Di*EthylPhosphoric Acid.** Soluble in water. Its salts appear to be all soluble in water.
$C_8 H_{11} P O_8 = \left.\begin{matrix} 2\,C_4 H_5 O \\ H O \end{matrix}\right\} P O_5$

***Di*EthylPhosphate of Ammonia.** Soluble in absolute alcohol.
$C_8 H_{10} (N H_4) P O_8$

***Di*EthylPhosphate of Baryta.** Readily soluble in water and in dilute alcohol.

***Di*EthylPhosphate of Copper.** Very soluble in water. (Vœgeli.)

***Di*EthylPhosphate of Lead.** Readily soluble in cold, more soluble in warm water. Readily soluble in dilute alcohol; very slowly soluble in cold, very easily soluble in warm alcohol of 40°.
$C_8 H_{10} Pb P O_8$

***Di*EthylPhosphate of Lime.** Very readily soluble in water; less soluble in dilute alcohol. Sparingly soluble in absolute alcohol.
$C_8 H_{10} Ca P O_8$

***Di*EthylPhosphate of Magnesia.** Very soluble in water.

***Di*EthylPhosphate of Nickel.** Very soluble in water.

***Di*EthylPhosphate of Silver.** Soluble in water. (Vœgeli.)

***Tri*EthylPhosphin.** Soluble in all proportions in alcohol, and ether.
$C_{12} H_{15} P = P \left\{ (C_4 H_5)_3 \right.$

EthylPhosphorous Acid. Soluble in water, with subsequent decomposition. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **16.** 218.)
(*EtheroPhosphorous Acid.*)
$C_4 H_7 P O_6 = C_4 H_5 O, 2\,H O, P O_3$

EthylPhosphite of Baryta. Deliquescent. Very readily soluble in water, and alcohol. Ether precipitates it from its alcoholic solution. (Wurtz, *loc. cit.*)
$C_4 H_6 Ba P O_0$

EthylPhosphite of Copper. Deliquescent. Very soluble in water.

EthylPhosphite of Lead. Permanent. Soluble in water, and alcohol. Its aqueous solution undergoes decomposition after a time. Insoluble in ether. (Wurtz, *loc. cit.*)
$C_4 H_0 Pb P O_6$

EthylPhosphite of Potash. Soluble in water. (Wurtz, *loc. cit.*)

***Di*EthylPhosphorous Acid.**
(*DiPhosphite of Ethyl.*)

***Di*EthylPhosphite *of protoxide* of Iron.** Extremely soluble in water. Apparently insoluble in alcohol. (Railton.)

***Di*EthylPhosphite of Magnesia.** Extremely soluble in water. Apparently insoluble in alcohol. (Railton.)

***Di*EthylPhosphite of Nickel.** Extremely soluble in water. Apparently insoluble in alcohol. (Railton.)

***Di*EthylPhosphite of Potash.** Deliquescent. Soluble in alcohol. Insoluble in ether. (Railton, *J. Ch. Soc.*, **7.** 220.)
$C_8 H_{10} K P O_8 = 2\,C_4 H_5 O, K O, P O_3$

***Di*EthylPhosphite of Soda.** Similar to the potash-salt. (Railton.)
$C_8 H_{10} Na P O_8$

***Di*EthylPhosphite of Zinc.** Extremely soluble in water. Apparently insoluble in alcohol. (Railton.)

EthylPhthalamin.
$C_{20} H_{13} N O_4$

EthylPhthalidin.
$C_{16} H_8 (C_4 H_5) N$

EthylPimelic Acid.
$C_4 H_5 O, H O, C_{14} H_{10} O_8$

EthylPiperidin. Soluble in water; but less so than piperidin. Easily soluble in alcohol, and ether. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 95.)
$C_{14} H_{15} N$

EthylPiperylUrea. *Vid.* Cyanate of EthylPiperidin.

EthylRacemic Acid. *Vid.* EthylParaTartaric Acid.

EthylQuinine. *Vid.* Hydrate of EthylQuinine.

EthylQuinolein. *Vid.* Hydrate of EthylQuinolein.

EthylSalicylamic Acid. Nearly insoluble in cold, tolerably readily soluble in boiling water. Easily soluble in boiling alcohol, and ether, but much less soluble in these liquids at the ordinary temperature. Soluble in concentrated sulphuric, chlorhydric, and nitric acids, when these are slightly heated; it is reprecipitated from the last two as the solutions cool, and from the first on the addition of water. Soluble in a warm aqueous solution of caustic potash separating out as the solution cools. (Limpricht, *Ann. Ch. u. Pharm.*, **98.** 264.)
$C_{18} H_{11} N O_4 = N H (C_4 H_5) C_{14} H_4 O_8, H O$

EthylSalicylic Acid. Very sparingly soluble, or insoluble, in water. Insoluble in ammonia-water, but after long-continued contact therewith it is decomposed and dissolves. (Cahours, *Ann. Ch. et Phys.*, (3.) **10.** 360.)
(*Salicylate of Ethyl. Salicylic Ether. Hydrate of EthylSalicyl.*)
$C_{18} H_{10} O_8 = C_{14} H_5 (C_4 H_5) O_8$

EthylSalicylate of Baryta. Sparingly soluble in water. (Cahours.)

EthylSalicylate of Potash. Soluble in water. (Cahours, *loc. cit.*)

EthylSalicylate of Soda. Soluble in water. (Cahours, *loc. cit.*)

EthylSelenhydric Acid. *Vid.* Selenhydrate of Ethyl.

EthylSinamin. Insoluble in water. Soluble in alcohol, and ether. Soluble in chlorhydric acid. (Hinterberger.)
(*Sinethylamin.*)
$C_{12} H_{10} N_2 = N \left\{ \begin{matrix} C_6 H_5 \\ C_4 H_5 \\ C_2 N \end{matrix} \right.$

EthylSolanin. $C_{48}H_{39}NO_{14} = N\left\{\begin{array}{l}C_{42}H_{33}O_{14}\\C_4H_5\\H\end{array}\right.$ Insoluble in water. Soluble in alcohol.

EthylStannEthyl. $(C_4H_5)_5Sn_4$ *Vid.* StannEthyl.

EthylSulphuric Acid. (*Sulphovinic Acid. Bisulphate of Ethyl.*) $C_4H_8S_2O_8 = C_4H_5O, HO, 2SO_3$) Soluble in all proportions in water, and alcohol. The aqueous solution is liable to suffer decomposition on standing, especially if it be dilute; it is also readily decomposed by boiling. Insoluble in ether. Its salts are all readily soluble in water, especially if this be hot. These solutions are decomposed on boiling. Some of the salts are soluble in alcohol, while others are precipitated from their aqueous solution on the addition of alcohol. Only the ammonia-salt is soluble in ether.

EthylSulphate of Alumina. Deliquescent. Soluble in alcohol. (Marchand.)

EthylSulphate of Ammonia. $C_4H_5(NH_4)S_2O_8$ Very deliquescent. Very soluble in water, with reduction of temperature. Tolerably soluble in alcohol, and ether. (Marchand.)

EthylSulphate of Ammonia & of Lead. Soluble in water. (Marchand.)

EthylSulphate of Ammonia & of Potash. $C_4H_5(NH_4)S_2O_8;\ 2C_4H_5KS_2O_8$ Easily soluble in water, and alcohol.

EthylSulphate of Ammonia & of Zinc.

EthylSulphate of Baryta. $C_4H_5BaS_2O_8 + 2\,Aq$ Permanent. The crystalline salt is soluble in 0.92 pt. of water at 17°. (Marchand.) Soluble in spirit; but insoluble in cold absolute alcohol.

EthylSulphate of Cadmium. $C_4H_5CdS_2O_8 + 2\,Aq$ Readily soluble in water, and alcohol. Insoluble in ether. (Marchand.)

EthylSulphate of Cobalt. $C_4H_5CoS_2O_8 + 2\,Aq$ Permanent. Readily soluble in water, and alcohol. Insoluble in ether, by which it is precipitated from the alcoholic solution. (Marchand.)

EthylSulphate of Copper. $C_4H_5CuS_2O_8 + 4\,Aq$ Permanent. Readily soluble in water, and alcohol. Insoluble in ether, by which it is precipitated from the alcoholic solution. (Marchand.)

EthylSulphate of Ethyl. (*Mono Sulphate of Ethyl*, C_4H_5O, SO_3.) $C_8H_{10}S_2O_8 = C_4H_5(C_4H_5)S_2O_8$ Insoluble in water; but is soon decomposed by water, even in the cold. Miscible in all proportions with alcohol, and ether. Soluble in fuming nitric acid, from which it is precipitated on the addition of water. (Wetherill.)

EthylSulphate *of protoxide* of Iron. Effloresces, with decomposition. Easily soluble in water, and alcohol. (Vogel.) Insoluble in ether. (Marchand.)

EthylSulphate *of sesquioxide* of Iron. Deliquesces, with decomposition. Soluble in water, and alcohol. Insoluble in ether, by which it is precipitated from the alcoholic solution. (Marchand.)

EthylSulphate of Lead.

I.) *normal.* $C_4H_5PbS_2O_8 + 2\,Aq$ Readily soluble in water, and alcohol. Insoluble in ether, by which it is precipitated from the alcoholic solution. (Marchand.)

II.) *basic.* $C_4H_5PbS_2O_8, PbO$ Hygroscopic. Soluble in 0.5 pt. of water (Vogel); in 0.54 pt. at 17°. (Marchand.) Easily soluble in spirit. Insoluble in ether.

EthylSulphate of Lime. $C_4H_5CaS_2O_8 + 2\,Aq$ Permanent. Soluble in 1 pt. of water at 8°, in 0.8 pt. at 17°, and in 0.63 pt. at 30°. Soluble in all proportions in boiling water. Less soluble in alcohol than in water. Insoluble in ether, by which it is precipitated from the alcoholic solution. (Marchand.)

EthylSulphate of Lime & of Soda.

EthylSulphate of Lithia. $C_4H_5LiS_2O_8 + 2\,Aq$ Deliquescent. Easily soluble in water, and alcohol. Insoluble in ether. (Marchand.)

EthylSulphate of Magnesia. $C_4H_5MgS_2O_8 + 4\,Aq$ Efflorescent. Very readily soluble in water, and alcohol. Insoluble in ether. The aqueous solution is more readily decomposed than that of any of the other ethylsulphates. (Marchand.)

EthylSulphate of Manganese. $C_4H_5MnS_2O_8 + 4\,Aq$ Permanent. Readily soluble in water, and alcohol. Insoluble in ether, by which it is precipitated from the alcoholic solution. (Marchand.)

EthylSulphate *of protoxide* of Mercury. Deliquescent. Soluble in alcohol. (Marchand.)

EthylSulphate of Nickel. $C_4H_5NiS_2O_8 + 2\,Aq$ Readily soluble in water, and alcohol. Insoluble in ether, by which it is precipitated from the alcoholic solution. (Marchand.)

EthylSulphate of Potash. $C_4H_5KS_2O_8$ Permanent. Deliquesces in moist air. Soluble in 0.8 pt. of water at 17°, and in much less hot water. (Marchand.) Readily soluble in spirit. (Hennel.) Insoluble in absolute alcohol, and ether. (Marchand.) Soluble, without decomposition, in ammonia-water, with a considerable reduction of temperature. (Marchand.)

EthylSulphate of Silver. $C_4H_5AgS_2O_8 + 2\,Aq$ Soluble in water, and alcohol. (Marchand.)

EthylSulphate of Soda. $C_4H_5NaS_2O_8 + 2\,Aq$ Deliquesces in moist air. Effloresces in warm air. The dry salt is soluble in 0.61 pt. of water at 17°, with reduction of temperature. Also soluble in alcohol. From the saturated hot alcoholic solution a compound of the salt and alcohol crystallizes on cooling, and from the cold mother liquor ether precipitates a further portion of it, but by washing with ether the alcohol may be completely removed. (Marchand.)

EthylSulphate of Strontia. $C_4H_5SrS_2O_8 + 2\,Aq$ Soluble in water. Very readily soluble in alcohol. Insoluble in ether. (Marchand.)

EthylSulphate *of protoxide* of Uranium. Deliquescent. Soluble in water. Easily soluble, with decomposition, in alcohol. Insoluble in ether. (Marchand.)

EthylSulphate *of sesquioxide* of Uranium. Soluble in water. Easily soluble, with decomposition, in alcohol. Insoluble in ether. (Marchand.)

ETHYLSULPHATE OF "WINE-OIL." Slightly soluble in water. It is decomposed after a time when in contact with water. (Sérullas.) Readily soluble in alcohol, and ether (Hennel); water precipitates it from these solutions. Decomposed by alkaline solutions.
$C_8 H_9 S_2 O_7$

ETHYLSULPHATE OF ZINC. Readily soluble in water, and alcohol. Insoluble in ether, by which it is precipitated from the alcoholic solution. (Marchand.)
$C_4 H_5 Zn S_2 O_8 + 2\,Aq$

ETHYLSULPHYDRIC ACID. *Vid.* Sulphydrate of Ethyl.

ETHYLSULPHIDE OF *X*. *Vid.* Sulphide of Ethyl & of *X*.

ETHYLSULPHUROUS ACID. Hygroscopic. Soluble in all proportions in water, and alcohol. (Lœwig & Weidmann.) Miscible in all proportions with water, and alcohol. (Muspratt, *J. Ch. Soc.*, **1.** 47.) The ethylsulphites of the metallic oxides are all soluble in water. (Muspratt.)
(*BiSulphEthylic Acid. Bisulphite of Ethyl. HypoSulphEthylic Acid.*)
$C_4 H_0 S_2 O_6 = C_4 H_5 O, H O, 2 S O_2$

ETHYLSULPHITE OF AMMONIA. Deliquescent. Very soluble in alcohol. (Lœwig & Weidmann.)

ETHYLSULPHITE OF BARYTA. Readily soluble in water and in ordinary alcohol. Insoluble in absolute alcohol, by which it is precipitated from the aqueous solution. (Lœwig & Weidmann.) Very soluble in water, spirit, and ether. Insoluble in absolute alcohol. (Muspratt, *J. Ch. Soc.*, **1.** 47.)
$C_4 H_5 Ba S_2 O_6 + Aq$

ETHYLSULPHITE OF COPPER. Very readily soluble in water, and alcohol. (Lœwig & Weidmann.) Very soluble in water, and spirit. (Muspratt, *J. Ch. Soc.*, **1.** 49.)
$C_4 H_5 Cu S_2 O_6 + 5\,Aq$

ETHYLSULPHITE *of protoxide* OF IRON. Readily soluble in water, and alcohol. (Lœwig & Weidmann.)

ETHYLSULPHITE OF LEAD. Extremely soluble in water, spirit, and alcohol. (Muspratt, *J. Ch. Soc.*, **1.** 49.)
$C_4 H_5 Pb S_2 O_6$

ETHYLSULPHITE OF LIME. Permanent. Readily soluble in water, and alcohol. (Lœwig & Weidmann.)
$C_4 H_5 Ca S_2 O_6$

ETHYLSULPHITE OF MAGNESIA. Easily soluble in water, and alcohol. (Lœwig & Weidmann.)

ETHYLSULPHITE OF MANGANESE. Readily soluble in water, and alcohol. (Lœwig & Weidmann.)

ETHYLSULPHITE OF POTASH. Deliquescent. Sparingly soluble in cold, more soluble in boiling alcohol.
$C_4 H_5 K S_2 O_0$

ETHYLSULPHITE OF SILVER. Soluble in water, and alcohol. (Lœwig & Weidmann.)
$C_4 H_5 Ag S_2 O_0$

ETHYLSULPHITE OF SODA. Slowly deliquesces. Slowly soluble in cold, more soluble in hot alcohol. (Lœwig & Weidmann.)
$C_4 H_5 Na S_2 O_6 + x\,Aq$

ETHYLSULPHITE OF ZINC. Effloresces in dry air. Deliquesces in moist air. Very soluble in water, and alcohol. (Lœwig & Weidmann.)
$C_4 H_5 Zn S_2 O_6 + 7\,Aq$

ETHYLSULPHOBENZOIC ACID. Soluble in water, and alcohol. Its salts appear to be all easily soluble in water, since a solution of the ammonia-salt produces no precipitate with any metallic solution.
(*SulphoBenzoate of Ethyl(mono).*)
$C_{18} H_{10} S_2 O_{10} = C_{14} H_4 (C_4 H_5) S_2 O_9, H O$

ETHYLSULPHOBENZOATE OF AMMONIA. Easily soluble in water, and spirit. Insoluble in ether.
$C_{18} H_9 (N H_4) S_2 O_{10}$

ETHYLSULPHOBENZOATE OF BARYTA. Readily soluble in water.
$C_{18} H_9 Ba S_2 O_{10}$

ETHYLSULPHOBENZOATE OF SILVER. Soluble in water.
$C_{18} H_9 Ag S_2 O_{10}$

ETHYLSULPHOBENZOATE OF SODA. Easily soluble in water, and alcohol. (Limpricht & v. Uslar, *Ann. Ch. u. Pharm.*, **102.** 256.)
$C_{18} H_9 Na S_2 O_{10}$

"ETHYLSULPHOCARBAMID." *Vid.* Hydrate of SulphoCarbonylEthylammonium.

"ETHYLSULPHOCARBONIC ACID." *Vid.* OxySulphoCarbonate of Ethyl.

ETHYLSULPHOCARBONATE OF COPPER with *di*SULPHIDE OF COPPER. Insoluble in water. Tolerably soluble in alcohol. Soluble in about 10,000 pts. of ether. (Debus.)
$3 (C_6 H_5 Cu S_2 O_4) ; Cu_2 S$

ETHYLSULPHOCARBONATE OF ETHYL. Insoluble in water. Easily soluble in alcohol, and ether. (Debus.)
(*SulphoCarbonate of Ethyl. Carbonate of SulphEthyl.*)
$C_{10} H_{10} S_2 O_4 = \left.\begin{matrix} C_4 H_5 S \\ C_4 H_5 S \end{matrix}\right\} C_2 O_4$; or $\left.\begin{matrix} C_2 S_2'' \\ (C_4 H_5)_2 \end{matrix}\right\} O_4$

ETHYLSULPHOCARBONATE OF LEAD. Insoluble in water. Decomposed when boiled with water. Sparingly soluble in alcohol, and ether. Soluble in solutions of acetate of lead, and ethylsulphocarbonate of potash. (Debus.)
$C_0 H_5 Pb S_2 O_4$

ETHYLSULPHOCARBONATE OF POTASH. Permanent. Very soluble in water; the solution decomposes, however, in the course of a few days. Very sparingly soluble in alcohol at 0°; but very easily soluble therein at 15° @ 20°. Very sparingly soluble in ether; by which it is precipitated from the alcoholic solution. Both the aqueous and alcoholic solution are decomposed by boiling.
$C_6 H_5 K S_2 O_4$

ETHYLSULPHOCARBONATE OF SILVER. Insoluble in water. (Debus.)
$C_6 H_5 Ag S_2 O_4$

ETHYLSULPHOCARBONATE OF ZINC. Tolerably soluble in water, and in absolute alcohol. After a time these solutions undergo decomposition. (Debus.)

II.) *acid.* Soluble in hot water. (Wœhler.)

Euchroate of Baryta. Ppt.
$C_{24}\,H_2\,Ba_2\,N_2\,O_{16}$ (?)

Euchroate of Lead.
$C_{24}\,H_2\,Pb_2\,N_2\,O_{16} + 2\,Aq$

Euchroate of Silver. Insoluble in ammonia-water.
$C_{24}\,Ag_4\,N_2\,O_{16} + 2\,Aq$

Eugenic Acid. Resinifies in the air. Very sparingly soluble in water. Very easily soluble in alcohol, ether, and aqueous alkaline solutions. Also soluble in concentrated acetic acid. Scarcely more soluble in dilute ammonia-water, or in a solution of carbonate of ammonia, than in pure water.
(*Nelkensäure. Essence de Girofle oxygenée.*)
$C_{20}\,H_{12}\,O_4 = C_{20}\,H_{11}\,O_3,\,H\,O$

Eugenate of Ammonia. Insoluble in ether.
$C_{20}\,H_{11}\,(N\,H_4)\,O_4$

Eugenate of Baryta. Difficultly soluble in cold, more easily soluble in hot water. Soluble in hot, less soluble in cold alcohol.
$C_{20}\,H_{11}\,Ba\,O_4$

Eugenate of Copper. Ppt.

Eugenate of Ethyl. Insoluble in water. Easily soluble in alcohol, and ether. (Cahours, *Ann. Ch. et Phys.*, (3.) **52.** 206.)
(*EugenEthyl.*)
$C_{24}\,H_{16}\,O_4 = C_{20}\,H_{11}\,(C_4\,H_5)\,O_4$

Eugenate *of protoxide* of Iron.

Eugenate of Lead.

Eugenate of Lime. Insoluble in cold, sparingly soluble in boiling water. Soluble in 235 pts. of water. (Bonastre.)

Eugenate of Magnesia. Insoluble in water, either hot or cold. (Bonastre.)

Eugenate of Potash. Soluble in water, with partial decomposition. Soluble
$C_{20}\,H_{11}\,K\,O_4\,;\,C_{20}\,H_{12}\,O_4 + 2\,Aq$

in hot, less soluble in cold alcohol. (Dumas.) Decomposed by alcohol, and ether. (Bonastre.)

EUGENATE OF SODA. Soluble in 10 @ 12 pts. of cold, and in any quantity of hot water. Soluble, with decomposition, in alcohol, and ether. (Bonastre.)
$C_{20}H_{11}NaO_4$

EUGENATE OF STRONTIA. Resembles the baryta salt.

EUGENIN (from *Eugenia caryophyllata*). Somewhat soluble in water. Easily soluble in alcohol, and ether. (Bonastre.)
$C_{20}H_{12}O_4$

EUGENOL. *Vid.* Eugenic Acid.

EUGENYL. Hypothetical radical in oil of clove.
$C_{20}H_{11}O_2$

EULYTE. Soluble in 10,000 pts. of water at 10°. Soluble in 170 pts. of alcohol, of 88%, at 10°; easily soluble in such alcohol when warm. Soluble in ether. Soluble in warm concentrated sulphuric acid, from which it separates out for the most part as the solution cools. (Baup, *Ann. Ch. et Phys.*, (3.) **33.** 198.)

EUPATORIN (from *Eupatorium cannabium*). Insoluble in water. Soluble in absolute alcohol, and ether.

EUPHORBIC ACID. Easily soluble in water. Somewhat more difficultly soluble in alcohol. Its alkaline salts are easily soluble.

EUPHORBATE OF LEAD. Soluble in warm water.

EUPHORBIIN. Soluble in alcohol, acetic acid, and oils. Difficultly soluble in alkaline solutions. Ether only dissolves traces of it.
$C_{20}H_{16}O$

EUPION. Insoluble in water. Easily soluble in absolute alcohol, ether, and oils.
(A mixture of oils obtained by the distillation of rich coals, &c., at low temperatures. *Coal-Oil.*)

EUXANTHIC ACID. Very sparingly soluble in cold, more soluble in boiling water. Readily soluble in boiling alcohol. Soluble in ether. Largely soluble in cold concentrated sulphuric acid, with combination. Soluble in boiling dilute chlorhydric acid. Its alkaline salts are soluble in water, the others are more or less insoluble.
(*Purreic Acid.*)
$C_{42}H_{18}O_{22} = C_{42}H_{17}O_{21}, HO$

EUXANTHATE OF AMMONIA. Readily soluble in pure water. Insoluble in alcohol. Insoluble in concentrated aqueous solutions of the alkaline carbonates.
$C_{42}H_{17}(NH_4)O_{22}$

EUXANTHATE OF BARYTA. Soluble in boiling, much less soluble in cold water.

EUXANTHATE OF COPPER. Tolerably soluble in pure water. Insoluble in an aqueous solution of sulphate of copper.

EUXANTHATE *of protoxide* **OF IRON.** Ppt.

EUXANTHATE *of sesquioxide* **OF IRON.** Ppt.

EUXANTHATE OF LEAD. Sparingly soluble in water.

EUXANTHATE OF LIME. Soluble in boiling, much less soluble in cold water.

EUXANTHATE OF MAGNESIA.

I.) *normal.* Appears to be soluble in water.

II.) *basic.* Insoluble in water.

EUXANTHATE OF MANGANESE. Ppt.

EUXANTHATE OF NICKEL. Ppt.

EUXANTHATE OF POTASH. Readily soluble in pure water. Insoluble in concentrated solutions of the alkaline carbonates.
$C_{42}H_{17}KO_{22}$

EUXANTHATE OF SILVER. Somewhat soluble in cold water.

EUXANTHATE OF SODA. Readily soluble in pure water. Insoluble in concentrated solutions of the alkaline carbonates.

EUXANTHONE. Sparingly soluble in water, cold alcohol, and ether. Easily soluble in boiling alcohol. Readily soluble in an aqueous solution of caustic potash; also soluble in concentrated, but almost entirely insoluble in dilute, ammonia-water.
(*Purrenone.*)
$C_{40}H_{12}O_{12}$

EVERNIC ACID. Insoluble in cold water. Very soluble in alcohol, and ether. Soluble in solutions of caustic potash and ammonia.
$C_{34}H_{16}O_{14}$

EVERNATE OF BARYTA. Sparingly soluble in water. Very soluble in weak spirit.
$C_{34}H_{15}BaO_{14}$

EVERNATE OF POTASH. Soluble in water, and in weak alcohol.
$C_{34}H_{15}KO_{14}$

EVERNINIC ACID. Sparingly soluble in cold, tolerably soluble in boiling water. Readily soluble in alcohol, and ether.
$C_{18}H_{10}O_8 = C_{18}H_9O_7, HO$

EVERNINATE OF BARYTA.

EVERNINATE OF ETHYL. Insoluble in water. Very soluble in alcohol, and ether. Insoluble in ammonia-water. Easily soluble in a solution of caustic potash.
$C_{18}H_9(C_4H_5)O_8$

EVERNINATE OF POTASH. Readily soluble in water; less soluble in cold alcohol.

EVERNINATE OF SILVER.
$C_{18}H_9AgO_8$

EVONYMIN (from *Evonymus europæus*).

FAGIN (from *Fagus sylvatica*). Easily soluble in water, alcohol, and dilute acids. Sparingly soluble in ether. (Buchner & Herberger.)

FATS [compare Oils (Fixed)]. The fats which occur in nature are, as a rule, exceedingly sparingly soluble in water. Scarcely at all soluble in cold ordinary alcohol, the small portion which dissolves being mostly *olein*; boiling alcohol dissolves them much more readily, some margarin being dissolved as well as olein; as the solution cools, most of the matter which has been dissolved is redeposited. Castor-oil is an exception to this rule, being tolerably soluble in ordinary alcohol, and very soluble in absolute alcohol.

The fats are very much more soluble in absolute alcohol than in weaker alcohol, their solubility decreasing with great rapidity as the sp. gr. of the alcohol is increased from 0.795 to 0.821 (Chevreul, *Ann. Ch. et Phys.*, 1816, (2.) **2.** 361; see under Stearin (natural).)

As a rule, the fats are all soluble in ether; which is generally considered to be their best solvent. They are also readily soluble in naphtha, benzin, and the various oils obtained from coal, &c., — both the coal-oils proper and the products obtained from coal-tar; also in oil of turpentine. In oil of ocotea (Hancock); and the other essential oils; in bisulphide of carbon, chloride of sulphur, protochloride of phosphorus, chloroform, fusel-oil (hydrate of amyl), capryl alcohol (hydrate of capryl) (Bouis), acetone, and the like.

They are soluble in a concentrated solution of butyric acid. (Chevreul; Barreswil, *Ann. Ch. et Phys.*, (3.) **10.** 445.) They are soluble, with combination, in concentrated sulphuric acid; and in the other concentrated mineral acids, with decomposition.

When boiled with aqueous solutions of the caustic alkalies, or heated in closed vessels (under pressure) with solutions of the alkaline carbonates, they are decomposed with separation of glycerin and formation of soap.

Oleic acid, and other fatty acids are soluble in almost any quantity in a mixture of oil of turpentine and alcohol. (Rousseau, *J. Ch. Méd.*, **22.** 310. [*Gm.*].)

Beef Fat. 100 pts. of boiling alcohol of 0.821 sp. gr. dissolve 2.52 pts. of it; or 1 pt. of the fat is soluble in 39.6 pts. of boiling alcohol of 0.821 sp. gr. (Chevreul, *Ann. Ch. et Phys.*, 1816, (2.) **2.** 348.) Soluble in hot oil of bay. (Brandes.)

Cacao Butter(from *Theobroma Cacao*).

Chinese Tallow(from *Stillingia Sebifera*). (*Mixture of palmitin & olein.*) Insoluble in water. The liquid portion of the tallow (its olein) being soluble in the cold in various menstrua imparts to them a solvent action on the solid portion also, which they otherwise do not possess; hence, not only do oil of turpentine and coal-tar naphtha dissolve it entirely, but it is also partially soluble in ether, in mixed ether and absolute alcohol (equal parts), ether and common alcohol, wood-spirit, absolute alcohol, and common strong alcohol. The order of these menstrua indicates the order of solubility. On boiling, it is completely dissolved by ether, by ether and absolute alcohol (equal parts), ether and common alcohol, absolute alcohol, wood-spirit, and common alcohol, — the facility of solution being indicated by the order of the solvents. The ethereal solutions remain clear after cooling, and only after some time deposit crystals. Crystals are formed immediately in the other solutions. (Maskelyne, *J. Ch. Soc.*, **8.** 2.)

Cow's Butter. Soluble in 28 pts. of boiling alcohol of 0.82.

Hog's Fat. 100 pts. of boiling alcohol, of 0.816 sp. gr. dissolve 2.8 pts. of it; or 1 pt. of the fat is soluble in 39.64 pts. of boiling alcohol of 0.816 sp. gr. (Chevreul, *Ann. Ch. et Phys.*, 1816, (2.) **2.** 348.)

Human Fat. 100 pts. of boiling alcohol of 0.821 sp. gr. dissolve 2.48 pts. of it; or 1 pt. of the fat is soluble in 40.32 pts. of boiling alcohol of 0.821 sp. gr. (Chevreul, *Ann. Ch. et Phys.*, 1816, (2.) **2.** 348.)

Jaguar Fat. 100 pts. of boiling alcohol, of 0.821 sp. gr. dissolve 2.18 pts. of it; or 1 pt. of the fat is soluble in 45.87 pts. of boiling alcohol of 0.821 sp. gr. (Chevreul, *Ann. Ch. et Phys.*, 1816, (2.) **2.** 348.)

Muscat Butter(from the nuts of *Myristica moschata*). Partially soluble in cold alcohol. Completely soluble in 4 pts. of boiling alcohol.

Mutton Fat. 100 pts. of boiling alcohol, of 0.821 sp. gr. dissolve 2.26 pts. of it; or 1 pt. of the fat is soluble in 44.24 pts. of boiling alcohol of 0.821 sp. gr. (Chevreul, *Ann. Ch. et Phys.*, 1816, (2.) **2.** 348.) Soluble in hot, less soluble in cold acetone, from which it is precipitated on the addition of water.

Nutmeg Butter(from *Myristica officinalis*). Contains two fatty oils. One soluble in alcohol, the other insoluble in alcohol, and soluble in ether.

Shea Butter. Soluble for the most part in alcohol. Completely soluble in cold ether. (Thomson & Wood.)

Ferment Oils. (*Fermentolea.*) These are volatile oils, produced by the fermentation of various plants, but not originally contained in the latter, and entirely different from the "essential oils," which are extracted from the unfermented plants by distillation with water. Ferment-oils are generally much more soluble in water than ordinary volatile oils.

Ferment-oil of Chærophyllum Sylvestre. Sparingly soluble in water. Easily soluble in alcohol, ether, and the fixed and volatile oils. It forms an emulsion with ammonia-water, and dissolves resin. (Bley.)

Ferment-oil of Chelidonium majus. Sparingly soluble in water. Readily soluble in alcohol, ether, and the fixed and volatile oils. (Bley.)

Ferment-oil of Conium maculatum. Easily soluble in alcohol, ether, and the fixed and volatile oils. (Landerer.)

Ferment-oil of diseased Apples. (*Oil of Apples. Maloil.*) Readily soluble in alcohol, and ether. (Rossignon.)

Ferment-oil of Erythræa Centaurium.

Ferment-oil of Echium vulgare. Easily soluble in alcohol, and ether. (Bley.)

Ferment-oil of Erica vulgaris. Soluble in ether. (Bley.)

Ferment-oil of Tussilago farfara. Sparingly soluble in water. Readily soluble in alcohol, and ether. (Bley.)

Ferment-oil of Marrubium vulgare. Soluble in water, in dilute nitric acid, and in an aqueous solution of caustic potash. Easily soluble in ether. (Bley.)

Ferment-oil of Achillea Millefolium. Soluble in alcohol, ether, and the fixed and volatile oils. (Bley.)

Ferment-oil of various species of Plantago. Soluble in alcohol, ether, and oils. (Bley.)

Ferment-oil of Quercus Robur. Sparingly soluble in water. Readily soluble in alcohol, ether, and the fixed and volatile oils. (Bley.)

Ferment-oil of Salix pentandra. Sparingly soluble in water. Easily soluble in all proportions in alcohol, ether, the fixed and volatile oils, and creosote. (Bley.)

Ferment-oil of Salvia pratensis. Sparingly soluble in water. Easily soluble in all proportions in alcohol, ether, and the fixed and volatile oils. Very sparingly soluble in an aqueous solution of caustic potash. Forms an emulsion with ammonia-water. (Bley.)

Ferment-oil of Trifolium fibrinum. Sparingly soluble in water. Easily soluble in alcohol, and ether. (Bley.)

Ferment-oil of Urtica urens. Resembles the ferment-oil of *Echium vulgare*.

Ferment-oil of Vitis vinifera. Sparingly soluble in water. Abundantly soluble in alcohol, ether, and the fixed oils. In oil of turpentine, and oil of lemon, it forms at first a milky solution, which afterwards becomes clear. With bisulphide of carbon it forms a milky liquid, from which it afterwards separates unaltered. Soluble, without alteration, in chlorhydric and acetic acids. Forms a soapy emulsion with ammonia-water.

Ferric Acid. Not isolated. All of the fer-

$Fe O_3$ rates, excepting those of potash and soda, are insoluble in water. (Fremy, *loc. inf. cit.*)

Ferrate of Baryta. Insoluble in water. $2 (Ba O, Fe O_3) + Aq$ (Denham Smith.) Insoluble in water. Decomposed by long boiling with water. Soluble in acetic acid at ordinary temperatures, without decomposition, — that is to say, the ferric acid is not destroyed, but remains in the solution. (Fremy, *Ann. Ch. et Phys.*, (3.) **12.** 373.)

Ferrate of Potash. Very deliquescent. Soluble in water, with evolution of so much heat that the salt is decomposed unless the mixture be refrigerated.

Very soluble in water. Insoluble in a concentrated aqueous solution of caustic potash. The aqueous solution soon decomposes when left to itself; this decomposition is instantaneous on boiling. If a hypochlorite be present in the solution, the ferrate of potash is only slowly decomposed on boiling. (Fremy, *Ann. Ch. et Phys.*, (3.) **12.** pp. 369, 371.)

Ferrate of Soda. Soluble in water, and in a concentrated solution of caustic soda. (Fremy, *loc. cit.*, p. 373.)

FerriCyanhydric Acid. Easily soluble in $C_{12} H_3 Fe_2 N_6 = 3 H Cy, Fe_2 Cy_3 = H_3 . Cfdy'''$ water; the solution undergoing decomposition when boiled for a long time. Also soluble in alcohol, but this solution is decomposed by the action of light. (Compare F. & E. Rodgers, *Phil. Mag.*, 1834, (3.) **4.** 102.)

The ferricyanides of metals, the oxides of which are soluble in ammonia-water, or in a solution of caustic potash, are themselves soluble in solutions of ammonia and potash. (Reynoso, *Ann. Ch. et Phys.*, (3.) **30.** 255.)

FerriCyanhydrate of Cinchonin.
$N_2 \left\{ C_{40} H_{24} O_2^{vi}, 3 H Cy, Fe_2 Cy_3 + 4 Aq \right.$

FerriCyanhydrate of Codein.

FerriCyanhydrate of Harmalin.

FerriCyanhydrate of Harmin.

FerriCyanhydrate of Morphine. Ppt.

FerriCyanhydrate of NitroHarmalin. Less soluble in water than the nitroharmin salt.

FerriCyanhydrate of NitroHarmin. More soluble in water than the nitroharmalin salt.

FerriCyanhydrate of Quinine. Easily $C_{40} H_{24} N_2 O_4, Fe_2 Cy_3, 3 H Cy + 3 Aq$ soluble in water, but the solution is decomposed by evaporation. (Dollfus.)

FerriCyanhydrate of Strychnine. Very $3 C_{42} H_{22} N_2 O_4, 3 H Cy, Fe_2 Cy_3 + 12 Aq$ hygroscopic. Very sparingly soluble in cold, more soluble in hot water. Soluble in cold, but more soluble in warm alcohol. (D. Brandis.)

FerriCyanide of Ammonium. Permanent. $3 N H_4 Cy, Fe_2 Cy_3 + 6 Aq$ Readily soluble in water. Soluble in alcohol (?).

FerriCyanide of Barium. Known only in $3 Ba Cy, Fe_2 Cy_3$ aqueous solution. (Berzelius's *Lehrb.*)

FerriCyanide of Barium & Potassium. $K Ba_2 Cy_3, Fe_2 Cy_3 + 6 Aq$ Permanent. Readily soluble in water; less soluble in alcohol. (Bette.)

FerriCyanide of Bismuth. Ppt. Insoluble $Bi Cy_3, Fe_2 Cy_3$ in chlorhydric acid.

FerriCyanide of Brucin. Resembles the ferrocyanide. (Brandes.)

FerriCyanide of Cadmium. Readily soluble $3 Cd Cy, Fe_2 Cy_3$ in aqueous solutions of ammoniacal salts, and in ammonia-water. (Wittstein.) Soluble in chlorhydric acid.

FerriCyanide of Calcium. Deliquescent $3 Ca Cy, Fe_2 Cy_3 + 10 Aq$ in moist air. Easily soluble in water. Also soluble in weak alcohol. (Bette.)

FerriCyanide *of protoxide* of Cerium. Appears to be soluble in water.

FerriCyanide *of sesquioxide* of Cerium. Ppt.

FerriCyanide of Cobalt. Insoluble in $3 Co Cy, Fe_2 Cy_3$ ammonia-water. (Wittstein.) Insoluble in chlorhydric acid. Soluble in ammonia-water. (Reynoso.)

***Di*FerriCyanide of Copper.** Ppt. Insolu- $3 Cu_2 Cy, Fe_2 Cy_3$ ble in solutions of the ammoniacal salts; but soluble in ammonia-water. (Wittstein.)

***Proto*FerriCyanide of Copper.** Soluble in $3 Cu Cy, Fe_2 Cy_3$ ammonia-water, and in an aqueous solution of carbonate of ammonia. Only partially soluble in hot solutions of the other ammoniacal salts. (Wittstein.) Insoluble in chlorhydric acid. (H. Rose, *Tr.*)

FerriCyanide of Ferammonium. Insoluble $3 \left(N \left\{ \begin{smallmatrix} H_3 \\ Fe \end{smallmatrix} \right. Cy \right), 2 Fe_2 Cy_3 + 9 Aq$ in an aqueous solution of tartrate of ammonia. Scarcely at all acted upon by ammonia-water. Decomposed by aqueous solutions of the fixed alkalies, even in the cold. (Monthiers.)

FerriCyanide of Iron.
(*Prussian Blue.*)

I.) *Turnbull's Blue.*
$C_{12} N_6 Fe_5 + 12 Aq = 3 Fe Cy, Fe_2 Cy_3 + 12 Aq$

II.) *Ordinary Prussian Blue.*
$C_{18} N_9 Fe_7 + 18 Aq = 3 Fe Cy, 2 Fe_2 Cy_3 + 18 Aq$ Very hygroscopic. (Berzelius.) Insoluble in water, alcohol, ether, the essential oils, or dilute acids. Unacted upon by small quantities of cold concentrated chlorhydric acid. It dissolves at once in a cold aqueous solution of normal tartrate of ammonia. (Monthiers.) Soluble in oxalic acid. Soluble in aqueous solutions of many of the nitro-prussids. (Playfair.) Insoluble in ammonia-water. (Reynoso.) Soluble in concentrated sulphuric acid, from which it is precipitated on the addition of water. (Berzelius, *Lehrb.*, **3.** pp. 586, 588.) Decomposed by nitric acid when this is gently warmed; also by strong fuming chlorhydric acid. Decomposed by alkaline solutions. (*Ibid.*) Solutions of tartrate or citrate of iron containing free tartaric or citric acid are not precipitated, but only colored blue, on the addition of ferrocyanide of potassium. (Calloud.) It is not formed in solutions which contain tartaric acid. (Spiller.)

"In all cases in which the formation of Prussian blue occurs in presence of a compound of potassium, the Prussian blue takes up ferrocyanide of potassium in a state of intimate union, and in particular abundance when the latter is present in excess. Prussian blue containing a considerable quantity of ferrocyanide of potassium, is not soluble in the saline liquid in which it is produced; but on decanting this liquid, and washing the residue with water, the water acquires a blue color which becomes continually deeper as the soluble salts are removed, the water in fact dissolving the greater part of the ferrocyanide of potassium, and by means of it a large quantity of Prussian blue. This is the soluble Prussian blue described by Berzelius and Robiquet. With a smaller quantity of ferrocyanide of potassium the Prussian blue does not dissolve in the wash water, but very slowly gives up to it the ferrocyanide of potassium, so that ultimately a residue is obtained, consisting of Prussian blue free from potassium." (L. Gmelin, *Handbook*, **7.** 439.)

Prussian blue which contains much ferrocyanide of potassium is wholly or in part soluble in water, but is insoluble in saline solutions like chloride of ammonium. It is not precipitated from this solution either on boiling or by the addition of alcohol, but is thrown down by chlorhydric acid and by many salts, after which it may again be dissolved in pure water. (Robiquet.) All samples of Prussian blue give up ferrocyanide of potassium to boiling water. (Wach.)

III.) *Ammoniacal Prussian Blue.* $3\,(Fe\,Cy, N\,H_3, H\,O), 2\,(Fe_2\,Cy_3) + 9\,Aq$ Insoluble in an aqueous solution of normal tartrate of ammonia. (Monthiers.)

IV.) *Green cyanide of Iron.* *(Prussian Green.)* $C_{24}\,N_{12}\,Fe_9 + 12\,Aq$ or $C_8\,N_4\,Fe_3 + 4\,Aq = Fe\,Cy, Fe_2\,Cy_3 + 4\,Aq$ Soluble in pure water. (Berzelius.) Insoluble in water. Insoluble in concentrated chlorhydric acid, but is decomposed when boiled therewith during several hours. (Pelouze.)

V.) *Basic Prussian Blue.* $3\,Fe\,Cy, 2\,Fe_2\,Cy_3;\ Fe_2\,O_3$ Soluble in water. Insoluble in an aqueous solution of ferrocyanide of potassium and in saline solutions generally, which also precipitate it from the aqueous solution. Alcohol does not precipitate it from the aqueous solution. (Berzelius.)

VI.) "*Soluble Prussian Blue.*" $3\,Fe\,Cy, 2\,Fe_2\,Cy_3;\ 2\,K\,Cy, Fe\,Cy$ Soluble in pure water. Insoluble in saline solutions, or in acids. Alcohol precipitates it from the aqueous solution. (Berzelius.)

VII.) $2\,(3\,Fe\,Cy, 2\,Fe_2\,Cy_3);\ 2\,K\,Cy, Fe\,Cy$ Insoluble in water, but is gradually oxidized and then dissolved when in contact with water. (Berzelius, *Lehrb.*, **3.** 592.)

VIII.) $3\,(3\,Fe\,Cy, 2\,Fe_2\,Cy_3);\ 2\,(2\,K\,Cy, Fe\,Cy)$ Soluble in water, and in dilute spirit. (*Ibid.*)

FERRICYANIDE OF LEAD. $3\,Pb\,Cy, Fe_2\,Cy_3$ Slightly soluble in water; more soluble in hot than in cold water, but the solution deposits a powder when boiled. (Gmelin.)

FERRICYANIDE OF LUTEOCOBALT. $6\,N\,H_3 \,.\, Co_2\,Cy_3, Fe_2\,Cy_3 + Aq$ Ppt.

FERRICYANIDE OF MAGNESIUM. $3\,Mg\,Cy, Fe_2\,Cy_3 + 17\,Aq$ Readily soluble in water. Soluble in spirit. (Bette.)

FERRICYANIDE OF MANGANESE. $3\,Mn\,Cy, Fe_2\,Cy_3$ Insoluble in water. Insoluble in ammonia-water. (Reynoso.) Insoluble in acids. (H. Rose, *Tr.*) Slightly soluble in an aqueous solution of carbonate of ammonia. Insoluble in a solution of chloride of ammonium. (Wittstein.)

FERRICYANIDE OF NICKEL. $3\,Ni\,Cy, Fe_2\,Cy_3$ Insoluble in chlorhydric acid.

FERRICYANIDE OF NICKEL & OF NICKELAMMONIUM. $Ni\,Cy, 2\,(N\left\{\begin{matrix}H_3\\Ni\end{matrix}\right., Cy), Fe_2\,Cy_3 + Aq$ Ppt.

FERRICYANIDE OF POTASSIUM. $3\,K\,Cy, Fe_2\,Cy_3$ Permanent.

At °C.	1 pt. of the salt is soluble in pts. of water.	100 pts. of water dissolve pts. of the salt.	Sp. gr. of the solution.
4.4°	3 03	33.0	1.151
10°	2 73	36 6	1.164
15.6°	2.54	40.8	1.178
37.8°	1.70	58.8	1.225
100°	1.29	77.5	1.250
104.4°	1.21	82.6	1.265

(Wallace, *J. Ch. Soc.*, **7.** 80.)

Soluble in 2.63 pts. of water at 13°; or 100 pts. of water at 13° dissolve 38 pts. of it; or the aqueous solution saturated at 13° contains 27.5% of it, and is of 1.1630 sp. gr. (H. Schiff, *Ann. Ch. u. Pharm.*, 1860, **113.** 350.) Soluble in 3.8 pts. of cold, and in a smaller quantity of hot water (L. Gmelin.); in 2 pts. of cold and in less than 1 pt. of hot water. (Girardin.)

An aqueous solution of sp. gr. (at 13°)	Contains (by experiment) per cent of $3\,K\,Cy, Fe_2\,Cy_3$
1.0158	3.06
1.0320	6.10
1.0492	9.20
1.0668	12.20
1.1026	18.33
1.1630	27.50

From these results Schiff deduces the formula: $D = 1 + 0.005069\,p + 0.00003123\,p^2$, in which D = the sp. gr. of the solution and p the percentage of substance in the solution, by means of which Ott has calculated the following table.

An aqueous solution of sp. gr. (at 13°)	Contains per cent of $3\,K\,Cy, Fe_2\,Cy_3$	An aqueous solution of sp. gr. (at 13°)	Contains per cent of $3\,K\,Cy, Fe_2\,Cy_3$
1.0051	1	1.0891	16
1.0103	2	1.0952	17
1.0155	3	1.1014	18
1.0208	4	1.1076	19
1.0261	5	1.1139	20
1.0315	6	1.1202	21
1.0370	7	1.1266	22
1.0426	8	1.1331	23
1.0482	9	1.1396	24
1.0538	10	1.1462	25
1.0595	11	1.1529	26
1.0653	12	1.1596	27
1.0712	13	1.1664	28
1.0771	14	1 1732	29
1.0831	15	1.1802	30

(H. Schiff, *Ann. Ch. u. Pharm.*, 1860, **113.** 199.)

The saturated aqueous solution boils at 104.4°. (Wallace, *loc. cit.*) Very insoluble in strong alcohol. (F. & E. Rodgers, *Phil. Mag.*, 1834, (3.) **4.** 102.) Insoluble in absolute alcohol. Very sparingly soluble in spirit. (L. Gmelin.)

FERRICYANIDE OF POTASSIUM & OF SODIUM. $3\,K\,Cy, Fe_2\,Cy_3;\ 3\,Na\,Cy, Fe_2\,Cy_3, \&\ + 6\,Aq$ Soluble in water. (Laurent.)

FERRICYANIDE OF POTASSIUM with IODIDE OF POTASSIUM. $3\,K\,Cy, Fe_2\,Cy_3;\ K\,I$ (Preuss.)

FERRICYANIDE OF ROSEOCOBALT. $5\,N\,H_3 \,.\, Co_2\,Cy_3, Fe_2\,Cy_3 + 3\,Aq$ Insoluble in cold, readily decomposed by hot water. (Gibbs & Genth, *Smithsonian Contributions*, Vol. **9.**)

FERRICYANIDE OF SILVER. $3\,Ag\,Cy, Fe_2\,Cy_3$ Soluble in ammonia-water, and in a hot aqueous solution of carbonate of ammonia; but insoluble in solutions of the other ammoniacal salts.

Insoluble in an aqueous solution of proto-nitrate of mercury. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 317.)

FerriCyanide of Sodium. $3 Na Cy, Fe_2 Cy_3 + 2 Aq$ Effloresces in moist air. (Kramer.) Deliquescent. (Bette.) Soluble in 5.3 pts. of cold, and in 1.25 pts. of boiling water. Very sparingly soluble in alcohol (Kramer); but alcohol does not precipitate it from the aqueous solution. (Bette.) Insoluble in alcohol; but even a very concentrated aqueous solution may be mixed with a large quantity of strong alcohol without precipitating the salt. (Berzelius, *Lehrb.*, **3.** 583.)

FerriCyanide of Tin. $3 Sn Cy, Fe_2 Cy_3$ Imperfectly soluble in ammonia-water, and in aqueous solutions of the ammoniacal salts. (Wittstein.) Soluble in chlorhydric acid.

FerriCyanide of Uranium($Ur_2 O_3$). Soluble in an aqueous solution of carbonate of ammonia. (Wittstein.)

FerriCyanide of Vanadium($V O_2$). Ppt.

FerriCyanide of Zinc. $3 Zn Cy, Fe_2 Cy_3$ Readily soluble in ammonia-water, and in aqueous solutions of the ammoniacal salts. (Wittstein.) Soluble in chlorhydric acid.

FerriCyanide of Zirconium. Appears to be soluble in water.

Ferride of Potassium.

Ferride of Tin. $Sn Fe_3$ Slowly soluble in concentrated chlorhydric acid. Easily soluble in aqua-regia. It is not attacked even by boiling nitric acid. (Lassaigne.)

Ferrous Acid. *Vid. Sesqui*Oxide of Iron.

Ferrite of Iron & of Manganese.
$(Fe O, Mn O), Fe_2 O_3$

Ferrite of Lime. $Ca O, 4 Fe_2 O_3$ Insoluble in pure water, or in a solution of sugar. Decomposed by an aqueous solution of carbonic acid, especially if it be boiled therewith. Decomposed by acids. Insoluble in a solution of caustic potash. (Pelouze, *Ann. Ch. et Phys.*, (3.) **33.** 7.)

Ferrite of Nickel.

Ferrite of Potash. $K O, Fe_2 O_3$ Decomposed by water, and by most liquids; but may be kept in contact with an aqueous solution of chloride of ammonium for some time without decomposition. (Salm-Horstmar.)

Ferrite of Soda. Decomposed by water, both cold and hot, the soda being entirely removed. (Schaffgotsch.) But, like the potash salt, it is not readily decomposed by a solution of chloride of ammonium. (Salm-Horstmar.)

Ferrite of Zinc. $Zn O, Fe_2 O_3$ Scarcely acted upon by cold dilute chlorhydric acid. Completely soluble in boiling concentrated chlorhydric acid. (Ebelmen, *Ann. Ch. et Phys.*, (3.) **33.** 48.)

FerroCyanhydric Acid. Soluble in water.
(*FerroPrussic Acid.*)
$C_6 N_3 Fe H_2 = 2 H Cy, Fe Cy, = H_2, Cfy''$ (Porrett, *Phil. Trans.*, 1814, p. 530.) Readily soluble in water, and alcohol. Insoluble in ether, by which it is precipitated from the aqueous solution. Very much less soluble in a mixture of ether and alcohol than in alcohol alone. (Posselt.) Insoluble in concentrated chlorhydric acid. (Robiquet.)

The ferrocyanides of metals, the oxides of which are soluble in ammonia-water or in a solution of caustic potash, are themselves soluble in solutions of ammonia, and potash. (Reynoso, *Ann. Ch. et Phys.*, (3.) **30.** 255.)

FerroCyanhydrate of Brucin.

I.) $4 C_{46} H_{26} N_2 O_8, 4 H Cy, 2 Fe Cy + 4 Aq$ Very hygroscopic. Sparingly soluble in cold, much more soluble in hot water or alcohol. (Brandes.)

II.) *acid.* Scarcely soluble in water or alcohol. Soluble in an alcoholic solution of brucin. (Brandes.)

FerroCyanhydrate of Cinchonin. $C_{40} H_{24} N_2 O_2, 4 H Cy, 2 Fe Cy + 4 Aq$ Somewhat soluble in water. Very sparingly soluble in alcohol. (Dollfus.) Insoluble in a cold aqueous solution of ferrocyanide of potassium, but dissolves when the aqueous liquor from which it has been precipitated is warmed, even when this contains an excess of ferrocyanide of potassium. (Bill, *Am. J. Sci.*, (2.) **26.** 109.)

FerroCyanhydrate of Codein. Soluble in ferrocyanhydric acid.

FerroCyanhydrate of Harmalin.

FerroCyanhydrate of Harmin. Sparingly soluble in water.

FerroCyanhydrate of Morphine. Soluble in alcohol.

FerroCyanhydrate of NitroHarmalin.

FerroCyanhydrate of NitroHarmin. Sparingly soluble in boiling water.

FerroCyanhydrate of Quinine. $C_{40} H_{24} N_2 O_4, 4 H Cy, 2 Fe Cy + 4 Aq$ Insoluble in water. Difficultly soluble in alcohol. (Parrish's *Pharm.*, p. 403.)

FerroCyanhydrate of Solanin.

FerroCyanhydrate of Strychnine.

I.) $4 C_{42} H_{22} N_2 O_4, 4 H Cy, 2 Fe Cy + 16 Aq$ Very hygroscopic. Difficultly soluble in cold water; more readily soluble in cold alcohol. It dissolves more readily in both these liquids when they are warm, but is decomposed by hot water. (D. Brandis.)

II.) $C_{42} H_{22} N_2 O_4, 2 H Cy, 2 Fe Cy + 5 Aq$ Very hygroscopic. Almost insoluble in water or alcohol. (D. Brandis.)

FerroCyanide of Aluminum.

I.) $2 Al_2 Cy_3, 3 Fe Cy$ Insoluble in water and in dilute acids. (Tissier.)

II.) Soluble in water.

FerroCyanide of Ammonium. $2 N H_4 Cy, Fe Cy + 3 Aq$ Permanent. Very soluble in cold water. Insoluble in alcohol.

There is a green isomeric modification of this salt, which is more soluble in water than the ordinary modification; alcohol precipitates it as a thick sirup from the aqueous solution. By repeated solution and evaporation it is gradually decomposed. The ordinary modification may be converted into the green modification by repeated evaporation. (Berzelius, *Lehrb.*, **3.** 577.)

FerroCyanide of Ammonium & of Copper.
$N H_4 Cy, Cu Cy, Fe Cy$

FerroCyanide of Ammonium & of Magnesium. Soluble in 178 pts. of boiling water.

FerroCyanide of Ammonium & of Potassium. $N H_4 Cy, 3 K Cy, 2 Fe Cy + 6 Aq$ Easily soluble in cold, more readily in hot water. Insoluble in alcohol. (Reindel.)

FerroCyanide of Barium.
$2\,\mathrm{Ba\,Cy,\ Fe\,Cy} + 6\,\mathrm{Aq}$
Permanent. Soluble in 584 pts. of cold, and in 116 pts of boiling water. (Duflos, *Schweigger's Journ. für Ch. u. Phys.*, 1832, **65.** 234); in 1800 pts. of cold water (Porrett, *Phil. Trans.*, 1814, p. 530); in 1920 pts. of cold, and about 100 pts. of boiling water. (Thomson.) 100 pts. of water at 15.5° dissolve 0.05 pt. of it, and at 100° 1 pt. of it. (Ure's *Dict.*) Soluble in nitric, and chlorhydric acids. [T.] Somewhat soluble in concentrated sulphuric acid. (Berzelius.)

There is an isomeric green modification of this salt which is more soluble in water than the ordinary variety; it is also soluble in weak alcohol. (Berzelius, *Lehrb.*, **3.** 577.)

FerroCyanide of Barium & of Potassium.
$\mathrm{K\,Cy,\ Ba\,Cy,\ Fe\,Cy} + 3\,\mathrm{Aq}$
Soluble in 38 pts. of cold, and in 9.5 pts. of boiling water (Duflos, *Schweigger's Journ. für Ch. u. Phys.*, 1832, **65.** 234); in 36.38 pts. of water at 14°, and in 11.85 pts. of boiling water. (Mosander.) No more soluble in solutions of ammoniacal salts than in water. Soluble in dilute, but insoluble in concentrated chlorhydric acid. (H. Rose, *Tr.*)

FerroCyanide of Bismuth.
$2\,\mathrm{Bi\,Cy_3,}\,3\,\mathrm{Fe\,Cy}$
Ppt. Insoluble in chlorhydric acid.

FerroCyanide of Cadmium.
$2\,\mathrm{Cd\,Cy,\ Fe\,Cy}$
Ppt. Soluble in ammonia-water; but only incompletely soluble in hot aqueous solutions of the ammoniacal salts. (Wittstein.) Soluble in chlorhydric acid.

FerroCyanide of Calcium.
$2\,\mathrm{Ca\,Cy,\ Fe\,Cy,} + 12\,\mathrm{Aq}$
Deliquescent. Very readily soluble in water. Insoluble in alcohol. (E. Marchand.)

FerroCyanide of Calcium & of Potassium.
$\mathrm{Ca\,Cy,\ K\,Cy,\ Fe\,Cy}$
Soluble in 795 pts. of water at 15°, and in 145 [144.7] pts. of boiling water. Since the solution in boiling water is of a different color from that obtained in the cold, and since it yields no precipitate on cooling, decomposition has probably occurred. The salt is also decomposed by long-continued washing with water. Soluble in dilute chlorhydric acid, from which it is precipitated, unchanged, on the addition of concentrated chlorhydric acid. Soluble in nitric acid of 1.2 sp. gr. (Mosander.) Insoluble in an aqueous solution of chloride of ammonium. (H. Rose, *Tr.*)

FerroCyanide *of protoxide* of Cerium. Ppt. Soluble in nitric acid.

FerroCyanide *of sesquioxide* of Cerium. Ppt.

FerroCyanide of Chromium. Ppt.
$2\,\mathrm{Cr\,Cy,\ Fe\,Cy}$

FerroCyanide of Cobalt.
$2\,\mathrm{Co\,Cy,\ Fe\,Cy} + x\,\mathrm{Aq}$
Soluble in an aqueous solution of carbonate of ammonia. Partially soluble in ammonia-water. (Wittstein.) Insoluble in a solution of chloride of ammonium (Brett), or in chlorhydric acid. Soluble, with decomposition, in concentrated sulphuric acid. It is not precipitated from solutions which contain citric acid. Soluble in an aqueous solution of cyanide of potassium.

FerroCyanide of Copper(Cu_2).
$2\,\mathrm{Cu_2\,Cy,\ Fe\,Cy}$ (?)
Ppt. Soluble in ammonia-water; insoluble in solutions of the ammoniacal salts. (Wittstein.)

FerroCyanide of Copper(Cu).
$2\,\mathrm{Cu\,Cy,\ Fe\,Cy}$
Insoluble in water. Insoluble in, and not decomposed by, acids. Insoluble in solutions of the ammoniacal salts. (Brett, Wittstein.) Soluble in ammonia-water. (Warington, *J. Ch. Soc.*, **5.** 137.) Sparingly soluble in concentrated sulphuric acid. (Berzelius.) Insoluble in chlorhydric acid. Ammonia decomposes the precipitate, but does not dissolve it. (H. Rose, *Tr.*)

FerroCyanide of Copper & of Potassium.

I.) of Cu.

$a = \mathrm{Cu\,Cy,\ K\,Cy,\ Fe\,Cy}$ Insoluble in cold, decomposed to a slight extent by boiling, water. (Mosander.)

$b = 3\,\mathrm{Cu\,Cy,\ K\,Cy,}\ 2\,\mathrm{Fe\,Cy} + 10\,\mathrm{Aq}$ Ppt. (Winkler.)

II.) of Cu_2.

$a = 2\,(\mathrm{K\,Cy,\ Cu_2\,Cy,\ Fe\,Cy}) + 3\,\mathrm{Aq}$ Insoluble in water, alcohol, or ether. Soluble in an aqueous solution of cyanide of potassium. Decomposed by acids and by boiling water. (Schulz.)

$b = 2\,\mathrm{Cu_2\,Cy,}\ 3\,\mathrm{K\,Cy,}\ 2\,\mathrm{Fe\,Cy} + 8\,\mathrm{Aq}$ (Bolley & Moldenhauer.)

FerroCyanide of Copper & of Sodium.

I.) of Cu.

$\mathrm{Cu\,Cy,\ Na\,Cy,\ Fe\,Cy}$

II.) of Cu_2.

$\mathrm{Cu_2\,Cy,\ Na\,Cy,\ Fe\,Cy}$

FerroCyanide of Cupr(*ic*)ammonium.
(*Ammonio FerroCyanide of Copper.*)
$\mathrm{C_6\,N_5\,H_6\,Fe\,Cu_2 = 2\,N\,H_3,\ 2\,Cu,\ Fe\,Cy_3} = 2\left(\mathrm{N}\left\{\begin{matrix}\mathrm{H_3}\\ \mathrm{Cu}\end{matrix}\right.\mathrm{Cy}\right)\mathrm{,\ Fe\,Cy}$
Insoluble in water or alcohol. Soluble in ammonia-water. Decomposed by acids. (Bunsen.)

FerroCyanide of Ethyl.
$2\,\mathrm{C_4\,H_5\,Cy,\ Fe\,Cy} + 6\,\mathrm{Aq}$
Readily soluble in alcohol; less soluble in ether, by which it is precipitated from the alcoholic solution. (H. L. Buff, *Ann. Ch. u. Pharm.*, **91.** 254.)

FerroCyanide of Glucinum. Easily soluble in water. (Berzelius.)

FerroCyanide of Iron. Insoluble in water or chlorhydric acid. [Compare FerriCyanide of Iron.]

FerroCyanide of Iron & of Potassium.
$\mathrm{Fe\,Cy,\ K\,Cy,\ Fe\,Cy}$
Insoluble in water. (Gerhardt's *Tr.*)

FerroCyanide of Lead.
$2\,\mathrm{Pb\,Cy,\ Fe\,Cy} + 3\,\mathrm{Aq}$
Insoluble in water. Partially soluble in hot ammonia-water. Perfectly soluble in hot aqueous solutions of chloride of ammonium or succinate of ammonia, but insoluble in solutions of the other ammoniacal salts. (Wittstein.) Insoluble in an aqueous solution of chloride of ammonium. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 97.) It is not precipitated from solutions containing citrate of soda. (Spiller.) Sparingly soluble in concentrated sulphuric acid, from which it is re-precipitated on the addition of water. (Berzelius.)

FerroCyanide of Magnesium.
$2\,\mathrm{Mg\,Cy,\ Fe\,Cy} + 12\,\mathrm{Aq}$
Permanent. Soluble in 3 [5] pts. of cold water. (Bette.)

FerroCyanide of Magnesium & of Potassium.
$\mathrm{Mg\,Cy,\ K\,Cy,\ Fe\,Cy}$
Soluble in 1575 pts. of water at 15°, and in 238 pts. at 100°; the solution in boiling water is colored and deposits nothing on cooling. The salt is also decomposed by washing, oxidation occurring.

FerroCyanide of Manganese. Insoluble

2 Mn Cy, Fe Cy in aqueous solutions of chloride of ammonium or nitrate of ammonia. (Brett.) Soluble in chlorhydric acid. (Berzelius.) Insoluble in water or acids. [T.] Soluble in acids. (H. Rose, *Tr.*)

FERROCYANIDE OF MANGANESE & OF POTASSIUM. Mn Cy, K Cy, Fe Cy Ppt.

FERROCYANIDE *of diCyanide* OF MERCURY. $2\ Hg_2\ Cy, Fe\ Cy$ Ppt.

FERROCYANIDE OF MERCURY(Hg). Soluble, with decomposition, in an excess of solution of caustic potash. (Reynoso.)

FERROCYANIDE OF MOLYBDENUM.

I.) *Corresponding to* $Mb\ O$. Soluble in an aqueous solution of ferrocyanide of potassium, and in ammonia-water; from the latter it is precipitated on the addition of chloride of ammonium. (Berzelius.)

II.) *Corresponding to* $Mb\ O_2$. Insoluble in a solution of ferrocyanide of potassium. Soluble, with decomposition, in ammonia-water. (Berzelius.)

III.) *Corresponding to* $Mb\ O_3$ Soluble in an aqueous solution of ferrocyanide of potassium. Very easily soluble, with decomposition, in ammonia-water. (Berzelius.)

FERROCYANIDE OF NICKEL. Soluble in an 2 Ni Cy, Fe Cy + x Aq aqueous solution of cyanide of potassium.

Soluble in ammonia-water (Tupputi), with decomposition. (Reynoso.) Not precipitated from solutions containing citric acid.

Insoluble in aqueous solutions of the ammoniacal salts (Wittstein); or in chlorhydric acid.

FERROCYANIDE OF NICKELAMMONIUM. $2\,(N\ H_3\ Ni)\ Cy, Fe\ Cy$ Completely insoluble in water. Decomposed by acids. Soluble, with decomposition, in ammonia-water. (Reynoso, *Ann. Ch. et Phys.*, (3.) **30.** 254.)

FERROCYANIDE OF POTASSIUM. Permanent. 2 K Cy, Fe Cy + 3 Aq Abundantly soluble in water, more so in hot than in cold. Soluble in 4.23 pts. of water at 15°; or 100 pts. of water at 15° dissolve 23.6 pts. of it; or the aqueous solution saturated at 15° contains 19.1% of it, or 16.6% of the anhydrous salt, and is of 1.1211 sp. gr. (H. Schiff, *Ann. Ch. u. Pharm.*, 1860, **113.** 350.)

100 pts. of water dissolve

27.8 pts. of it	at	12.2°
65.8 "	"	37.7°
87.6 "	"	65.5°
90.6 "	"	96.3°;

the solubility not being much increased by any augmentation of temperature beyond 93°. (T. Thomson, in his *System of Chem.*, London, 1831, **2.** 250.) Soluble in 3 pts. of water at 15°, and in 1 pt. of boiling water. The solution saturated at 15° contains 25% of it, and that saturated at boiling 50%. (M. R. & P.) Soluble in 4 pts. of cold, and in 2 pts. of boiling water (Wittstein's *Handw.*); in 4 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) 100 pts. of water at 15.5° dissolve 30 pts. of it; at 100°, 100 pts. of it. (Ure's *Dict.*) The aqueous solution saturated at 15° is of 1.144089 sp. gr., and contains dissolved in every 100 pts. of water at least 29.229 pts. of the salt. (Michel & Krafft, *Ann. Ch. et Phys.*, (3.) **41.** pp. 478, 482.) An aqueous solution saturated at 8° is of 1.13 sp. gr. (Anthon, *Ann. der Pharm.*, 1837, **24.** 211.)

An aqueous solution of sp. gr. (at 15°)	Contains (by experiment) per cent of 2 K Cy, Fe Cy + 3 Aq.
1.0121	2.12
1.0243	4.25
1.0380	6.40
1.0512	8.50
1.0786	12 80
1.1211	19.10

From these results Schiff deduces the formula: $D = 1 + 0.005733\ p + 0.0000321\ p^2$, in which D = the sp. gr. of the solution, and p the percentage of substance in the solution, by means of which Ott has calculated the following table: —

An aqueous solution of sp. gr. (at 15°)	Contains	
	Per cent of 2 K Cy, Fe Cy + 3 Aq.	Per cent of anhydrous 2 K Cy, Fe Cy.
1.0058	1	0.872
1.0116	2	1.744
1.0175	3	2.616
1.0234	4	3.488
1.0295	5	4.360
1.0356	6	5.232
1.0417	7	6.104
1.0479	8	6.976
1.0542	9	7.848
1.0605	10	8.720
1.0669	11	9.592
1.0734	12	10.464
1.0800	13	11.336
1.0866	14	12.208
1.0932	15	13.080
1 0999	16·	13.952
1.1067	17	14.824
1.1136	18	15.696
1.1205	19	16.568
1.1275	20	17.440

(H. Schiff, *Ann. Ch. u. Pharm.*, 1860, **113.** 199.)

It is liable to form supersaturated solutions. (Ogden.) Insoluble in alcohol. Soluble in concentrated sulphuric acid forming a compound soluble in water, but decomposed by alcohol. (Berzelius.) In his *Lehrbuch*, **3.** 576, Berzelius alludes to a green modification of this salt which is more readily soluble than the ordinary modification.

FERROCYANIDE OF POTASSIUM & OF SODIUM. 3 K Cy, Na Cy, 2 Fe Cy + 7 Aq Permanent. Readily soluble both in hot and in cold water. Insoluble in alcohol. (Reindel.)

FERROCYANIDE OF POTASSIUM & OF STRONTIUM? Soluble in water, and in aqueous solutions of ammoniacal salts. (H. Rose, *Tr.*)

FERROCYANIDE OF POTASSIUM & OF ZINC. K Cy, 3 Zn Cy, 2 Fe Cy + 6 Aq Insoluble in water. Easily soluble in warm chlorhydric acid. (Mosander.)

FERROCYANIDE OF SILVER. Insoluble in 2 Ag Cy, Fe Cy water or dilute acids. Insoluble in ammonia-water or in an aqueous solution of nitrate of protoxide of mercury. (Wittstein.) Soluble in an aqueous solution of cyanide of potassium. Soluble [?] in ammonia-water, but insoluble in aqueous solutions of the ammoniacal salts. (Wittstein.) Partially soluble, with decomposition, in concentrated sulphuric acid. (Berzelius.) Unacted upon by other acids, excepting nitric acid, which decomposes it. (Ittner.)

FERROCYANIDE OF SODIUM. Effloresces in 2 Na Cy, Fe Cy + 12 Aq dry air. Soluble in 4.5 pts. of water at 12.7°; and in a much smaller quantity of boiling water (John); in 1 pt. of cold water. (Ittner.) 100 pts. of water at 15.5° dissolve 22 pts. of it. (Ure's *Dict.*) Insoluble in alcohol. (John.) Soluble in alcohol. (*Gehlen's Journ.*, (2.) **3.** 171 [T.].)

FERROCYANIDE OF STRONTIUM. Efflorescent. $2\,Sr\,Cy, Fe\,Cy + 15\,Aq$ Soluble in 2 pts. of cold, and in less than 1 pt. of boiling water. Slightly soluble in alcohol. (Bette.) Soluble in less than 4 pts. of cold water. (Henry, *Nicholson's Journ.*, **3.** 171 [T.].)

FERROCYANIDE OF TANTALUM.

FERROCYANIDE OF THORIUM. Insoluble in water, soluble in acids. (Berzelius.)

FERROCYANIDE OF TIN. Insoluble in water $2\,Sn\,Cy, Fe\,Cy$ or acids. (Ittner.) Imperfectly soluble in ammonia-water and in solutions of the ammoniacal salts. (Wittstein.) Insoluble in aqueous solutions of chloride of ammonium or nitrate of ammonia. (Brett.)

FERROCYANIDE OF TITANIUM. Ppt.

FERROCYANIDE OF URANIUM.

I.) $2\,Ur\,Cy, Fe\,Cy$ Sparingly soluble in chlorhydric or nitric acid, easily soluble, with decomposition in hot aqua-regia. Decomposed by a solution of caustic potash.

II.) $Ur_2\,Cy_3, Fe\,Cy$? Soluble in aqueous solutions of carbonate of ammonia (Wittstein), and carbonate of soda. (Herschel.) It is not precipitated from solutions containing citric acid.

FERROCYANIDE OF VANADIUM.

I.) *Corresponding to* $V\,O_2$. Insoluble in water; not perceptibly soluble in acids. (Berzelius.)

II.) *Corresponding to* $V\,O_3$. Insoluble in water or acids. (Berzelius.)

FERROCYANIDE OF XANTHOCOBALT. Almost $N\,O_2 . 5\,N\,H_3 . Co_2\,O . Cy_2, Fe\,Cy + 7\,Aq$ insoluble in cold, immediately decomposed by warm water. (Gibbs & Genth, *Smithsonian Contributions*, Vol. **9.**)

FERROCYANIDE OF YTTRIUM. Insoluble in $2\,Yr\,Cy, Fe\,Cy$ water or acetic acid. (Eckeberg.) Soluble in chlorhydric acid. (Klaproth.)

FERROCYANIDE OF ZINC. Insoluble in water $2\,Zn\,Cy, Fe\,Cy + 3\,Aq$ or acids. [T.] Soluble in ammonia-water, and in aqueous solutions of ammoniacal salts. (Wittstein.) Soluble, with decomposition, in an aqueous solution of caustic potash. (Reynoso.) Does not appear to dissolve in aqueous solutions of chloride of ammonium or nitrate of ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 97.) Sparingly soluble in boiling aqueous solutions of ferrocyanide or ferricyanide of potassium; readily soluble in a boiling solution of cyanide of potassium. (Gore.) Sparingly soluble, without decomposition, in cold dilute acids.

Insoluble in cold, sparingly soluble in boiling chlorhydric acid. (Parrish's *Pharm.*, p. 533.) Insoluble in chlorhydric acid. (Lea, *Am. J. Sci.*, (2.) **31.** 191.)

FERROCYANIDE OF ZINC & OF ZINCAMMONIUM. Ppt. (Bunsen.)
(*AmmonioFerroCyanide of Zinc.*)
$Zn\,Cy, 3\,N\left\{\begin{matrix}H_3\\Zn\end{matrix}\right.Cy, 2\,Fe\,Cy + 2\,Aq$

FERROCYANIDE OF ZIRCONIUM. Ppt. (H. Rose, *Tr.*)

Fettsäure. *Vid.* Sebacic Acid.

FIBRIN. When coagulated, either spontaneously or by boiling, it is insoluble in water, alcohol, or ether; but is partially decomposed by long-continued boiling with water.

When heated to 150° with water in a closed tube it dissolves entirely with decomposition. (Hlaziwetz.) Fibrin from blood, as well as muscular fibre which has been boiled with water, dissolves completely in water, with the exception of an insignificant residue, when heated therewith to 150° in a closed vessel, during two or three hours. This solution is precipitated on the addition of acids, even by exceedingly dilute nitric acid; the precipitate produced by acetic acid being easily soluble in an excess of the latter. (Wœhler & J. Vogel, *Ann. Ch. u. Pharm.*, 1842, **41.** 239.) When exposed to the air it decomposes rapidly and putrefies, dissolving at the same time if water be present, being converted into a substance which, like albumen, is coagulable by heat. (Lehmann.) After having been dried, it swells up in water and again becomes soft and flexible.

It is softened by solutions of the caustic alkalies, and at length forms with them a homogeneous emulsion. (Caventou, *loc inf. cit.*) More easily soluble in alkaline solutions than many of the other protein compounds. (Lehmann.) Soluble in a solution of caustic potash, even when this is very dilute. Insoluble in ammonia-water.

Most mineral acids cause fibrin to swell up. Soluble in strong, but insoluble in weak sulphuric acid. Soluble in concentrated acetic acid.

Concentrated acetic acid causes fibrin to swell up and renders it soluble in water; especially if the fibrin has been obtained from young animals. (Dumas.) More easily soluble in acetic acid than many of the other protein compounds. (Lehmann.)

Slowly soluble in cold concentrated chlorhydric acid. (Caventou, *Ann. Ch. et Phys.*, (3.) **8.** pp. 326, 328.) Decomposed by boiling chlorhydric acid. Rapidly soluble in very dilute chlorhydric acid at a temperature of 36°. (Dumas.) Blood fibrin is insoluble in water which contains 0.1 pt. of chlorhydric acid; while the fibrin of flesh dissolves in such acidulated water with greater or less rapidity, according to the animal from which it came. (Liebig.) When uncooked fibrin, either from blood or flesh, is digested with ten times its weight of water containing so little chlorhydric acid that it scarcely reddens litmus-paper, or better, containing for every 1000 grms. of water 0.634 grm., of chlorhydric acid, during twelve hours at the ordinary temperature, the liquid becomes gelatinous, the fibrin having dissolved; this jelly is soluble in water, forming a liquid which coagulates when heated; on the addition of chlorhydric acid to this solution a precipitate is formed, but this redissolves in an excess of the acid. But after having been cooked, fibrin is no longer soluble, even in extremely dilute chlorhydric acid alone, though soluble therein on the addition of a peculiar substance ["pepsin"] which occurs in the stomachs of living animals. (Bouchardat & Sandras, *Ann. Ch. et Phys.*, (3.) **5.** pp. 481, 484, 490.)

In terhydrated phosphoric acid it swells up, forming a mass which is soluble in water. Easily soluble, with decomposition, in boiling nitric acid.

Partially soluble in aqueous solutions of neutral salts of the alkalies, especially in a solution of nitrate of potash.

"It is generally supposed that spontaneously coagulated fibrin will dissolve in solutions of certain alkaline salts; but we should greatly err if we were to regard a fluid thus obtained as a simple solution; for fibrin not only requires a longer period to dissolve in a saline fluid than is necessary for the solution of a simple substance in an indifferent menstruum, but also a higher temperature, and the saline fluid must always be kept for an hour or more, at a temperature approximating to the hatching heat (between 30° and 40°), before any considerable quantity of fibrin will be dissolved. Moreover, the fibrin should not be too long exposed to the action of the air, if we wish to effect its solution. Denis (*Arch. Gén. de Méd.*, (3.) **1.** 171), who first noticed this solubility of fibrin, Scherer (*Ann. Ch. u. Pharm.*, **40.** 35), and Polli (*Ann. Univ. di Med.*, 1839, Apr., pp. 25–33) used for this purpose a solution of 3 pts. of nitrate of potash in 50 pts. of water. Zimmermann (*Casper's Wochenschrift*, 1843, No. 30) has, however, shown that solutions of the alkaline sulphates, phosphates, carbonates, and acetates, as well as the chlorides, bromides, and iodides, might be employed for the same object. The solution thus obtained, which is always imperfect, and contains undissolved portions requiring to be removed, is viscid, and at about 73° coagulates in flakes. It differs from an albuminous solution in being strongly precipitated by acetic acid (which is only the case to a slight degree with albumen when carefully neutralized); it is not coagulated by ether, in which respect it differs from the naturally dissolved substance which forms fibrin. When the fibrin has been digested for a sufficient length of time, the solution is not rendered turbid by dilution with water, as is the case after digestion for only a short period. At ordinary temperatures, the clear solution remains for a long time unaffected by the atmosphere, only depositing solid particles after it has absorbed oxygen, when it has passed into a state of putrefaction, and exhibits vibriones. Scherer thought that he had proved that the fibrin from arterial blood or from venous blood in inflammatory diseases could not be converted into this albuminous substance by saline solutions. This view has been contradicted by Zimmermann, but the subject has not yet been fully investigated. Lehmann's own experiments tend to show that the fibrin of the venous blood of the ox very speedily loses these properties, while that of the arterial blood of the same animal does not dissolve in a solution of nitrate of potash. In man Lehmann found that fibrin, whether from venous, arterial, or inflammatory blood, was soluble, excepting in two cases of inflammatory blood; the arterial and venous fibrin from pigs' blood dissolved equally well, and with great rapidity in water containing nitrate of potash." (Lehmann, in his *Physiol. Chem.*, London, 1851, **1.** pp. 351, 352.)

After having been boiled, fibrin can no longer be converted into this soluble, albumen-like substance by digestion in solutions of alkaline salts. With acids and alkalies, however, boiled fibrin reacts in the same manner as coagulated albumen, dissolving in alkalies, and forming combinations with acids which are insoluble in acidulated water, but freely soluble in pure water. By prolonged boiling with water it is decomposed to a soluble and an insoluble compound. (Lehmann.)

In its naturally dissolved form, fibrin is not easily distinguished from albumen. In filtered frogs' blood neither acetic acid nor ammonia-water occasion any precipitation; but a concentrated solution of caustic potash will precipitate fibrin as well as albumen; ether causes fibrin to coagulate, while it allows the albumen of frogs' blood to remain dissolved. The spontaneous coagulation of the fibrin from the plasma of all vertebrate animals, which occurs on exposure to the air, may be greatly retarded by dilute solutions of the alkaline sulphates, nitrates, chlorides, carbonates, and acetates, and may even be entirely prevented by concentrated solutions. (Lehmann.)

II.) *Vegetable Fibrin.* Insoluble in water, alcohol, or ether. Soluble in dilute solutions of caustic potash. (Compare Dumas & Cahours, *Ann. Ch. et Phys.*, (3.) **6.** pp. 389, 400.)
(*Albumine*(of Berzelius). *Zymone.*)

Fibroin. Insoluble in boiling water, alcohol, ether, or acetic acid. Soluble in a cold concentrated solution of caustic potash, a precipitate being formed on the addition of water as well as by acids. Insoluble in cold, soluble in a hot, dilute aqueous solution of caustic potash. Insoluble in ammonia-water and in aqueous solutions of the alkaline carbonates. Soluble in cold concentrated sulphuric, chlorhydric, phosphoric, and nitric acids.

Fichtelite. Soluble in alcohol, and ether. (Clark.)
C_8H_7

"FlavEquisetin." Very sparingly soluble in cold, more soluble in boiling water. Soluble in alcohol. Sparingly soluble in ether. (Baup, *Ann. Ch. et Phys.*, (3.) **30.** 313.)

Flavindic Acid.
$C_{48}H_{21}N_3O_{12}$

Flavindate of Silver. Ppt.
$C_{48}H_{18}Ag_3N_3O_{12}$

Flavindin. Slightly soluble in boiling water. Sparingly soluble in boiling alcohol. Soluble in ammonia-water. (Laurent.)
$C_{48}H_{15}N_3O_6$

Flavin. *Vid. di*PhenylUrea.

Flowers of Benzoin. *Vid.* Benzoic Acid.

"FluoBoric Acid." *Vid.* Fluorhydrate of Boracic Acid.
$HO, BO_3, 3HFl$

FluoBoric Acid. Known only in aqueous solution.
HFl, BFl_3

Many of the fluoborates are soluble, as such, in water.

FluoBorate of Aluminum. Soluble in water only when this is acidulated. Easily soluble in acids. (Berzelius.)
$Al_2Fl_3, 3BFl_3$

FluoBorate of Ammonium. Very soluble in water. Tolerably readily soluble in alcohol. (Berzelius.)
NH_4Fl, BFl_8

FluoBorate of Barium. Deliquesces in moist air. Easily soluble in water. Decomposed by alcohol, with formation of a soluble acid, and an insoluble basic, salt. (Berzelius.)
$BaFl, BFl_3 + 2Aq$

FluoBorate of Calcium. Decomposed by water, with formation of a soluble acid, and an insoluble basic, salt. (Berzelius.)
$CaFl, BFl_3$

FluoBorate of Copper. Easily deliquescent. Soluble in water. (Berzelius.)
$CuFl, BFl_3$

FluoBorate of Lead. Partially decomposed by boiling water or alcohol, to a soluble acid salt and an insoluble basic salt. (Berzelius.)
(*Borofluoride of Lead.*)
$PbFl, BFl_3$

FluoBorate of Lithium. Hygroscopic. Easily soluble in water. (Berzelius.)
$LiFl, BFl_3$

FluoBorate of Magnesium. Readily soluble in water. (Berzelius.)
$MgFl, BFl_3$

FluoBorate of Potassium. $K Fl, B Fl_3$ Soluble in 70.42 pts. of cold water; or 100 pts. of cold water dissolve 1.42 pts. of it; very much more soluble in boiling water. Slightly soluble in hot, less soluble in cold alcohol. (Berzelius.) Insoluble in strong alcohol; but somewhat soluble in weak spirit, made by mixing 2 volumes of 84% alcohol with 1 volume of water. Insoluble in a concentrated aqueous solution of acetate of potash. (Aug. Stromeyer, *Ann. Ch. u. Pharm.*, **100.** 82.) No more soluble in ammonia-water than in pure water, and crystallizes out unchanged from the boiling solution. Soluble in boiling aqueous solutions of carbonate of potash, and of soda, without any evolution of carbonic acid; also in a solution of caustic potash, separating out unchanged from the boiling solution. (Berzelius, *Lehrb.*, **3.** 102.)

FluoBorate of Sodium. $Na Fl, B Fl_3$ Easily soluble in water. Very sparingly soluble in alcohol. (Berzelius, *Lehrb.*)

FluoBorate of Yttrium. $Y Fl, B Fl_3$ Soluble only in water which contains an excess of acid. (Berzelius.)

FluoBorate of Zinc. $Zn Fl, B Fl_3$ Deliquescent. Soluble in water. (Berzelius.)

FluoBoride of *X*. *Vid.* FluoBorate of *X*.

Fluohydric Acid. *Vid.* Fluorhydric Acid.

FluoPlatinic Acid. *Vid. bi*Fluoride of Platinum.

FluoPlatinate of Ammonium. Decomposed by water to a soluble acid, and an insoluble basic, salt. Insoluble in alcohol. (Berzelius.)

FluoPlatinate of Potassium. Deliquescent. Decomposed by water, with deposition of a basic salt. Insoluble in alcohol. (Berzelius.)

FluoPlatinate of Sodium. Decomposed by water, to a soluble acid, and an insoluble basic, salt. (Berzelius.)

Fluorhydric Acid. (*Hydrofluoric acid. Fluoric acid.*) $H Fl$ Very soluble in water, with great evolution of heat.

Very soluble in water: at the ordinary temperature, 2 grains of water were observed to take up 200 times their bulk of the gas, and leave little residuum besides common air; but the solution is seldom obtained in large quantities so strong as this. (Dalton, in his *New System*, **2.** 279.) Soluble in alcohol, apparently with combination. (Reinsch.) The metallic fluorides vary in solubility, several of them are soluble in ether. The double salts of the metallic fluorides dissolve with more difficulty in water than either of their component salts. (Berzelius.) The acid fluorhydrates (see bifluorides M Fl, H Fl) are all soluble in water.

Fluorhydrate of Boracic Acid. (*Fluorboric Acid.*) $H O, B O_3, 3 H Fl$ Known only in aqueous solution. When the concentrated solution is diluted with much water boracic acid is precipitated. Alcohol is decomposed by it with formation of ether.

[For its salts, see Borate of *X* with Fluoride of *X*.]

Fluorhydrate of Brucin. Tolerably easily soluble in water. Sparingly soluble in boiling, scarcely at all soluble in cold alcohol. (Elderhorst.)

Fluorhydrate of Cinchonidin (of Pasteur). Very readily soluble in water. (Leers, *Ann. Ch. u. Pharm.*, **82.** 159.)

Fluorhydrate of Cinchonin. $C_{40} H_{24} N_2 O_2, 2 H Fl$ Soluble in water and in dilute alcohol. (Elderhorst.)

Fluorhydrate of Cumidin.

Fluorhydrate of Fluoride of *X*. *Vid. bi*Fluoride of *X*.

Fluorhydrate of MelAnilin. Tolerably easily soluble in water; less soluble in alcohol. (Hofmann, *J. Ch. Soc.*, **1.** 294.)

"**Fluorhydrate of Methylene.**" *Vid.* Fluoride of Methyl.

Fluorhydrate of Morphine. Sparingly soluble in water. Insoluble in alcohol or ether. (Elderhorst.)

Fluorhydrate of Quinine. Deliquescent. Soluble in water. Readily soluble in alcohol. (Elderhorst.)

Fluorhydrate of Strychnine. $C_{42} H_{22} N_2 O_4, 4 H Fl + 4 Aq$ Readily soluble in warm water; still more soluble in boiling alcohol. Insoluble in ether. (Elderhorst.)

Fluoric Acid. *Vid.* Fluorhydric Acid.

Fluorides. The fluorides of potassium, sodium, ammonium, and silver are soluble in water, the other metallic fluorides are insoluble. (Persoz, *Chim. Moléc.*, p. 463.)

Fluoride of Aluminum.

I.) $Al_2 Fl_3$ Insoluble in water. Unacted upon by acids. Scarcely at all attacked by boiling concentrated sulphuric acid, or by a boiling concentrated solution of caustic potash. (Deville, *Ann. Ch. et Phys.*, (3.) **49.** 79.)

II.) *bi ? or hydrated.* Slowly soluble in cold, more readily soluble in hot water. (Berzelius.)

III.) *basic.* Insoluble in water.

Fluoride of Aluminum & of Ammonium. $Al_2 Fl_3 ; N H_4 Fl$ Slightly soluble in water. Insoluble in water which contains ammonia, or fluoride of ammonium. (Berzelius.)

Fluoride of Aluminum & of Copper. $Al_2 Fl_3 ; Cu Fl$ Very slowly, but completely, soluble in water. (Berzelius.)

Fluoride of Aluminum & of Lithium. Insoluble in water. (Berzelius.)

Fluoride of Aluminum & of Nickel. $Al_2 Fl_3 ; Ni Fl$ Slowly, but completely, soluble in water. (Berzelius.)

Fluoride of Aluminum & of Potassium.

I.) "*potash kryolite*" (*artificial*). Insoluble in water. (Deville.)

II.) $2 K Fl ; Al_2 Fl_3$ Very sparingly soluble in acids, and still less soluble in water. (Gay-Lussac & Thénard.)

III.) $3 K Fl ; Al_2 Fl_3$ Insoluble in water or in an aqueous solution of fluorhydric acid.

Fluoride of Aluminum & of Sodium.

I.) "*artificial kryolite.*" $Na Fl ; Al_2 Fl_3$ Insoluble in water. (Deville.)

II.) *kryolite* (*native*). $3 Na Fl ; Al_2 Fl_3$ Sparingly soluble in water.

Fluoride of Aluminum & of Zinc. $Zn Fl ; Al_2 Fl_3$ Very slowly, but completely, soluble in water. (Berzelius.)

Fluoride of Ammonium.

I.) *normal.* $N H_4 Fl$ Permanent. Readily soluble in water. Sparingly soluble in alcohol. These solutions lose ammonia when evaporated. (Berzelius.)

II.) *acid.* $N H_4 Fl, H Fl$ Very quickly deliquesces. Soluble in water. (Berzelius, *Lehrb.*)

Fluoride of Ammonium & of Antimony. $2NH_4Fl; SbFl_3$ Hygroscopic. Soluble in 0.9 pt. of cold water. Insoluble in alcohol or ether. (Flueckiger.)

Fluoride of Ammonium & of Chromium. $NH_4Fl; Cr_2Fl_3$ Sparingly soluble in water. (Berzelius.)

Fluoride of Ammonium & of Cobalt. $NH_4Fl; CoFl$ Sparingly soluble in water. (Berzelius.)

Fluoride of Ammonium & of Molybdenum(Mo Fl). Resembles the potassium compound.

Fluoride of Ammonium & of Molybdenum($MoFl_2$). Easily soluble in water. (Berzelius, *Lehrb.*)

Fluoride of Ammonium & of Nickel. Easily soluble in water. (Berzelius.)

Fluoride of Ammonium & of Titanium.

I.) $NH_4Fl; TiFl_2$ Soluble in ammonia-water.

II.) $NH_4Fl; 2TiFl_3$ Soluble in water.

Fluoride of Antimony. Deliquescent.

I.) *ter.* $SbFl_3$ Very soluble in water. (Berzelius.)

II.) *quadri.* $SbFl_4$
III.) *quinqui.* $SbFl_5$
} Both very soluble in water. (Berzelius.)

Fluoride of Antimony & of Lithium. $2LiFl; SbFl_3$ Soluble in more than 20 pts. of water. (Flueckiger.)

Fluoride of Antimony & of Potassium.

I.) $2KFl; SbFl_3$ Soluble in 9 pts. of water at 13°, and in less than 2 pts. of boiling water. Insoluble in alcohol or ether. (Flueckiger.)

II.) $KFl; SbFl_3$ More easily soluble than No. I., requiring only 2.8 pts. of water. (Flueckiger.)

Fluoride of Antimony & of Sodium. $3NaFl, SbFl_3$ Soluble in 14 pts. of cold, and in 4 pts. of boiling water. (Flueckiger.)

*Ter***Fluoride of Arsenic.** $AsFl_3$ Soluble, with decomposition, in water. Miscible, with more or less decomposition, with alcohol and ether, and somewhat less easily with fixed and volatile oils. (Unverdorben.)

Fluoride of Barium.

I.) *normal.* $BaFl$ Sparingly soluble in water. (Berzelius.) Less soluble in water than fluorspar(Ca Fl). (Wilson.) Soluble in an aqueous solution of normal citrate of soda. (Spiller.) Readily soluble in chlorhydric, nitric, and fluorhydric acids. (Gay-Lussac & Thénard.)

II.) *acid.* $BaFl, HFl$ Soluble in fluorhydric acid. (Fremy.)

Fluoride of Bismuth. $BiFl_3$ Soluble in water. The aqueous solution is decomposed by evaporation. (Berzelius.)

Fluoride of Boron. BFl_3 Almost instantly absorbed by water, with separation of some boracic acid and formation of fluoboric acid. It is the most soluble gas known, 1 vol. of water dissolving 700 vols. of it. Alcohol absorbs it, and is converted into ether. 1 vol. of concentrated sulphuric acid, of 1.85 sp. gr., absorbs 50 vols. of it; on adding a little water to this solution boracic acid is precipitated. (J. Davy.) Cold oil of turpentine absorbs 6.8% of it.

Isoterebenthene absorbs 14.3% of it at 23°. (Berthelot.) Soluble in terebene without alteration. (Berthelot.)

Fluoride of Bromine. Easily soluble in water. (Leeson.)

Fluoride of Cacodyl. C_4H_6AsFl Insoluble in water, but appears to be decomposed thereby.

Fluoride of Cadmium. $CdFl$ Sparingly soluble in water; more readily soluble in fluorhydric acid. (Berzelius.)

Fluoride of Calcium. $CaFl$ Permanent. Soluble in 26545 pts. of water at 15.5°. More soluble in water at a higher temperature. (George Wilson, *Rep. Br. Assoc.*, 1846, p. 39.) In a subsequent, more careful research, Wilson determined that 1 pt. of fluoride of calcium dissolves in 26923 pts. of water at 15.5°. (*Rep. Br. Assoc.*, 1850, p. 69.) Boiling water dissolves no inconsiderable quantity of it, if it be finely powdered, cold water acts more slowly. (Wilson, in *Ot. Gr.*) When prepared in the moist way, it is not completely insoluble in water. Scarcely at all soluble in dilute, more soluble in concentrated chlorhydric acid. Decomposed by strong sulphuric acid. It is not decomposed by dilute alkaline solutions. (Fresenius, *Quant.*, p. 163.) Soluble in aqueous solutions of ammoniacal salts. (Rose.)

Pure fluoride of calcium, either native or artificial, is not decomposed by concentrated sulphuric acid at temperatures lower than 40°, but forms with it a thick sirup, which is completely transparent and capable of being drawn out into threads; but if silicic acid be present, fluosilicic acid gas is evolved and gypsum formed in the fluid, rendering it opaque. If water be added to the clear fluid, fluoride of calcium will be precipitated and the mass become milky. Concentrated chlorhydric and nitric acids also dissolve it to a clear fluid, but this is not viscid; on the addition of water the liquid becomes milky, and the filtrate contains but very little fluoride of calcium in solution. Fluorhydric acid dissolves only an insignificant trace of it. A solution of fluorhydric acid is rendered cloudy by the least addition of carbonate of lime, but when a very dilute solution of the acid is treated with a solution of a salt of lime, no precipitate occurs until the acid is neutralized with an alkali, and on the other hand fluorhydric acid precipitates fluoride of calcium from less dilute neutral solutions of lime. Boiling chlorhydric acid dissolves a small portion of it. It is decomposed by boiling nitric acid. The more strongly saturated solutions of fluoride of calcium in chlorhydric and nitric acids which several chemists have observed were doubtless occasioned by the presence of silica in the fluorspar examined by them; by which means fluosilicate of calcium, a salt readily soluble in acids, was formed. Not decomposed by aqueous alkaline solutions. (Berzelius, in his *Lehrb.*, 3. 397.) When free from silicic acid, it is partially decomposed by boiling with aqueous solutions of carbonate of potash and carbonate of soda. (Dulong, *Ann. de Chim.*, 82. 278.)

II.) *acid.* $CaFl, HFl + 6Aq$ Decomposed by boiling water. Soluble in fluorhydric acid. (Fremy.)

Fluoride of Calcium & of Titanium. Soluble in acidulated water. Decomposed by pure water, with formation of a precipitate and an acid salt.

*Proto***Fluoride of Cerium.** $CeFl$ Insoluble in water. (Berzelius, Mosander.)

*Sesqui***Fluoride of Cerium.**

I.) $Ce_2 Fl_3$ Insoluble in water.

II.) *basic.*
$Ce_2 Fl_3 ; Ce_2 O_3, H O$

*Proto*FLUORIDE OF CHROMIUM.

*Sesqui*FLUORIDE OF CHROMIUM. Perfectly $Cr_2 Fl_3$ soluble in water. This compound unites with more basic metallic fluorides forming salts which are generally difficultly soluble. (Berzelius.)

*Per*FLUORIDE OF CHROMIUM. Decomposed $Cr Fl_3$ by water, and alcohol. (Unverdorben.)

*Sesqui*FLUORIDE OF CHROMIUM & OF POTASSIUM. $Cr_2 Fl_3 ; K Fl$ Very difficultly soluble in water. (Berzelius.)

*Sesqui*FLUORIDE OF CHROMIUM & OF SODIUM. Very sparingly soluble in water. (Berzelius.)

FLUORIDE OF COBALT.

I.) *normal.* Very difficultly soluble in water; $Co Fl + 2 Aq$ more readily soluble in water which contains fluorhydric acid. When treated with a small quantity of water it dissolves without suffering decomposition, but when mixed with much water, and when boiled with water, it is decomposed to an insoluble basic salt while free acid remains in solution. (Berzelius, *Lehrb.*, 3. 642.)

II.) *basic.* Insoluble in water.
$2 (Co Fl, Co O) + Aq$

FLUORIDE OF COBALT & OF POTASSIUM. Slightly soluble in water. (Berzelius.)

*Di*FLUORIDE OF COPPER. Permanent. In- $Cu_2 Fl$ soluble in water or fluorhydric acid. Insoluble in alcohol. Soluble in strong chlorhydric acid, from which it is precipitated on the addition of water. (Berzelius.)

*Proto*FLUORIDE OF COPPER.

I.) *normal.* Difficultly soluble in water. When $Cu Fl$ treated with a small quantity of water, it dissolves without decomposition, though slowly; but if this solution be heated or diluted with much water, a basic salt will be precipitated. (Berzelius, *Lehrb.*)

II.) *basic.* Insoluble in water.
$Cu Fl ; Cu O$

*Proto*FLUORIDE OF COPPER & OF POTASSIUM. $Cu Fl ; K Fl$ Easily soluble in water. (Berzelius.)

FLUORIDE OF COPPER & OF TITANIUM. Sol- $Cu Fl, Ti Fl_3 + Aq$ uble in water, with partial decomposition. Easily soluble in acidulated water.

FLUORIDE OF ETHYL. Precipitated by water. (*Fluorhydric Ether.*) (Reinsch.)
$C_4 H_5, Fl$

FLUORIDE OF GLUCINUM. Easily soluble in $Gl_2 Fl_3 + x Aq$ water, even after it has been heated. It forms double salts with the alkaline fluorides. (Berzelius.) It may be somewhat basic without ceasing to be soluble in water.

FLUORIDE OF GLUCINUM & OF POTASSIUM. $Gl_2 Fl_3, 3 K Fl$ Difficultly soluble in water. (Awdejew.) Much more freely soluble in hot than in cold water. (Berzelius.)

*Proto*FLUORIDE OF IRON. Very difficultly sol- $Fe Fl + x Aq$ uble in water; more easily soluble in water acidulated with fluorhydric acid. (Berzelius, *Lehrb.*)

*Sesqui*FLUORIDE OF IRON.

I.) $Fe_2 Fl_3$ Slowly, but completely, soluble in water. (Berzelius.)

II.) *basic.* Insoluble in ammonia-water. (Ber- $x Fe_2 O_3, Fe_2 Fl_3$ zelius.)

FLUORIDE OF IRON & OF POTASSIUM.

I.) *proto.* Soluble in water. (Berzelius.)
$K Fl, Fe Fl$

II.) *sesqui.*

$a = 3 K Fl, Fe_2 Fl_3$ Somewhat soluble in water, especially in hot water. (Berzelius.)

$b = 2 K Fl, Fe_2 Fl_3$ Somewhat soluble in water. (Berzelius.)

*Sesqui*FLUORIDE OF IRON & *bifluoride* OF TITANIUM. Soluble, with decomposition, in water. (Berzelius.)

FLUORIDE OF LEAD.

I.) *normal.* Only very slightly soluble in water $Pb Fl$ or fluorhydric acid (Berzelius); more abundantly soluble in chlorhydric and nitric acids. (Gay-Lussac & Thénard.)

II.) *acid.* Soluble in chlorhydric acid. (Fremy.)

III.) *basic.* Much more abundantly soluble in water than the normal salt. (Berzelius, *Lehrb.*)

FLUORIDE OF LEAD & TANTALUM. Difficultly soluble in water.

FLUORIDE OF LEAD & OF TITANIUM. Easily soluble in water. (Berzelius.)

FLUORIDE OF LEAD with NITRATE OF LEAD.

FLUORIDE OF LITHIUM.

I.) *normal.* Scarcely soluble in water, being $Li Fl$ almost as difficultly soluble as the carbonate. (Berzelius.) Sparingly soluble in water. (Troost.)

II.) *acid.* Difficultly soluble in water, but more $Li Fl, H Fl$ soluble than the normal salt. (Berzelius.)

FLUORIDE OF MAGNESIUM. Insoluble in wa- $Mg Fl$ ter. Nearly insoluble in acids. (Gay-Lussac & Thénard.) Insoluble in water or fluorhydric acid. (Berzelius.) Soluble in dilute nitric acid, from which it is precipitated on the addition of alcohol. (Bergman, *Essays*, 1. 443. Compare *Ibid.*, p. 445.)

FLUORIDE OF MAGNESIUM & OF TITANIUM. Easily soluble in water; when the solution is allowed to evaporate spontaneously, crystals form which cannot again be completely dissolved in water. (Berzelius, *Lehrb.*, 3. 433.) Decomposed by pure water. Soluble in acidulated water. (Berzelius, cited by Gm.)

*Proto*FLUORIDE OF MANGANESE. Soluble in $Mn Fl$ acidulated water. (Berzelius.)

*Sesqui*FLUORIDE OF MANGANESE. Completely $Mn_2 Fl_3$ soluble in a small quantity of water; but when this solution is boiled, or diluted with much water, an insoluble basic salt separates while an acid salt is formed; on cooling the hot solution a portion of the former is redissolved if acid be present. (Berzelius.)

*Per*FLUORIDE OF MANGANESE. Soluble, with $Mn_2 Fl_7$ decomposition, in water. (Wœhler.)

FLUORIDE OF MANGANESE & OF POTASSIUM. Insoluble in water. Tolerably soluble in acids. (Guy-Lussac & Thénard.)

FLUORIDE OF MANGANESE & OF SODIUM. Difficultly soluble in water. (Berzelius.)

*Di*FLUORIDE OF MERCURY. Insoluble in wa- $Hg_2 Fl$ ter.

*Proto*FLUORIDE OF MERCURY.

I.) *normal.* $HgFl$ Soluble in water, especially if some acid be present. (Guy-Lussac & Thénard.) With water it forms a soluble acid and an insoluble basic salt. (Berzelius.)

II.) *acid (hydrated).* Decomposed by water. Soluble in fluorhydric acid. (Fremy.)

Fluoride of Mercury with Sulphide of Mercury. $HgFl; 2HgS$ Decomposed by boiling water to soluble fluoride of mercury and insoluble sulphide of mercury. (H. Rose.)

Fluoride of Methyl. (*Hydrofluate of Methylene. Fluorhydrate of Methylene. Methylic Fluoride.*) C_2H_3Fl 1 vol. of water absorbs 1.66 vols. of it. (Dumas & Péligot.)

Fluoride of MethylNicotin. Soluble in water.

*Proto*Fluoride of Molybdenum. $MoFl$ Soluble in water. After having been dried, it is no longer completely soluble in water. (Berzelius.)

*Bi*Fluoride of Molybdenum. $MoFl_2$ Soluble in water. (Berzelius.)

*Ter*Fluoride of Molybdenum. $MoFl_3$ Soluble in water; but if this solution be evaporated to dryness, the residue dissolves but imperfectly in water. (Berzelius.)

Fluoride of Molybdenum & of Potassium. $MoFl; KFl$ Ppt. Soluble in acidulated water.

*Bi*Fluoride of Molybdenum & of Potassium. $KFl; MoFl_2$ Sparingly soluble in water. Less soluble than the ammonia compound. (Berzelius.)

Fluoride of Molybdenum & of Potassium with Molybdate of Potash. $KFl, MoFl_3; KO, MoO_3 + 2Aq$ Permanent. Soluble in boiling, less soluble in cold water. (Berzelius.)

Fluoride of Molybdenum & of Sodium.

I.) *proto.* Easily soluble in water. More soluble than the potassium salt in water.

II.) *bi.* Easily soluble in water.

Fluoride of Nickel. $NiFl$ Behaves like the cobalt salt. Soluble in water acidulated with fluorhydric acid. (Berzelius, *Lehrb.*)

Fluoride of Nickel & of Potassium. Easily soluble in water. (Berzelius.)

Fluoride of Palladium. $PdFl$ Very slightly soluble in water or in fluorhydric acid. Difficultly soluble, while yet moist, in ammonia-water. After having become dry, it is no longer soluble in ammonia-water, unless this is boiling. Insoluble in a boiling aqueous solution of normal or acid fluoride of sodium. (Berzelius, *Lehrb.*, 3. 964.)

Fluoride of Palladium & of Potassium. (*Fluo Palladite of Potassium.*) Sparingly soluble in water. (Berzelius.)

Fluoride of Palladium & of Sodium. Resembles the potassium compound.

Fluoride of Phosphorus. PFl_3 Decomposed, with solution, by water.

*Bi*Fluoride of Platinum. $PtFl_2$ Entirely soluble in water when this is not too strongly heated; if heated, a basic salt remains undissolved. Soluble in alcohol. (Berzelius.)

*Bi*Fluoride of Platinum & of X. *Vid.* FluoPlatinate of X.

Fluoride of Potassium.

I.) *normal.* $KFl, \& + 4Aq$ Very deliquescent. Soluble in water, with evolution of heat. Sparingly soluble in alcohol. (Berzelius.) Very deliquescent and soluble in water. (Fremy, *Ann. Ch. et Phys.*, (3.) **47.** 31.) Alcohol precipitates it from the concentrated aqueous solution; but it is easily soluble in weak spirit prepared by mixing 2 measures of 84% alcohol with 1 measure of water. Easily soluble in a concentrated aqueous solution of acetate of potash. (Aug. Stromeyer, *Ann. Ch. u. Pharm.*, **100.** 83.)

II.) *acid.* KFl, HFl Easily soluble in water. Very difficultly soluble in water containing free fluorhydric acid. (Berzelius.) With alcohol it behaves like the normal salt. (Aug. Stromeyer, *loc. cit.*)

Fluoride of Potassium & of Tantalum. Permanent. Easily soluble in water. (H. Rose.)

Fluoride of Potassium & of Thorium. $KFl, ThFl$ Insoluble in water. Soluble in fluorhydric acid, with decomposition.

Fluoride of Potassium & of Titanium. $KFl, TiFl_2$ Readily soluble, without decomposition, in water. (Berzelius.)

Fluoride of Potassium & of Tungsten with Tungstate of Potash. $KFl, WFl_3; KO, WO_3 + 2Aq$ Difficultly soluble in cold, more readily soluble in hot water. It is not readily decomposed, by repeated solution, in water, or fluorhydric acid, and evaporation. (Berzelius.)

Fluoride of Potassium & of Tungsten with Tungstate of Soda.

Fluoride of Potassium & of Vanadium. Readily soluble in water. Insoluble in alcohol.

Fluoride of Potassium & of Yttrium.

Fluoride of Potassium & of Zinc. $KFl, ZnFl$ Soluble in water. (Berzelius.)

Fluoride of Potassium & of Zirconium.

$$\left.\begin{array}{l}\text{I.) } 2KFl; 2Zr_2Fl_3 \\ \text{II.) } 3KFl; 2Zr_2Fl_3\end{array}\right\}$$ Sparingly soluble in cold, more abundantly soluble in boiling water.

Fluoride of Selenium. $SeFl_3$ Soluble in water, with decomposition to fluorhydric and selenious acids. Soluble in fluorhydric acid, without decomposition. (Knox.)

Fluoride of Silicon. $SiFl_3$ Absorbed in large quantity by water, but is decomposed thereby. 1 vol. of water absorbs 265 vols. of it. Alcohol absorbs more than its own weight of it; the solution finally solidifying to a jelly. The alcoholic solution is decomposed by water, with evolution of alcohol. (Kuhlmann.) Readily absorbed by ether. (Unverdorben.) Sparingly soluble, without decomposition, in naphtha. (Berzelius.) Oil of turpentine also absorbs a considerable quantity of it. (T.)

Fluoride of Silicon & of X. *Vid.* FluoSilicate of X.

Fluoride of Silver.

I.) *normal.* $AgFl + 4Aq$ Deliquescent. Readily soluble in water. (Gay-Lussac & Thénard.)

II.) *acid.* Deliquescent. Soluble in water, and in fluorhydric acid. (Fremy.)

Fluoride of Sodium.

I.) *normal.* $NaFl$ Permanent. 100 pts. of water dissolve 4 pts. of it; *i. e.* 1 pt. of the salt dissolves in 25 pts. of water; and it is not in the least more soluble in boiling than in cold water, so that the hot saturated solution deposits nothing on cooling. However, by boiling down the aqueous solution until a crust of the salt has formed upon its surface, the liquid obtained is a solution of 1 pt. of the salt in 23 pts. of water. The salt, moreover, dissolves so slowly that it is difficult to obtain a solution of it unless it be reduced to an extremely fine powder. Alcohol only dissolves a trace of it. (Berzelius, *Lehrb.*, **3.** 217.) 100 pts. of water at 15° dissolve 4 pts. of this salt; *i. e.* 1 pt. of it is soluble in 25 pts. of water at 15°; it is somewhat more soluble in hot water. (Fremy, *Ann. Ch. et Phys.*, (3.) **47.** 32.) Difficultly soluble in a concentrated aqueous solution of acetate of potash. (Berzelius.)

II.) *bi.* Rather difficultly soluble in cold, but much more easily soluble in boiling water. (Berzelius, *Lehrb.*)
$Na Fl, H Fl$

FLUORIDE OF SODIUM & OF TANTALUM. Permanent. Easily soluble in water. (H. Rose.)

FLUORIDE OF SODIUM & OF TELLURIUM. Soluble in small quantity in boiling water; decomposed by cold water. (Berzelius.)

FLUORIDE OF SODIUM & OF TITANIUM. Very easily soluble in water, being more soluble than the corresponding potassium compound. (Berzelius.)

FLUORIDE OF SODIUM & OF TUNGSTEN. Easily soluble in water. (Berzelius, *Lehrb.*)

FLUORIDE OF SODIUM & OF TUNGSTEN with TUNGSTATE OF SODA. More easily soluble in water than the corresponding potash compound. (Berzelius.)

FLUORIDE OF SODIUM & *bifluoride* OF VANADIUM. Readily soluble in water. Insoluble in alcohol.

FLUORIDE OF SODIUM with PHOSPHATE OF SODA. Soluble in 8.31 pts. of water at 25°, and in 1.74 pts. at 70°. (Briegleb.)
$Na Fl ; 3 NaO, cP O_5 + 24 Aq$

FLUORIDE OF STRONTIUM. Very sparingly soluble in water. Insoluble in fluorhydric acid. (Berzelius.)
$Sr Fl$

FLUORIDE OF SULPHUR.

FLUORIDE OF TANTALUM. Known only in solution, or combination with other fluorides. The aqueous solution is not decomposed by boiling, but is decomposed when evaporated to dryness. (H. Rose.)
$Ta Fl_2$

FLUORIDE OF TELLURETHYL. Soluble in water.

*Bi*FLUORIDE OF TELLURIUM.

I.) *normal.* Deliquescent. Decomposed by a large quantity of water. (Berzelius.)
$Te Fl_2$

II.) *basic.* Decomposed by boiling water.
$Te Fl_2 ; Te O$

FLUORIDE OF THORIUM. Insoluble in water or fluorhydric acid. (Berzelius, *Lehrb.*)
$Th Fl$

*Proto*FLUORIDE OF TIN.

I.) *normal.* Easily soluble in water. (Gay-Lussac & Thénard.)
$Sn Fl$

II.) *acid.*
$Sn Fl, H Fl$

*Bi*FLUORIDE OF TIN. Probably soluble in water. Soluble in fluorhydric acid; when the solution is boiled it coagulates like albumen. (Berzelius.)
$Sn Fl_2$

FLUORIDE OF TITANIUM.

I.) *normal.*

a = *anhydrous.* (Unverdorben.)
$Ti Fl_2$

b = *hydrated.* Decomposed by water to a soluble acid and an insoluble basic salt. (Berzelius, *Lehrb.*)

II.) *acid.* Soluble in water.
(*Titanfluorhydric Acid.*)
$Ti Fl_2, H Fl$

FLUORIDE OF TUNGSTEN. Decomposed by water. Soluble in fluorhydric acid.
$W Fl$

*Ter*FLUORIDE OF URANIUM.

I.) *basic.* Easily soluble in water. With the alkaline fluorides it forms salts soluble in water. (Berzelius.)
$Ur_2 Fl_3, 2 Ur_2 O_3$

*Bi*FLUORIDE OF VANADIUM. Perfectly soluble in water. Soluble in absolute alcohol. Soluble, with combination, in aqueous solutions of the alkaline fluorides.
$Va Fl_2$

*Ter*FLUORIDE OF VANADIUM. Soluble in water.
$Va Fl_3$

FLUORIDE OF YTTRIUM. Insoluble in water or in fluorhydric acid. (Berzelius.)
$Y Fl$

FLUORIDE OF ZINC. Very sparingly soluble in water; somewhat more freely soluble in fluorhydric acid; also in chlorhydric and nitric acids. Easily soluble in ammonia-water. With the alkaline fluorides it forms sparingly soluble compounds.
$Zn Fl$

FLUORIDE OF ZIRCONIUM. Easily soluble in water. When the solution of hydrate of zirconia in fluorhydric acid is evaporated at a gentle heat a crystallized salt is obtained, which is decomposed when treated with water, an insoluble basic salt separating out while a salt with excess of acid dissolves; and if this acid solution be boiled, a portion of hydrate of zirconia will be precipitated, and the solution become still more acid. (Berzelius, *Lehrb.*, **3.** 504.) Insoluble in water. Unacted upon by acids. (Deville.)
$Zr_2 Fl_3$

FLUORBORATE OF *X.* *Vid.* FluoBorate of *X.*

FLUORINE. Not isolated.
Fl

FLUOSILICANILID. *Vid.* FluoSilicate of Anilin.

FLUOSILICIC ACID. Soluble in water. Many of its salts are soluble in water.
(*Hydro Fluo Silicic Acid.*)
$H Fl, Si Fl_3 + Aq$

FLUOSILICATE OF ALUMINUM. Easily soluble in water. After the solution has been evaporated to dryness the residue is slowly but completely redissolved by water. (Berzelius, *Lehrb.*)

FLUO SILICATE OF AMMONIUM. Easily soluble in water. (Berzelius.)
$N H_4 Fl, 2 Si Fl_3$

FLUOSILICATE OF ANILIN. Decomposed by water. Very sparingly soluble in boiling, less soluble in cold alcohol. Insoluble, or very sparingly soluble, in ether. (Laurent & Delbos, *Ann. Ch. et Phys.*, (3.) **22.** 101.)
(*Fluo Silicanilid.*)
$C_{48} H_{33} N_4 O_6 Si Fl_{11}$ (?)

FLUOSILICATE OF ANTIMONY($Sb O_3$). Readily soluble in water containing fluorhydric acid. (Berzelius.)
$Sb Fl_3 ; 2 Si Fl_3$

FLUOSILICATE OF BARIUM. Permanent. Very sparingly soluble in water, but more freely in hot than in cold. The presence of chlorhydric acid does not increase its solubility to a noticeable extent. (Berzelius, *Lehrb.*, **3.** 357.) When recently precipitated it dissolves in 3802 pts. of water at ordinary temperatures; it is more readily soluble in hot water. When a hot solution is cooled the greater portion of the salt precipitates out, but
(*Fluoride of Barium & of Silicium.*)
$Ba Fl, Si Fl_3$

the cooled solution still contains somewhat more of the salt than that prepared by digestion in the cold; thus, by experiment, it was observed that 1 pt. of the salt was soluble in 3392 pts. of water. It is considerably more soluble, with more or less decomposition, in presence of free chlorhydric acid. Thus, by experiment, 1 pt. is soluble in the cold in 733 pts. of water acidulated with chlorhydric acid. 1 pt. is soluble at 12° in 640 pts. of water very feebly acidulated with chlorhydric acid when the mixture is heated to boiling before being cooled to this temperature. (Fresenius, *Ann. Ch. u. Pharm.*, 1846, **59.** 120.) Almost insoluble in spirit. (Fresenius, *Quant.*, p. 126.) Almost entirely insoluble in chlorhydric or nitric acid. (H. Rose, *Tr.*) When fluosilicic acid is added to a solution of chloride of barium it produces a precipitate after a time, even when in presence of 3800 pts. of water. (Harting.) Soluble in 428 pts. of a saturated cold solution of chloride of ammonium, and in 589 pts. of a more dilute solution obtained by mixing the saturated solution with twice its vol. of water. (J. W. Mallet, *Am. J Sci.*, (2.) **28.** 50.)

FluoSilicate of Cadmium. $Cd\,Fl, Si\,Fl_3 + Aq$ Effloresces in warm air. Very easily soluble in water. (Berzelius.)

FluoSilicate of Calcium. $Ca\,Fl, Si\,Fl_3 + 2\,Aq$ Sparingly soluble in water, being partially decomposed thereby with formation of fluorhydric acid. Soluble in fluorhydric and in chlorhydric acids.

FluoSilicate of Chromium. Efflorescent. Soluble in water. (Berlin.)

FluoSilicate of Cobalt. $Co\,Fl, Si\,Fl_3 + 7\,Aq$ Easily soluble in water. (Berzelius.)

*Di*FluoSilicate of Copper. $Cu_2\,Fl, Si\,Fl_3$ Insoluble in water.

*Proto*FluoSilicate of Copper. $Cu\,Fl, Si\,Fl_3 + 7\,Aq$ Efflorescent. Easily soluble in water. (Berzelius.)

FluoSilicate of Glucinum. $G_2\,Fl_3, Si\,Fl_3$ Readily soluble in water. (Berzelius.)

*Proto*FluoSilicate of Iron. $Fe\,Fl, Si\,Fl_3$ Easily soluble in water. (Berzelius.)

*Sesqui*FluoSilicate of Iron. $Fe_2\,Fl_3, 3\,Si\,Fl_3$ Soluble in water. (Berzelius.)

FluoSilicate of Lead.

I.) $Pb\,Fl. Si\,Fl_3$ Very easily soluble in water. (Berzelius.)

II.) *basic?* Insoluble in water. Soluble in a saturated aqueous solution of chloride of sodium. (Becquerel, *C. R.*, 1845, **20.** 1523.)

FluoSilicate of Lithium. $Li\,Fl, Si\,Fl_3$ Exceedingly difficultly soluble in water; more readily soluble in water which contains an excess of acid. (Berzelius.)

FluoSilicate of Magnesium. $Mg\,Fl, Si\,Fl_3$ Easily soluble in water. (Berzelius.)

FluoSilicate of Manganese. $Mn\,Fl, Si\,Fl_3 + 7\,Aq$ Easily soluble in water. (Berzelius.)

*Di*FluoSilicate of Mercury. $Hg_2\,Fl, Si\,Fl_3$ Sparingly soluble in water; more freely soluble in acidulated water, from which it is precipitated on the addition of chlorhydric acid. (Berzelius.)

*Proto*FluoSilicate of Mercury. $Hg\,Fl, Si\,Fl_3$ Decomposed by water to a soluble acid and an insoluble basic salt; completely soluble in acidulated water.

*Proto*FluoSilicate of Molybdenum. (*Molybdofluoride of Silicon.*) $Mo\,Fl, Si\,Fl_3$ Easily soluble in fluorhydric acid. (Berzelius.)

*Bi*FluoSilicate of Molybdenum. $Mo\,Fl_2, 2\,Si\,Fl_3$ Decomposed by water to a soluble acid and an insoluble basic salt. Easily soluble, without decomposition, in acidulated water. (Berzelius.)

*Per*FluoSilicate of Molybdenum. $Mo\,Fl_3, 3\,Si\,Fl_3$ Mostly soluble in water, only a small amount of basic matter being left behind. (Berzelius.)

FluoSilicate of Nickel. $Ni\,Fl, Si\,Fl_3 + 7\,Aq$ Easily soluble in water. (Berzelius.)

FluoSilicate of Platinum. $Pt\,Fl_2, Si\,Fl_3$ Decomposed by water to a soluble acid and an insoluble basic salt. (Berzelius.)

FluoSilicate of Potassium. $K\,Fl, Si\,Fl_3$ Difficultly soluble in water, though somewhat more easily in hot than in cold. (Berzelius, *Lehrb.*) Difficultly soluble in water. Insoluble in dilute spirit. (Fresenius, *Quant.*, p. 286.) 100 pts. of boiling water dissolve 0.66 pt. of it. (Ure's *Dict.*) Soluble in 790 pts. of cold, and in 50 pts. of boiling water. Insoluble in alcohol. (Wittstein's *Handw.*) Unacted upon by aqueous solutions of caustic or carbonated potash at the ordinary temperature, but is dissolved, with decomposition, on boiling therewith; the solution thus obtained soon gelatinizes from separation of silicic acid. (Berzelius, *Lehrb.*) Insoluble in chlorhydric acid.

FluoSilicate of Silver. $Ag\,Fl, Si\,Fl_3$ Deliquescent.

FluoSilicate of Sodium. $Na\,Fl, Si\,Fl_3$ Difficultly soluble in water. Insoluble in dilute spirit. (Fresenius, *Quant.*, p. 286.) More readily soluble in water than the potassium salt, and much more soluble in hot than in cold water. An excess of the acid does not increase its solubility. (Berzelius, *Lehrb.*)

FluoSilicate of Strontium. $Sr\,Fl, Si\,Fl_3 + x\,Aq$ Not completely soluble in pure water, a certain slight excess of acid being required to prevent the formation of an insoluble basic salt. But the amount of the residue insoluble in water is very trifling, and the solubility of the salt is in remarkable contrast with the insolubility of fluosilicate of barium. (Berzelius, *Lehrb.*, **3.** 385.)

FluoSilicate of Tin. $Sn\,Fl_2, Si\,Fl_3$ Very easily soluble in water. (Berzelius.)

FluoSilicate of Uranium. $Ur\,Fl, Si\,Fl_3$ After having become dry it dissolves very sparingly in acid. It is but slightly changed by boiling with a solution of potash. It is not precipitated in presence of free fluorhydric acid. (Rammelsberg.)

FluoSilicate *of biFluoride* of Vanadium. Soluble in water.

FluoSilicate *of terFluoride* of Vanadium. $V\,Fl_3, 3\,Si\,Fl_3$ Partially soluble in water.

FluoSilicate of Yttrium. $Y\,Fl, Si\,Fl_3$ Insoluble in water. Soluble in dilute chlorhydric acid.

FluoSilicate of Zinc. $Zn\,Fl, Si\,Fl_3 + 7\,Aq$ Very easily soluble in water. (Berzelius.)

FluoSilicate of Zirconium. $Zr_2\,Fl_3, Si\,Fl_3$ Very soluble in water. The aqueous solution becomes turbid on boiling, but most of the salt remains dissolved. (Berzelius.)

FormAnil. *Vid.* MethylAnilin.

FormAnilid. *Vid.* PhenylFormylamid.

FormAnilin. *Vid.* MethylAnilin.

FormEmylAnilin. *Vid.* MethylAmylAnilin.

Formene. *Vid.* Hydride of Methyl.

"*Bi*Formene" (of Lallemand). *Vid.* Propylene.

Formic Acid. Miscible with water, alcohol, and ether, in all proportions. Soluble in glycerin. (Berthelot.) All of its salts are soluble in water, and many of them are soluble in alcohol also.
$C_2H_2O_4 = C_2HO_3, HO$

Formiate of Alumina.

I.) *normal.* Hygroscopic. Sparingly soluble in water. (Arvidson, Richter.) Decomposed by hot water (Gœbel) only when sulphate of potash is present. (Liebig.) Deliquescent. Easily soluble in water. A solution of the pure salt may be heated to boiling without suffering decomposition, but a solution which contains sulphate of potash, or alum, becomes cloudy on boiling, from the separation of a basic salt which redissolves as the liquid cools.
$C_6H_3Al_2'''O_{12}$

II.) *terbasic.* Soluble in water; but the solution is somewhat readily decomposed. (Ordway, *Am. J. Sci.*, (2.) **26.** 204.)

Formiate of Ammonia. Very deliquescent. Easily soluble in water.
$C_2H(NH_4)O_4$

Formiate of AmmoniumChloroPlatin(ous)ammonium.
(*Gros's Formiate.*)

Formiate of Amyl.

I.) $C_2H(C_{10}H_{11})O_4$ Sparingly soluble in water. (H. Kopp.)

II.) *basic.*

Formiate of Baryta. Permanent. Soluble in nearly 4 pts. of water at 15^c. (Gehlen, in *Schweigger's Journ. für Ch. u. Phys.*, 1812, **4.** pp. 40, 34.) Insoluble in alcohol. Insoluble in hot alcohol of 85%. (Scheerer.)
C_2HBaO_4

Formiate of Baryta & of Copper.

I.) $C_2H(BaCu)O_4 + 4\,Aq$

II.) $2(C_2HBaO_4); C_2HCuO_4 + 4\,Aq$

Formiate of Baryta & of Manganese.
$C_2H(BaMn)O_4 + 2\,Aq$

Formiate of Baryta & of Zinc.
$C_2H(BaZn)O_4 + 2\,Aq$

Formiate of Bismuth. Easily soluble in water. (Arvidson.)
$C_6H_3Bi'''O_{12}$

Formiate of Butyl. Insoluble, or but sparingly soluble, in water.
(*Formiate of Tetryl.*)
$C_2H(C_8H_9)O_4$

Formiate of Cadmium. Very soluble in water.
$C_2HCdO_4 + 2\,Aq$

Formiate of Cerium. Very sparingly soluble in water. (Beringer.)
$2\,C_2HCeO_4 + Aq$

Formiate *of sesquioxide* **of Chromium.**

I.) *bibasic.* Soluble in water. (Ordway, *Am. J. Sci.*, (2.) **26.** 203.)

Formiate of ChlorAmyl. *Vid.* ChloroCarbonate of Amyl.

Formiate of ChlorEthyl. *Vid.* ChloroCarbonate of Ethyl.

Formiate of ***bi*****ChlorEthyl.** Insoluble in water, in contact with which, however, it is very slowly decomposed. Easily soluble in alcohol, and ether. (Malaguti.)
(*BiChloroFormic Ether.*
BiChlorovinic Formiate.
Formiate d'ethyle bichloré.)
$C_6H_4Cl_2O_4 = C_2H(C_4H_3Cl_2)O_4$

Formiate of ChloroMethyl. *Vid.* ChloroCarbonate of ChloroMethyl.

Formiate of Cinchonidin (of Pasteur). Tolerably easily soluble in water. (Leers, *Ann. Ch. u. Pharm.*, **82.** 161.)

Formiate of Cinchonin. Readily soluble in water.

Formiate of Cobalt. Slightly soluble in water. More easily soluble in water acidulated with formic acid. Insoluble in alcohol. (Arvidson.)
C_2HCoO_4

Formiate of Copper.

I.) *normal.* Effloresces in warm dry air. Soluble in 8.42 pts of water at 20°. At the temperature of boiling it appears to be soluble in all proportions in water, since the crystals melt in their own water when heated. Soluble in 400 pts. of alcohol, of 86%, at 17.5°. (Gehlen, *Schweigger's Journ. für Ch. u. Phys.*, 1812, **4.** pp. 28, 30.) Soluble in 7 pts. of cold water. (Arvidson.)
$C_2HCuO_4 + 4\,Aq$

II.) *basic.* Slightly soluble in water.

Formiate of Copper & of Strontia.

I.) $C_2H(CuSr)O_4 + 4\,Aq$

II.) $C_2HCuO_4 + 4\,Aq;\ 2(C_2HSrO_4 + 2\,Aq)$

Formiate of Ethyl. Soluble in 9 pts. of water at 17.5°. (Gehlen, *Schweigger's Journ. für Ch. u. Phys.*, 1812, **4.** 22.) The aqueous solution soon decomposes. Readily soluble in alcohol, from which solution water precipitates it. (Bucholz.) Miscible in all proportions with wood-spirit, ether, and fixed or volatile oils. (Liebig.)
(*Formic Ether.*
Ethylic Formiate.
Vinic Formiate.)
$C_6H_6O_4 = C_2H(C_4H_5)O_4$

*Tri***Formiate of Ethyl.** Very sparingly soluble in water. (Kay.)
$3\,C_4H_5O, C_2HO_3 = C_{14}H_{16}O_6$

Formiate of Ethyl*chloré*. *Vid.* Formiate of ChlorEthyl.

Formiate of Ethyl *perchloré*. *Vid.* ChloroFormiate of *per*ChlorEthyl.

Formiate of Glucina.

I.) *basic* (*almost terbasic*). Soluble in water. (Ordway, *Am. J. Sci.*, (2.) **26.** 207.)

Formiate *of protoxide* **of Iron.** Soluble in water.

Formiate *of sesquioxide* **of Iron.** Deliquescent. Easily soluble in water. Sparingly soluble in alcohol. (Arvidson.)
$C_6H_3Fe_2'''O_{12}$

The basic formiates of sesquioxide of iron which contain six equivalents or less of the base may be obtained dissolved in water; but those containing more than six equivalents of base are insoluble in water. (Ordway, *Am. J. Sci.*, (2.) **26.** 202.) Some of these solutions of basic salt are decomposed by boiling.

Formiate of Lead.

I.) *normal.* Soluble in 36 @ 40 pts. of cold water; more readily soluble in boiling water. (Arvidson.) Formiate of lead is almost insoluble in cold, but is soluble in hot water. (Berthelot, *Ann. Ch. et Phys.*, (3.) **41.** 295.) Nearly insoluble in alcohol. (Arvidson.)
C_2HPbO_4

II.) *di.* Soluble in water.

III.) *tri.* (Berthelot, *Ann. Ch. et Phys.*, (3.) **46.** 487.)
$C_2HPbO_4, 2\,PbO$

Formiate of Lead with Nitrate of Lead. Permanent. Difficultly soluble in cold water. (Lucius, *Ann. Ch. u. Pharm.*, **103.** 115.)
$3(C_2HPbO_4); PbO, NO_5 + 2\,Aq$

Formiate of Lime. Permanent. Effloresces

$C_2HCaO_4 + x\,Aq$

in warm air. Soluble in 8 pts. of cold water (Arvidson); in 10 pts. of water at 19° (Gœbel); much more soluble in hot water. Insoluble in alcohol.

Formiate of Lithia. Deliquescent. Soluble in water. Sparingly soluble in alcohol. (Rammelsberg.)

$C_2HLiO_4 + 2\,Aq$

Formiate of Magnesia. Permanent. (Süersen.) Very difficultly soluble in water, requiring 13 pts. of water to dissolve it at a moderate heat. Insoluble in spirit. (Bergman, *Essays*, **1**. 451.) Soluble in 13 pts. of cold water. Insoluble in alcohol. (Arvidson, [Gm.].)

C_2HMgO_4

Formiate of Manganese. Efflorescent. Soluble in 15 pts. of cold water. Insoluble in alcohol. (Arvidson.)

$C_2HMnO_4 + 2\,Aq$

Formiate of Melamin. Very soluble in water.

Formiate of *di*Mercur(*ous*)ammonium with *din*Oxide of Mercury. Insoluble in water.

$N\left\{\begin{matrix}H_2\\2\,Hg_2\end{matrix}\right.O, C_2HO_3; 2\,Hg_2O$

Formiate of Mercury(Hg_2). Soluble in 520 pts. of water at 17°; much more abundantly soluble in warm water, but in this case incipient decomposition occurs, and on boiling the decomposition is complete. Insoluble in alcohol or ether. (Gœbel.)

$C_2HHg_2O_4$

Formiate of Mercury(Hg). Easily soluble in water; the solution undergoes decomposition if it be slightly heated. (Liebig.)

C_2HHgO_4

Formiate of Methyl. Insoluble in water.

(*Methylic formiate. Formic methyl ether. Formiate of the oxide of methyl.*)

$C_4H_4O_4 = C_2H(C_2H_3)O_4$

Formiate of Methyl *perchloré*. *Vid.* ChloroCarbonate of ChloroMethyl.

Formiate of Morphine. Readily soluble in water.

Formiate of Nickel. Difficultly soluble in water. (Berzelius, *Lehrb.*)

$C_2HNiO_4 + x\,Aq$

Formiate of Potash.

I.) *normal.* Deliquescent. Very soluble in water.

C_2HKO_4

Permanent. Easily soluble in water, and alcohol. (Berzelius's *Lehrb.*, **3**. 166.)

II.) *acid.* Deliquescent. Very soluble in water, alcohol, and formic acid. The aqueous solution is partially decomposed when evaporated over the water-bath. (Bineau, *Ann. Ch. et Phys.*, (3.) **19**. 294, & (3.) **21**. 186.)

$C_2HKO_4, C_2H_2O_4 + x\,Aq$

Formiate of Quinine. Readily soluble in water.

Formiate of Quinolein. Soluble in boiling water, and alcohol. (Gerhardt.)

Formiate of Silver. Easily [difficultly (Witts. *Handw.*)] soluble in water. Insoluble in alcohol.

C_2HAgO_4

Formiate of Soda.

I.) *normal.* Melts in its water of crystallization when heated, and solidifies, as this evaporates, to a dry mass, which is deliquescent, according to Gœbel, and is soluble in 2 pts. of water, according to Afzelius. (Berzelius's *Lehrb.*, **3**. 253.)

$C_2HNaO_4 + 2\,Aq$

II.) *acid.* Extremely deliquescent. Very soluble in water; but the solution is decomposed by evaporation, or when a large quantity of water is added to it, to formic acid and the normal salt. (Bineau, *Ann. Ch. et Phys.*, (3.) **21**. 187.)

$C_2HNaO_4, C_2H_2O_4 + x\,Aq$

Formiate of Solanin. Soluble in water.

Formiate of StannEthyl. Tolerably soluble in water. (Cahours & Riche.)

Formiate of StibEthylium. Difficultly soluble in water; more easily soluble in alcohol.

Formiate of StibMethylethylium. Very sparingly soluble in cold water, and in alcohol. Tolerably abundantly soluble in boiling water. (Friedlænder.)

$C_2H\left(Sb\left\{\begin{matrix}C_2H_3\\(C_4H_5)_3\end{matrix}\right.\right)O_4$

Formiate of Strontia. Permanent. Soluble in water.

$C_2HSrO_4 + 2\,Aq$

Formiate of TellurMethyl. Easily soluble in water.

Formiate of Thoria. Soluble in hot water. Decomposed by cold water to an acid solution and a basic salt. Sparingly soluble in alcohol. (Berzelius.)

C_2HThO_4

Formiate *of protoxide* of Tin. Some samples are insoluble in water; others form a gelatinous solution from which alcohol precipitates a white powder. (Arvidson.)

C_2HSnO_4

Formiate *of protoxide* of Uranium. Ppt. Soluble in an aqueous solution of formiate of soda; but the solution is decomposed on boiling.

C_2HUrO_4

Formiate *of sesquioxide* of Uranium. Deliquescent.

Formiate of Vanadium(VO_2). Easily soluble in water. The solution undergoes decomposition after a time, unless free acid is present. (Berzelius.)

Formiate of Zinc. Permanent. Soluble in 24 pts. of water at 19°. (Gœbel.) Less easily soluble in water than acetate of zinc. (Berzelius, *Lehrb.*) Insoluble in alcohol. (Marggraf, Arvidson.) Soluble in 20 pts. of water at the ordinary temperature. (Arvidson & Œhrn.)

$C_2HZnO_4 + 2\,Aq$

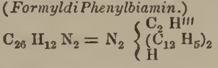
Formic Acid with Mannite. Tolerably soluble in alcohol of 90%.

$C_{12}H_{14}O_{12}, 2\,C_2H_4O_4 + x\,Aq$

Formic Ether. *Vid.* Formiate of Ethyl.

Formicyl*di*Phenyl*bi*amin. Insoluble in water. Easily soluble in alcohol, and ether.

(*FormyldiPhenylbiamin.*)



$C_{26}H_{12}N_2 = N_2\left\{\begin{matrix}C_2H'''\\(C_{12}H_5)_2\\H\end{matrix}\right.$

FormoBenzoic Acid. *Vid.* FormoBenzoylic Acid.

FormoBenzoylic Acid. Very easily soluble in water, and in the smallest quantities of alcohol, and ether. Soluble in chlorhydric acid, and in concentrated sulphuric acid, the solution undergoing decomposition when heated. (Winckler.)

(*FormoBenzoic Acid. Mandelic Acid.*)

$C_{16}H_8O_6 = C_{14}H_6(C_2HO_2)O_3, HO$

FormoBenzoylate of Ammonia. Soluble in almost all proportions in water, and alcohol. (Winckler.)

FormoBenzoylate of Baryta. Much less soluble than the potash salt in water. Sparingly soluble in alcohol. (Winckler.)

$C_{16}H_7BaO_6$

FormoBenzoylate of Copper. Nearly insoluble in water, and in alcohol. (Winckler.)
$C_{16}H_7CuO_6$

FormoBenzoylate of Lead. Scarcely at all soluble in water. (Winckler.)

FormoBenzoylate of Magnesia.

FormoBenzoylate of Mercury(Hg O). Ppt.

FormoBenzoylate of Potash. Very readily soluble in water and in alcohol. (Winckler.)

FormoBenzoylate of Silver. Scarcely at all soluble in cold, more soluble in boiling water.
$C_{16}H_7AgO_6$

FormoMethylal. Miscible with water in all proportions. (Kane.) 1 volume of it requires 1.7 vols. of water for its solution. (Malaguti.) Decomposed by a solution of caustic potash.
(*Formal.*)
$C_8H_{10}O_6$

FormoNaphtalid. *Vid.* FormylNaphtylamid.

Formonetin. Insoluble in water. Soluble in concentrated boiling alcohol, less soluble in cold alcohol. Almost insoluble in ether. Easily soluble in solutions of the alkalies.
$C_{50}H_{23}O_{15}$

Formosal. *Vid.* Lignone.

FormoVinAmylamin. *Vid.* MethylEthylAmylamin.

FormoylAmin.
(*Formiliak.*)
$C_2H_3N = N\left\{\begin{matrix}C_2H\\H_2\end{matrix}\right.$

FormylNaphtylamid. Tolerably soluble in boiling water. Very easily soluble in alcohol. (Zinin.)
(*FormylNaphthalid.*)
$C_{22}H_9NO_2 = N\left\{\begin{matrix}C_{20}H_8''\\C_2HO_2\end{matrix}\right.$

Frangulin. Insoluble in water. Soluble in 160 pts. of warm 80% alcohol; very sparingly soluble in cold alcohol. Scarcely at all soluble in cold, very sparingly soluble in boiling ether; — less soluble than chrysophanic acid in ether. Soluble in boiling benzin, oil of turpentine, and the fatty oils. Slowly soluble in cold, readily soluble in warm ammonia-water. Soluble in cold concentrated sulphuric acid, from which solution it is precipitated by water. Soluble in boiling concentrated nitric acid, separating out again, unchanged, as the solution cools. Insoluble in cold concentrated nitric acid. Soluble in solutions of the alkalies. (Casselmann, *Ann. Ch. u. Pharm.*, **104.** 80.)
(*Rhamnoxanthin*(impure).)
$C_{12}H_6O_6$

Fraxin(from the bark of *Fraxinus excelsior*). Soluble in 1000 pts. of cold water. Easily soluble in hot water. Sparingly soluble in cold alcohol, though more readily soluble therein than in cold water, tolerably easily soluble in hot alcohol. Insoluble in ether. (Salm-Horstmar, *Pogg. Ann.*, **100.** 607, cited in Wittstein's *Handw.*) Several previous observers have confounded fraxinin with mannite, thus Stenhouse (*Ann. Ch. u. Pharm.*, **91.** 256) asserts that the two are identical.
(*Fraxinin.*)

Fucusamid.
$N_2\left\{(C_{10}H_4O_2'')_3\right.$

Fucusin. Only half as soluble in water as furfurin, and much less soluble than the latter in weak alcohol.
(Isomeric with *Furfurin.*)
$C_{30}H_{12}N_2O_6$

Fucusol. Soluble in 14 pts. of water at 13°; and in 12 pts. of concentrated ammonia-water at 13.5°. (Stenhouse.)
$C_{10}H_4O_4$

Fulminic Acid. Not isolated.
$C_4H_2N_2O_4$

Fulminate of Alumina. Easily soluble in water.

Fulminate of Ammonia & of Copper. Soluble in water. (Gladstone.)

Fulminate of Ammonia & of Silver. Very sparingly soluble in water. (Liebig.)

Fulminate of Ammonia & of Zinc. Deliquescent. Soluble in water.

Fulminate of Baryta. Easily soluble in water, and alcohol. (E. Davy.)

Fulminate of Baryta & of Silver. Sparingly soluble in water. (Liebig.)

Fulminate of Baryta & of Zinc. Soluble in water, and alcohol. (E. Davy.)

Fulminate of Cadmium & of Zinc. Somewhat soluble in water.

Fulminate of Calcium & of Silver. Readily soluble in cold water. (Liebig.)

Fulminate of Calcium & of Zinc. Deliquescent. Sparingly soluble in water.

Fulminate of Chromium & of Zinc. Easily soluble in water.

Fulminate of Cobalt & of Zinc. Sparingly soluble in cold, rather more soluble in boiling water.

Fulminate of Copper.

I.) *normal.* Very sparingly soluble in boiling water.

II.) *acid.* Soluble in water. (Liebig & Gay-Lussac.)

Fulminate of Copper & of Potash. Soluble in water. (Liebig.)

Fulminate of Gold. Insoluble in water. Soluble in chlorhydric and in concentrated sulphuric acids. Also in ammonia-water. (E. Davy.)
$\left.\begin{matrix}Au'''\\Cy_3\end{matrix}\right\}O_6$

Fulminate of Gold & of Zinc.

I.) Soluble in ammonia-water, and in concentrated chlorhydric and sulphuric acids.

II.) Insoluble in water or chlorhydric acid. Soluble in aqua-regia. (E. Davy.)

Fulminate of Lead & of Zinc.

Fulminate of Magnesia & of Silver.

I.) Soluble in water.

II.) *subsalt.* Insoluble in water. (Liebig.)

Fulminate of Magnesia & of Zinc. Readily soluble in water, and alcohol.

Fulminate of Manganese & of Zinc. Soluble in water.

Fulminate of Mercury. Very sparingly soluble in cold, more soluble in boiling water. Soluble in ammonia-water. Abundantly soluble in a warm aqueous solution of nitrate of protoxide of mercury ($Hg O, N O_5$) acidulated with nitric acid. (Schischkoff.)
$C_4Hg_2N_2O_4 + Aq$

Fulminate of Mercury & of Silver. Sparingly soluble in water. (Liebig.)

Fulminate of Mercury with Iodide of Potassium. Insoluble in water or alcohol. (Schischkoff.)
$2\,C_4Hg_2N_2O_4;\ KI$

Fulminate of Nickel & of Zinc. Sparingly soluble in water. (E. Davy.)

Fulminate of Palladium & of Zinc.) Insoluble in water. (E. Davy.)

Fulminate of Platinum & of Zinc. Soluble in water. (E Davy.)

Fulminate of Potash. Deliquescent. Insoluble in alcohol. (E. Davy.)

Fulminate of Potash & of Silver. Soluble in 8 pts. of boiling water; less soluble in cold water. (Liebig.)

Fulminate of Potash & of Zinc. Deliquescent. Soluble in water. Insoluble in alcohol. (E. Davy.)

Fulminate of Silver.

I.) *normal.* Very sparingly soluble in cold water. Soluble in 36 pts. of boiling water; from which it separates in great part as the solution cools. (Gay-Lussac & Liebig.) More soluble in ammonia-water, without alteration. (Descotils.)
$C_4 Ag_2 N_2 O_4$

II.) *acid.* Easily soluble in boiling, less soluble in cold water. (Liebig.)

Fulminate of Silver & of Soda. More soluble than the silver salt in water. (Liebig.)

Fulminate of Silver & of Strontia. Sparingly soluble in water. (Liebig.)

Fulminate of Silver & of Zinc. Soluble in water. (Liebig.)

Fulminate of Soda & of Zinc. Efflorescent.

Fulminate of Strontium & of Zinc.

Fulminate of Zinc.

I.) *normal.* Insoluble in cold, sparingly soluble in boiling water. Insoluble in alcohol. Very soluble in ammonia-water. Soluble in aqueous solutions of the alkalies. (E. Davy.)

II.) *acid.* Soluble in water.

Fulminuric Acid. *Vid.* IsoCyanuric Acid.

Fumaramid. Insoluble in cold, soluble in boiling water. (Hagen.) Insoluble in alcohol. Slowly decomposed by water.
$C_8 H_8 N_2 O_4 = N_2 \left\{ \begin{matrix} C_8 H_2 O_4'' \\ H_4 \end{matrix} \right.$

Fumaramid with *prot***oxide of Mercury.** Insoluble in water. (Dessaignes.)
$C_8 H_6 N_2 O_4, 2 Hg O$

Fumaric Acid. Permanent. Sparingly soluble in water, requiring nearly 200 pts. of water at the ordinary temperature to dissolve it.
(*Lichenic Acid. Boletic Acid. ParaMaleic Acid.*)
$C_8 H_4 O_8 = C_8 H_2 O_8, 2 H O$

Soluble in 390 pts. of water at 10°, and in much less hot water (Winckler); in 210 pts. of water at 12° (Lassaigne); in 216 pts. of water at 17° (Probst); in 160 pts. of water, and in 40 pts. of ordinary alcohol (Riegel); in 180 pts. of water at 20°, and in 45 pts. of alcohol at 20° (Braconnot, Thomson's *System*); in 21 pts. of cold alcohol of 76%. (Probst.) Readily soluble in alcohol of 82%. (Winckler.) Very soluble in alcohol, and ether. Easily soluble, without decomposition, in boiling dilute nitric acid. Many of the fumarates dissolve in water, but none of them are soluble in strong alcohol. (Winckler.)

Fumarate of Ammonia.

I.) *normal.* Very soluble in water; the solution undergoing decomposition when evaporated. Soluble in 26 pts. of water at 20°. (Thomson's *System.*) 100 pts. of water at 15.5° dissolve 38 pts. of it. (Ure's *Dict.*)

II.) *acid.* Very soluble in water. Insoluble in alcohol. (Winckler.)
$C_8 H_3 (N H_4) O_8$

Fumarate of Baryta. Efflorescent. Very slowly soluble in water, alcohol, and dilute acids. (Rieckher.)
$C_8 H_2 Ba_2 O_8$

Fumarate of Cobalt. Very soluble in water and in ammonia-water. Sparingly soluble in dilute spirit. (Rieckher.)
$C_8 H_2 Co_2 O_8 + 6 Aq$

Fumarate of Copper. Slowly soluble in water, and alcohol. Insoluble in boiling fumaric acid. (Rieckher.) Soluble in chlorhydric, and nitric acids. (Winckler.)
$C_8 H_2 Cu_2 O_8 + 6 Aq$

Fumarate of Cuprammonium. Soluble in water. Insoluble in alcohol. (Rieckher.)

Fumarate of Ethyl. Sparingly soluble in water. (Hagen.)
$C_8 H_2 (C_4 H_5)_2 O_8$

Fumarate *of protoxide* **of Iron.** Soluble in water. (Riegel.)

Fumarate *of sesquioxide* **of Iron.** Insoluble in water, ammonia-water, or a solution of fumarate of ammonia. Soluble in acids.
$Fe_2 O_3, C_8 H_2 O_8$

Fumarate of Lead.

I.) *normal.* Scarcely at all soluble in cold, easily soluble in boiling water. (Winckler.) Insoluble in alcohol. (Rieckher.) Easily soluble, with decomposition, in nitric acid. Nearly insoluble in strong acetic acid. (Winckler.)
$C_8 H_2 Pb_2 O_8$

II.) *tri.*
$C_8 H_2 Pb_2 O_8, Pb O$

III.) *hexa.*
$C_8 H_2 Pb_2 O_8, 4 Pb O$

Fumarate of Lime. Permanent. Scarcely at all soluble in water. Insoluble in alcohol. (Winckler.) 100 pts. of water at 15.5° dissolve 0.9 pt. of it. (Ure's *Dict.*)
$C_8 H_2 Ca_2 O_8 + 6 Aq$

Fumarate of Magnesia. Soluble in water. Insoluble in alcohol. (Rieckher.)
$C_8 H_2 Mg_2 O_8 + 8 Aq$

Fumarate of Manganese. Sparingly soluble in water. Insoluble in alcohol.
$C_8 H_2 Mn_2 O_8 + 6 Aq$

Fumarate *of dinoxide* **of Mercury.**
$C_8 H_2 Hg_2 O_8$

Fumarate *of protoxide* **of Mercury.**

Fumarate of Nickel. Soluble in water, spirit, and ammonia-water. (Rieckher.)
$C_8 H_2 Ni_2 O_8 + 8 Aq$

Fumarate of Potash.

I.) *normal.* Very soluble in water. Insoluble in alcohol. (Winckler.) Sparingly soluble in weak alcohol. (Rieckher.) From its aqueous solution acetic acid precipitates the acid salt. (Winckler.)
$C_8 H_2 K_2 O_8 + 4 Aq$

II.) *acid.* Much less soluble than the normal salt in cold water. Easily soluble in boiling water. Nearly insoluble in cold, sparingly soluble in boiling spirit of 81%. (Winckler.)
$C_8 H_3 K O_8 + 2 Aq$

Fumarate of Silver. Absolutely insoluble in water. (Pelouze.) Soluble in ammonia-water. Easily soluble in nitric acid. (Winckler.)
$C_8 H_2 Ag_2 O_8$

Fumarate of Soda.

I.) *normal.* Permanent. Readily soluble in cold water. Insoluble in alcohol. (Winckler.)
$C_8 H_2 Na_2 O_8 + 2 Aq \;\&\; + 6 Aq$

Fumarate of Strontia. Very sparingly soluble in water, and alcohol. (Rieckher.)
$C_8 H_2 Sr_2 O_8 + 6 Aq$

Fumarate of Zinc. Readily soluble in water. $C_8H_2Zn_2O_8 + 6\,Aq\ \&\ 8\,Aq$ Insoluble in alcohol. (Winckler.) The 8 Aq salt is efflorescent.

Fumaric Ether. *Vid.* Maleate of Ethyl.

Fumarimid. Very sparingly soluble in boiling $C_8H_3NO_4 + Aq = N\left\{\begin{matrix}C_8H_2O_4''\\ H\end{matrix}\right.$ water. Soluble in warm concentrated acids, whence water precipitates it unaltered.

Fumarin (from *Fumaria officinalis*). Soluble in water, and alcohol. Insoluble in ether. (Peschier.)

Fungic Acid. *Vid.* Malic Acid.

Furfuramid. Insoluble in cold water. Very $C_{30}H_{12}N_2O_6 = N_2\{(C_{10}H_4O_2'')_3$ soluble in alcohol, and ether. (Fownes.) Slowly decomposed by boiling with water or alcohol. Acids decompose it at once. Also decomposed by alkalies.

Furfuric Acid. *Vid.* PyroMucic Acid.

Furfurin. Permanent. Soluble in about $C_{30}H_{12}N_2O_6$ 137 pts. of boiling water; it is almost entirely deposited again as the solution cools. Very readily soluble in alcohol, and ether. (Fownes.)

Furfurol. Readily soluble in cold water. $C_{10}H_4O_4$ Soluble in 11 pts. of water at 13° (Stenhouse); 12 pts. at 15.6° (Fownes); and in 9 pts. of concentrated ammonia-water at 13.5°. (Stenhouse.) Easily soluble in alcohol. (Stenhouse.) Soluble in cold methylamin, and ethylamin, without reaction. Soluble in cold concentrated sulphuric acid, from which it is precipitated on the addition of water. Also soluble in concentrated chlorhydric acid. (Fownes.)

FurfurolSelenié. *Vid.* SelenioFurfol.

FurfurolSulphuré. *Vid.* ThioFurfol.

Fusel-Oil. *Vid.* Hydrate of Amyl.

Fustin (from *Maclura tinctoria*).

G.

Gaduin. Soluble in alcohol, but by repeated $C_{35}H_{22}O_3, HO$ evaporation it passes into an insoluble isomeric modification. (Jongh.)

Gædinic Acid. Insoluble in water. Easily (*Gæidinsæure.*) $C_{32}H_{30}O_4$ soluble in alcohol, and ether. (Caldwell & Gœssmann, *Ann. Ch. u. Pharm.*, **99.** 307.)

Gædinate of Copper. Insoluble in water. $C_{32}H_{29}CuO_4$ Difficultly soluble in alcohol. (C. & G., *loc. cit.*)

Gædinate of Ethyl. Insoluble in water. $C_{32}H_{29}(C_4H_5)O_4$ Somewhat difficultly soluble in alcohol. (C. & G., *loc. cit.*)

Gædinate of Silver. Insoluble in water, $C_{32}H_{29}AgO_4$ alcohol, or ether. (C. & G., *loc. cit.*)

Gædinate of Soda. Soluble in absolute alcohol. (C. & G., *loc. cit.*)

Gaiacic Acid. *Vid.* Guaiacic Acid.

Galactin. Insoluble in water; it nevertheless swells up in water. Soluble in alcohol, and ether. Readily soluble in oil of turpentine, and in olive-oil. (Th. Thomson, *Rep. Br. Assoc.*, 1838, p. 46.)

Galbanum. Soluble in alcohol.

GalLactic Acid. Exceedingly hygroscopic. $G_{14}H_8O_7, 2\,HO$ Miscible in all proportions with water, and alcohol. Insoluble in ether. (Bœdecker & Struckmann, *Ann. Ch. u. Pharm.*, **100.** 276.)

GalLactate of Ammonia. Exceedingly soluble in water. Alcohol precipitates it from the concentrated aqueous solution. (B. & S., *loc. cit.*)

GalLactate of Baryta. Exceedingly soluble in water. Alcohol precipitates it from the concentrated aqueous solution. (B. & S., *loc. cit.*)

GalLactate *of sesquioxide* of Iron. Ppt.

GalLactate of Copper. Ppt.

GalLactate of Lead. Ppt. $2\,PbO, C_{14}H_3O_7 + 3\,Aq$

GalLactate of Lime. Very hygroscopic. $C_{14}H_3Ca_2O_9 + 3\,Aq$ Soluble in water. Insoluble in spirit. (B. & S., *loc. cit.*)

GalLactate of Magnesia. Very easily soluble in water. Alcohol precipitates the aqueous solution. (B. & S., *loc. cit.*)

GalLactate *of dinoxide* of Mercury. Insoluble in water. Difficultly soluble in dilute nitric acid. (B. & S., *loc. cit.*)

GalLactate *of protoxide* of Mercury. In- $2\,HgO, C_{14}H_8O_7$ soluble in water. (B. & S., *loc. cit.*)

GalLactate of Potash. Exceedingly soluble in water. Alcohol precipitates it from the strong aqueous solution. (B. & S., *loc. cit.*)

GalLactate of Soda. Exceedingly soluble in water. Alcohol precipitates it from the strong aqueous solution. (B. & S., *loc. cit.*)

GalLactate of Zinc. Easily soluble in water; alcohol precipitates it from the aqueous solution. (Bœdeker & Struckmann, *Ann. Ch. u. Pharm.*, **100.** 276.)

Gallamic Acid. Sparingly soluble in cold, (*Gallaminsæure. Gallussæureamid. Tannigenamic Acid.*) $C_{14}H_7NO_8 + 3\,Aq$ much more soluble in hot water. Less soluble in water acidulated with chlorhydric acid than in pure water, and much more soluble in the acidulated water when hot than when cold. Decomposed by solutions of caustic potash, and ammonia. Also decomposed by concentrated sulphuric acid.

Gallic Acid. Soluble in 100 pts. of cold, (*Gallussæure.*) $C_{14}H_6O_{10} + 2\,Aq = C_{14}H_3O_7, 3\,HO + 2\,Aq$ and 3 pts. of boiling water (Braconnot); in 20 pts. of cold water, and 3 pts. of water at 100°. The cold saturated solution, therefore, contains 4.76% of it, and the boiling saturated solution 25%. 100 pts. of water at 15.5° dissolves 8.3 pts. of it, and at 100°, 66 pts. (Ure's *Dict.*) Soluble in cold water in about the proportion of 4 grains to the ounce. (Parrish's *Pharm.*, p. 378.) Soluble in 12 pts. of cold, and in 1.5 pts. of boiling water; the aqueous solution undergoes decomposition when boiled. Soluble in 4 pts. of cold alcohol, of 0.83 ? sp. gr., and in 1 pt. of the same alcohol when boiling. Soluble in ether. (Scheele, cited in Thomson's *System.*) Soluble in 96 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 75.) Easily soluble in alcohol; less soluble in ether.

Its salts, excepting those of the alkalies, are insoluble in water, but readily soluble in alcohol;

they are sparingly soluble in ether; and are decomposed by acids and by alkaline solutions.

Gallate of Alumina. Insoluble, or very sparingly soluble, in water.

Gallate of Ammonia.

I.) *acid.* Soluble in water, less in cold than in hot. Sparingly soluble in absolute alcohol.
$C_{14} H_5 (N H_4) O_{10} + 2 Aq$

Gallate of Antimony. Permanent. Insoluble in water.
$C_{14} H_3 Sb''' O_{10} + 2 Aq$

Gallate of Baryta.

I.) *acid.* Sparingly soluble in water. It is less readily soluble after having been heated to 100°. Insoluble in cold alcohol. (Buechner.)
$C_{14} H_5 Ba O_{10} + 3 Aq$

Gallate of Bismuth. Insoluble in water.

Gallate of Cadmium. Soluble in water.

Gallate of Cobalt.

I.) $Co O, 3 C_{14} H_3 Co_3 O_{10} + 11 Aq$ Permanent.

II.) $C_{14} H_4 Co_2 O_{10} + 6 Aq$ Insoluble in water.

Gallate *of protoxide* of Iron. More soluble in water than gallotannate of iron. Abundantly soluble in acetic acid. Very easily soluble in ammonia-water and in aqueous solutions of caustic and carbonated potash. Also soluble in gallic acid. (Wittstein.)

Gallate *of sesquioxide* of Iron. Insoluble in water.

Gallate of Lead.

I.) *di.* Insoluble in water. When recently precipitated, it is readily soluble in warm strong acetic acid.
$C_{14} H_4 Pb_2 O_{10} + 2 Aq$

Soluble in a saturated aqueous solution of chloride of sodium. (Becquerel, *C. R.*, 1845, **20.** 1523.)

II.) *tetra.* Ppt.
$C_{14} H_3 Pb_3 O_{10}, Pb O$

Gallate of Lime.

I.) *acid.* Sparingly soluble in water, more difficultly after it has been dried at 100°. Insoluble in alcohol. (Buechner.)
$C_{14} H_5 Ca O_{10} + 3 Aq$

Gallate of Lithia. Soluble in water.

Gallate of Magnesia.

I.) *normal*, or *tri.* Soluble in water. Insoluble in alcohol. (Buechner.)
$C_{14} H_3 Mg_3 O_{10} + 6 Aq$

II.) *di.* Very sparingly soluble in water.
$C_{14} H_4 Mg_2 O_{10} + 4 Aq$

III.) $C_{14} H_3 Mg_3 O_{10} ; 2 C_{14} H_4 Mg_2 O_{10} + 14 Aq$ Insoluble in gallic acid; soluble in chlorhydric acid. (Buechner.)

IV.) $2 (C_{14} H_3 Mg_3 O_{10}) ; C_{14} H_4 Mg_2 O_{10} + 16 Aq$

Gallate of Manganese.

I.) Soluble in water.

II.) $C_{14} H_3 Mn_3 O_{10} ; 2 C_{14} H_4 Mn_2 O_{10} + 11 Aq$

Gallate of Mercur(*ous*)ammonium. Insoluble in water.

Gallate of Mercur(*ic*)ammonium.

Gallate *of dinoxide* of Mercury. Soluble in strong nitric acid. (Harff.)
$2 C_{14} H_3 Hg_6 O_{10} ; C_{14} H_5 Hg_2 O_{10} + 7 Aq$

Gallate *of protoxide* of Mercury. Soluble in nitric and in chlorhydric acid. (Harff.)
$2 C_{14} H_3 Hg_3 O_{10} ; C_{14} H_4 Hg_2 O_{10} + 12 Aq$

Gallate of Molybdenum. Insoluble in water.

Gallate of Nickel.

I.) Soluble in water.

II.) *basic.* Very sparingly soluble in water.
$2 C_{14} H_3 Ni_3 O_{10} ; C_{14} H_4 Ni_2 O_{10} + 16 Aq$

Gallate of Potash.

I.) *peracid.* Readily soluble in water. Very sparingly soluble in alcohol. (Buechner.)
$2 C_{14} H_5 K O_{10} ; C_{14} H_6 O_{10} + 2 Aq$

Gallate of Quinine. Almost insoluble in cold, soluble in boiling water. Soluble in alcohol, and in dilute acids.

Gallate of Soda.

I.) *acid.* Permanent. Easily soluble in water.
$C_{14} H_5 Na O_{10} + 6 Aq$

Gallate of Solanin. Soluble in water.

Gallate of Strontia.

I.) *acid.* Soluble in water; less easily soluble after having been heated to 100°. More readily soluble in water than the baryta salt. Insoluble in alcohol. (Buechner.)
$C_{14} H_5 Sr O_{10} + 4 Aq$

Gallate *of protoxide* of Tin.

I.) Insoluble in water. Soluble in chlorhydric acid.

II.) *basic.* Insoluble in water. (Buechner.)
$C_{14} H_4 Sn_2 O_{10} ; Sn O$

Gallate of Uranium. Insoluble in water.

Gallate of Urea. Decomposed by water, unless an excess of urea be present, in which case it can be recrystallized. (Hlasiwetz.)
$C_{14} H_5 (C_2 H_4 N_2 O_2) O_{10} + Aq$

Gallate of Vanadium. Insoluble in water.

Gallate of Zinc.

I.) *basic.* Insoluble in water or alcohol.
$C_{14} H_3 Zn_3 O_{10} ; Zn O + Aq$

Gallate of Zirconia. Insoluble in water. Soluble in a solution of gallic acid. (Vauquelin.)

GallHuminic Acid. *Vid.* GallUlmic Acid.

GalloLacticAcid. *Vid* GalLactic Acid.

GalloTannic Acid. Readily soluble in water. Soluble in alcohol, and ether. Readily soluble in water, glycerin, alcohol, and absolute ether. Soluble in fixed and volatile oils. (Parrish's *Pharm.*, p. 377.) Insoluble in fatty and essential oils.
(*Tannic Acid. Tannin of Nut Galls. Gallæpfelsæure.*)
$C_{54} H_{22} O_{34} = C_{54} H_{20} O_{32}, 2 H O$

The concentrated ethereal solution forms a syrup, which contains from 46 to 56% of the acid; it is insoluble in ether, and consequently will not mix with a fresh portion of ether. (Mohr.) Soluble to a considerable extent in ether, from which solution it is in great measure precipitated on the addition of water, in which, however, it subsequently dissolves. (Strecker.) Only sparingly soluble in water acidulated with sulphuric acid. (Gerhardt.) Insoluble in caoutchin. (Himly.) Soluble in cold concentrated sulphuric acid. Decomposed by boiling with dilute sulphuric acid. (Strecker.) Sulphuric, phosphoric, arsenic, boracic, and especially chlorhydric acids, precipitate it from the aqueous solution. Sulphurous, selenious, acetic, citric, malic, and succinic acids do not thus precipitate it, nor do oxalic or tartaric acids, excepting from a very concentrated solution. (Wackenroder.) This precipitation depends upon the fact that with the acids first named it forms compounds which are less soluble than itself in water. (Strecker.)

It was formerly thought that the ether with which galls are extracted should not be anhydrous, — ordinary "washed ether" being preferred, — and that the heavy layer which separates, beneath the ether, in the bottle below the displacement tube was an aqueous solution of the acid; but Mohr, Saudrock, and others now assert that this syrupy liquor is a concentrated solution of tannin in ether, which is not miscible with ether, except by the intervention of a little alcohol; they therefore reject the aqueous ether, which tends to swell up the powdered galls and to retard percolation, and recommend a mixture of alcohol of 90 per cent, and ether (1 pt. alcohol to 20 pts. ether, Guibourt). (Parrish's *Pharm.*, p. 376.)

The alkaline gallotannates are soluble in water.

GalloTannate of Ammonia. Readily soluble in water. Insoluble in strong alcohol.
$C_{54}H_{21}(NH_4)O_{34}$

GalloTannate of Anilin. Ppt. Soluble in boiling water, and in alcohol. (Hofmann, *Ann. Ch. et Phys.*, (3.) **9.** 147.)

GalloTannate of Antimony. Very sparingly soluble in water.

GalloTannate of Baryta.

I.) Almost insoluble in cold, sparingly soluble in boiling water.
$C_{54}H_{20}Ba_2O_{34}$

II.) Soluble in water. Insoluble in alcohol.

GalloTannate of Cadmium. Insoluble in water or alcohol. (Schiff.)
$C_{54}H_{19}Cd_3O_{34}$

GalloTannate of Caffein. Soluble in hot water, from which it separates on cooling. Soluble in alcohol. (Mulder.) Insoluble in cold, soluble in warm water. (Peligot, *Ann. Ch. et Phys.*, (3.) **11.** 137.)

GalloTannate of Cinchonin. Very sparingly soluble in water at the ordinary temperature, more soluble in boiling water. Soluble in alcohol.

GalloTannate of Copper. Soluble in ammonia-water.

GalloTannate of Emetin. Soluble in solutions of the caustic alkalies.

GalloTannate of Gelatin. Insoluble in water, alcohol, or ether. Soluble in warm potash-lye.

GalloTannate *of protoxide* of Iron.

GalloTannate *of sesquioxide* of Iron. Only traces of it are dissolved by water; scarcely more soluble in acetic acid. Easily soluble in citric, tartaric, oxalic, chlorhydric, and gallotannic acids. Completely decomposed by aqueous solutions of caustic and carbonated potash, but only incompletely decomposed by ammonia-water. (Wittstein.)

GalloTannate of Lead.

I.) $C_{54}H_{19}O_{31}, 3\,PbO$ Insoluble in water.

II.) $C_{54}H_{19}O_{31}, 6\,PbO$ Insoluble in water.

III.) $C_{54}H_{19}O_{31}, 10\,PbO$ Insoluble in water. Many other gallotannates of lead have been described, but they were doubtless mixtures of those given above. The compounds analyzed by Berzelius and Pelouze are the same as No. I.; they were, however, dried at a lower temperature than this. (Strecker, *Ann. Ch. u. Pharm.*, **90.** 349.) "Tannate of lead" is soluble in 1440 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.)

GalloTannate of Lime.

I.) *normal.* Soluble in pure water.

II.) *basic.* Almost insoluble in water.

GalloTannate of Magnesia.

I.) *basic.*

GalloTannate *of dinoxide* of Mercury. Soluble, with subsequent decomposition, in a solution of nitrate of dinoxide of mercury.

GalloTannate *of protoxide* of Mercury. Insoluble in an aqueous solution of nitrate of protoxide of mercury. Soluble, with decomposition, in chlorhydric acid.

GalloTannate of Morphine. Soluble in acetic acid.

GalloTannate of Potash. Soluble in water. Insoluble in alcohol.
$C_{54}H_{20}K_2O_{34}$

GalloTannate of Quinine. Soluble in 480 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 75.) Sparingly soluble in boiling water. Readily soluble in alcohol.

Only sparingly soluble in neutral liquids. Soluble in acids, and acidulated solutions. (Parrish's *Pharm.*, p. 403.)

GalloTannate of Quinolein. Soluble in boiling water, and in alcohol.

GalloTannate of Silver.

GalloTannate of Soda. Easily soluble in water. Insoluble in alcohol.
$C_{54}H_{20}Na_2O_{34}$

GalloTannate of Solanin. Sparingly soluble in cold, very soluble in boiling water.

GalloTannate of Strychnine. Sparingly soluble in water.

Scarcely at all soluble in water. (Parrish's *Pharm.*, p. 409.)

GalloTannate of Theobromin. Soluble in boiling water, in alcohol, and in an aqueous solution of gallotannic acid.

GalloTannate *of protoxide* of Tin. Ppt.

GalloTannate of *tetra*Vinylium. Insoluble in water or alcohol. (Heintz & Wislicenus.)

GalloTannate of Zinc.

GallUlmic Acid. Easily soluble in aqueous solutions of caustic potash, soda, and ammonia. Insoluble in water.
(*GallHuminic Acid. Meta Gallic Acid.*)
$C_{12}H_4O_4$

GallUlmate of Potash.

GallUlmate of Silver.
$C_{12}H_3AgO_4$

Gamboge (concrete juice of a tree). Forms an emulsion with water. Soluble in alcohol. Sparingly soluble in benzin. Soluble in solutions of the caustic alkalies. [See also under Resins.]
(*Gummi Gutta. Gomme Gutte.*)

Somewhat soluble in benzin. (Mansfield, *J. Ch. Soc.*, **1.** 261.)

Gardenin. Nearly insoluble in water. Tolerably readily soluble in alcohol; much less readily soluble in ether. Soluble in concentrated sulphuric acid, from which solution it is precipitated unchanged on the addition of water. Sparingly soluble in hot chlorhydric acid. (Stenhouse, *J. Ch. Soc.*, **9.** 239.)

Gaultheric Acid. *Vid.* MethylSalicylic Acid.

Gaultheric Acid *binitré*. *Vid.* Methyl *bi*-NitroSalicylic Acid.

Gaultherylene. Insoluble in water. (Cahours, *Ann. Ch. et Phys.*, (3.) **10.** 358.)
(*Gaultherilene.*)
$C_{20}H_{16}$

Gein (from *Geum urbanum*).

Gelatin. Permanent. It swells up in cold water, but does not dissolve therein. Soluble in warm water. Insoluble in alcohol. Soluble in acetic acid. Decomposed by boiling with alkaline solutions. Soluble, with decomposition, in cold concentrated sulphuric
$C_{12}H_{10}N_2O_4$

acid; also soluble, with partial decomposition, in nitric acid.

Soluble in cold concentrated chlorhydric acid. Slowly and partially dissolved by solutions of the caustic alkalies. (Caventou, *Ann. Ch. et Phys.*, (3.) **8.** 329.)

Gentianic Acid. Permanent. Soluble in 3630 pts. of water at 16°; more soluble in ether. Readily soluble in boiling alcohol. Readily soluble in solutions of the alkalies. Soluble in concentrated sulphuric acid. Unacted upon by chlorhydric, acetic, or weak sulphuric acids. The gentianin of Henry & Caventou, which, according to H. Trommsdorff, was impure, was very slightly soluble in cold, but somewhat more soluble in boiling water. Easily soluble in alcohol, and ether. More soluble in dilute alkalies than in water. Soluble to a considerable extent in acids. Trommsdorff's gentianin is insoluble in cold, and very slightly soluble in boiling water; more soluble in alcohol, and ether. Several of the acids increase its solubility in water, but only to a slight extent. Easily soluble in aqueous solutions of the alkalies and alkaline carbonates. (Trommsdorff, *Ann. der Pharm.*, 1837, **21.** 136.) Soluble in 500 pts. of cold, and in 100 pts. of boiling alcohol. Only sparingly soluble in cold ether. (Wittstein's *Handw.*)

(*Gentisic Acid. Gentianin.*)
$C_{28} H_{10} O_{10}$

Gentianate of Baryta. Ppt.
$C_{28} H_8 Ba_2 O_{10} + 2 Aq$

Gentianate of Lead.
I.) *basic.* Ppt.
$C_{28} H_8 Pb_2 O_{10}; 2 Pb O, H O$

Gentianate of Potash. Soluble in alcohol.

Gentianate of Soda. Efflorescent. More soluble than gentianic acid in water.

Gentianin. *Vid.* Gentianic Acid.

Gentisin. Deliquescent. Very easily soluble in water. Sparingly soluble in absolute alcohol, more readily soluble in spirit. (Dulk.)

(*Gentian bitter. Gentianin* (of Caventou & Henry).)

Geoffroyin. *Vid.* Surinamin.

Geraniin (from the roots of various species of Geranium). Very hygroscopic. Easily soluble in water, and ordinary alcohol. Insoluble in absolute alcohol, and in ether. (Mueller.)

Gerhardt's Bases. *Vid.* Oxide of Platin(*ic*)-amin.
$N H_3 Pt O_2$ & $N_2 H_6 Pt O_2$

Githagin. *Vid.* Saponin.

Glairin. Sparingly soluble in cold water, alcohol, oil of turpentine, weak acids, or alkaline solutions; more soluble in these liquids when they are hot. Insoluble in ether.

(*Baregin. Zoogene. Luchonin.*)

Glauber's Salt. *Vid.* Sulphate of Soda.

Glaucin (from *Glaucium luteum*). Tolerably easily soluble in water, especially when this is hot; less soluble in an aqueous solution of sulphate of soda. Very easily soluble in alcohol, and ether. (Probst.)

GlaucoMelanic Acid. Not isolated.
$C_{24} H_6 O_{14} = C_{24} H_4 O_{12}, 2 H O$

GlaucoMelanate of Potash. Sparingly soluble in cold, more soluble in boiling water. (Wœhler & Merklein.) Insoluble in alcohol. Soluble in hot, strong potash-lye.
$C_{24} H_4 K_2 O_{14}$

GlaucoMelanate of Soda.

GlaucoPicrin (from the root of *Glaucium luteum*). Permanent. Soluble in water, especially if it be warm. Also soluble in alcohol, less soluble in ether. (Probst.)

Gliadin. Soluble in hot spirit, and in glacial acetic acid. (Taddei.)

Globulin. Occurs naturally in the soluble state, but becomes insoluble on being boiled. After having been dried at 50°, soluble globulin swells like albumen in water, and gradually dissolves, forming a viscid solution. Strong alcohol precipitates the aqueous solution; the precipitate formed being insoluble in water, but partially soluble in boiling alcohol; on cooling it separates again from this solution. The aqueous solution is coagulated, on the addition of ether. When dried, the soluble modification may be heated to 100° without passing into the insoluble state. The aqueous solution does not become opalescent at a lower temperature than 73°; at 83° it becomes milky, and at 93° coagulates, but this precipitate cannot be removed by filtration, unless the liquid containing it be first boiled with neutral alkaline salts. An aqueous solution of globulin is not precipitated by acetic acid or by ammonia, but it becomes turbid when both of these reagents are added successively. On the addition of a little dilute acetic acid, the solution of globulin becomes opalescent, and when heated to 50° a milky coagulum separates; the fluid rendered turbid by a little acetic acid, becomes clearer when more of the acid is added, but always remains opalescent; this fluid does not coagulate till heated to 98°; it is only when a very great excess of acetic acid has been added that the globulin ceases to be coagulable by heat. Towards mineral acids and metallic salts it behaves like albumen. It is coagulated by creosote. (Lehmann.)

(*Crystallin.*)

Glonoin. *Vid.* NitroGlycerin.

Glucic Acid. Permanent. (Mulder.) Very hygroscopic. (Peligot.) Easily soluble in water. (Mulder.) Soluble in water in all proportions. (Peligot.) The aqueous solution undergoes decomposition after long-continued boiling, and especially if chlorhydric or sulphuric acid be present. Readily soluble in alcohol. (Mulder.) The acid and normal glucates are all soluble in water, excepting the lead salt. (Peligot.)

(*KalisaccharicAcid.*)
$C_{24} H_{18} O_{18}$

Glucate of Baryta. Appears to be soluble in water.

Glucate of Copper. Appears to be soluble in water.

Glucate *of sesquioxide* of Iron. Appears to be soluble in water.

Glucate of Lead.
I.) *basic.* Insoluble in water. (Peligot.)
$C_{24} H_{15} Pb_3 O_{18}; 3 Pb O + Aq$

Glucate of Lime.
I.) *normal.* Readily soluble in water. Sparingly soluble in alcohol. (Mulder.)
$C_{24} H_{15} Ca_3 O_{18} + Aq$

II.) *acid.* Soluble in water. Easily soluble in alcohol. (Mulder.)

Glucate *of dinoxide* of Mercury. Ppt.

Glucate of Silver. Ppt.

Glucina. *Vid.* Oxide of Glucinum.

Glucinic Acid. *Vid.* Oxide of Glueinum
$Gl_2 O_3$ (No. II. = hydrated.)

Glucinate of Potash. Soluble in aqueous

solutions of caustic potash; when the potash is dilute, the compound is decomposed on boiling, but if the potash be concentrated, the solution may be boiled or evaporated without decomposing, and when cold it may be diluted freely with water. [Compare Oxide of Glucinum (II.) hydrated.] (H. Rose, *Tr.*)

Glucinum. Gl Unacted upon by boiling water, or by cold concentrated nitric acid; difficultly attacked by hot concentrated nitric acid. Easily soluble in dilute chlorhydric or sulphuric acids, but only slightly attacked by dilute nitric acid. Soluble, even at the ordinary temperature, in a concentrated solution of caustic potash, but not in ammonia-water. (Debray.)

Glucose. (*Grape Sugar. Diabetic Sugar.*) $C_{12}H_{12}O_{12}$ & + Aq & 2 Aq Soluble in 1.333 pt. of cold water, and in all proportions in boiling water.

Its solution in water is attended with a considerable diminution of temperature. (Pohl, *Wien. Akad. Bericht*, **6.** 598.)

To dissolve 1 pt. of	Are required pls. of water at 15°.	Or, in other words, 100 pts. of water at 15° dissolve pls.
Anhydrous Glucose (prepared from starch by SO_3)	1.224	81.68
Monohydrated Glucose	1.119	89.36
Bihydrated Glucose	1.022	97.85

When treated with water, glucose dissolves rather rapidly at first, but more slowly as the water becomes charged with it, and only after the lapse of several days, during which time the mixture is repeatedly agitated, does it become completely saturated. The sp. gr. of a solution saturated at 15° is 1.206, and the solution contains 44.96% of glucose. The slowness with which the last portions dissolve will be seen from the following experimental results. An excess of pulverized glucose agitated with water at the ordinary temperature afforded a solution the sp. gr. of which increased as follows: —

After 36 hours the sp. gr. was 1.201
" 50 " " 1.202
" 74 " " 1.205
" 98 " " 1.206

after which no increase occurred. (C. F. Anthon, *Dingler's polyt. J.*, 1859, **151.** 214.)

Chemically pure grape-sugar in hard crystals, and dried so that it held but 0.2% of water, having been finely powdered, was added by small weighed portions to various samples of alcohol of different strengths at 17.5° C., until the last portion added no longer dissolved, even after persistent agitation of the carefully stopped bottle.

At 17.5° 100 pts. of the solution prepared with spirit of sp. gr.	Contained pts. of the grape-sugar.
0.837	1.95
0.880	9.30
0.910	17.74
9.950	36.45

Consequently, 1 pt. of grape-sugar requires for its solution,

50.2 pts. of alcohol of 0.837 sp. gr.
9.7 " " 0.880 "
4.6 " " 0.910 "
1.7 " " 0.950 "

Although in preparing these solutions at 17.5° by agitation, care was taken that they should not be warmed by the hand, they nevertheless deposited crystals of grape-sugar after standing for several hours, the quantity of the crystalline deposit being so much the greater in proportion as the sp. gr. of the alcohol employed was greater, i. e. in proportion as the alcohol was more dilute. After these crystals had ceased to form, the amount of grape-sugar remaining in solution was determined by evaporation in each case: —

In the spirit of sp. gr.	There was contained per cent of grape-sugar.
0.837	1.94
0.880	8.10
0.910	16.00
0.950	32.50

The cause of this phenomenon is not apparent. That it does not depend upon any evolution of heat on dissolving the sugar in dilute alcohol is proved by the fact that on agitating finely powdered grape-sugar with an equal quantity of alcohol of 0.950 sp. gr. there was not only no increase of temperature, but a decided diminution thereof, the thermometer having fallen 5° (from 15° to 10°). The numbers of the table last given should be regarded as expressing the real solubility of grape-sugar in alcohol; hence

1 pt. of grape-sugar (nearly anhydrous) is soluble at 17.5° in pts.	of alcohol of sp. gr.
50.54	0.837
11.34	0.880
5.25	0.910
2.07	0.950

If one calculates from the foregoing the quantities of grape-sugar which are dissolved in the water contained in the spirit employed, it appears that

100 pts. of water in the spirit of sp. gr.	Have dissolved pts. of grape-sugar.
0.837	12.37
0.880	25.92
0.910	40.52
0.950	72.95

But 100 pts. of pure water dissolve 81.68 pts. of andydrous grape-sugar at 17.5°. Whence it appears that the solubility of the sugar in spirit does not stand in proportion to the amount of water which this contains, and that a determined quantity of water is capable of dissolving so much the less sugar in proportion as it is contained in stronger spirit. Besides the above experiments at 17.5°, others were made at the temperature of boiling, from which it appeared that

100 pts. of boiling alcohol, of sp. gr.	Dissolve pts. of grape-sugar.
0.837	21.7
0.880	136.7

Or, 1 pt. of grape-sugar is soluble,

In pts. of boiling alcohol	Of sp. gr.
4.60	0.837
0.73	0.880

These boiling solutions deposit a quantity of the sugar on cooling, but even after the lapse of 7 days the cooled solutions still contain more of it than solutions which have been saturated at the ordinary temperature.

Thus, 100 pts. of the solution, in spirit of sp. gr.	Contained, after standiug for 6 days at the ordinary temperature, pts. of grape-sugar.
0.837	2.9
0.880	12.4

These numbers all refer to anhydrous, or nearly anhydrous, grape-sugar; the hydrated salt would of course be somewhat more readily soluble. (C. F. Anthon, *Dingler's polyt. J.*, 1860, **155.** 386.)

Only half as soluble as cane-sugar in water, but more soluble than milk-sugar. Only slightly soluble in alcohol, being less soluble therein than cane-sugar. Soluble in 8 pts. of alcohol, of 85% at 25°, and in 20 pts. of absolute alcohol. Soluble in wood-spirit. Insoluble in ether. Only slightly acted upon by dilute acids. Decomposed by strong nitric acid. Soluble, with combination, in concentrated sulphuric acid. Easily decomposed by alkaline solutions.

Glucosate of Baryta.

I.) $C_{12} H_{11} Ba O_{12}$ Readily soluble in water.

II.) $2 C_{12} H_{11} Ba O_{12}, Ba O + 6 Aq$? Insoluble in wood-spirit.

Glucosate of Chloride of Sodium. *Vid.* Chloride of Sodium with Glucose.

Glucosate of Lead. Ppt.
$C_{12} H_{12} O_{12}, 3 Pb O + Aq$

Glucosate of Lime. Soluble in water, from which it is precipitated on the addition of alcohol.
$C_{12} H_{12} O_{12}, 2 Ca O$

Glucosate of Potash. Deliquescent. Soluble in water; less soluble in alcohol.
$C_{12} H_{12} O_{12}, 2 K O$

Glue. Permanent. Swells up in cold water. Soluble in hot water, and in dilute spirit, also in acetic acid, and dilute mineral acids. Insoluble in alcohol, coal-oils, &c.

Gluten. Insoluble in cold, and only very slightly soluble in hot water. Decomposed by long-continued contact with water. Readily soluble in boiling alcohol, from which it is precipitated by water. [Soluble in concentrated chlorhydric acid. (J. Lehmann.)] When digested for twelve hours at the ordinary temperature with water very slightly acidulated with chlorhydric acid, freshly prepared gluten loses its coherence, and forms a limpid solution, which coagulates when heated, and is precipitated [with subsequent re-solution] on the addition of chlorhydric, nitric, or sulphuric acids. In a word, the gluten behaves precisely like fibrin, *q. v.* (Bouchardat & Sandras, *Ann. Ch. et Phys.*, (3.) **5.** 483.) Easily ("imperfectly") soluble in concentrated acetic acid. Easily soluble in weak alkaline solutions.

As prepared by kneading flour in a current of water, gluten contains at least 4 distinct substances, viz. fibrin (vegetable), casein, glutin, and a fatty matter soluble in ether. (Dumas & Cahours, *Ann. Ch. et Phys.*, (3.) **6.** 389.)

Glutin. Insoluble in water or ether. Easily soluble in boiling alcohol, and is not precipitated from this solution as it cools, but by evaporation a concentrated solution is obtained which solidifies on cooling. [After having been dried it appears to be insoluble in alcohol, or less soluble than before.] (Dumas & Cahours, *Ann. Ch. et Phys.*, (3.) **6.** pp. 418, 390.) Only partially soluble in cold alcohol. It swells up in water, but is insoluble therein. Soluble in acids, and in solutions of the caustic alkalies. Easily soluble in cold dilute ammonia-water; this solution coagulates when boiled. Soluble in acetic acid.
(*Glaiadin.*)

Glyceramin. Very soluble in water, and ether. (Berthelot & DeLuca, *Ann. Ch. et Phys.*, (3.) **48.** 318.)
$C_6 H_9 N O_4$

Glyceric Acid (Anhydrous). Hygroscopic.
(*Glyceric Anhydride.*)
$C_6 H_4 O_6$

Glyceric Acid. Soluble in all proportions in water, and alcohol. Insoluble in ether.
$C_6 H_6 O_8$

Glycerate of Ammonia. Soluble in water.
$C_6 H_5 (N H_4) O_8$

Glycerate of Baryta.
$C_6 H_5 Ba O_8$

Glycerate of Copper.

Glycerate *of sesquioxide* of Iron.

Glycerate of Lead. Sparingly soluble in cold, tolerably soluble in hot water.
$C_6 H_5 Pb O_8$

Glycerate of Lime. Easily soluble in water. Insoluble in alcohol.
$C_6 H_5 Ca O_8 + 2 Aq$

Glycerate of Potash.

I.) *normal.* Soluble in water.
$C_6 H_5 K O_8$

II.) *acid.* Soluble in water.
$C_6 H_5 K O_8, C_6 H_6 O_8$

Glycerate of Silver. Appears to be soluble in water. (Debus.)

Glycerate of Zinc.
$C_6 H_5 Zn O_8 + Aq$

Glycerin. Hygroscopic. Miscible in all proportions with water, and alcohol. Insoluble in ether.
(*Hydrated Oxide of Glyceryl*, or *of Lipyl.*)
$C_6 H_8 O_6 = C_6 H_5 O_3, 3 H O = \left.\begin{matrix} C_6 H_5''' \\ H_3 \end{matrix}\right\} O_6$

Soluble in water. Also soluble in absolute alcohol, from which it is partially precipitated on the addition of an equal volume of ether. (Berthelot, *Ann. Ch. et Phys.*, (3.) **43.** 262.) A small quantity of ether does not precipitate glycerin from its alcoholic solution, although it is insoluble in ether alone. (Wurtz.) Glycerin is not miscible with the fatty oils. (Parrish's *Pharm.*, p. 324.) Soluble in cold fuming chlorhydric acid.

An aqueous solution of sp. gr. (at 17.5°)	Contains per cent of glycerin of 1.26 sp. gr.*	Freezes at °C.
1.024	10	—1.25°
1.051	20	—2.5°
1.075	30	—6.25°
1.105	40	—17.5°
1.117	45	—26.25°
1.127	50	—31.25° @ [33.75°
1.159	60	Not freezing at —35°
1.179	70	
1.1204	80	
1.232	90	
1.241	100	

(Fabian, *Dingler's polyt. Journ.*, 1860, **155.** 347.)

---

* According to Fergusson Wilson, a sample of 1.26 sp. gr. contains 98 per cent of anhydrous glycerin.

Glycerin approaches very nearly to diluted alcohol in its solvent power. It dissolves all deliquescent salts, several metallic nitrates, chlorides, and sulphates, the alkalies, and several of the metallic oxides, as oxide of lead, in large quantities; it also dissolves many vegetable acids. (Pelouze.)

The solvent power of glycerin is between that of water and of alcohol. In general terms, substances may be said to be more soluble in glycerin the more soluble they are in alcohol. A high temperature greatly increases its solvent power. (Parrish's *Pharm.*, p. 236.) Most of the Glycerides are insoluble, or but sparingly soluble in water. The compounds of glycerin with *baryta*, *lime* [see Oxide of Calcium], and *strontia*, are soluble in water, from which carbonic acid does not precipitate them: they are also sparingly soluble in alcohol. (Chevreul.)

GlyceroCitric Acid.

GlyceroPhosphoric Acid. *Vid.* Phospho-Glyceric Acid.

GlyceroPyroTartaric Acid. Deliquescent.
$C_{14}H_{14}O_{18} = C_8H_5(C_6H_7O_4)O_{12} + 2Aq$

GlyceroPyroTartrate of Lime. Easily soluble in water. Insoluble in alcohol. (Berzelius.)

GlyceroSuccinic Acid. Readily soluble in water.

GlyceroSuccinate of Lead. Soluble in water. Somewhat soluble in alcohol. (Van Bemmelen.)

GlyceroSulphuric Acid. *Vid.* Sulpho-Glyceric Acid.

GlyceroTartaric Acid. Deliquescent. Soluble in water. Its alkaline salts are soluble in water, but insoluble in alcohol. (Berzelius.)
$C_{14}H_{12}O_{16}$

GlyceroTartrate of Baryta.
$C_{14}H_{11}BaO_{16}$

GlyceroTartrate of Copper.
GlyceroTartrate of Lead.
} Soluble in water; the solution subsequently slowly undergoing decomposition.

GlyceroTartrate of Lime. Permanent. Soluble in water. Insoluble in alcohol. (Berzelius.)
$C_{14}H_{11}CaO_{16}$

GlyceroTartrate of Magnesia.
GlyceroTartrate of Silver.
GlyceroTartrate of Zinc.
} Soluble in water; the solution subsequently slowly undergoes decomposition. (Desplats.)

$C_{30}H_{18}Ca_4O_{38}$

*Epi*Glycero*bi*Tartaric Acid.
$C_{22}H_{14}O_{24}$

*Epi*Glycero*bi*Tartrate of Baryta.
$C_{22}H_{13}BaO_{24}$

*Epi*Glycero*bi*Tartrate of Lime.
$C_{22}H_{18}CaO_{24}$

GlycerOxalic Acid.

GlycerOxalate of Lime. Soluble in water. (Van Bemmelen.)

Glycin. *Vid.* Glycocoll.

Glycocholic Acid. *Vid.* Cholic Acid.

Glycocin. *Vid.* Glycocoll.

Glycocoll. Permanent. Soluble in 4.4 pts. of cold water (Mulder); in from 4.24 to 4.35 pts. of water. (Horsford, *Am. J. Sci.*, (2.) **3.** 376.) Tolerably soluble in spirit. (Braconnot.) Soluble in 930 pts. of alcohol of 0.828. (Mulder.) Much less soluble than leucin in alcohol. Insoluble in boiling absolute alcohol and in ether. (H. Kopp.) Slightly soluble in alcohol; more soluble in alcohol containing chloride of ammonium than in pure alcohol; more soluble in hot than in cold spirit. Quite insoluble in ether, and scarcely less insoluble in absolute alcohol. (Horsford, *Am. J. Sci.*, (2.) **3.** 376.) Soluble, without decomposition, in the mineral acids; and in alkaline solutions, when these are not too concentrated.
(*Glycin. Glycolin. Glycocin. Sugar of Gelatin. Acetamic Acid.*)
$C_4H_5NO_4 = N\left\{\begin{matrix}C_4H_3O_2\\H_2\end{matrix}\right. .O_2$

Glycocoll with Baryta(Ba O). Soluble in water. (Horsford, *loc. cit.*)

Glycocoll with Cadmium + Aq. Soluble in hot water. (Dessaignes.)

Glycocoll with Copper(Cu O). Very soluble in water, from which it is precipitated by strong alcohol. (Horsford, *loc. cit.*)
$C_4H_4CuNO_4 + Aq$

Glycocoll with Lead(Pb O). Soluble in water. Only sparingly soluble in alcohol.
$C_4H_4PbNO_4 + Aq$

Glycocoll with Mercury(Hg O). Soluble in water; the solution undergoing decomposition when boiled. (Dessaignes.)

Glycocoll with Potash. Very deliquescent, and soluble in water. Sparingly soluble in alcohol. (Horsford, *loc. cit.*)

Glycocoll with Silver(Ag O). Soluble in warm water. Only sparingly soluble in spirit. (Horsford, *loc. cit.*)
$C_4H_4AgNO_4$

Glycocoll with Zinc. Soluble in hot water. (Dessaignes.)

Glycol. Soluble in all proportions in water, and alcohol. (A. Wurtz.)
(*Hydrate of Ethylene.*)
$C_4H_8O_4 = C_4H_4O_2'', 2HO = \left.\begin{matrix}C_4H_4''\\H_2\end{matrix}\right\}O_4$

Glycolamid. Very easily soluble in water. Sparingly soluble in spirit. (Dessaignes.)
(*Glycolamic Acid. Isomeric with Glycocoll.*)
$C_4H_5NO_4 = N\left\{\begin{matrix}C_4H_2O_2''\\H_2\end{matrix}\right. .O, HO$

Glycolic Acid(Anhydrous). Insoluble in cold, very sparingly soluble in warm water. After a long time it enters into combination with water, forming glycolic acid. Soluble in a solution of caustic potash, with formation of glycolic acid. (Dessaignes.)
(*Glycolid. Glycollid.*)
$\left.C_4H_2O_2''\right\}O_2$

Glycolic Acid. Deliquescent. Soluble in water in all proportions. Miscible in all proportions with alcohol, and ether. Most of the glycolates are easily soluble in water.
(*Homolactic Acid.*)
$C_4H_4O_6 = C_4H_2O_4, 2HO$

Glycolate of Baryta. Soluble in water.
$C_4H_3BaO_6$

Glycolate of Lime. Soluble in water, from which solution it is precipitated by alcohol. (A. Wurtz.) Sparingly soluble in water; from which solution alcohol precipitates it. (Kekulé.) Insoluble, or very sparingly soluble, in absolute alcohol. (Debus, *Phil. Mag.*, (4.) **12.** 362.)
$C_4H_3CaO_6 + 3Aq$

Glycolate of Lime with Glyoxalate of Lime. More easily soluble in hot than in cold water. (Debus, *Phil. Mag.*, (4.) **12.** 365.) Decomposed by repeated solution in hot water.
$C_4H_3CaO_6; 2C_4H_3CaO_8 + 2Aq$

Glycolate of Potash. Soluble in water.

Glycolate of Silver. Slightly soluble in cold water. (Clocz.) Readily soluble in hot water. (Dessaignes.) Sparingly soluble in cold water; soluble in hot water, with decomposition. Insoluble in alcohol. (Kekulé.)
$C_4H_3AgO_6 + Aq$

Glycolate of Zinc. Permanent. Sparingly soluble in cold water. Soluble in 33 pts. of water at 20°; more soluble in hot water. (Gerhardt's *Tr.*) Soluble in 33 pts. of hot water. (Gmelin's *Handbook.*) Insoluble in alcohol. (Socoloff & Strecker.)
$C_4H_3ZnO_6 + 2Aq$

GlycolicAcetoButyrin. *Vid.* AcetoButyrate of Ethylene.

GlycolicBromhydrin. $C_4H_5BrO_2$

GlycolicChloracetin. Insoluble in water. $C_8H_7ClO_4$ Difficultly decomposed by boiling water. Scarcely, if at all, acted upon by cold water.

GlycolicChlorhydrin. Soluble in water in (*Glycol monochlorhydrique.*) all proportions. (Wurtz.) $C_4H_5ClO_2$

GlycolicChloroButyrin. Insoluble in water; $C_{12}H_{11}ClO_4$ freely soluble in alcohol. (Simpson.)

GlycolicIodAcetin. Insoluble in water. $C_8H_7IO_4$ Soluble in alcohol, and ether. (Simpson.)

GlycolicIodhydrin. Soluble in water, and $C_4H_5IO_2$ in alcohol. Insoluble in ether. (Simpson.)

Glycolide. *Vid.* Glycolic Acid(Anhydrous).

Glycolin. *Vid.* Glycocoll.

Glycollamid. *Vid.* Glycolamid.

Glycollid. *Vid.* Glycolic Acid(Anhydrous).

Glycyrrhizin. Sparingly soluble in cold, more $C_{16}H_{12}O_8$ easily soluble in boiling water. Readily soluble in absolute alcohol. Scarcely at all soluble in ether. Easily soluble in alkalies. Sparingly soluble in acids.

Glyoxal. Exceedingly deliquescent. Very (*Isomeric with anhydrous Glycolic Acid.*) easily soluble in water, alcohol, and ether. (Debus.) $C_4H_2O_4$

Glyoxalic Acid. Very hygroscopic. Read- $C_4H_4O_8$ ily soluble in water. (Debus, *Phil. Mag.*, (4.) **12.** 361.)

Glyoxalate of Ammonia. Slowly but abun- $C_4H_3(NH_4)O_8$ dantly soluble in water; the solution undergoing decomposition on boiling, especially if it be strong. Very sparingly soluble in strong alcohol; more soluble in dilute spirit. (Debus, *loc. cit.*)

Glyoxalate of Baryta.

I.) *normal.* Soluble in water; the solution is partially decomposed by boiling. (Debus.)

II.) *basic.* Almost insoluble in water.

Glyoxalate of Lead. Ppt. Easily soluble $C_4H_2Pb_2O_8$ in acetic and nitric acids. (Debus, *loc. cit*)

Glyoxalate of Lime.

I.) *prisms.* Soluble in 177 pts. of water at 8°; $C_4H_3CaO_8$ more soluble in boiling water. Alcohol precipitates it from the aqueous solution.

II.) *needles.* 100 pts. of water at 8° dissolve $C_4H_3CaO_8$ of the needles 0.50 pt., and of the prisms 0.56 pt. (Debus, *Phil. Mag.*, (4.) **12.** 363.)

III.) *basic.* Almost insoluble in water. It is $2C_4H_3CaO_8;\ CaO, HO$ decomposed by water, slowly at ordinary temperatures rapidly by hot water. Soluble in acetic acid. (Debus, *loc. cit.*)

Glyoxalate of Potash. Deliquescent. Very $C_4H_3KO_8$ easily soluble in water; somewhat less soluble in strong alcohol. (Debus, *loc. cit.*)

Glyoxalate of Silver. But sparingly sol- $C_4H_3AgO_8$ uble in water. (Debus, *loc. cit.*)

Glyoxalate of Zinc. Sparingly soluble in $C_4H_3ZnO_8$ water. Easily soluble in acetic, and chlorhydric acids and in a solution of caustic potash. (Debus.)

Gold. Insoluble in pure chlorhydric, or nitric, Au acid, or in sulphuric acid, even when these are concentrated. Soluble in aqua-regia and in mixtures of nitric acid with bromhydric acid, chloride of ammonium, chloride of sodium, and other metallic chlorides; and mixtures of chlorhydric acid with nitrates of the metallic oxides. Soluble in chlorine water. Soluble in chlorhydric acid which contains chromic, manganic, selenic, or arsenic acids; (or perchloride of iron, Glauber, H. Wurtz.) Soluble in selenic acid. (Mitscherlich.) Soluble in iodic acid. (Gay-Lussac.) Soluble in nitric acid, which contains nitrous acid. (Makin.) Insoluble in a mixture of chlorhydric acid and a nitrite. (Berzelius, *Lehrb.*, **3.** 49.) Soluble in mixed aqueous solutions of chloride of sodium, or alum, and nitrate of potash. When very finely divided, it is soluble in concentrated sulphuric acid which contains nitric acid. As obtained by reducing its solutions by protosulphate of iron, it is soluble in a boiling aqueous solution of cyanide of potassium.

Gold leaf is not acted upon by a boiling aqueous solution of protochloride of mercury(Hg Cl). (A. Vogel, *J. pr. Ch.*, 1840, **20.** 366, *note.*)

Granatin(from *Punica granatum*). Soluble in water, and alcohol. (Landerer.) The "granatin" of Latour de Trie was mannite.

Graphitic Acid. Somewhat soluble in pure $C_{22}H_4O_{10}$ water. Insoluble in water containing acids or salts. (Brodie.)

Graphitate of Ammonia. An insoluble jelly.

Graphitate of Baryta. Insoluble in water. $C_{22}H_3BaO_{10}$

Gratiolin. Sparingly soluble in boiling wa- $C_{40}H_{34}O_{14}$ ter. Easily soluble in alcohol. Almost insoluble in ether.

Gratiosolin. Soluble in water, and alcohol. $C_{40}H_{42}O_{25}$ Insoluble in ether. (Parrish's *Pharm.*, p. 423.)

Gros's Base. *Vid.* Oxide of Ammonium- $N_2H_6PtClO = N\left\{\begin{matrix}H_2\\ PtCl\\ NH_4\end{matrix}\right. .\ O$ ChloroPlatin(*ous*)ammonium.

Guacin(from *Mikania guaco*). Very sparingly soluble in cold, abundantly soluble in boiling water. Very easily soluble in alcohol, and ether. (Fauré.)

Guaiacic Acid. More readily soluble in wa- $C_{12}H_8O_6$ ter than either benzoic or cinnamic acid. Soluble in alcohol, and ether. (Thierry.) Soluble in benzin, and other light naphthas from coal. (De la Rue.)

Guaiacene. Very sparingly soluble in water. (*Guajol.*) Soluble in all proportions in alcohol, $C_{10}H_8O_2$ and ether. Soluble, with combination, in concentrated sulphuric acid. (Vœlckel, *Ann. Ch. u. Pharm.*, **89.** 347.)

Guajacene. *Vid.* Guaiacene.

Guaiacin. *Vid.* Resin of Guaiacum.

Guajol. *Vid.* Guaiacene.

Guanin. Insoluble in water, alcohol, and ether, $C_{10}H_5N_5O_2$ or ammonia-water. Soluble in strong acids, the solutions undergoing decomposition on the addition of water. Soluble in boiling nitric acid without decomposition. Also soluble in chlorhydric acid. (Unger.) Insoluble in acetic or tartaric acids. Almost entirely insoluble in lactic, citric, succinic, or hippuric acids. (Neubauer & Kerner, *Ann. Ch. u. Pharm.*, **101.** 323.) More readily soluble in aqueous solutions of caustic potash and soda than in acids. Very sparingly soluble even in boiling lime, or baryta, water.

GUANIN with SODA. Efflorescent. Soluble in water, with decomposition.
$2\,NaO, C_{10}H_5N_5O_2 + 12\,Aq$

GUARANIN. *Vid.* Caffein.

GUMS. The gums proper swell up in water and form mucilages or pastes which approach more or less nearly to true solutions. The gums are insoluble in alcohol; many of them are soluble in concentrated acetic acid; they are all decomposed, with formation of glucose, when boiled with weak acids.

For several substances also called "gums," in commerce, see under RESINS.

GUM AMMONIAC. See under RESINS.

GUM ARABIC. Slowly soluble, but soluble in all proportions, in water. It dissolves much more rapidly in hot than in cold water. Insoluble in alcohol, ether, or the fatty and essential oils. Soluble in acetic acid. The aqueous solution may be diluted with several times its volume of alcohol without precipitation. But on the addition of a trace of chlorhydric acid, or of chloride of sodium, arabin is precipitated.
(*Arabin.*)
$C_{12}H_{10}O_{10} + Aq$

ARABIN with COPPER. Soluble in pure water. Insoluble in an aqueous solution of the compound of arabin and potash.

ARABIN with LEAD.

I.) Insoluble in water. (Berzelius.)
$PbO, C_{12}H_{10}O_{10} + Aq$

II.) *basic.* Soluble in an excess of an aqueous solution of arabin.

ARABIN with LIME.

I.) $2\,C_{12}H_{10}O_{10}\,;\,CaO$

II.) $6\,C_{12}H_{10}O_{10}\,;\,CaO$

ARABIN with POTASH. Easily soluble in water. Insoluble in alcohol.

BASSORA GUM. A small portion is soluble in water, either hot or cold, but the remainder (consisting of *Bassorin*, $C_{12}H_{10}O_{10}$ *q. v.*) is insoluble in water, alcohol, or ether; it softens and swells up in hot or cold water. Soluble, with decomposition, in hot dilute chlorhydric or nitric acids.

BASSORIN with LEAD. Insoluble in water.
$C_{12}H_9PbO_{10} + 2\,Aq$

GUM BENZOIN. *Vid.* Benzoin.

GUM CARANNA. See Caranna, under RESINS.

GUM GUAIACUM. See under RESINS.

GUMMI GUTTA. *Vid.* Gamboge.
(*Gomme Gutte.*)

GUM LAC. See under RESINS.

Gomme du Pays. Imperfectly soluble in water.

GUM TRAJACANTH. About one half of it is soluble in cold water; the remainder swelling up to form an emulsion. Insoluble in alcohol. Decomposed by boiling dilute acids.

GUN COTTON. Of the almost innumerable varieties of gun-cotton, nearly all appear to be insoluble in water, alcohol, or acetic acid. Some specimens are soluble, while others are insoluble, in mixed alcohol and ether.
(*Pyroxilin.*)
$C_{12}H_8(NO_4)_2O_{10}$ (?)

Insoluble in alcohol or ether alone, but dissolves very well in a mixture of these two liquids. (Gélis.) Acetate of ethyl, acetate of methyl, and acetone dissolve gun-cotton.

When recently prepared, and still moist, it dissolves slowly at the ordinary temperature in moderately concentrated potash-lye, with decomposition. (VanKerckhoff.) It is insoluble even in a large excess of cold nitric acid, but dissolves at a temperature of 80° @ 90° in monohydrated nitric acid (Pelouze); from this solution sulphuric acid precipitates unaltered gun-cotton, water precipitates a substance soluble in alcohol and in a large quantity of water. (DeVry.)

Béchamp (*Ann. Ch. et Phys.*, (3.) **46.** 338) distinguishes the following varieties of gun-cotton, considering them as compounds of cellulose and nitric acid.

I.) *Cellulose terNitric.* Completely insoluble in water. Soluble in cold concentrated alcohol, forming a clear solution. Insoluble in pure ether, but readily soluble in ether which contains a little alcohol. Insoluble in cold, but completely soluble in boiling acetic acid, from which it separates out for the most part as the solution becomes cold. Soluble in fuming nitric acid, a precipitate being formed in this solution on adding water. Sparingly soluble in cold, abundantly soluble in hot chlorhydric acid, a precipitate being formed on the addition of water. Easily soluble in an aqueous solution of caustic potash, even when this is dilute.
$C_{24}H_{17}O_{17}, 3\,NO_5$

II.) *Cellulose quadriNitric.* Insoluble in alcohol or ether, alone; but easily soluble in ether which contains a little alcohol or in alcohol containing a little ether; from these solutions it is precipitated on the addition of water. Insoluble in hot or cold acetic acid. Soluble in fuming nitric acid, a precipitate being formed in this solution on adding water. Insoluble in cold, but soluble, with decomposition, in hot chlorhydric acid. Insoluble in a cold dilute solution of caustic potash. Soluble, with decomposition, in a concentrated solution of potash.
$C_{24}H_{17}O_{17}, 4\,NO_5\ \&\ + Aq$

III.) *Cellulose pentaNitric, or Pyroxilin.* When prepared in the cold, an insoluble modification is obtained; but when made at a slightly elevated temperature, a soluble modification is formed. According to the mode of its preparation, it is soluble or insoluble in ether which contains a small amount of alcohol. It is insoluble in alcohol, and in hot or cold acetic acid. Soluble in fuming nitric acid, a precipitate being formed in this solution on adding water. Insoluble in cold, soluble, with decomposition, in hot chlorhydric acid. Insoluble in a cold moderately concentrated solution of caustic potash, but dissolves therein, with decomposition, on the application of heat. The ethereal solution is viscous. (Béchamp, *Ann. Ch. et Phys.*, (3.) **46.** 338.)
(*Ordinary gun-cotton.*)
$C_{24}H_{17}O_{17}, 5\,NO_5$

GUTTAPERCHA. Insoluble in water or alcohol. Soluble in ether, caoutchin, and coal-tar naphtha. (Page, *Am. J. Sci.*, (2.) **4.** 342.) Insoluble in boiling alcohol. Readily soluble in boiling oil of turpentine. Soluble in naphtha, and in coal-tar. (Oxley, *Am. J. Sci.*, (2.) **5.** 440.) Soluble in benzin. (Mansfield, *J. Ch. Soc.*, **1.** 261.) Insoluble in water, alcohol, oils, alkaline solutions, or in chlorhydric or acetic acids. It softens and partially dissolves in ether, essential oils, and coal-tar naphtha. Its best solvent is oil of turpentine. Concentrated sulphuric acid slowly chars it; concentrated nitric acid also gradually oxidizes it. (Solly, *Rep. Br. Assoc.*, 1845, p. 32.)

Soluble in pure chloroform, in bisulphide of carbon, in rectified oils of turpentine, resin, gutta-percha, and tar; also in terebene, chlorhydrate of terebene, and, slightly, in pure ether. Of these solvents, the two first mentioned are the best, and dissolve the gutta-percha at low temperatures. The other solvents act only at temperatures above 21°, and when the solutions obtained are cooled much below 16°, the gutta-percha is deposited as a granular mass. The length of time required to produce this precipitate depends upon the degree of cold; sometimes it requires several days, at others the exposure of an hour suffices to produce it. From its solutions in chloroform and bisulphide of carbon, the gum may be recovered in its natural state either by evaporating or by precipitating it with alcohol. But when any of the hydrocarbons are used as solvents, a portion is retained with such tenacity that it cannot be removed without decomposing the gum. Solutions of gutta-percha are precipitated by alcohol. Ether also precipitates it from the solution in chloroform. Crude gutta-percha contains a small portion of a soft yellow resin, soluble in alcohol, ether, and oil of turpentine. (Kent, *Am. J. Sci.*, (2.) **6.** 246.)

Insoluble in dilute alcohol; traces of it are dissolved by strong alcohol. Only about 0.15 @ 0.22% of it is soluble in hot alcohol or ether (anhydrous). Soluble in cold bisulphide of carbon, and chloroform. Sparingly soluble in warm, insoluble in cold olive-oil. Partially soluble in cold, almost entirely soluble in hot benzin, and oil of turpentine. Unacted upon by solutions of the caustic alkalies, ammonia-water, saline solutions, carbonic acid water, or the various vegetable, and dilute mineral, acids. Unacted upon by fluorhydric acid, it is attacked by concentrated sulphuric, chlorhydric, and nitric acids. (Gerhardt's *Tr.*)

Payen finds in gutta-percha several resins [see under RESINS], and

Pure Gutta: which is insoluble in alcohol or ether. Soluble in cold chloroform, and bisulphide of carbon; and in warm benzin, and oil of turpentine.

Gyrophoric Acid. Almost insoluble even in boiling water. Very sparingly soluble in alcohol or ether. Its best solvent is boiling alcohol. Scarcely at all soluble in ammonia-water. (Stenhouse.)

H.

Hæmathionic Acid. *Vid.* Hemathionic Acid.

Harmalin (from the seeds of *Peganum harmala*, *Ruta sylvestris*). $C_{26}H_{14}N_2O_2 = N_2 \left\{ C_{26}H_{14}O_2^{\text{vi}} \right.$ Sparingly soluble in water. Tolerably soluble in cold, largely soluble in boiling alcohol. Sparingly soluble in ether. The salts of harmalin are readily soluble in water.

Harmin. $C_{26}H_{12}N_2O_2 = N_2 \left\{ C_{26}H_{12}O_2^{\text{vi}} \right.$ Almost insoluble in water. Very sparingly soluble in alcohol, and ether. Very sparingly soluble, or insoluble, in aqueous solutions of chloride of sodium or nitrate of soda.

Hartin. $C_{40}H_{34}O_4$ Completely insoluble in water. Sparingly soluble in ether, and still less soluble in alcohol. Soluble in naphtha.

Hederic Acid. Insoluble in water. Soluble in alcohol. Insoluble in ether. Most of its salts are insoluble in water; but soluble in alcohol.

Hederate of Ammonia. Sparingly soluble in water.

Hederate of Baryta. Insoluble in water. Soluble in boiling alcohol.

Hederate of Lead.

Hederate of Lime. Insoluble in water. Soluble in boiling alcohol.

Hederate of Potash. Sparingly soluble in water.

Hederate of Silver. Soluble in boiling, less soluble in cold alcohol.

Hederin (from *Hedera helix*).

Helenin. *Vid.* Inulin.

Helicin.

$C_{26}H_{18}O_{14} + 2\,Aq$

I.) *Crystalline modification.* Very sparingly soluble in cold, very easily soluble in boiling water. Soluble in about 64 pts. of water at 8°. More soluble in ordinary alcohol than in water. Entirely insoluble in ether. More soluble in cold alkaline liquors than in water, and this without decomposition; it is decomposed, however, by a boiling solution of caustic potash. Also decomposed by boiling acids. (Piria, *Ann. Ch. et Phys.*, (3.) **14.** 288.)

II.) *amorphous modification.* (Produced by keeping No. I. in a state of fusion during some time.) Only traces of it are dissolved by water or alcohol, even boiling. Soluble, with partial decomposition, in very dilute boiling chlorhydric acid, being converted into the crystalline modification. Decomposed by a boiling solution of caustic potash. (Piria, *Ann. Ch. et Phys.*, (3.) **14.** 289.)

Helicoidin. (*Helicin Salicin.*) $C_{52}H_{34}O_{28} + 3\,Aq$ Soluble in boiling, less soluble in cold water. Decomposed by acids, and by alkaline solutions.

Helleborin (from *Helleborus niger*). Easily soluble in water, and alcohol; still more soluble in ether. Decomposed by concentrated sulphuric and nitric acids.

Hellenene. $C_{38}H_{26}$ Unacted upon by cold concentrated sulphuric acid, but when this is gently heated the hellenene dissolves, with combination. (Gerhardt, *loc. cit.*)

Hellenin. (*Camphor of Elecampane.*) $C_{42}H_{28}O_6$ Insoluble in water. Very soluble in alcohol, and ether. Soluble in cold concentrated sulphuric and nitric acids.

Hellonin. *Vid.* Pseudo Veratrin.

Hemaphein (yellow coloring matter of the serum of blood). (*Hæmaphæine.*) Easily soluble in alcohol; less soluble in water, and ether. Also soluble in fatty oils. (J. F. Simon.)

Hematein. (*Hæmatein. Hæmatoxein. Hæmatoxeic Acid.*) $C_{32}H_{12}O_{12}$ Slowly soluble in cold, more soluble in boiling water. Soluble in alcohol. Very sparingly soluble in ether. Soluble, apparently with combination, in the mineral acids; less easily soluble in acetic acid. Soluble in solutions of caustic potash and ammonia, the resulting solutions becoming colored when exposed to the air.

Hemateate of Ammonia. (*Hæmatoxeate of Ammonia.*) $C_{32}H_{10}(NH_4)_2O_{12}$ Easily soluble in water. Soluble in alcohol.

Hemathionic Acid. (*Hæmathionic Acid.*) $C_{28}H_{14}O_{24}, S_2O_6$ Soluble in water; the solution undergoing decomposition when boiled. Soluble in alcohol. Soluble in concentrated sulphuric acid.

Hemathionate of Baryta. Soluble in water.

Hemathionate of Lead. Ppt.

"Hematin" (coloring matter of blood). *Vid.* Hematosin.

Hematin (coloring matter of logwood). (*Hæmatoxylin. Brasilin. Hæmatin. Hæmatoxylic Acid*) $C_{32} H_{14} O_{12}$; & + 2 Aq; & + 6 Aq. Sparingly and slowly soluble in cold, readily soluble in hot water. Easily soluble in alcohol, ether, and dilute acids. Not much altered by dilute chlorhydric and sulphuric acids.

HematoCristallin. (*Blood Crystals.*) These crystals vary in solubility according as they are derived from different animals; those from Guinea-pigs, rats, and mice are least soluble, and require 600 pts. of water for their solution. The aqueous solution is coagulated by heat, and the crystals are precipitated from it by nitric acid. On the other hand, neither sulphuric, chlorhydric, or acetic acids precipitate the crystals. They are easily soluble in acetic acid. Also soluble in ammonia-water. Insoluble in a concentrated solution of caustic potash.

Hematoidin. $C_{14} H_9 N O_3$? Insoluble in water, alcohol, ether, glycerin, or acetic acid. Easily soluble in ammonia-water. When treated with aqueous solutions of potash or soda it swells up and is dissolved to a slight extent. Readily soluble in nitric acid. Slightly soluble in chlorhydric acid. Insoluble in concentrated sulphuric acid. (Ch. Robin.)

Hematosin. (*Improperly "Hæmatin."* Red coloring matter of blood.) $C_{44} H_{22} N_3 O_6 Fe$ (?) Insoluble in water, alcohol, or ether; but soluble in these liquids when they contain a small quantity of caustic or carbonated potash, soda, or ammonia. Soluble in warm oil of turpentine, and linseed oil. (Mulder.) Insoluble in water, alcohol, ether, acetate of ethyl, and fatty and volatile oils; Mulder, however, regards it as slightly soluble in fatty and ethereal oils. (Lehmann.) It dissolves very readily in weak alcohol acidulated with sulphuric or chlorhydric acid; but water similarly acidulated does not dissolve it, and even precipitates it from the alcoholic solution. Insoluble in concentrated sulphuric and chlorhydric acids, which, however, abstract a little of the iron. After having been triturated with sulphate of soda, it dissolves for the most part in water. Decomposed by nitric acid.

Hematoxylin. *Vid.* Hematin.

Hemipinic Acid. $C_{20} H_{10} O_{12} + 4 Aq = C_{20} H_8 O_{10}, 2 HO + 4 Aq$ Difficultly soluble in cold water; more readily soluble in alcohol, and ether. (Wœhler.) Much more readily soluble in water than opianic acid. (Blyth.)

Hemipinate of Ammonia. Permanent. Easily soluble in water.

Hemipinate of Ethyl. *Vid.* EthylHemipinic Acid.

Hemipinate *of sesquioxide* of Iron. Insoluble in water.

Hemipinate of Lead. Insoluble in water. Soluble in an aqueous solution of acetate of lead. (Wœhler.)

Hemipinate of Potash.

I.) *normal.* Readily soluble in water. (Anderson.)

II.) *acid.* $C_{20} H_9 K O_{12} + 5 Aq$ Readily soluble in water, and alcohol. Insoluble in ether. (Anderson.)

Hemipinate of Silver. $C_{20} H_8 Ag_2 O_{12}$ Insoluble in water.

Hepta. See *hepta*, as prefix, under the generic name of the substance sought for.

Hesperidin (of Lebreton). (*Aurantiin.*) Insoluble in cold water. Soluble in 60 p. c. of boiling water. Readily soluble in boiling alcohol. Insoluble in ether. Soluble in warm concentrated acetic acid. Insoluble in the fatty or essential oils. Easily soluble in solutions of the caustic alkalies. Soluble in concentrated sulphuric acid, with coloration.

Widmann, on the other hand, describes hesperidin as being easily soluble in boiling water, but almost entirely insoluble in alcohol. It is admitted that the name has been applied to two different substances.

Heveene. $Cn\ Hn$ Miscible in all proportions with alcohol, ether, and the fatty and essential oils.

Hexa. See *hexa*, as prefix, under the generic name of the substance sought for.

Hexyl. *Vid.* Caproyl.

Hexylene. *Vid.* Caproylene.

Hipparaffin. $C_{16} H_8 N O_2$ Sparingly soluble in hot, insoluble in cold water. Its solubility in water is not increased by the addition of sulphuric or chlorhydric acid, or caustic potash or ammonia. Readily soluble in boiling alcohol. Very readily soluble in ether. Easily soluble in concentrated sulphuric acid, without much alteration, from which it is precipitated by water. (Schwarz.)

Hippuramic Acid. (*AmidoHippuric Acid.*)

$$C_{18} H_{10} N_2 O_6 = C_{18} H_9 N_2 O_5, H O = N_2 \left\{ \begin{array}{l} C_2 O_2'' \\ C_{14} H_5 O_2 . O_2 \\ C_2 H_3 \\ H_2 \end{array} \right.$$

Sparingly soluble in cold, easily soluble in boiling water, or alcohol. Insoluble in ether. Soluble in 370 pts. of water at 20°; and in 1200 pts. of alcohol at 15°. Easily soluble, with combination, in acids. Soluble in an aqueous solution of caustic potash. (Schwanert, *Ann. Ch. u. Pharm.*, **112.** 70, *et seq.* [K.].)

Hippuramid.

$$C_{18} H_{10} N_2 O_4 = N_2 \left\{ \begin{array}{l} C_2 O_2'' \\ C_{14} H_5 O_2 \\ C_2 H_3 \\ H_2 \end{array} \right.$$

Soluble in 100 pts. of water; in 60 pts of alcohol; and in 80 pts. of wood-spirit. Easily soluble in ether.

Hippuric Acid. (*Urobenzoic Acid.*)

$$C_{18} H_0 N O_6 = N \left\{ \begin{array}{l} C_2 O_2'' \\ C_{14} H_5 O_2 . O, H O \\ C_2 H_3 \end{array} \right.$$

Soluble in 600 pts. of water at 0°. (Liebig, *Pogg. Ann.*, 1829, **17.** 393.) Easily soluble in boiling water, and in alcohol. (Liebig.) Almost insoluble in ether; being far less soluble than benzoic acid. Soluble in hydrate of anisyl.

Very readily soluble in water containing ordinary (*di*)phosphate of soda. (Liebig.) Very sparingly soluble in liquors acidulated with chlorhydric acid. Soluble in hot strong chlorhydric acid, by which it is decomposed if the solution be maintained in ebullition.

Less soluble than benzoic acid in water. Easily soluble in concentrated sulphuric acid at 120°, without blackening, and is precipitated, unchanged, on the addition of water; but it undergoes decomposition when the solution is more strongly heated. Equally easily soluble in warm concentrated nitric acid, but is decomposed when the solution is boiled. Soluble in hot concentrated chlorhydric acid, from which it crystallizes unchanged on cooling. (Liebig, *Pogg. Ann.*, 1829, **17.** pp. 389, 390.)

In boiling concentrated chlorhydric acid it dissolves, without decomposition at first; for if the solution be cooled immediately after its formation, the greater part of the hippuric acid is deposited unchanged; but if the ebullition be continued during half an hour, the hippuric acid is decomposed. (Dessaignes, *Ann. Ch. et Phys.*, (3.) **17.** 50.)

With the exception of the salt of sesquioxide of iron, all the hippurates are soluble in boiling water, the alkaline salts being also easily soluble in cold water. Most of the hippurates are soluble in boiling alcohol, and a portion of them are soluble in ether also.

HIPPURATE OF ALUMINA. Appears to be soluble in water. (Liebig, *Pogg. Ann.*, **17.** 396.)

HIPPURATE OF AMMONIA.

I.) *normal.* Soluble in water, the solution evolving ammonia on being evaporated. (Liebig, *Pogg. Ann.*, 1829, **17.** 394.)

II.) *acid.* Very readily soluble in water, and alcohol. Sparingly soluble in ether. (Schwarz.)
$C_{18}H_8(NH_4)NO_6, C_{18}H_9NO_6 + 2Aq$

HIPPURATE OF BARYTA.

I.) $C_{18}H_8BaNO_6 + Aq$ Soluble in water.

II.) *basic.* Soluble in water. (Liebig, *Pogg. Ann.*, **17.** 394.)

HIPPURATE OF CINCHONIDIN (of Pasteur). Easily soluble in water, and spirit. (Leers, *Ann. Ch. u. Pharm.*, **82.** 162.)

HIPPURATE OF CINCHONIN. Soluble in water. (Elderhorst.)

HIPPURATE OF COBALT. Soluble in water, from which it is precipitated by alcohol. (Schwarz.)
$C_{18}H_8CoNO_6 + 5Aq$

HIPPURATE OF COPPER. Sparingly soluble in cold water. Readily soluble in hot, less soluble in cold alcohol. (Schwarz.)
$C_{18}H_8CuNO_6 + 3Aq$

HIPPURATE OF ETHYL. Very sparingly soluble in cold, more soluble in hot water. Soluble in all proportions in alcohol, from which it separates on the addition of water. Easily soluble in ether. (Stenhouse.)
$C_{18}H_8(C_4H_5)NO_6$

HIPPURATE *of sesquioxide* OF IRON. Insoluble in hot water. Readily soluble in alcohol, especially when this is hot.

HIPPURATE OF LEAD.

I.) *normal.* Effloresces in hot air. Soluble in 5 @ 6 pts. of cold water. (Liebig, *Pogg. Ann.*, **17.** 396.)
$C_{18}H_8PbNO_6 + 2Aq \,\&\, 3Aq$

II.) *basic.* Soluble in water. (Liebig, *Pogg. Ann.*, **17.** 395.)

HIPPURATE OF LIME. Soluble in 18 pts. of cold, and in 6 pts. of boiling water. (Liebig, *Pogg. Ann.*, 1829, **17.** 395.)
$C_{18}H_8CaNO_6 + 3Aq$

HIPPURATE OF MAGNESIA. Easily soluble in water. (Liebig, *loc. cit.*, p. 394.)
$C_{18}H_8MgNO_6 + 5Aq$

HIPPURATE OF MANGANESE. Appears to be soluble in water. (Liebig, *loc. cit.*, p. 396.)

HIPPURATE *of dinoxide* OF MERCURY. Ppt. (Liebig, *loc. cit.*, p. 394.)

HIPPURATE *of protoxide* OF MERCURY. Appears to be soluble in water. (Liebig, *loc. cit.*, p. 396.)

HIPPURATE OF METHYL. Soluble in 120 pts. of water at the ordinary temperature and in 60 pts. of water at 30°. Soluble in all proportions in alcohol, wood-spirit, and ether; from these solutions it is precipitated by water.
$C_{18}H_8(C_2H_3)NO_6$

HIPPURATE OF MORPHINE.

HIPPURATE OF NICKEL. Very sparingly soluble in cold water, more soluble in boiling water, and in alcohol. Insoluble in ether. (Schwarz.)
$C_{18}H_8NiNO_6 + 5Aq$

HIPPURATE OF POTASH.

I.) *normal.* Readily soluble in water and in ordinary alcohol. Sparingly soluble in cold, more readily soluble in warm, absolute alchohol or ether. (Schwarz.)
$C_{18}H_8KNO_6 + 2Aq$

II.) *acid.* Much more difficultly soluble than the normal salt.
$C_{18}H_8KNO_6, C_{18}H_9NO_6 + 2Aq$

HIPPURATE OF SILVER. Sparingly soluble in boiling, less soluble in cold water. (Schwarz.)
$C_{18}H_8AgNO_6 + Aq$

HIPPURATE OF SODA. Readily soluble in water, and in boiling alcohol. Almost insoluble in cold absolute alcohol or in ether.
$C_{18}H_8NaNO_6$

HIPPURATE OF STRONTIA. Somewhat sparingly soluble in cold water, alcohol, or ether. Easily soluble in boiling water or alcohol. (Schwarz.)
$C_{18}H_8SrNO_6 + 5Aq$

HIPPURATE OF STRYCHNINE. Soluble in water. (Elderhorst.)

HIPPURATE OF UREA. Its aqueous solution soon decomposes. Soluble in hot absolute alcohol. (Dessaignes.)

Does not exist, according to Pelouze. (*Ann. Ch. et Phys.*, 1842, (3.) **6.** 67.)

HIPPURATE OF ZINC. The anhydrous salt is soluble in 53.16 pts. of water at 17.5°, and in about 4 pts. of water at 100°. Soluble in 60.5 pts. of boiling alcohol of 0.82 sp. gr. Almost insoluble in ether. (Lœwe.)
$C_{18}H_8ZnNO_6 + 5Aq$

HIRCIC ACID. Very soluble in water. (Joss.) Sparingly soluble in water. Very readily soluble in alcohol. Soluble in ether. (Chevreul.)

HIRCATE OF AMMONIA.

HIRCATE OF BARYTA.

I.) Sparingly soluble in water. (Chevreul.) Tolerably easily soluble in water. (Joss.)

II.) Very soluble in water. (Joss.)

HOMOLACTIC ACID. *Vid.* Glycolic Acid.

HORDEIC ACID. Soluble in alcohol, and ether.
$C_{24}H_{24}O_4$

HORDEIN. Insoluble in water or alcohol.
(*Cevadin.*)

HORN. Insoluble in boiling water, alcohol, or ether. It dissolves gradually in water at a high temperature in Papin's digester. Scarcely at all acted upon by hot ammonia-water. Easily soluble in solutions of caustic potash and soda, especially if these are hot.
(*Epidermose.*)

In warm concentrated sulphuric acid it swells up and dissolves for the most part. Decomposed by ebullition with weak sulphuric acid. Slowly soluble in boiling chlorhydric acid. Soluble, with decomposition, in nitric acid, especially if it be warm. Insoluble in acetic acid, which only causes it to swell up.

Huanokin. *Vid.* Cinchonin.

Humic Acid. Soluble in aqueous solutions of the fixed caustic alkalies, and ammonia.

Humin. Insoluble in alkaline solutions.

Humopic Acid. Insoluble in water or in weak acids. Soluble in alcohol and in solutions of the caustic alkalies.
$C_{40}H_{22}O_{14}$

Humulin. *Vid.* Lupulin.

Hurin (from *Hura crepitans*). Insoluble in water. Easily soluble in alcohol, ether, and oils.

Hydallantoinic Acid. Deliquescent. Soluble in water. Insoluble in absolute alcohol. Its salts appear to be generally soluble in water, and insoluble in absolute alcohol. (Schlieper.)
$C_8H_8N_4O_8, HO$

Hydallantoinate of Lead. Insoluble in alcohol. Easily soluble in acetic acid. (Schlieper.)
$PbO, C_8H_8N_4O_8$

Hydallantoinate of Potash. Soluble in water. Insoluble in absolute alcohol. (Schlieper, *Am. J. Sci.*, (2.) **6.** 374.)

Hydantoic Acid. Deliquescent. Soluble in water. Insoluble in alcohol. Its alkaline salts are soluble in water, but insoluble in alcohol.
$C_8H_8N_4O_8$

Hydantoate of Lead. Very sparingly soluble in hot acetic acid. Readily soluble in nitric acid.

Hydantoate of Potash. Soluble in water. Insoluble in alcohol.

Hydantoate of Silver. Ppt.

Hydranzothin. *Vid. bi*Sulphide of Sulphocarbammonium.

HydrargAcryl. *Vid.* MercurAllyl.

HydrargAllyl, &c. *Vid.* MercurAllyl, &c.

Hydrarsin. *Vid.* Cacodylate of Cacodyl.

Hydrastin (from the root of *Hydrastis Canadensis.*) Insoluble in water. Sparingly soluble in cold alcohol or ether. Soluble in chloroform and in boiling alcohol. It fuses in hot oil of turpentine. Soluble in concentrated chlorhydric acid. Only slightly acted upon by cold concentrated sulphuric acid. (Parrish's *Pharm.*, p. 394.) Soluble in warm alcohol. Nearly insoluble in cold alcohol, ether, oil of turpentine, or water. More soluble in water containing acetic acid, and in alcohol containing caustic potash or ammonia. (Parrish's *Pharm.*, p. 192.)

Hydrate of Acetosamin. Readily soluble in water, and alcohol. (Natanson.)
(*Oxide of Acetylammonium.*)
C_4H_6NO

Hydrate of Allyl. Soluble in all proportions in water, alcohol, and wood-spirit. (Hofmann & Cahours, *J. Ch. Soc.*, **10.** 316.) Miscible in all proportions with water. (Berthelot & DeLuca.)
(*Allylic Alcohol. Acrylic Alcohol.*)
C_6H_5O, HO

Hydrate of *tetr*Allylammonium. Readily soluble in water. (Cahours & Hofmann.)
$C_{24}H_{21}NO_2 = N\left\{(C_6H_5)_4 . O, HO\right.$

Hydrate of Alumina. *Vid.* Oxide of Aluminum.

Hydrate of Amyl. Insoluble in water. (Balard, *loc. inf. cit.*) Sparingly soluble in water. (Pelletan.) Soluble in all proportions in alcohol, ether, fixed and essential oils, and strong acetic acid. (Pelletan.) Soluble in an aqueous solution of acetate of potash.
(*Amyl Alcohol. Amylic Alcohol. Fusel-Oil. Hydrate of Oxide of Amyl.*)
$C_{10}H_{12}O_2 = \left.\begin{matrix}C_{10}H_{11}O\\HO\end{matrix}\right\}$

Soluble in strong chlorhydric acid. (Balard, *Ann. Ch. et Phys.*, (3.) **12.** 300.) Soluble to a certain extent in an aqueous solution of caproate of potash. (Brazier & Gossleth, *J. Ch. Soc.*, **3.** 215.) Insoluble in a cold aqueous solution of chloride of zinc, but on heating the two together the hydrate of amyl is dissolved with decomposition. (Balard, *Ann. Ch. et Phys.*, (3.) **12.** 320.) Most of its compounds are, like itself, insoluble in water. (Balard, *Ibid.*, p. 296.)

Hydrate of *tetr*Amylammonium. Somewhat deliquescent. Readily soluble in water, though less soluble than the corresponding compounds of ethyl and methyl. (Hofmann.)
$C_{40}H_{45}NO_2 = N\left\{(C_{10}H_{11})_4 . O, HO\right.$

Hydrate of Amylene. When pure it is soluble in water in all proportions. (A. Wurtz.) Easily soluble in alcohol, and ether.
(*Amylic Glycol.*)
$C_{10}H_{12}O_4 = C_{10}H_{10}O_2, 2HO$

Hydrate of AmylStrychnine. Soluble in water, and in hot absolute alcohol, from which it is precipitated on the addition of ether. (How.)

Hydrate of AmylNicotin. Soluble in water. Its salts are soluble in water. (Stahlschmidt, *Ann. Ch. u. Pharm.*, **90.** 226.)

Hydrate of Anisoyl. Soluble in ether. (Cannizzaro & Bertagnini, *Ann. Ch. u. Pharm.*, **98.** 190.)
(*Anisalcohol. Anisyl Alcohol.*)
$C_{16}H_{10}O_4 = \left.\begin{matrix}C_{16}H_9O_2\\H\end{matrix}\right\}O_2$

Hydrate of ArsenEthylium, &c. *Vid.* Oxide of ArsenEthylium, &c.

Hydrate of Baryta. *Vid.* Oxide of Barium.

Hydrate of Benzol. Very unstable.
(*Benzol Alcohol. Benzo Glycol.*)
$C_{14}H_8O_4 = \left.\begin{matrix}C_{14}H_6''\\H_2\end{matrix}\right\}O_4$

Hydrate of Benzoyl. *Vid.* Stilbous Acid.

Hydrate of Bismuth. *Vid.* Oxide of Bismuth.

Hydrate of BromoCumoyl. Decomposed by water. (Bertagnini.)
(*Bromocuminol. Hydride of BromoCumyl.*)
$C_{20}H_{11}BrO_2 = \left.\begin{matrix}C_{20}H_{10}Br\\H\end{matrix}\right\}O_2$

Hydrate of Butyl. Soluble in 10.5 pts. of water at 18°. Insoluble in solutions of chloride of calcium, chloride of sodium, or in general any other salt easily soluble in water. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **42.** 137.) Miscible in all proportions with alcohol, and ether.
(*Hydrate of Tetryl. Butylic Alcohol. Tetrylic Alcohol.*)
$C_8H_{10}O_2 = C_8H_9O, HO$

Hydrate of Butylene. Soluble in all proportions in water, alcohol, and ether. Its solubility in ether distinguishes it from the analogous compounds of ethylene and propylene, which are but sparingly soluble in this liquid. (A. Wurtz.)
(*Butylic Glycol. Butyl Glycol.*)
$C_8H_{10}O_4 = C_8H_8'' . O_2, 2HO = \left.\begin{matrix}C_8H_8''\\H_2\end{matrix}\right\}O_4$

Hydrate of Cadmium. *Vid.* Oxide of Cadmium.

Hydrate of Cajputene.

I.) *mono.*
$C_{20}H_{16}, HO$

II.) *bi.* Soluble in all proportions in alcohol,
$C_{20}H_{16}, 2HO$
ether, and oil of turpentine. (Max. Schmidt.)

III.) *sex.* Sparingly soluble in cold, easily in
$C_{20}H_{16}, 6HO$
boiling alcohol. (Max. Schmidt.)

Hydrate of Capricyl. Insoluble in water.
(*Hydrate of Capryl. Caprylic Aldehyde. Methyl Œnanthol.*)
$C_{16}H_{16}O_2 = \left.\begin{matrix}C_{16}H_{15}\\ H\end{matrix}\right\} O_2$
Soluble in alcohol, ether, and the fatty oils. (Bouis, *Ann. Ch. et Phys.*, (3.) **48.** 102.) Insoluble in water. Miscible in all proportions with alcohol, and ether. (Stædeler.)

Hydrate of Caproyl. Insoluble in water.
(*Caproic*, or *Capronic*, *Alcohol. Hydrate of Hexyl.*)
(Faget.)
$C_{12}H_{14}O_2 = \left.\begin{matrix}C_{12}H_{13}\\ H\end{matrix}\right\} O_2$

Hydrate of Capryl. *Vid.* Hydrate of Octyl, and Hydrate of Capricyl.

Hydrate of Cerium. *Vid.* Oxide of Cerium.

Hydrate of Ceryl. Insoluble in water. Ea-
(*Cerotic Alcohol. Cerotin.*)
$C_{54}H_{55}O, HO$
sily soluble in absolute alcohol, in ether, and in benzin.

Hydrate of Cetyl. Insoluble in water.
(*Ethal. Æthal.*)
$C_{32}H_{33}O, HO$
Miscible in all proportions with alcohol, ether, and essential oils. Insoluble in alkaline solutions. Soluble, with combination, in concentrated sulphuric acid. Decomposed by hot nitric acid.

Hydrate of Chloral. *Vid.* Chloral(Hydride of *ter*ChlorAcetyl).

Hydrate of ChloroCumoyl. Decomposed
(*ChloroCuminol. Hydride of ChloroCumyl. Isomeric with Chloride of Cumyl.*)
$C_{20}H_{11}ClO_2 = \left.\begin{matrix}C_{20}H_{10}Cl\\ H\end{matrix}\right\} O_2$
by moist air; by strong sulphuric acid and by boiling potash-lye. Soluble in absolute alcohol. (Gerhardt & Cahours.)

Hydrate of *ter*ChloroToluenyl. *Vid. ter*ChloroToluenic Acid.

Hydrate of *quadri*ChloroToluenyl. Sol-
(*QuadriChloro Toluenol. QuadriChloroBenzinol.*)
uble in alcohol.
$C_{14}H_4Cl_4O_2 = C_{14}H_3Cl_4O, HO$

Hydrate of Chromium. *Vid.* Oxide of Chromium.

Hydrate of Cobalt. *Vid.* Oxide of Cobalt.

Hydrate of Copper. *Vid.* Oxide of Copper.

Hydrate of Cresyl. Very sparingly solu-
$C_{14}H_8O_2 = C_{14}H_7O, HO$
ble in water. Easily soluble in alcohol, ether, bisulphide of carbon, and strong acetic acid. Almost entirely insoluble in ammonia-water. Soluble, with combination, in concentrated sulphuric acid.

Hydrate of Cubebene. Insoluble in water.
$C_{30}H_{24}, 2HO$
Soluble in alcohol, ether, and the essential oils. Sparingly soluble in a boiling concentrated solution of caustic potash. Soluble in concentrated sulphuric acid.

Hydrate of Cumicyl. Insoluble in water.
$C_{20}H_{13}O, HO$
Soluble in all proportions in alcohol, and ether. Decomposed by concentrated sulphuric and nitric acids. (Kraut, *Ann. Ch. u. Pharm.*, **92.** 68.)

Hydrate of Ethyl. *Vid.* Alcohol.

Hydrate of *tetra*Ethylammonium. Very
$N(C_4H_5)_4O, HO$
deliquescent. Very soluble in water. Its salts, with the exception of the carbonate, are highly deliquescent. (Hofmann.)

Hydrate of *tri*EthylAmylammonium. Soluble in water.
$C_{22}H_{27}NO_2 = N\left\{\begin{matrix}(C_4H_5)_3\\ C_{10}H_{11}\end{matrix}\right. . O, HO$

Hydrate of EthylBrucin. Readily soluble in water, alcohol, and ether. (Gunning.)

Hydrate of Ethyl*tri*Caproylammonium.
$C_{40}H_{45}NO_2 = N\left\{ C_4H_5(C_{12}H_{13})_3O, HQ\right.$

Hydrate of EthylCodein. Highly soluble in water. (How, *J. Ch. Soc.*, **6.** 136.)

Hydrate of *di*EthylConiin. Soluble in
(*BiEthylConiin.*)
$C_{24}H_{25}NO_2 = N\left\{\begin{matrix}C_{16}H_{14}''\\ (C_4H_5)\end{matrix}\right. . O, HO$
water. (v. Planta & Kekulè, *Ann. Ch. u. Pharm.*, **89.** 146.)

Hydrate of Ethylene. *Vid.* Glycol.

Hydrate of EthylFurfurin. Sparingly
$N_2\left\{\begin{matrix}(C_{10}H_4O_2'')_2\\ C_{10}H_3(C_4H_5)O_2''\end{matrix}\right. . HO$
soluble in water. Easily soluble in alcohol. (Davidson.)

Hydrate of EthylMorphine. Readily soluble in cold water. Difficultly soluble in alcohol of 90%. (How, *J. Ch. Soc.*, **6.** 128.)

Hydrate of EthylNicotin. Soluble in water; the aqueous solution is decomposed by evaporation, and slowly by exposure to the air. The salts of ethylnicotin appear to be all soluble in water. (v. Planta & Kekulè, *Ann. Ch. u. Pharm.*, **87.** 5.)

Hydrate of Ethyl*tri*Phenylammonium.
(*Ethylbi Cinnammylamin.*)
$C_{40}H_{21}NO_2 = N\left\{\begin{matrix}C_4H_5\\ (C_{12}H_5)_3\end{matrix}\right. . O, HO$
Difficultly soluble in water. Easily soluble in alcohol. When the aqueous solution is boiled, it deposits oily drops. The salts of ethyltriphenylammonium are deliquescent. (Gœssmann.)

Hydrate of *tri*EthylPhenylammonium.
$C_{24}H_{21}NO_2 = N\left\{\begin{matrix}C_{12}H_5\\ (C_4H_5)_3\end{matrix}\right. . O, HO$
Soluble in water. (Hofmann.)

Hydrate of *tetr*EthylPhosphonium. Deli-
$C_{16}H_{21}PO_2 = P\left\{(C_4H_5)_4O, HO\right.$
quescent. Soluble in water.

Hydrate of EthylPicolin. Deliquescent. Soluble in water; the solution undergoing decomposition when boiled. (Anderson.)

Hydrate of *di*EthylPiperylammonium. Very deliquescent. Soluble in water. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 98.)

Hydrate of EthylPyridin.

Hydrate of EthylQuinine. Easily soluble in water, and alcohol. Ether precipitates it from the alcoholic solution. (Strecker, *Ann. Ch. u. Pharm.*, **91.** 166.)

Hydrate of EthylQuinolein. Soluble in
(*EthylChinolin. VineChinolin.*)
water, and alcohol. (Williams.)

Hydrate of EthylSalicyl. *Vid.* EthylSalicylic Acid.

Hydrate of EthylStrychnine. Perma-
$C_{42}H_{21}(C_4H_5)N_2O_4, 2HO + 3Aq$
nent. Very easily soluble in water. Soluble in boiling, less soluble in cold absolute alcohol. Ether precipitates it from the alcoholic solution. (How.)

Hydrate of *tri*EthylToluenyl(or Toluyl)ammonium. $C_{26}H_{23}NO_2 = N\left\{\begin{matrix}(C_4H_5)_3\\ C_{14}H_7\end{matrix}\right. .O,HO$ Soluble in water. (Morley & Abel, *J. Ch. Soc.*, **7.** 73.)

Hydrate of Glucina. *Vid.* Oxide of Glucinum.

Hydrate of Gold. *Vid.* Oxide of Gold.

Hydrate of Hexyl. *Vid.* Hydrate of Caproyl.

Hydrate of Iridium. *Vid.* Oxide of Iridium.

Hydrate of Iron. *Vid.* Oxide of Iron.

Hydrate of Lanthanum. *Vid.* Oxide of Lanthanum.

Hydrate of Laurel-Oil(of Guiana). $C_{20}H_{20}O_4 = C_{20}H_{16}, 4HO$ Insoluble in water. Soluble in alcohol. Decomposed by strong sulphuric acid. (Stenhouse.)

Hydrate of Lauricyl.
(*Lethal. Lauryl Alcohol.*)
$C_{24}H_{26}O_2 = \left.\begin{matrix}C_{24}H_{25}\\ H\end{matrix}\right\}O_2$

Hydrate of Lead. *Vid.* Oxide of Lead.

Hydrate of Lithium. *Vid.* Oxide of Lithium.

Hydrate of Magnesia. *Vid.* Oxide of Magnesium.

Hydrate of Manganese. *Vid.* Oxide of Manganese.

Hydrate of Mercury. *Vid.* Oxide of Mercury.

***Bi*Hydrate of Mesitylene.** $C_{18}H_{14}O_2$ Perhaps identical with Phorone. (Limpricht.)

Hydrate of Methyl. (*Wood-spirit. Pyroxilic-spirit. Wood-naphtha. Methyl alcohol. Methylic alcohol. BiHydrate of Methylene.*) $C_2H_4O_2 = \left.\begin{matrix}C_2H_3\\ H\end{matrix}\right\}O_2$ Mixes in all proportions with water, alcohol, ether, and the fatty and essential oils. Upon salts it exerts a solvent power similar to that of alcohol; and as a rule it resembles alcohol in solvent power.

Percentage of anhydrous wood-spirit (of sp. gr. 0.8136) *in the aqueous solution at* 15.5°.

(H. Deville, *Ann. Ch. et Phys.*, (3.) **5.** 140.)

Hydrate of *tetra*Methylammonium. $C_8H_{13}NO_2 = N\left\{(C_2H_3)_4 . O, HO\right.$ Deliquescent. Soluble in water. (Hofmann.)

Hydrate of MethylCinchonidin. Soluble in water.

Hydrate of MethylCinchonin. Soluble in water. Its salts are readily soluble in water, and alcohol. (Stahlschmidt, *Ann. Ch. u. Pharm.*, **90.** 220.)

Hydrate of Methylene. *Vid.* Oxide of Methyl.

***Bi*Hydrate of Methylene.** *Vid.* Hydrate of Methyl.

Hydrate of Methyl*tri*Ethylammonium. $C_{14}H_{19}NO_2 = N\left\{C_2H_3(C_4H_5)_3O, HO\right.$ Soluble in water.

Hydrate of Methyl*di*EthylAmylammonium. $NC_{20}H_{25}O_2 = N\left\{\begin{matrix}C_2H_3\\ (C_4H_5)_2\\ C_{10}H_{11}\end{matrix}\right. .O, HO$ Soluble in water. (Hofmann.)

Hydrate of MethylEthylAmylPhenylammonium. $C_{28}H_{25}NO_2 = N\left\{\begin{matrix}C_2H_3\\ C_4H_5\\ C_{10}H_{11}\\ C_{12}H_5\end{matrix}\right. .O, HO$ Soluble in water. (Hofmann.)

Hydrate of MethylEthylConiin. (*EthylMethylConiin.*) $C_{22}H_{23}NO_2 = \left\{\begin{matrix}C_{16}H_{14}''\\ C_2H_3\\ C_4H_5.\end{matrix}\right. .O, HO$ Soluble in water. (v. Planta & Kekulè, *Ann. Ch. u. Pharm.*, **89.** 138.)

Hydrate of Methyl*di*EthylPhenylammonium. $C_{22}H_{19}NO_2 = N\left\{\begin{matrix}C_2H_3\\ (C_4H_5)_2\\ C_{12}H_5\end{matrix}\right. .O, HO$

Hydrate of MethylNicotin. Soluble in water. Its salts are readily soluble in water. (Stahlschmidt, *Ann. Ch. u. Pharm.*, **90.** 223.)

Hydrate of MethylSalicyl. *Vid.* Methyl-Salicylic Acid.

Hydrate of Molybdenum. *Vid.* Oxide of Molybdenum.

Hydrate of Myricyl. (*Melissin. Hydrate of Melyl. Melissic Alcohol.*) $C_{60}H_{62}O_2 = C_{60}H_{61}O, HO$ Soluble in hot, less soluble in cold alcohol, and benzin. Soluble in ether.

Hydrate of Nickel. *Vid.* Oxide of Nickel.

Hydrate of *ter*NitroXylyl.
$C_{16}H_7N_3O_{14} = \left.\begin{matrix}C_{16}H_6(NO_4)_3\\ H\end{matrix}\right\}O_2$

Hydrate of Octyl. (*Hydrate of Capryl. Caprylic Alcohol.*) $C_{16}H_{17}O, HO$ Insoluble in water. Soluble in alcohol, ether, and acetic acid (Bouis, *Ann. Ch. et Phys.*, (3.) **44.** 103.) Soluble in wood-spirit, and very readily in acetic acid.

Hydrate of Œnanthyl. $C_{14}H_{14}O_2, HO$ Insoluble in water. Soluble in alcohol, ether, and acetic acid. (Bussy.)

Hydrate of Oroselone. Sparingly soluble in cold, tolerably soluble in hot water. Easily soluble in alcohol, and ether. Readily soluble in a dilute solution of caustic potash, less easily soluble in ammonia-water. (S. & W.)

$C_{14}H_6O_4 = C_{14}H_5O_3, HO$

Hydrate of Osmium. *Vid.* Oxide of Osmium.

Hydrate of Palladium. *Vid.* Oxide of Palladium.

Hydrate of Phenyl. *Vid.* Phenic Acid.

Hydrate of Phloryl. *Vid.* Phloretol.

***Bi*Hydrate of Phosphide of Nitrogen.** *Vid.* BiPhosphamid.

Hydrate of Platinamin. *Vid.* Oxide of Platinamin.

Hydrate of Platinum. *Vid.* Oxide of Platinum.

Hydrate of Potash. *Vid.* under *prot*Oxide of Potassium.

Hydrate of Propyl. Miscible with water in all proportions: from this solution carbonate of potash causes it to separate. (Berthelot, *Ann. Ch. et Phys.*, (3.) **43.** 399.) Readily soluble in water, but not miscible with it in all proportions. (Chancel.)

(*Hydrate of Trityl*(of Gerhardt).
Propylic Alcohol.
Propionic do.
Metacetic do.
Metacetonic do.
Tritylic do.)
$C_6H_8O_2 = C_6H_7O, HO$

Hydrate of Propylene. Soluble in all proportions in water, and alcohol. Insoluble in a small quantity of ether, but dissolves completely in 10 or 12 times its volume of this liquid. (A. Wurtz.)

(*Hydrate of Tritylene.*
Propylic Glycol)
$C_6H_8O_4 = \left.\begin{matrix} C_6H_6'' \\ H_2 \end{matrix}\right\} O_4$

Hydrate of Rhodium. *Vid.* Oxide of Rhodium.

Hydrate of Ruthenium. *Vid.* Oxide of Ruthenium.

Hydrate of Rutoyl. *Vid.* Hydride of Rutyl.

Hydrate of Soda. *Vid.* Oxide of Sodium.

Hydrate of Strontia. *Vid.* Oxide of Strontium.

Hydrate of SulphoCarbonylEthylammonium. Slightly soluble in water. Soluble in all proportions in alcohol, and in ether. (Debus.) Soluble in water, and especially soluble in alcohol, and ether. Easily soluble, without decomposition, in concentrated sulphuric acid, from which water precipitates it. The sulphuric acid solution decomposes when heated or left to stand for some time. (Chancel, *Ann. Ch. et Phys.*, (3.) **35.** 468)

(*EthylSulphoCarbamid.*
Sulpho Carbamate of Ethyl.
Xanthamid. Xanthogenamid.
Urethane sulphuré.)
$C_6H_7NS_2O_2 = N\left\{\begin{matrix} C_2S_2'' \\ C_4H_5 \\ H \end{matrix}\right. . O, HO$

Hydrate of SulphoCarbonylEthylammonium with *din*Iodide of Copper.

I.) $N\left\{\begin{matrix} C_2S_2'' \\ C_4H_5 \\ H \end{matrix}\right. O, HO; Cu_2I$

II.) $2\left(N\left\{\begin{matrix} C_2S_2'' \\ C_4H_5 \\ H \end{matrix}\right. O, HO\right); Cu_2I$ Insoluble in water. Very easily soluble in cold alcohol, but the alcoholic solution is decomposed on boiling.

III.) $3\left(N\left\{\begin{matrix} C_2S_2'' \\ C_4H_5 \\ H \end{matrix}\right. O, HO\right); Cu_2I$ More readily soluble in alcohol than No. II.

Hydrate of SulphoCarbonylEthylammonium with *di*SulphoCyanide of Copper.

I.) $N\left\{\begin{matrix} C_2S_2'' \\ C_4H_5 \\ H \end{matrix}\right. O, HO; \left.\begin{matrix} Cu_2 \\ C_2N \end{matrix}\right\} S_2$

II.) $2\left(N\left\{\begin{matrix} C_2S_2'' \\ C_4H_5 \\ H \end{matrix}\right. O, HO\right); 3\left(\left.\begin{matrix} Cu_2 \\ C_2N \end{matrix}\right\} S_2\right)$

III.) $N\left\{\begin{matrix} C_2S_2'' \\ C_4H_5 \\ H \end{matrix}\right. O, HO; 10\left(\left.\begin{matrix} Cu_2 \\ C_2N \end{matrix}\right\} S_2\right)$ Insoluble in cold water or alcohol. [There are various other double compounds.]

Hydrate of Tellurium. *Vid.* Oxide of Tellurium.

Hydrate of Tetryl. *Vid.* Hydrate of Butyl.

Hydrate of Thoria. *Vid.* Oxide of Thorium.

Hydrate of Thymyl. *Vid.* Thymylic Acid.

Hydrate of Tin. *Vid.* Oxide of Tin.

Hydrate of Toluenyl. Insoluble in water. Miscible in all proportions with alcohol, ether, bisulphide of carbon, and acetic acid. (Cannizzaro.)

(*Benzylic Alcohol. Benzoic Alcohol BenzAlcohol.*)
$C_{14}H_8O_2 = C_{14}H_7O, HO$

Hydrate of Trityl. *Vid.* Hydrate of Propyl.

Hydrate of Turpentine-Oil.

I.) *Solid.*

a = "*Anhydrous Turpentine-Camphor.*" Hygroscopic. (List.)

(*Bi Hydrate of Oil of Turpentine*(of Deville).
TetraHydrate of Oil of Turpentine(of Berthelot).)
$C_{20}H_{20}O_4$

b = "*Crystallized Turpentine-Camphor.*" Crystallized turpentine-camphor is soluble in 200 pts. of cold water, and in 22 pts. of boiling water, crystallizing from the hot solution as it cools. (Buchner, List.) Soluble in 250 pts. of cold, and in 30 @ 36 pts. of boiling water (Voget); in 24 pts. of boiling water. (Trommsdorff.) Commercial oils of turpentine form hydrates of various degrees of solubility in water. (Berthelot, *Ann. Ch. et Phys.*, (3.) **40.** 40 [*Gm.*].) Soluble in 7 pts. of alcohol, of 85%, at 10°; in 10 @ 12 pts. of 86% alcohol, and in 5 @ 6 pts. of boiling alcohol. According to some statements the alcoholic solution becomes turbid when mixed with water, according to others it does not. Soluble in 8 @ 10 pts. of ether. (Voget.) Soluble in acetic acid. (Boissenot & Persot.) This solution is not rendered turbid by water (Brandes); when mixed with water, it deposits unaltered turpentine-camphor. (Trommsdorff.) Readily soluble in hot oils, whether fixed or volatile (Trommsdorff, Buchner); from the warm solution in oil of turpentine it does not separate on cooling (Hæfner, Brandes), but from a solution in poppy oil separation occurs. (Hæfner.) According to Voget, it is insoluble in oil of turpentine or oil of almonds. Soluble in hot ammonia-water. (Brandes.) Soluble in dilute aqueous solutions of the caustic alkalies, but when heated in concentrated solutions it melts without dissolving. (Trommsdorff.) Easily soluble in concentrated sulphuric acid with formation of terpinol. (List.)

(*Terpin*(of Berzelius, and List).
TriHydrate of Essence of Turpentine(of Deville.)
$C_{20}H_{20}O_4 \& + 2\,Aq = \left.\begin{matrix} C_{20}H_{19}O_2 \\ H \end{matrix}\right\} O_2 + 2\,Aq$

Soluble, without decomposition, in cold concentrated nitric acid; the solution undergoing decomposition when heated. (Trommsdorff, List.)

II.) *Liquid.* Soluble in alcohol, from which it is precipitated on the addition of water.
(*Liquid Turpentine-Camphor MonoHydrate of Oil of Turpentine*(of Deville). *BiHydrate of Oil of Turpentine* (of Berthelot).)
$C_{20}H_{18}O_2$

III.) "*MonoHydrate of Oil of Turpentine*"(of Berthelot, and Gerhardt). *Vid.* Terpinol.

HYDRATE OF URANIUM. *Vid.* Oxide of Uranium.

HYDRATE OF VANADIUM. *Vid.* Oxide of Vanadium.

HYDRATE OF *tetra*VINYLIUM. Very sparingly soluble in water, rather more soluble in cold than in warm water. Soluble in all proportions in alcohol. Insoluble in ether. Most of its salts are easily soluble in water, but insoluble in alcohol. (Heintz & Wislicenus.)
$C_{16}H_{12}NO, HO$

HYDRATE OF YTTRIUM. *Vid.* Oxide of Yttrium.

HYDRATE OF ZINC. *Vid.* Oxide of Zinc.

HYDRIDE OF ACETYL. Miscible in all proportions with water, alcohol, and ether. Insoluble in an aqueous solution of chloride of calcium.
(*Aldehyde. Acetyl Aldehyde. Hydrate of Acetoyl.*)
$C_4H_3O_2, H$

There are several other isomeric modifications; as,

α = *Metaldehyde.* Insoluble in water. Very soluble in alcohol, and ether.

β = *Paraldehyde.* Easily soluble in alcohol, and ether. Very slightly soluble in water.

γ = *Elaldehyde.* Soluble in water, alcohol, and ether.

HYDRIDE OF ACETYL*bromé, chloré, etc.* *Vid.* Hydride of Brom(Chlor, &c.)Acetyl.

HYDRIDE OF ACRYL. Soluble in about 40 pts. of water at 15°. Slowly decomposed when in contact with water. Soluble in spirit. More soluble in ether than in water, this being its best solvent. (Redtenbacher.) Soluble in all proportions in alcohol, ether, and essential oils. (Buchner.) Soluble in 2 or 3 pts. of water at 15°. (Geuther & Cartmell.)
(*Acrolein. Acrol. Pimelin.*)
$C_6H_4O_2 = \left.\begin{matrix}C_6H_3O_2\\H\end{matrix}\right\}$

HYDRIDE OF ALLYL.
(*Hydride of Propionoyl. Isomeric with Propylene.*)
$C_6H_6 = C_6H_5, H$

HYDRIDE OF AMYL. Insoluble in water. Soluble in alcohol, and ether. Water precipitates it from the alcoholic solution. (Frankland, *J. Ch. Soc.*, **3.** 41.)
$C_{10}H_{12} = \left.\begin{matrix}C_{10}H_{11}\\H\end{matrix}\right\}$

HYDRIDE OF ANGELICYL.
(*Angelic Aldehyde.*)
$C_{10}H_8O_2 = \left.\begin{matrix}C_{10}H_7O_2\\H\end{matrix}\right\}$

HYDRIDE OF ANISYL. Very sparingly soluble in water. Soluble in all proportions in alcohol, and ether. Soluble in concentrated sulphuric acid, from which it is precipitated on the addition of water. Insoluble in a cold aqueous solution of caustic potash, even when this is concentrated; but when boiled for a long time in this solution it dissolves, with decomposition. (Cahours, *Ann. Ch. et Phys.*, (3.) **14.** 484.)
(*Anisol Anisaldehyde. Anisylous Acid. Hydrate of Anisicyl*)
$C_{16}H_8O_4 = \left.\begin{matrix}C_{10}H_7O_4\\H\end{matrix}\right\}$, or $\left.\begin{matrix}C_{10}H_7O_2\\H\end{matrix}\right\} O_2$

HYDRIDE OF AZOANISYL. Insoluble in water. Soluble in hot, less soluble in cold alcohol, and ether. Soluble at a gentle heat in concentrated chlorhydric acid, from which it is deposited as the solution cools. (Cahours, *Ann. Ch. et Phys.*, (3.) **14.** 487.)
(*AzoAnisylamin. Trianisylbiamid.*)
$C_{48}H_{24}N_2O_6 = N_2\left\{\begin{matrix}(C_{16}H_7O_2)_3\\H_3\end{matrix}\right.$

HYDRIDE OF AZOBENZOYL. *Vid.* HydroBenzamid.

HYDRIDE OF AZOCINNAMYL. *Vid.* CinnamylHydramid.

HYDRIDE OF AZOSALICYL. Apparently insoluble in water. Very sparingly soluble in cold alcohol. Soluble in about 50 pts. of boiling alcohol. Unacted upon by dilute acids in the cold, but is decomposed on boiling.
(*Salhydramid. Salicylimid. Spiroylimid. Spirionid. TriSalicoylbiamid.*)
$C_{42}H_{18}N_2O_6 = N_2\left\{\begin{matrix}(C_{14}H_5O_2)_3\\H_3\end{matrix}\right.$

For its compounds, *vid.* AzoSalicylides.

HYDRIDE OF BENZOYL. Soluble in 30 pts. of cold water. Miscible in all proportions with alcohol, ether, and the fatty and essential oils. Soluble, without decomposition, in cold monohydrated sulphuric and in cold concentrated nitric acid. (Wœhler.)
(*Oil of Bitter-Almonds. Benzaldehyde. Benzaldide. Benzoilal. Hydrate of Benzoicyl. Laurel-Oil. Oxide of Picramyl. Essence d'amandes amères.*)
$C_{14}H_6O_2 = \left.\begin{matrix}C_{14}H_5O_2\\H\end{matrix}\right\}$

HYDRIDE OF BENZOYL*nitrosulphuré.* *Vid.* Hydride of NitroSulphoBenzoyl.

HYDRIDE OF BISMUTH ?
BiH

HYDRIDE OF *ter*BROMACETYL. Very soluble in water, alcohol, and ether. (Lœwig.)
(*Bromal. Hydrure de Acetyltribromé. Oxyde de Brométhise.*)
$a = C_4HBr_3O_2 = \left.\begin{matrix}C_4Br_3O_2\\H\end{matrix}\right\}$

b = *hydrated.* Very soluble in water.
$C_4HBr_3O_2 + 4Aq$

HYDRIDE OF BROMAZOSALICYL. Resembles the corresponding chloro compound.
(*BromoSalicylimid. Bromosamid. TriBromoSalicoylbiamid.*)
$C_{42}H_{15}Br_3N_2O_6 = N_2\left\{\begin{matrix}(C_{14}H_4BrO_2)_3\\H_3\end{matrix}\right.$

HYDRIDE OF BROMOCUMYL. *Vid.* Hydrate of BromoCumoyl.

HYDRIDE OF BROMOMETHYL. Scarcely at all soluble in water. 1 volume of water at 14° dissolves 0.07 @ 0.09 vol. of it. (Bæyer, *Ann. Ch. u. Pharm.*, **103.** 183.) Easily soluble in alcohol.
(*Isomeric with Bromide of Methyl.*)
$C_2H_3Br = \left.\begin{matrix}C_2H_2Br\\H\end{matrix}\right\}$

HYDRIDE OF BROMOPHENYL. Insoluble in dilute alkaline solutions. Soluble in concentrated sulphuric acid. (Couper.)
(*BromoBenzol. BromoPhenyl.*)
$C_{12}H_5Br = \left.\begin{matrix}C_{12}H_4Br\\H\end{matrix}\right\}$

HYDRIDE OF *bi*BROMOPHENYL. Soluble in ether. (Couper.)
(*BiBromoBenzin.*)
$C_{12}H_4Br_2 = \left.\begin{matrix}C_{12}H_3Br_2\\H\end{matrix}\right\}$

HYDRIDE OF *ter*BROMOPHENYL. Insoluble, or but sparingly soluble, in water. Very easily soluble in alcohol, and ether. (Lassaigne.)
(*TerBromoBenzine. BromoBenzid. BromoBenzinise. Bromide of diBromoPhenyl.*)
$C_{12}H_3Br_3 = \left.\begin{matrix}C_{12}H_2Br_3\\H\end{matrix}\right\}$

Hydride of BromOpianyl. *Vid.* Bromo-Meconin.

Hydride of BromoSalicyl. *Vid.* Bromo-Salicylous Acid.

Hydride of BromoSulphoSalicyl. *Vid.* Sulphide of BromoSalicene.

Hydride of Butyl. Very sparingly soluble in water. Extremely soluble in absolute alcohol. Very sparingly soluble in concentrated sulphuric or chlorhydric acids, in a chlorhydric acid solution of dichloride of copper, or in bromine. (Berthelot, *Ann. Ch. et Phys.*, (3.) **51.** 71.) Soluble in alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **42.** 141.)

(Hydride of Tetryl.)
$\left.\begin{matrix}C_8\,H_9\\H\end{matrix}\right\}$

Hydride of Butyryl. There are two modifications of this substance.

(Butyral. Butyric Aldehyde. Butaldide. Butyraldehyde.)
$C_8\,H_8\,O_2 = C_8\,H_7\,O_2,\,H$

a) Butyral. Sparingly soluble in water. Soluble in all proportions in alcohol, ether, wood-spirit, potato-spirit, and oils. (Chancel.) Butyral dissolves a little water.

β) Butyraldehyde. Very sparingly soluble in water. Soluble in all proportions in alcohol, and ether. (Guckelberger.)

Hydride of Capronyl.

(Capral. Caproic Aldehyde.)
$\left.\begin{matrix}C_{12}\,H_{11}\,O_2\\H\end{matrix}\right\}$

Hydride of Caproyl. Insoluble in water. Easily soluble in alcohol, and ether. (Wurtz.)

(Hydride of Hexyl.)
$\left.\begin{matrix}C_{12}\,H_{13}\\H\end{matrix}\right\}$

"Hydride of Capryl." *Vid.* Hydride of Octyl.

$\left.\begin{matrix}C_{16}\,H_{17}\\H\end{matrix}\right\}$

Hydride of Capryl. *Vid.* Hydrate of Capricyl.

$C_{16}\,H_{18}\,O_2$

Hydride of *ter*ChlorAcetyl.

(Chloral. Hydrure d'Acetyl trichloré. Chlorure de Chloréthise.)

$a = C_4\,H\,Cl_3\,O_2 = \left.\begin{matrix}C_4\,Cl_3\,O_2\\H\end{matrix}\right\}$ Very soluble in water, alcohol, and ether.

b = "*Hydrate of Chloral.*" Soluble in water.
$C_4\,H\,Cl_3\,O_2 + 2\,Aq$

There is another modification of chloral ("insoluble chloral") which is insoluble in cold, and only very sparingly soluble in boiling water; and is insoluble, or very difficultly soluble, in alcohol or ether. (Liebig, Dumas.)

Hydride of ChlorAzoSalicyl. Almost insoluble in water. (Piria.) Soluble in hot absolute alcohol. More soluble in ether, especially when this is warm. Absolute alcohol does not decompose it, but it is decomposed by warm spirit.

(ChloroSalicylimid. Chlorosamid. TerChloroSalicoylbiamid.)
$C_{42}\,H_{15}\,Cl_3\,N_2\,O_8$

Hydride of ChlorEthyl. Water absorbs about twice as much of it as it can of chloride of ethyl.

(Isomeric with Chloride of Ethyl.)
$C_4\,H_5\,Cl = \left.\begin{matrix}C_4\,H_4\,Cl\\H\end{matrix}\right\}$

1 vol. of water absorbs 2 vols. of it. (Frankland & Kolbe.)

Hydride of ChloroBenzoyl. *Vid.* Chloride of Benzol.

Hydride of ChloroButyryl. Insoluble in water. Soluble in all proportions in alcohol, and ether. (Chancel.)

(ChloroButyral. Butyralmonochloré.)
$C_8\,H_7\,Cl\,O_2 = C_8\,H_6\,Cl\,O_2,\,H$

Hydride of *bi*ChloroButyryl.

(BiChloroButyral. Butyralbichloré.)
$C_8\,H_8\,Cl_2\,O_2 = C_8\,H_5\,Cl_2\,O_2,\,H$

Hydride of *quadri*ChloroButyryl. Insoluble in water. Soluble in alcohol, and ether. (Chancel.)

(QuadriChloroButyral. Butyral quadrichloré.)
$C_8\,H_4\,Cl_4\,O_2 = C_8\,H_3\,Cl_4\,O_2,\,H$

Hydride of *quadri*ChloroCinnamyl. Soluble in boiling alcohol, from which it separates on cooling. Unacted upon by boiling concentrated sulphuric acid. (Dumas & Peligot.)

(Chlorocinnose. TetraCinnamyl. Hydrate of QuadriChlorocinnamoyl.)
$\left.\begin{matrix}C_{18}\,H_8\,Cl_4\,O_2\\H\end{matrix}\right\}$

Hydride of ChloroCumyl. *Vid.* Hydrate of ChloroCuminol; and also Chloride of Cumol $(C_{20}\,H_{12}'')$.

Hydride of ChlorŒnanthyl. *Vid.* Chloride of Œnanthyl.

Hydride of ChloroMethyl. Very soluble in water, and alcohol.

(Isomeric with Chloride of Methyl.)
$C_2\,H_3\,Cl = \left.\begin{matrix}C_2\,H_2\,Cl\\H\end{matrix}\right\}$

1 vol. of water absorbs 2.6 vols. of it. (Bunsen.) More soluble in alcohol, but less soluble in ether.

Hydride of *ter*ChloroPhenyl. Insoluble in water. Easily soluble in alcohol, ether, and benzin. (Laurent.)

(TerChloroBenzol. ChloroBenzide. Chlorophenise. Chloride of diChloro Phenyl. TerChloro Benzene.)
$C_{12}\,H_3\,Cl_3 = \left.\begin{matrix}C_{12}\,H_2\,Cl_3\\H\end{matrix}\right\}$

Hydride of ChlorOpianyl. *Vid.* Chloro-Meconin.

Hydride of *per*ChloroPropionyl.

$C_6\,Cl_5\,H\,O_2 = \left.\begin{matrix}C_8\,Cl_5\,O_2\\H\end{matrix}\right\}$ & $+\ 8\,Aq$

Hydride of ChloroSalicyl. *Vid.* Chloro-Salicylous Acid.

Hydride of ChloroToluenyl. Soluble in ether. (Deville.)

(SexiChloroToluene. SexiChloroToluol. BenzoeneSexchloré. ChloroBenzoenyl. TolueneSexchloré.)
$C_{14}\,H_2\,Cl_8 = \left.\begin{matrix}C_{14}\,H\,Cl_6\\H\end{matrix}\right\}$

Hydride of Cinnamyl. Soluble in alcohol, and chlorhydric acid, in concentrated sulphuric acid with decomposition, and an aqueous solution of caustic potash. (Cahours.)

(Cinnamic Aldehyde. Hydrate of Cinnamoyl. Oil of Cinnamon.)
$C_{18}\,H_8\,O_2 = \left.\begin{matrix}C_{18}\,H_7\,O_2\\H\end{matrix}\right\}$

Hydride of Cinnamyl with Iodine & Iodide of Potassium. Decomposed by water. Soluble in alcohol, and ether. (Apjohn.)

$C_{18}\,H_8\,O_2,\,3\,I,\,K\,I$

Hydride of Copper.

$Cu_2\,H$

Hydride of Cumenyl. *Vid.* Cumene.

Hydride of Cumyl. Insoluble in water. Easily soluble in alcohol.

(Hydrate of Cumoyl. Cuminol. Cuminaldehyde.)
$C_{20}\,H_{12}\,O_2 = \left.\begin{matrix}C_{20}\,H_{11}\,O_2\\H\end{matrix}\right\}$

Hydride of CyanoBenzoyl. Insoluble in water. Sparingly soluble in boiling alcohol, and ether. (Laurent, Gregory.) Tolerably soluble in wood-spirit. (Laurent.) Decomposed by hot acids. Insoluble in cold chlorhydric acid, or in a solution of caustic potash.

(Benzimid.)
$C_{46}\,H_{18}\,N_2\,O_4$

Connected with Hydride of CyanoBenzoyl are two compounds, designated as

I.) *α* Hydride of CyanoBenzoyl. Insoluble in water. Very sparingly soluble in cold alcohol. Readily soluble in ether.

(Benzhydramid. BiToluenyl-CyanBenzoylamid.)
$C_{44}\,H_{18}\,N_2\,O_2$

II.) *β* Hydride of CyanoBenzoyl. Almost

(*ToluenylCyanoBenzoicylamin.*)
$C_{30} H_{12} N_2$

insoluble in boiling alcohol. Insoluble in ether.

HYDRIDE OF ETHYL. Nearly insoluble in water. 1 vol. of alcohol at 8.8° and 665.5$^{mm.}$ pressure, absorbs 1.22 vols. of it. (Frankland.) Tolerably soluble in absolute alcohol at ordinary temperatures; it is evolved on ebullition. Very sparingly soluble in a chlorhydric acid solution of dichloride of copper, in concentrated sulphuric acid or in bromine. (Berthelot, *Ann. Ch. et Phys.*, (3.) **51.** 68.) Neither absorbed by fuming sulphuric acid nor by perchloride of antimony. (Kolbe's *Lehrb.*, 1. 233.)

(*Isomeric with Methyl.*)
$C_4 H_6 = \left.\begin{matrix} C_4 H_5 \\ H \end{matrix}\right\}$

1 vol. of water under a pressure of $0^m.76$ of mercury, at °C.	Dissolves (by experiment) of hydride of ethyl, vols. reduced to 0°C. and $0^m.76$ pressure of mercury.

(Bunsen's *Gasometry*, pp. 288, 128, 149.)

Insoluble in caoutchin.

HYDRIDE OF METHYL*bromé, etc.* *Vid.* Hydride of Bromo(*etc.*)Methyl.

HYDRIDE OF NITROBENZOYL. Sparingly soluble in cold, tolerably easily soluble in boiling water. Readily soluble in alcohol, especially when this is warm. Tolerably soluble in ether. Easily soluble, without decomposition, in chlorhydric,

(*NitroBenzaldid.*)
$C_{14} H_5 N O_6 = \left.\begin{matrix} C_{14} H_4 (N O_4) O_2 \\ H \end{matrix}\right\}$

sulphuric, and nitric acids. Its solubility in water is not augmented by the addition of alkaline carbonates, but the caustic alkalies dissolve it readily with decomposition. (Bertagnini, *Ann. Ch. et Phys.*, (3) **33.** 468.)

Hydride of *ter*NitroMethyl. Tolerably readily soluble in water. (Schischkoff, *Ann. Ch. u. Pharm.*, **103.** 364.)
(Nitroform. Hydride of Methyltrinitré.)
$\left.\begin{matrix}C_2(NO_4)_3\\H\end{matrix}\right\}$

Hydride of *ter*NitroMethyl with Ammonia. *Vid.* *ter*NitroMethylide of Ammonium.

Hydride of NitrOpianyl. *Vid.* NitroMeconin.

Hydride of NitroPhenyl. Almost insoluble in water. Soluble in all proportions in alcohol, and ether. Easily soluble in concentrated sulphuric, and nitric acids, especially when these are warm. (Mitscherlich.)
(NitroBenzin(e). NitroBenzol. NitroBenzene. NitroBenzid. NitroBenzinase. Essence de Mirbane.)
$C_{12}H_5(NO_4) = \left.\begin{matrix}C_{12}H_4(NO_4)\\H\end{matrix}\right\}$

Hydride of *bi*NitroPhenyl. Insoluble in water. Very readily soluble in warm alcohol. (Deville.)
(BiNitroBenzin. BiNitroBenzol. DiNitroBenzol. BiNitroBenzene. BiNitroBenzid. Nitrobenzinese.)
$C_{12}H_4(NO_4)_2 = \left.\begin{matrix}C_{12}H_3(NO_4)_2\\H\end{matrix}\right\}$

Hydride of NitroSalicyl. Sparingly soluble in water. Very soluble in alçohol, and ether.
(Spiroilic Acid.)
$C_{14}H_5NO_8 = C_{14}H_4(NO_4)O_4, H$

Hydride of NitroSulphoBenzoyl. Insoluble in water, even boiling. Insoluble in alcohol, or ether. Soluble, without decomposition, in warm, or even in cold, sulphuric acid from which water precipitates it. Decomposed by nitric acid. Soluble in an alcoholic solution of caustic potash, from which it is precipitated by water. (Bertagnini.)
(Sulphide of NitroBenzylene. Hydrure de SulphoBenzoil-nitré. Hydrure de Benzoile nitrosulfuré.)
$C_{14}H_5NO_4S_2 = \left.\begin{matrix}C_{14}H_4(NO_4)S_2\\H\end{matrix}\right\}$

Hydride of NitroToluenyl. Insoluble in water. Very readily soluble in alcohol, and ether. Soluble in an aqueous solution of caustic potash, with decomposition (Deville); more readily soluble in an alcoholic solution of caustic potash. (Ritthausen.)
(NitroToluene. NitroToluol. NitroBenzoene. NitroBenzoenase. NitroDracyl. NitroToluide. NitroTole.)
$C_{14}H_7(NO_4) = \left.\begin{matrix}C_{14}H_6(NO_4)\\H\end{matrix}\right\}$

Hydride of *bi*NitroToluenyl. Sparingly soluble in water; or in water acidulated with nitric acid. Soluble in alcohol; and in an aqueous solution of caustic potash, with decomposition.
(BiNitroToluene. BiNitroToluol. BiNitroBenzoene. NitroBenzoenese.)
$C_{14}H_6(NO_4)_2 = \left.\begin{matrix}C_{14}H_5(NO_4)_2\\H\end{matrix}\right\}$

Hydride of Octyl.
(Hydride of Capryl.)
$\left.\begin{matrix}C_{16}H_{17}\\H\end{matrix}\right\}$

Hydride of Œnanthyl.
(Œnanthol. Œnanthal. Œnanthylic Aldehyde.)

a = $\left.\begin{matrix}C_{14}H_{13}O_2\\H\end{matrix}\right\}$ Very sparingly soluble in water. Soluble in all proportions in alcohol, and ether.

It combines with concentrated sulphuric acid, forming a copulate acid, the baryta, lead, and lime salts of which are soluble. (Bouis.)

b = *hydrated.* Insoluble in water. Soluble in alcohol, and in acetic acid. (Bussy & Lecanu.)
$\left.\begin{matrix}C_{14}H_{13}O_2\\H\end{matrix}\right\}HO$

Hydride of Opianyl. *Vid.* Meconin.

Hydride of Palmityl. Soluble in alcohol, and ether.
(Cetylic Aldehyde.)
$C_{32}H_{32}O_2 = C_{32}H_{31}O_2, H$

Hydride of Pelargyl. Not isolated.
$\left.\begin{matrix}C_{18}H_{17}O_2\\H\end{matrix}\right\}$

Hydride of Phenyl. Insoluble in water. (Regnault.) Very sparingly soluble in water. (Mitscherlich.) More readily soluble in alcohol than most of the other hydrocarbons; from this solution it is precipitated by water. Soluble in wood-spirit. Very sparingly soluble in ether. Readily soluble in acetone. (Mansfield.) Insoluble in very dilute alcohol. Benzin dissolves the fatty and essential oils, wax, caoutchouc, gutta-percha, and small quantities of sulphur, phosphorus, and iodine.
(Benzin(e). Benzol. Benzon. Benzene. Phene. BiCarburet of Hydrogen.)
$C_{12}H_6 = \left.\begin{matrix}C_{12}H_5\\H\end{matrix}\right\}$

Hydride of Phosphorus. *Vid.* Phosphuretted Hydrogen [No. I.(solid)].

Hydride of Propionyl. Miscible in all proportions with water, alcohol, and ether.
(Propionic, or Propylic, Aldehyde. Isomeric with Acetone, Propylal, and Hydrate of Allyl.)
$C_6H_6O_2 = \left.\begin{matrix}C_6H_5O_2\\H\end{matrix}\right\}$

Hydride of Propyl. Very sparingly soluble in water, bromine, concentrated sulphuric acid, or a chlorhydric acid solution of dichloride of copper. Extremely soluble in absolute alcohol. (Berthelot, *Ann. Ch. et Phys.*, (3.) **51.** 70.)
(Hydride of Trityl.)
$C_6H_8 = \left.\begin{matrix}C_6H_7\\H\end{matrix}\right\}$

Hydride of Rutyl. Soluble in cold concentrated sulphuric acid, from which it is precipitated by water. Soluble in 1 pt. of alcohol, of 0.85 sp. gr.
(Capric Aldehyde. Caprol. Oil of Rue. Hydrate of Rutoyl.)
$\left.\begin{matrix}C_{20}H_{19}O_2\\H\end{matrix}\right\}$

Hydride of Salicyl. *Vid.* Salicylous Acid.

Hydride of Suberyl.
(Suberone.)
$C_{14}H_{12}O_2$

Hydride of SulphAcetyl. Sparingly soluble in water. Soluble in alcohol, and ether. Soluble in concentrated sulphuric acid, from which it is precipitated by water. Unacted upon by solutions of caustic potash or ammonia.
(Acetyl (or Acetylic) Mercaptan. SulphAldehyde. Sulphydrate of Acetoyl(C_4H_3).)
$\left.\begin{matrix}C_4H_3S_2\\H\end{matrix}\right\}$

Hydride of SulphAcetyl with Nitrate of Silver. Soluble in water; the solution undergoing decomposition when evaporated. Soluble in boiling, less soluble in cold, absolute alcohol; more readily soluble in dilute spirit. (Weidenbusch.)
$3C_4H_4S_2; 2(AgO, NO_5)$

Hydride of SulphAcetyl with Sulphydric Acid. Sparingly soluble in water. Very soluble in alcohol, and ether. Miscible with the fatty and volatile oils.
$6C_4H_4S_2, 2HS$

Hydride of SulphAnisyl. Insoluble, or but sparingly soluble, in alcohol. (Cahours.)
(SulphAnisylous Acid. Thianisiol.)
$\left.\begin{matrix}C_{16}H_7O_2S_2\\H\end{matrix}\right\}$

Hydride of SulphAzoBenzoyl. Very abundantly soluble in cold alcohol. Slowly decomposed by boil-
(ThioBenzaldin.)
$\left.\begin{matrix}C_{42}H_{18}NS_4\\H\end{matrix}\right\}$

ing with alcohol. Soluble in 20 @ 30 pts. of boiling ether. (Laurent.)

Hydride of SulphoBenzoyl. Insoluble in water, or alcohol. Decomposed by boiling with hydrated alcohol. Sparingly soluble in ether. (Laurent.)

(*Sulphide of Stilbene.*)
[*Isomeric, not identical with Sulphide of Benzol.* (Gerhardt.)]
$\left.\begin{matrix}C_{14}H_5S_2\\H\end{matrix}\right\}$

Hydride of SulphoBenzoyl*nitre*. *Vid.* Hydride of NitroSulphoBenzoyl.

Hydride of SulphoCinnamyl.
(*Thiocinnol.*)
$C_{18}H_8S_2$

Hydride of SulphoCumyl.
(*SulphoCumol.*)
$C_{20}H_{12}S_2$

Hydride of SulphoCyanoBenzoyl. Insoluble in water. Soluble, with decomposition, in alcohol, and ether. (Quadrat.)

(*Sulpho Cyanide of Benzoyl. SulphoCarbonylBenzoicylamid.*)
$C_{10}H_5NS_2 = N\left\{\begin{matrix}C_2S_2''\\C_{14}H_5\end{matrix}\right.$

Hydride of SulphoSalicyl.
(*ThioSalicol.*)
$C_{14}H_6O_2S_2$

Hydride of Tetryl. *Vid.* Hydride of Butyl.

Hydride of Thymyl. *Vid.* Cymene.

Hydride of Toluenyl. Insoluble in water. Sparingly soluble in alcohol; more soluble in ether. (Glénard & Boudault; Deville.) Soluble in fixed and volatile oils. (Pelletier & Walter; Glénard & Boudault.)

(*Toluene. Toluol. Hydride of Tolyl. Retinaphtha. Dracyl. Benzoene. Heptacarbure quadrihydrique*(of Courbe).)
$C_{14}H_8 = \left.\begin{matrix}C_{14}H_7\\H\end{matrix}\right\}$

Hydride of Trityl. *Vid.* Hydride of Propyl.

Hydride of Valeryl. Insoluble in water. Soluble in all proportions in alcohol, ether, and the volatile oils. (Chancel.) Miscible with oil of vitriol. (Gaultier de Claubry.)

(*Valeral. Valeraldide. Valerianic Aldehyde. Myaldid. AmylAldehyde.*)
$C_{10}H_{10}O_2 = \left.\begin{matrix}C_{10}H_9O_2\\H\end{matrix}\right\}$

Hydride of Xylyl. *Vid.* Xylene.

Hydrindin. Insoluble in water. Sparingly soluble in boiling, less soluble in cold alcohol. Soluble in concentrated sulphuric acid, from which it is precipitated unchanged on the addition of water. (Laurent.)

$C_{64}H_{22}N_4O_8 + 2\,Aq$

Hydrindin with Potash. Decomposed by much water. Soluble in boiling alcohol, from which it is precipitated on the addition of a small quantity of water. (Laurent.)

$C_{64}H_{21}KN_4O_8 + 6\,Aq$

Hydriodic Acid. *Vid.* Iodhydric Acid.

Hydriodic Ether. *Vid.* Iodide of Ethyl.

HydroAloetate of Tin.
$C_{14}H_4Sn_8N_2O_{17}$

HydroBenzamid. Insoluble in water. Easily soluble in hot alcohol, and ether. The alcoholic solution is decomposed by long-continued boiling. Decomposed by acids. (Laurent.)

(*Hydride of AzoBenzoyl. Nitride of Picramyl. TriBenzoicylbiamin.*)
$C_{42}H_{18}N_2 = N_2\left\{\begin{matrix}(C_{14}H_5)_3\\H_8\end{matrix}\right.$

HydroBenzamid*nitré*. *Vid.* *ter*NitroHydroBenzamid.

HydroBenzil. Insoluble in water. Easily soluble in alcohol, and ether. Easily soluble in concentrated sulphuric acid, from which it is precipitated unchanged on the addition of water. Soluble in an alcoholic solution of potash. (Zinin.)

$C_{28}H_{12}O_2$

HydroBromic Acid. *Vid.* Bromhydric Acid.

HydroBromic Ether. *Vid.* Bromide of Ethyl.

HydroBryoretin. Easily soluble in alcohol. Insoluble in ether.

$C_{42}H_{37}O_{16}$

HydroCarbide of Bromine. *Vid.* Iodide of *bi*BromoMethyl.

HydroCarotin. Insoluble in water. Abundantly soluble in boiling alcohol. More soluble in ether, bisulphide of carbon, benzin, essential oils, and chloroform than in alcohol. Also soluble in fatty oils, even in the cold. After having been melted it is much less soluble in benzin, and especially in bisulphide of carbon, than when in the crystalline state. This amorphous modification is, however, about as soluble as the crystalline in alcohol, and ether. (Husemann, *Ann. Ch. u. Pharm.*, 1861, **117.** pp. 206, 203.)

$C_{36}H_{30}O_2$

HydroChinone. *Vid.* HydroKinone.

HydroChloric Acid. *Vid.* Chlorhydric Acid.

HydroChrysamid. Insoluble in boiling water. Sparingly soluble in boiling alcohol. Soluble in concentrated sulphuric acid, from which it is precipitated on the addition of water. Soluble in a boiling aqueous solution of caustic potash, less soluble in a cold solution. Also soluble in solutions of the alkaline carbonates. (Schunck.)

(*Isomeric with NitroBenzamid.*)
$C_{14}H_6(NO_4)NO_2 = N\left\{\begin{matrix}C_{14}H_4(NO_4)O_2\\H_2\end{matrix}\right.$

HydroCinnamid. *Vid.* CinnamylHydramid.

HydroCyanaldin. Tolerably soluble in boiling, sparingly soluble in cold water. Easily soluble in alcohol. Sparingly soluble in ether. (Strecker, *Ann. Ch. u. Pharm.*, **91.** 350.)

Hydurilic Acid(of Schlieper). $C_{12}H_5N_3O_{11}$? [Laurent doubts its existence.] Nearly insoluble in cold, sparingly and slowly soluble in hot water. Insoluble in alcohol. Soluble, with decomposition, in concentrated sulphuric acid. (Schlieper.)

Hyduralate of Ammonia.

I.) $C_{12}H_3(NH_4)_2N_3O_{11}$ Tolerably soluble in water. Very easily soluble in ammonia-water.

II.) *acid.* Insoluble in dilute acids.

Hyduralate of Potash. Soluble in water. Insoluble in alcohol.

Hyduralate of Silver. Ppt.
$C_{12}H_3Ag_2N_3O_{11}$

Hyduralate of Soda.
$C_{12}H_3Na_2N_3O_{11} + 5\,Aq$

Hyocholalic Acid. Insoluble in water. Soluble in alcohol, and ether.
$C_{50}H_{40}O_8$

Hyocholalate of Baryta.
$C_{50}H_{39}BaO_8$

Hyocholic Acid. Very sparingly soluble in water. Easily soluble in alcohol, in cold concentrated sulphuric and nitric acids, without change, and in alkaline solutions. Insoluble in ether.
(*Hyoglycocholic Acid.*)
$C_{54}H_{43}NO_{10}$

Hyocholate of Ammonia. Very soluble in water. Very sparingly soluble in concentrated aqueous solutions of the ammoniacal salts. Its solutions are decomposed on ebullition.
$C_{54}H_{42}(NH_4)NO_{10} + Aq$

Hyocholate of Baryta. Slightly soluble in cold, tolerably soluble in hot water. Very soluble in alcohol.
$C_{54}H_{42}BaNO_{10} + Aq$

Hyocholate of Lead. Slightly soluble in water. Readily soluble in spirit, from which it is precipitated by ether.

Hyocholate of Lime. Sparingly soluble in water. Very soluble in alcohol.
$C_{54}H_{42}CaNO_{10} + Aq$

Hyocholate of Magnesia. Ppt.

Hyocholate of Potash. Soluble in water, and in absolute alcohol; less soluble in ether. [Insoluble in a solution of sulphate of potash?]
$C_{54}H_{42}KNO_{10} + Aq$

Hyocholate of Silver. Very sparingly soluble in water. Tolerably easily soluble in alcohol.
$C_{54}H_{42}AgNO_{10}$

Hyocholate of Soda. Permanent. Easily soluble in water and in absolute alcohol. Insoluble in ether. [Insoluble in a solution of sulphate of soda?] (Strecker, *Ann. Ch. et Phys.*, (3.) **22.** 42.) It is precipitated from the aqueous solution on the addition of soda salts.
$C_{54}H_{42}NaNO_{10} + Aq$

Hyodyslysin. Insoluble in water. Sparingly soluble in boiling alcohol. Tolerably soluble in ether. Insoluble in aqueous solutions of caustic potash or ammonia.
$C_{50}H_{38}O_6$

Hyoscyamin (from *Hyoscyamus niger, etc.*). Permanent. Tolerably soluble in water.

Soluble in 500 pts. of cold water; the saturated solution containing 0.2% of it. Readily soluble in alcohol, and ether. Soluble in olive-oil. It is easily decomposed when in solution. Decomposed by warm mineral acids. Its salts are soluble in water, and alcohol.

Hyper. See *per*, as prefix, under the generic name of the substance sought for.

HypoBromite of Potash.

HypoBromite of Silver.

HypoBromite of Soda.

HypoBromite of Strontia.

HypoChloric Acid. 1 vol. of water absorbs 20 vols. of the gas at 4° [by error "40°" in Otto's *Lehrbuch*], at a lower temperature the water freezes. When water at 0° is poured upon liquid hypochloric acid, a solid hydrate is formed. (Millon, *Ann. Ch. et Phys.*, (3.) **7.** 308.) Water absorbs more than 7 times its volume of the gas. (Stadion.) The aqueous solution remains undecomposed in the dark, but decomposes in a few hours when exposed to direct sunlight, and in the course of a few months by exposure to diffused daylight. (Stadion; Millon, *loc. cit.*, p. 331.)
(*Chloric oxide. Oxide of Chlorine. perOxide of Chlorine.*)
ClO_4

HypoChlorate of Ammonia. Soluble in water. (Soubeiran, *Ann. Ch. et Phys.*, **48.** 140.)

HypoChlorate of Potash. Deliquesces in moist air.

HypoChlorous Acid.
ClO

α = *liquid.* Slowly soluble in water. (Pelouze, *Ann. Ch. et Phys.*, (3.) **7.** 180.)

β = *gas.* 1 volume of water at 0° dissolves at least 200 vols. of the gas. Or, 100 pts. of water dissolve 77.364 pts. of it, i. e. more than $\frac{3}{4}$ of its weight. The aqueous solution is decomposed by acids and alkalies, and by many other substances. (Pelouze, *Ann. Ch. et Phys.*, (3.) **7.** pp. 183, 184.) Water absorbs it very quickly, probably taking up more than 100 volumes. (Balard.) Balard prepared the gas by adding dry nitrate of lime to the aqueous solution, but according to Gay-Lussac (*Ann. Ch. et Phys.*, (3.) **5.** 278) this process yields an impure product. Very soluble in water, the statement of Balard that 1 vol. of water can dissolve more than 100 vols. of it being probably correct. Although when in aqueous solution it is more stable than when in the gaseous state, the solution, nevertheless, gradually undergoes decomposition. This decomposition is much more rapid in sunlight, especially when the solution is concentrated. The concentrated aqueous solution is also decomposed when heated on a boiling water bath, but with more dilute solutions the decomposition is less marked. (Gay-Lussac, *Ann. Ch. et Phys.*, (3.) **5.** 281.)

The hypochlorites are very instable compounds, undergoing decomposition even in the cold. At the temperature of boiling water the decomposition is rapid. (Gay-Lussac, *Ibid.*, pp. 291, 299.)

HypoChlorite of Ammonia. Known only in solution.

HypoChlorite of Baryta. Known only in solution.

HypoChlorite of Copper. Known only in solution. (Balard.)

HypoChlorite of Lead. Known only in $Pb\,O, Cl\,O$ aqueous solution, and this soon undergoes decomposition. (Berzelius's *Lehrb.*)

HypoChlorite of Lime. Soluble in water, $Ca\,O, Cl\,O$ the solution undergoing decomposition on boiling.

HypoChlorite of Magnesia. Known only in solution.

HypoChlorite of Potash. Known only in $K\,O, Cl\,O$ solution.

HypoChlorite of Silver.

HypoChlorite of Soda. Soluble in water.

HypoChlorite of Zinc. Known only in solution.

HypoChloroSulphuric Compound of Millon. $S_2\,O_3\,Cl_2$ *Vid.* OxyChloride of Sulphur.

Hypocyanic Acid. *Vid.* Cyamelid.

Hypogeic Acid. Insoluble in water. Read- $C_{32}\,H_{30}\,O_4 = C_{32}\,H_{29}\,O_3, H\,O$ ily soluble in alcohol, and ether. (Gœssmann & Scheven, *Ann. Ch. u. Pharm.*, **94.** 232.)

Hypogeate of Baryta.

I.) $C_{32}\,H_{29}\,Ba\,O_4$ Soluble in hot, very sparingly soluble in cold alcohol.

II.) *basic.* Insoluble in hot alcohol. (G. & S., *loc. cit.*)

Hypogeate of Copper. Tolerably soluble $C_{32}\,H_{29}\,Cu\,O_4$ in alcohol. (G. & S., *loc. cit.*)

Hypogeate of Ethyl. Insoluble in water. $C_{32}\,H_{29}\,(C_4\,H_5)\,O_4$ Sparingly soluble in alcohol. (G. & S., *loc. cit.*)

Hypogeate of Lead. Soluble in ether. (G. & S., *loc. cit.*)

HypoHydroSulphite of Ammonia. *Vid.* *hepta*Sulphide of Ammonium.

*Sub***HypoIodic Acid**(?)(of Millon). Perma- $I_5\,O_{19}$ nent. Slowly decomposed by cold water; otherwise its comportment with solvents resembles that of hypoiodic acid, *q. v.* (Millon, *Ann. Ch. et. Phys.*, (3.) **12.** 359.)

HypoIodic Acid. Permanent. Insoluble in $I\,O_4$ cold, rapidly decomposed by boiling water. Insoluble in alcohol. Insoluble in cold, soluble, with combination, in warm concentrated sulphuric acid; the resulting compound ($I\,O_4$, $2\,S\,O_3$, $H\,O$) separates out as the solution cools. Decomposed by solutions of the caustic alkalies. (Millon, *Ann. Ch. et Phys.*, (3.) **12.** 356.)

HypoNitric Acid. (Regarded by most as a $N\,O_4$ mixture of Nitric and Nitrous acids.) Decomposed by much water; when treated with a smaller quantity of water some hyponitric acid remains undecomposed. Soluble in concentrated nitric acid.

HypoNitrate of Lead.

I.) *di.* Soluble in 85 pts. of cold water (Bro- $2\,Pb\,O, N\,O_4 + Aq$ meis); in 80 pts. of water at 25°, and in 10.6 pts. of boiling water. (Chevreul.) Soluble in cold strong acetic acid.

II.) *tetra.* Soluble in 1250 pts. of cold, and in $4\,Pb\,O, N\,O_4 + 2\,Aq$ 34 pts. of boiling water. (Peligot.)

HypoNitroMeconic Acid. *Vid.* Meconin-HypoNitric Acid.

HypoNitrous Acid. *Vid.* Nitrous Acid.

HypoPhosphorous Acid(hydrated). Very $P\,O + 3\,H\,O$ soluble in water. Soluble in alcohol.

Most of the salts of hypophosphorous acid are permanent when dry (H. Rose), those of the alkalies are very deliquescent. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **7.** 37.) They are all soluble in water, and several are soluble in alcohol also. (H. Rose.)

HypoPhosphite of Alumina. Permanent. $2\,Al_2\,O_3, 3\,H\,O, 3\,P\,O$ Soluble in water. (H. Rose.)

HypoPhosphite of Ammonia. Deliquescent. $N\,H_4\,O, 2\,H\,O, P\,O$ Very soluble in water and in absolute alcohol. (Dulong.) Less deliquescent than the potash salt. (Wurtz, *Ann. Ch. et Phys.*, (3.) **16.** 193.)

HypoPhosphite of Baryta. Permanent. $Ba\,O, 2\,H\,O, P\,O + Aq$ Soluble in water. Insoluble in alcohol. (H. Rose.) Soluble in 3.5 pts. of cold, and in 3 pts. of boiling water. Insoluble in alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **7.** 40.)

HypoPhosphite of Cadmium. Very soluble $Cd\,O, 2\,H\,O, P\,O$ in water. (H. Rose.)

HypoPhosphite of Cadmium & of Lime.

HypoPhosphite of Chromium. Soluble in $Cr_2\,O_3, 3\,H\,O, 2\,P\,O + 4\,Aq$ water. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **16.** 196.)

HypoPhosphite of Cobalt. Effloresces in $Co\,O, 2\,H\,O, P\,O + 6\,Aq$ dry air. Very easily soluble in water. (H. Rose.)

HypoPhosphite of Cobalt & of Lime. $2\,(Ca\,O, 2\,H\,O, P\,O)$; $Co\,O, 2\,H\,O, P\,O + 2\,Aq$ Deliquescent. Soluble in water. (H. Rose.)

HypoPhosphite of Copper. Soluble in wa- $Cu\,O, 2\,H\,O, P\,O$ ter; the solution is readily decomposed. (A. Wurtz, *loc. cit.*, 199.)

HypoPhosphite of Glucina. Soluble in $Gl_2\,O_3, P\,O$ water. (H. Rose.)

HypoPhosphite *of protoxide* **of Iron.** Solu- $Fe\,O, 2\,H\,O, P\,O + 6\,Aq$ ble in water.

HypoPhosphite *of sesquioxide* **of Iron.** When $2\,Fe_2\,O_3, 3\,H\,O, 3\,P\,O$ gelatinous it is somewhat, though difficultly, soluble in water. When boiled with water it is decomposed to the soluble salt of the protoxide, and to an insoluble basic salt of the sesquioxide. Sparingly soluble in hypophosphorous acid.

Freely soluble in chlorhydric, and hypophosphous acids. (Parrish's *Pharm.*, p. 501.)

HypoPhosphite *of sesquioxide* of Iron & of Lime. Soluble in water. (H. Rose.)

HypoPhosphite of Lead.

I.) $PbO, 2HO, PO$ Difficultly soluble in cold, easily soluble in hot water. Insoluble in alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **7.** 43.)

II.) *basic*(of H. Rose) was *tri*Phosphite of Lead, *q. v.* (A. Wurtz, *loc. cit.*, p. 44.)

HypoPhosphite of Lime. $CaO, 2HO, PO$ Permanent. Soluble in 6 pts. of cold water; not much more soluble in hot water. (H. Rose; Wurtz, *Ann. Ch. et Phys.*, (3.) **7.** 38.) Insoluble in alcohol of 0.835 sp. gr., and but slightly soluble in dilute alcohol.

HypoPhosphite of Magnesia. $MgO, 2HO, PO + 6Aq$ Efflorescent. Easily soluble in water. (H. Rose.)

HypoPhosphite of Manganese. $MnO, 2HO, PO + Aq$ Permanent. Very soluble in water. (H. Rose.)

HypoPhosphite of Nickel. $NiO, 2HO, PO + 6Aq$ Efflorescent. Easily soluble in water. (H. Rose.)

HypoPhosphite of Potash. $KO, 2HO, PO$ More deliquescent than chloride of calcium. Very soluble in water, and alcohol. (Dulong.) Abundantly soluble in alcohol. (Gmelin.) Very deliquescent. Very soluble in water and in weak alcohol; less soluble in absolute alcohol. Insoluble in ether. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **16.** 192.)

The aqueous solution gradually absorbs oxygen when exposed to the air, phosphorous acid being formed. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **7.** 37.)

HypoPhosphite of Quinine. Soluble in 60 pts. of water at 15.5°. Very soluble in hot water. (Lawrence Smith, *Parrish's Pharm.*, p. 502.)

HypoPhosphite of Soda. $NaO, 2HO, PO$ Very deliquescent, though less so than the potash-salt. Very soluble in water. Very readily soluble in absolute alcohol.

The aqueous solution gradually absorbs oxygen when exposed to the air, phosphorous acid being formed. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **7.** 37.)

HypoPhosphite of Strontia. $SrO, 2HO, PO$ Very soluble in water. (Dulong.) Permanent. Very soluble in water. Insoluble in alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **16.** 194.)

HypoPhosphite of Sulphide of Mercury. HgS, PS *Vid.* HypoSulphoPhosphite of Mercury.

HypoPhosphite of Zinc. $ZnO, 2HO, PO + Aq$ Very easily soluble in water.

It occurs as octahedrons, which are very efflorescent, and in rhombohedrons, which are permanent. Soluble in water. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **16.** 195.)

HypoPicrotoxic Acid(from the husks of Cocculus-grains). $C_{22}H_{13}O_8$ Insoluble in water, even when this is boiling. Soluble in alcohol. Insoluble in ether. Readily soluble in alkaline solutions. (Pelletier & Courbe.)

HypoSulphAmylic Acid. *Vid.* AmylSulphurous Acid.

HypoSulphArsenious Acid. AsS_2 *Vid. bi*Sulphide of Arsenic.

HypoSulphArsenite of Ammonium. Difficultly soluble in water.

HypoSulphArsenite of Barium. Insoluble in water. (Berzelius.)

HypoSulphArsenite of Calcium. CaS, AsS_2 Insoluble in water. (Berzelius.)

HypoSulphArsenite of Cerium. Insoluble in water.

HypoSulphArsenite of Magnesium.

HypoSulphArsenite of Manganese. Ppt.

HypoSulphArsenite of Potassium.

I.) *mono.* KS, AsS_2 Partially soluble in water which contains no sulpharseniate of potassium, a basic salt ($3KS, AsS_2$?) being dissolved out.

II.) *di.* $2KS, AsS_2$ Completely insoluble in water. Soluble in an aqueous solution of caustic potash. (Berzelius, *Lehrb.*, **3.** 201.)

HypoSulphArsenite of Sodium.

I.) *mono.* } Precisely similar to the correspond-
II.) *di.* } ing compounds of potassium. (Ber-
III.) *tri.* } zelius.)

HypoSulphArsenite of Strontium.

HypoSulphArsenite of Zinc.

HypoSulphArsenite of Zirconium. $Zr_2S_3, 3AsS_2$ Insoluble in water. (Berzelius.)

HypoSulphuric Acid.

monosulfuré. *Vid. tri*Thionic Acid.
bisulfuré. *Vid. tetra*Thionic Acid.
trisulfuré. *Vid. penta*Thionic Acid.

HypoSulphuric Acid. (*DiThionic Acid.*) $S_2O_5 + xAq$ Soluble in water. The aqueous solution may be concentrated until it is of 1.347 sp. gr., but decomposes if it be further evaporated. The dilute aqueous solution is also decomposed by boiling. (Heeren, *Pogg. Ann.*, 1826, **7.** 66.) All the normal salts of hyposulphuric acid are soluble in water (*Ibid.*, p. 68), but insoluble, or only sparingly soluble in alcohol. (Gmelin.) Like the solution of the acid, solutions of several of the hyposulphates are decomposed when boiled. (Heeren, *Ibid.*, p. 66.)

HypoSulphate of Alumina. $Al_2O_3, 3S_2O_5$ Soluble in water, but undergoes decomposition when evaporated. (Heeren, *Pogg. Ann.*, 1826, **7.** 180.)

HypoSulphate of Ammonia. $NH_4O, S_2O_5 + Aq$ Permanent. Soluble in 0.79 pt. of water at 16°, with considerable reduction of temperature. Insoluble in absolute alcohol. The aqueous solution is not decomposed by boiling. (Heeren, *Pogg. Ann.*, 1826, **7.** 171.)

HypoSulphate of Argent*bi*amin. (*Ammonio HypoSulphate of Silver.*) $N_2\left\{H_6\right. . AgO, S_2O_5 + Aq$ Soluble in water. (Rammelsberg.)

HypoSulphate of Baryta.

I.) $BaO, S_2O_5 + 2Aq$ Permanent. Soluble in 7.17 pts. of water at 8.14° (Gay-Lussac); in 4.04 pts. at 18°, and in 1.1 pts. of boiling-water. Insoluble in alcohol. (Heeren, *Pogg. Ann.*, 1826, **7.** 172.)

II.) $BaO, S_2O_5 + 4Aq$ Effloresces, losing half its water of crystallization. (Heeren, *Ibid.*, p. 177.)

HypoSulphate of Cadmium. CdO, S_2O_5 Quickly deliquesces in moist air. Easily soluble in water. (Heeren, *Ibid.*, p. 183.)

HypoSulphate of Cadmium*bi*amin. Decom-

(Ammonio Hypo Sulphate of Cadmium.) $N_2\left\{H_6 \,.\, Cd\,O, S_2O_5\right.$ posed by alcohol. Soluble in ammonia-water, but the solution is decomposed when heated.

HypoSulphate of Cerium. Permanent. CeO, S_2O_5 Soluble in water. (Heeren, *Pogg. Ann.*, 1826, 7. 181.)

HypoSulphate *of sesquioxide* **of Chromium.** $Cr_2O_3, 3\,S_2O_5$ Soluble in water. (Berlin.)

HypoSulphate of Cinchonin. Almost as difficultly soluble as the sulphate in cold water; more soluble in hot water. (Heeren, *Pogg. Ann.*, 1826, 7. 193.)

HypoSulphate of Cobalt. Permanent. $CoO, S_2O_5 + 6\,Aq$ Very easily soluble in water. (Heeren, *Pogg. Ann.*, 1826, 7. 190.)

HypoSulphate of Copper.

I.) *mono.* Slightly efflorescent in dry air. $CuO, S_2O_5 + 4\,Aq$ Easily soluble in water. Insoluble in alcohol. (Heeren, *Pogg. Ann.*, 7. 187.)

II.) *tetra.* Very difficultly soluble in water. $4\,CuO, S_2O_5 + 4\,Aq$ (Heeren, *Pogg. Ann.*, 7. 188.)

HypoSulphate of Cupr(*ic*)*bi*amin. Permanent. *(Ammonio Hypo Sulphate of Copper.)* $N_2\left\{H_6 \,.\, Cu\,O, S_2O_5\right.$ Rather difficultly soluble in cold water. (Heeren, *Pogg. Ann.*, 1826, 7. 189.)

HypoSulphate *of protoxide* **of Iron.** Exceedingly easily soluble in water; $FeO, S_2O_5 + 5\,Aq$ the solution being decomposed by boiling. Insoluble in alcohol. (Heeren, *Pogg. Ann.*, 1826, 7. 181.)

HypoSulphate *of sesquioxide* **of Iron.**

I.) *normal.* Soluble in water. (Berzelius, $Fe_2O_3, 3\,S_2O_5$ *Lehrb.*)

II.) *basic.* Insoluble in water or alcohol. Easily $8\,Fe_2O_3, S_2O_5 + 20\,Aq$ soluble in chlorhydric acid. (Heeren, *Pogg. Ann.*, 1826, 7. 182.)

HypoSulphate of Lead.

I.) *mono.* Permanent. Very easily soluble in $PbO, S_2O_5 + 4\,Aq$ water. (Heeren, *Pogg. Ann.*, 7. 183.)

II.) *di.* Soluble in water; much more so than $2\,PbO, S_2O_5 + 2\,Aq$ No. III. (Heeren, *Ibid.*, p. 186.)

III.) *deca.* Somewhat soluble in water. (Heeren, $10\,PbO, S_2O_5 + 25\,Aq$ *Ibid.*, p. 186.)

HypoSulphate of Lime. Permanent. Soluble $CaO, S_2O_5 + 4\,Aq$ in 2.46 pts. of water at 19°, and in 0.8 pt. of boiling water. Insoluble in alcohol, which only removes some of its water of crystallization. (Heeren, *Pogg. Ann.* 7. 179.)

HypoSulphate of Lithia. Somewhat hygroscopic. $LiO, S_2O_5 + 2\,Aq$ Easily soluble in water. Insoluble in alcohol. (Rammelsberg.)

HypoSulphate of Magnesia. Permanent. $MgO, S_2O_5 + 6\,Aq$ Soluble in 0.85 pt. of water at 13°; the solution is not decomposed by boiling. (Heeren, *Pogg. Ann.*, 1826, 7. 179.)

HypoSulphate of Manganese. Deliquescent. MnO, S_2O_5 Easily soluble in water. (Welter & Gay-Lussac.)

HypoSulphate *of dinoxide* **of Mercury.** Hg_2O, S_2O_5 Sparingly soluble in cold, decomposed by boiling water. Easily soluble in nitric acid. (Rammelsberg.)

HypoSulphate *of protoxide* **of Mercury.**

I.) *basic.* Easily soluble in chlorhydric acid. $2\,(HgO, S_2O_5)\,;\,3\,HgO$ (Rammelsberg.)

HypoSulphate of Nickel. Soluble in $NiO, S_2O_5 + 6\,Aq$ water. (Rammelsberg.)

HypoSulphate of Nickel*ter*amin. Decomposed *(Ammonio Hypo Sulphate of Nickel.)* $N_3\left\{H_9 \,.\, Ni\,O, S_2O_5\right.$ by water. Soluble in warm, less soluble in cold ammonia-water. (Rammelsberg.)

HypoSulphate of Potash. Permanent. Soluble KO, S_2O_5 in 16.5 pts. of water at 16°, and in 1.58 pts. of boiling water.* (Heeren, *Pogg. Ann.*, 1826, 7. 72.) Insoluble in alcohol. (Heeren, *Ibid.*) Soluble in 2.65 pts. of water at 16°. Soluble in alcohol. (Dumas, *Tr.*, 6. 219.)

HypoSulphate of Quinine. Almost as difficultly soluble as the sulphate in cold water; more readily soluble in hot water. (Heeren, *Pogg. Ann.*, 1826, 7. 193.)

HypoSulphate of Silver. Permanent. $AgO, S_2O_5\ \ 2\,Aq$ Soluble in 2 pts. of water at 16°. (Heeren, *Pogg. Ann.*, 7. 191.)

HypoSulphate of Soda. Permanent. Soluble $NaO, S_2O_5\ \ 2\,Aq$ in 2.1 pts. of water at 16°, and in 1.1 pts. of boiling water. Insoluble in alcohol. When the hot aqueous solution is cooled it is very liable to form a supersaturated solution. (Heeren, *Pogg. Ann.*, 1826, 7. pp. 76, 77.)

HypoSulphate of Strontia. Permanent. $SrO, S_2O_5 + 4\,Aq$ Soluble in 4.5 pts. of water at 16°, and in 1.5 pts. of boiling water. Insoluble in alcohol. (Heeren, *Pogg. Ann.*, 7. 177.)

HypoSulphate *of protoxide* **of Tin.** Known only in solution. (Bouquet.)

HypoSulphate of Yttria. Permanent. YO, S_2O_5 Soluble in water. (Berlin.)

HypoSulphate of Zinc. Permanent. Very $ZnO, S_2O_5 + 6\,Aq$ soluble in water, the solution undergoing decomposition when boiled. (Heeren, *Pogg. Ann.*, 7. 183.)

HypoSulphate of Zinc*bi*amin. Decomposed *(Ammonio Hypo Sulphite of Zinc.)* $N_2\left\{H_6 \,.\, Zn\,O, S_2O_5\right.$ by water. Soluble in warm, less soluble in cold ammonia-water. (Rammelsberg.)

HypoSulphEthylic Acid. *Vid.* EthylSulphurous Acid.

HypoSulphIndigotic Acid. Hygroscopic. Readily soluble in water. Its alkaline salts are soluble in alcohol of 0.84 sp. gr.

---

* As with the other hyposulphates, this solubility was determined by placing a known weight of the salt in a tared flask with narrow throat, and dissolved in water; the solution obtained was then boiled down until crystals began to separate, when the whole was allowed to cool. On now weighing the flask and contents, the amount of water necessary to dissolve the salt taken was obtained. The solution being then left to itself in a cool place for about twelve hours, a portion of it was filtered off, weighed, and evaporated to dryness, and from the weight of the residue the solubility of the salt for the lower temperature determined. (Heeren, *loc. cit.*, p. 72, *note.*)

HypoSulphIndigotate of Alumina. Readily soluble in water.

HypoSulphIndigotate of Ammonia. Soluble in water, and alcohol.

HypoSulphIndigotate of Baryta. Readily soluble in pure water.

HypoSulphIndigotate of Lead.

I.) Slowly, but completely soluble in water. Sparingly soluble in alcohol. (Berzelius.)

II.) *basic.* Ppt.

HypoSulphIndigotate of Lime.

I.) *normal.* Readily soluble in water, and alcohol.

II.) *acid.*

HypoSulphIndigotate of Magnesia. Permanent Readily soluble in water, and alcohol. It is not precipitated from the aqueous solution by an excess of solution of a magnesia salt.

HypoSulphIndigotate of Potash. }
HypoSulphIndigotate of Soda. } Readily soluble in water, from which they are precipitated on the addition of a very small quantity of sulphuric acid, and by solutions of various salts. Soluble in alcohol of 0.84 sp. gr.

HypoSulphurous Acid. (*Sulphuretted Sulphurous Acid. Dithionous Acid. Oxide of Sulphur.*) S_2O_2 Not known in the free state. All the alkaline hyposulphites are soluble in water, the baryta salt, however, but slightly. They are all insoluble, or but sparingly soluble, in alcohol.

The hyposulphites, with one or two exceptions, are easily soluble in water. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 10.)

HypoSulphite of Ammonia.

I.) NH_4O, S_2O_2 Exceedingly easily soluble in water. Insoluble, or very sparingly soluble, in alcohol. (Arppe, *Ann. Ch. u. Pharm.*, **96.** 114.)

II.) $3(NH_4O, S_2O_2) + Aq$ Deliquescent. Soluble in water. (Rammelsberg.)

HypoSulphite of Ammonia & of Lead. $2(NH_4O, S_2O_2); PbO, S_2O_2 + 3\,Aq$ Easily soluble in cold water; but after a while a portion of the lead salt is deposited from the solution. (Rammelsberg.)

HypoSulphite of Ammonia & of Magnesia. $NH_4O, S_2O_2; MgO, S_2O_2 + 6\,Aq$ Very deliquescent. Soluble in water. (Kessler.)

HypoSulphite of Ammonia & of Mercury. $4(NH_4O, S_2O_2); HgO, S_2O_2 + 2\,Aq$ Soluble in cold, decomposed by boiling water. (Rammelsberg.)

HypoSulphite of Ammonia & of Silver.

I.) $NH_4O, S_2O_2; AgO, S_2O_2$ (?) Extremely insoluble in water. Readily and abundantly soluble in ammonia-water, from which it is reprecipitated unchanged on the addition of an acid. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 399.)

II.) $2(NH_4O, S_2O_2); AgO, S_2O_2$ Very readily soluble in water; somewhat soluble in alcohol, although precipitated thereby from the saturated aqueous solution. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 398.)

HypoSulphite of Baryta. Very sparingly $BaO, S_2O_2 + Aq$ soluble in water; but soluble in water containing an excess of acid. (Dumas, *Tr.*) Less soluble in alcohol than in water. (Rammelsberg.) Far from being insoluble in water. Insoluble, or very sparingly soluble, in dilute alcohol. (Fordos & Gélis, *Ann. Ch. et Phys.*, (3.) **6.** 489.) Slightly, but perceptibly soluble in cold water. 1 pt. of it could not be dissolved in 2000 pts. of water. But when the solutions from which it is to be precipitated are mixed in a somewhat dilute state, as in the case of a solution containing $\frac{1}{20}$ hyposulphite of lime, some minutes elapse before any cloudiness commences. Soluble in dilute chlorhydric acid without decomposition, no sulphur being separated. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 20.) Dilute alcohol precipitates it from the aqueous solution. (Sobrero & Selmi, *Ann. Ch. et Phys.*, (3.) **28.** 211.)

HypoSulphite of Baryta & of Gold. Slightly soluble in water. Insoluble in alcohol. (Fordos & Gélis.)

HypoSulphite of Baryta & of Lead. Insoluble in water.

HypoSulphite of Baryta & of Mercury (Hg O).

HypoSulphite of Brucin. $N_2\left\{C_{46}H_{26}O_8^{vi}, HO, S_2O_2 + 5\,Aq\right.$ Soluble in 105 pts. of cold water. (How.)

HypoSulphite of Cadmium. CdO, S_2O_2 Very easily soluble in water, and alcohol. When the solution is evaporated to a syrup, decomposition occurs. (Berzelius, *Lehrb.*)

HypoSulphite of Cinchonidin (of Pasteur). Rather difficultly soluble in water. Easily soluble in spirit. (Leers, *Ann. Ch. u. Pharm.*, **82.** 159.)

HypoSulphite of Cinchonin. $N_2\left\{C_{40}H_{24}O_2^{vi}, HO, S_2O_2 + Aq\right.$ Soluble in 205 pts. of cold, more easily soluble in hot water. (How.) Very sparingly soluble in cold water. (Winkler.)

HypoSulphite of Cobalt. Soluble in water. $CoO, S_2O_2 + 6\,Aq$ (Rammelsberg.)

HypoSulphite of Codein. $N\left\{\begin{matrix}C_{36}H_{20}O_6''\\H\end{matrix}\right., HO, S_2O_2 + 5\,Aq$ Soluble in 18 pts. of cold water, and still more easily in hot water, and in alcohol. (How.)

HypoSulphite *of dinoxide* of Copper.

I.) Cu_2O, S_2O_2 Soluble in water. (Herschel.)

II.) $Cu_2O, 3S_2O_2 + 2\,Aq$ Soluble, with combination, in a warm aqueous solution of chloride of ammonium. (v. Hauer.)

HypoSulphite *of protoxide* of Copper & of Lead.

HypoSulphite *of dinoxide* of Copper & *dinoxide* of Mercury. $5(Cu_2O, S_2O_2); 3(Hg_2O, S_2O_2)$ Insoluble, or very sparingly soluble in cold, decomposed by boiling water. (Rammelsberg.)

HypoSulphite *of dinoxide* of Copper & of Potash.

I.) $Cu_2O, S_2O_2; KO, S_2O_2 + 2\,Aq$ Difficultly soluble in water. Decomposed by boiling with water. Easily soluble in an aqueous solution of hyposulphite of potash.

II.) $Cu_2O, S_2O_2; 3(KO, S_2O_2) + 3\,Aq$ More soluble in water than No. I., and the solution is not decomposed by boiling. (Rammelsberg.)

HypoSulphite *of dinoxide* of Copper & of Soda.

I.) $Cu_2O, S_2O_2; 3(NaO, S_2O_2) + 2 Aq$ Insoluble in alcohol. (C. Lenz.)

II.) $3(Cu_2O, S_2O_2); 2(NaO, S_2O_2) + 5 Aq$ Sparingly soluble in water. Easily soluble in an aqueous solution of hyposulphite of soda, and in ammonia-water. Insoluble in alcohol. (Lenz.)

HypoSulphite of Ethylene. *Vid.* Sulphite of Sulphide of Ethyl.

HypoSulphite *of protoxide* of Gold & of Soda. $AuO, S_2O_2; 3(NaO, S_2O_2) + 4 Aq$ Very easily soluble in water; but the solution undergoes decomposition when heated. Alcohol precipitates it from the aqueous solution. (Fordos & Gélis.)

HypoSulphite *of teroxide* of Gold & of Soda. Soluble in water.

HypoSulphite *of protoxide* of Iron.

I.) $2(FeO, S_2O_2) + 5 Aq$ Hygroscopic. Very easily soluble in water, and alcohol. (Kœne.)

II.) Insoluble even in boiling water; slowly soluble in carbonic acid water. (A. Vogel.)

HypoSulphite of Lead. PbO, S_2O_2 Very sparingly soluble, requiring not less than 3266 pts. of water to prevent its precipitation. Somewhat soluble in aqueous solutions of the hyposulphites, especially of hyposulphite of ammonia. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 24.) Easily soluble in aqueous solutions of the alkaline hyposulphites. (Rammelsberg.)

HypoSulphite of Lead & of Lime. $PbO, S_2O_2; 2(CaO, S_2O_2) + 4 Aq$ Partially soluble, with decomposition, in water. Insoluble in alcohol. (Rammelsberg.)

HypoSulphite of Lead & of Potash. $PbO, S_2O_2; 2(KO, S_2O_2) + 2 Aq$ Water dissolves out the potash salt, leaving the lead salt undissolved. Soluble, without decomposition, in a solution of hyposulphite of potash.

HypoSulphite of Lead & of Silver (?). (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 400.)

HypoSulphite of Lead & of Soda. $PbO, S_2O_2; 2(NaO, S_2O_2)$ Sparingly soluble in water. Freely soluble in aqueous solntions of acetate and of hyposulphite of soda. (Lenz.) Insoluble in alcohol.

HypoSulphite of Lead & of Strontia. Soluble in water; from which it is precipitated as a syrup on the addition of alcohol. (Rammelsberg.)

HypoSulphite of Lime. Permanent. $CaO, S_2O_2 + 6 Aq$ Very soluble in water. Soluble in about 1 pt. of water at 2.7°, the temperature falling to — 0.5°. The aqueous solution saturated at 10° is of 1.300 sp. gr. A solution of 1.11437 sp. gr. at 15.5° contains 0.2081 of its weight of the salt. The aqueous solution undergoes decomposition when heated. Insoluble in alcohol of 0.8234 sp. gr. (Herschel, *Edin. Phil. Journ.*, **1.** 15.)

HypoSulphite of Lime & *of protoxide* of Mercury. Ppt. Slightly soluble in an aqueous solution of hyposulphite of lime. (Herschel, *Edin. Phil. Journ.*, **1.** 28.)

HypoSulphite of Lime & of Silver.

I.) $CaO, S_2O_2; AgO, S_2O_2$ (?) Very difficultly soluble in water. Readily and abundantly soluble in ammonia-water. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 400.)

II.) $2(CaO, S_2O_2); AgO, S_2O_2$ (?) Easily soluble in water; less soluble in alcohol. After having been dried in vacuo, it is no longer completely soluble in water. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 399.)

HypoSulphite of Lithia. Readily soluble in water. (Persoz, *Chim. Moléc.*, p. 197.)

HypoSulphite of Magnesia. Permanent. $MgO, S_2O_2 + 6 Aq$ Very soluble in water, much more readily in hot than in cold. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 21.) Alcohol precipitates it from concentrated aqueous solutions.

HypoSulphite of Magnesia & of Potash. $MgO, S_2O_2; KO, S_2O_2 + 6 Aq$ Deliquescent. Easily soluble in water, though less so than hyposulphite of potash. (Rammelsberg.)

HypoSulphite of Manganese. MnO, S_2O_2 Soluble in water, from which it is precipitated on the addition of strong alcohol. (Berzelius.)

HypoSulphite *of protoxide* of Mercury & of Potash. $HgO, S_2O_2; KO, S_2O_2$ Soluble in 10 pts. of water at 15°, and in 0.5 pt. of boiling water. Alcohol precipitates it from the aqueous solution. (Kirchoff.)

HypoSulphite *of protoxide* of Mercury & of Soda. $HgO, S_2O_2; NaO, S_2O_2$ Soluble in water. Insoluble, or but sparingly soluble in alcohol. (Rammelsberg.)

HypoSulphite *of protoxide* of Mercury & of Strontia. Similar to the compound of mercury and baryta.

HypoSulphite of Morphine. $N\left\{\begin{matrix}C_{34}H_{18}O_6''\\H\end{matrix}\right. \cdot HO, S_2O_2 + 4 Aq$ Soluble in 32 pts. of water; and in 1050 pts. of ordinary alcohol. (How.)

HypoSulphite of Nickel. Permanent. $NiO, S_2O_2 + 6 Aq$ Soluble in water; more readily than sulphite of nickel. (Rammelsberg.)

HypoSulphite of Nickel*bi*amin. Soluble (*Ammonio HypoSulphite of Nickel.*) $N_2\left\{H_6 . NiO, S_2O_2 + 6 Aq\right.$ in ammonia-water. Insoluble in alcohol. (Rammelsberg.)

HypoSulphite of Potash.

I.) $3(KO, S_2O_2) + Aq$ Very deliqnescent. Exceedingly easily soluble in water. Insoluble in alcohol. (Rammelsberg, in *Berzelius's Lehrb.*, **3.** 121.) Very deliquescent. Readily soluble in water. (Herschel, *Edin. Phil. Journ.*, **1.** 19.) Insoluble in commercial acetate of ethyl. (Casaseca, *C. R.*, 1850, **30.** 821.)

II.) $3(KO, S_2O_2) + 5 Aq$ Soluble in water, with great reduction of temperature. More soluble in water than No. I.

HypoSulphite of Potash & of Silver. Sparingly soluble in water. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** pp. 27, 398.)

HypoSulphite of Quinine. $C_{40}H_{24}N_2O_4, HO, S_2O_2 + 2 Aq$ Soluble in 300 pts. of cold water. (How.) Very sparingly soluble in cold water. (Winkler.) Soluble in warm, less soluble in cold alcohol. (Wetherill, *Ann. Ch. u. Pharm.*, 1848, **66.** 151.)

HypoSulphite of Silver. AgO, S_2O_2 Slightly soluble in water. Soluble in aqueous solutions of the alkaline hyposulphites; from which solutions alcohol precipitates double salts. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 26.)

HypoSulphite of Silver & of Soda.

I.) $Ag O, S_2 O_2 ; Na O, S_2 O_2 + 2 Aq$ Not very soluble in water. (Herschel, *Edin. Phil. Journ.*, **1.** 398.) Slightly soluble in water; the solution being decomposed by boiling. Soluble in an aqueous solution of hyposulphite of soda, and in ammonia-water. (Lenz.)

II.) $Ag O, S_2 O_2 ; 2 (Na O, S_2 O_2) + 2 Aq$ Permanent. Easily soluble in water; the solution being decomposed by long-continued ebullition. (Herschel.) Easily soluble in ammonia-water; also to a certain extent in alcohol, especially if this be dilute and warm. (Lenz.)

HypoSulphite of Silver & of Strontia. Nearly insoluble in water. Very slightly, if at all, soluble in an aqueous solution of hyposulphite of strontia. Easily soluble in ammonia-water. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 400.)

HypoSulphite of Soda.

a = anhydrous.

$Na O, S_2 O_2$

Soluble in 2.01 pts. of water at 0°
" 1.44 " 20°
" 0.96 " 40°
" 0.52 " 60°

(Kremers, *Pogg. Ann.*, **99.** 50.) Insoluble in commercial acetate of ethyl. (Casaseca, *C. R.*, 1850, **30.** 821.)

b = crystallized.

$Na O, S_2 O_2 + 6 Aq$ Extremely deliquescent. Readily soluble in water. When heated, it melts in its water of crystallization. Totally insoluble in alcohol of 0.8234, which precipitates it as a thick syrup from the aqueous solution. (Herschel, *Edin. Phil. Journ.*, **1.** 19.) Soluble in less than 1 pt. of water, but the aqueous solution decomposes after a time.

"$Na O, S_2 O_2 + 5 Aq$" is soluble in 0.585 pt. of water at 19.5°; or, 100 pts. of water at 19.5° dissolve 171 pts. of it; or, the aqueous solution saturated at 19.5° contains 63.5% of it, or 45.8% of the anhydrous salt, and is of 1.3875 sp. gr. (H. Schiff, *Ann. Ch. u. Pharm.*, 1860, **113.** 350.) The hydrated salt ($Na O, S_2 O_2 + 6 Aq$) melts in its water of crystallization at about 48°. (Kremers, *loc. cit.*, **99.** 50.) When melted in its water of crystallization it deposits a white powder as soon as some of the water has been driven off;—if now the whole be sealed up in a tube, and exposed to a higher temperature, the powder redissolves, and if the solution thus obtained be cooled down gradually, a supersaturated solution will be formed, which may even contain so much as 1 pt. of the anhydrous salt in 0.46 pt. of water at 0°. (Kremers, *Pogg. Ann.*, **94.** 261.)

An aqueous solution of sp. gr. (at 19°)	Contains (by experiment) per cent. of $Na O, S_2 O_2 + 5 Aq.$
1.0338	6.32
1.0674	12.64
1.1030	18.96
1.1396	25.28
1.2170	37.92
1.3434	56.88

From these results Schiff calculates the following table by means of the formula: $D = 1 + 0.005131\ p + 0.00001528\ p^2$; in which D = the sp. gr. of the solution and p the percentage of substance in the solution.

Sp. gr. (at 19°.)	Per cent of $Na O, S_2 O_2 + 5 Aq.$	Per cent of anhyd. $Na O, S_2 O_2$
1.0052	1	0.637
1.0105	2	1.274
1.0158	3	1.911
1.0211	4	2.584
1.0264	5	3.185
1.0317	6	3.822
1.0370	7	4.459
1.0423	8	5.096
1.0476	9	5.734
1.0529	10	6.371
1.0584	11	7.008

(H. Schiff, *Ann. Ch. u. Pharm.*, 1860, **113.** 188.)

HypoSulphite of Strontia. Permanent.

$Sr O, S_2 O_2 + 6 Aq$ Soluble in 6 pts. of cold water. (Gay-Lussac); in about 4 pts. of water at 7.2°, and in 1.75 pts. of boiling water. Insoluble in alcohol, unless very dilute. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 21.) 100 pts. of water at 10° dissolve 16.6 pts. of it. (Ure's *Dict.*)

HypoSulphite of Strychnine. Soluble in

$N_2 \left\} C_{42} H_{22} O_4^{vi}, H O, S_2 O_2 + 3 Aq \right.$ 114 pts. of water. (How.)

HypoSulphite *of protoxide* of Tin. Soluble

$Sn O, S_2 O_2$ in water.

HypoSulphite of Zinc. Easily soluble in

$Zn O, S_2 O_2$ water, and alcohol.

Soluble in water, and alcohol. The solutions are very easily decomposed (Fordos & Gélis, *Ann. Ch. et Phys.*, (3.) **8.** 350.)

HypoSulphite of Zincammonium. Soluble

$N_2 \left\{ \begin{matrix} H_3 \\ Zn \end{matrix} \right. O, S_2 O_2$ in ammonia-water, from which it is precipitated on the addition of alcohol. Decomposed by water. (Rammelsberg.)

HypoSulphoCœurulic Acid. *Vid.* HypoSulphIndigotic Acid.

HypoSulphoGlutic Acid. With a small quantity of water it forms a viscid, glutinous paste. Readily soluble in water, from which it is precipitated as a paste on the addition of sulphuric or chlorhydric acid. Soluble in nitric acid, and is decomposed on boiling therewith. The salts of hyposulphoglutic acid are slightly soluble in cold, more abundantly soluble in warm water. Soluble in alcohol; less soluble in ether. (Berzelius.)

HypoSulphoGlutate of Ammonia. Soluble in water, from which it is precipitated for the most part on the addition of ammonia-water, or carbonate of ammonia. (Berzelius.)

HypoSulphoGlutate of Baryta. Soluble in warm water, from which it is precipitated on cooling. Also soluble in warm alcohol. (Berzelius.)

HypoSulphoGlutate of Lead. Soluble in warm water, from which it is precipitated on cooling. Soluble in warm alcohol. (Berzelius.)

HypoSulphoGlutate of Potash. Soluble in water, from which it is precipitated for the most part on the addition of caustic potash. (Berzelius.)

HypoSulphoGlutate of Soda. Soluble in water, from which it is precipitated for the most part on the addition of caustic soda. (Berzelius.)

HypoSulphoMethylic Acid. *Vid.* MethylSulphurous Acid.

HypoSulphoPhosphoric Acid. *Vid. proto*-Sulphide of Phosphorus.

HypoSulphoPhosphorous Acid. *Vid. di*-Sulphide of Phosphorus.

HypoSulphoPhosphite *of protosulphide* of Copper. $Cu\,S, P\,S$ Insoluble in dilute chlorhydric acid. Slightly soluble in hot concentrated chlorhydric acid, from which it is entirely precipitated on the addition of water. (Berzelius.)

HypoSulphoPhosphite *of disulphide* of Copper.

I.) *mono.* Ppt.
$Cu_2\,S, P\,S$

II.) *di.*
$2\,Cu_2\,S, P\,S$

HypoSulphoPhosphite *of protosulphide* of Iron.

HypoSulphoPhosphite of Manganese. $Mn\,S, P\,S$ Insoluble in water. Decomposed by chlorhydric acid. (Berzelius, *Lehrb.*)

HypoSulphoPhosphite *of protosulphide* of Mercury.

I.) $Hg\,S, P\,S$

II.) $2\,Hg\,S, P\,S$

HypoSulphoPhosphite of Silver.

I.) *normal.* $Ag\,S, P\,S$ Only very slightly acted upon by warm nitric acid of 1.22 sp. gr. (Berzelius, *Lehrb.*)

II.) *basic.* $2\,Ag\,S, P\,S$ Decomposed by nitric acid, which dissolves out half of the sulphide of silver. (*Ibid.*)

HypoSulphoPhosphite of Zinc with SulphoPhosphite of Zinc. $Zn\,S, P\,S; Zn\,S, P_2\,S$ Decomposed by chlorhydric acid.

HypoVanadiate of Ammonia.

HypoVanadiate of Potash. Insoluble in aqueous solutions of potash, ammonia, or carbonate of ammonia, but soluble in solutions of carbonate of potash and carbonate of soda. (Berzelius.)

Hypoxanthin. $C_{10}\,H_4\,N_4\,O_2$ Soluble in 1090 pts. of cold, and in 180 pts. of boiling water. Sparingly soluble in boiling alcohol. Soluble in concentrated sulphuric acid, from which it is not precipitated by water. Almost insoluble in cold, and only sparingly soluble in warm chlorhydric acid. Easily soluble in solutions of caustic potash or ammonia. Insoluble in solutions of the alkaline carbonates. Soluble, with decomposition, in warm nitric acid. (Scherer.)

I.

Ichthidin. Soluble in water. (Fremy.)

Ichthin. Insoluble in water, alcohol, or ether. Soluble in chlorhydric acid. Easily soluble in dilute acetic and phosphoric acids, and in the other strong acids. Insoluble in ammonia-water. Slowly soluble in solutions of potash and soda. (Fremy, *Ann. Ch. et Phys.*, (3.) 50. 150.)

Ichthulin. Insoluble in water, alcohol, or ether. Soluble in acetic, phosphoric, and chlorhydric acids. (Fremy.)

Ichthyocoll. Soluble in cold concentrated chlorhydric acid. Slowly and partially soluble in solutions of the caustic alkalies. (Caventou, *Ann. Ch. et Phys.*, (3.) 8. 329.)

Idrialin. $C_{84}\,H_{28}\,O_2$ Insoluble in boiling water. Scarcely at all soluble in boiling alcohol, or ether. Its best solvent is boiling oil of turpentine. Soluble, with combination, in concentrated sulphuric acid. (Dumas.)

Idryl.
$n\,C_6\,H_2$

α) Very soluble in alcohol, ether, oil of turpentine, and acetic acid.

β) Much less soluble than α. (Bœdeker.)

Igasuric Acid. Said to be identical with Lactic Acid. Very soluble in water, and alcohol. Most of its salts are soluble in water, and alcohol.

Igasurate of Ammonia. Very sparingly soluble in water.

Igasurate of Baryta. Readily soluble in water.

Igasurate of Copper. Sparingly soluble in water.

Igasurate of Lead. Insoluble in water.

Igasurate of Lime. Soluble in water.

Igasurate of Magnesia. Soluble in boiling, less soluble in cold water.

Igasurate of Zinc. Soluble in water. (Pelletier & Caventou.)

Igasurin (from *Nux vomica.*) Rapidly soluble in 200 (100 ?) pts. of boiling water, separating out again quickly as the solution cools; being but sparingly soluble in water at 20°. Igasurin is much more soluble in water than either brucin or strychnine, the last being the least soluble of the three. Readily soluble in alcohol [Soluble in weak alcohol (Parrish's *Pharm.*, p. 410)], chloroform, and the fatty and essential oils. Sparingly soluble in ether. Easily soluble in dilute acids. Somewhat soluble in solutions of the alkalies, especially in a solution of potash. Most of its salts are soluble in water.

Ilexic Acid. Easily soluble in water. Most of its salts appear to be soluble in water.

Ilexate of Baryta. Soluble in water.

Ilexate of Lime. Easily soluble in water. Insoluble in alcohol. (Moldenhauer, *Ann. Ch. u. Pharm.*, **102.** 348.)

Ilicin (from *Ilex aquifolium*). Hygroscopic. Readily soluble in water. Soluble in absolute alcohol. Insoluble in ether.

Permanent. Soluble in water, and alcohol. (Lebourdais, *Ann. Ch. et Phys.*, (3.) **24.** 62.)

b = (from *Ilex opaca*). Soluble in water, and alcohol. Freely soluble in ether. (Pancoast, in Parrish's *Pharm.*, p. 421, from *Amer. J. Pharm.*, **28.** 312.)

Ilixanthin. $C_{32}H_{22}O_{22}$ Almost entirely insoluble in cold water; tolerably easily soluble in hot water. Soluble in alcohol. Insoluble in ether. Easily soluble in concentrated chlorhydric acid. With oxide of lead it forms a compound insoluble in water, but soluble in acetic acid. (Moldenhauer, *Ann. Ch. u. Pharm.*, **102.** 348.)

Imabenzil. $C_{28}H_{11}NO_2 = N\left\{\begin{matrix}C_{28}H_9O_2\\H_2\end{matrix}\right.$ Insoluble in water. Somewhat soluble in a boiling mixture of ether and alcohol, from which it separates on cooling. Insoluble in boiling alcohol, or ether. (Laurent.)

Imasatin. $C_{32}H_{11}N_3O_6$ Insoluble in water or alcohol. Very sparingly soluble in boiling alcohol. Soluble in a solution of caustic potash. When freshly precipitated it is soluble in ammonia-water; but after having been dried, it is insoluble therein. Unacted upon by boiling chlorhydric acid. (Laurent.)

ImeChlorIsatinase. *Vid.* ChlorImesatin.

Imesatin. $C_{16}H_6N_2O_2$ Insoluble in water. Tolerably soluble in boiling alcohol. Very difficultly soluble in ether. (Laurent.) [Insoluble in ether. (Gmelin's *Handbook*.)]

Imid. *Hypothetical.*
NH

Imperatorin. *Vid.* Peucedamin.

Indelibrome. (*BiBromIsamic Acid.*) $C_{32}H_8Br_4N_3O_8$ Insoluble in water. Almost insoluble in alcohol or ether. Unacted upon by a boiling solution of caustic potash, by ammonia-water, or concentrated chlorhydric acid. (Laurent.)

Indican. $C_{52}H_{33}NO_{36}$ Deliquescent. Soluble in water, alcohol, and ether. Decomposed by strong boiling acids, with formation of indigo-blue. (Schunck, *Phil. Mag.*, (4.) **10.** 84.)

Indigo-Blue. (*Indigotin. Oxidized Indigo.*) $C_{16}H_5NO_2$ Insoluble in water, alcohol, ether, fatty or essential oils, weak acids, or alkaline solutions. Soluble, with combination, in concentrated sulphuric acid; also, in fuming sulphuric acid, with evolution of heat.

Hot alcohol dissolves small quantities of indigo-blue, but this separates out almost completely as the solution cools, unless some indigo-red be present in the solution, in which case some indigo-blue will remain dissolved in cold alcohol. (Chevreul.) Sparingly soluble in boiling oil of turpentine, from which it separates on cooling. (Crum.) Insoluble in cold, but pretty readily soluble in hot, carbolic acid; a small portion of alcohol may be mixed with this solution, but the indigo is precipitated on the addition of a large quantity of alcohol. Soluble in creosote. (Reichenbach.) Soluble in fatty acids at temperatures exceeding 100°; on cooling these solutions it separates out. (Weston, *Brandes's Archiv.*, **36.** 371; in Gmelin's *Handbook*, **13.** 45.) Liquid anhydrous sulphuric acid does not act upon indigo-blue (Bussy); nor is it acted upon by phosphoric or by concentrated chlorhydric acids. (Dœbereiner.) Indigo-blue dissolves in cold concentrated sulphuric acid at first with a yellow color which subsequently changes to green, and finally to blue. (Hausmann, *J. de Phys.*, 1788.) While the solution is still yellow, undecomposed indigo-blue may be precipitated by adding water to the solution. It is only as the action of the sulphuric acid progresses that sulphophenic and sulphindigotic acids are gradually formed, and the solution turns blue. This solution is much more complete when effected at 100°. Indigo is more readily soluble in fuming sulphuric acid, in proportion as this contains more anhydrous SO_3; 1½ times as much of the strongest oil of vitriol is required as of the fuming acid.

Indigo-Brown. (*Resinous Indigo-Green.*) Slightly soluble in water; more readily soluble in acids. Soluble in concentrated sulphuric acid. Readily soluble in alcohol, even in the cold. It combines with acids, forming compounds which are slightly soluble in water; also with alkalies forming compounds soluble in water. Soluble in solutions of caustic and carbonated ammonia. When treated with acetic acid it forms two compounds, one of which is soluble, the other insoluble in water.

Indigo-Brown with Baryta. Difficultly soluble in water.

Indigo-Brown with Lime. Insoluble in water.

Indigogene. *Vid.* Indigo-White.

Indigo-Green. Readily soluble in water, and in absolute alcohol. (Berzelius.)

Indigo-Purple. *Vid.* SulphoPhœnicic Acid.

Indigo-Red.

I.) *properly so called.* Insoluble in water. Very readily soluble in alcohol, and ether. It is precipitated from the alcoholic solution on the addition of sulphuric acid.

Slightly soluble in alcohol; more abundantly soluble in ether. (Berzelius.) Very slightly soluble in acetic acid. (Henry.) Soluble in cold creosote. (Reichenbach.) Slightly soluble in solutions of caustic potash and ammonia. Insoluble in hot concentrated solutions of the caustic alkalies, or in dilute acids. Soluble in concentrated sulphuric acid, and the solution thus obtained is miscible with water. Insoluble in concentrated chlorhydric acid, by the action of which, however, it becomes black.

II.) *colorless or deoxidized Indigo-Red.* Insoluble in water, or in aqueous solutions of the caustic alkalies, even when these are highly concentrated and boiling. Very slightly soluble in acetic acid, the solution obtained being miscible with water. Slowly soluble in alcohol and ether. Very slowly, and but partially soluble in concentrated sulphuric acid; in this solution water produces a precipitate. Traces of it are dissolved by concentrated chlorhydric acid, and the solution obtained is miscible with water. Soluble in fuming nitric acid, with conversion to indigo-red (No. I.) and subsequent decomposition.

Indigotic Acid. *Vid.* NitroSalicylic Acid.

Indigotate of Methylene. *Vid.* MethylNitroSalicylic Acid.

Indigotic Ether. *Vid.* EthylNitroSalicylic Acid.

Indigo-White. (*Indigotin. Indigogene. Reduced Indigo.*) $C_{16} H_8 N O_2$ Entirely insoluble in water. Soluble in alcohol, and ether; the solutions being decomposed by contact with the air. Insoluble in such acids as do not decompose it, — as a rule, insoluble in dilute acids. Soluble, with decomposition, in concentrated sulphuric acid. Readily soluble in aqueous solutions of the alkalies, alkaline earths, alkaline carbonates, and carbonate of ammonia. (Berzelius, Liebig.)

Indigo-White with Alumina. Ppt.

Indigo-White with Cobalt. Ppt.

Indigo-White with *protoxide of* **Iron.** Ppt.

Indigo-White with *sesquioxide of* **Iron.** Ppt.

Indigo-White with Lead. Ppt.

Indigo-White with Lime.
I.) *normal.* Readily soluble in water.

II.) *basic.* Almost insoluble in water. Very sparingly soluble in water. (Berzelius.)

Indigo-White with Magnesia. Very sparingly soluble in water.

Indigo-White with Manganese.
Indigo-White with Silver.
Indigo-White with Tin.
Indigo-White with Zinc.
} Ppts.

Indigo-Yellow. *Vid.* SulphoFlavic Acid.

Indihumin. Insoluble in boiling alcohol. Soluble in caustic alkalies. (Schunck.)

Indin. $C_{32} H_{10} N_2 O_4$ Insoluble in water. Very sparingly soluble in boiling alcohol, and ether. Soluble in concentrated sulphuric acid, from which it is precipitated unchanged on the addition of water. (Laurent.)

Indin with Potassium. $C_{32} H_9 K N_2 O_4$ Hygroscopic. Insoluble, or very sparingly soluble in cold, absolute alcohol.

Indiretin. Soluble in alcohol, and in ammonia-water. (Schunck.)

Indirubin. Soluble in alcohol. Insoluble in solutions of the caustic alkalies. (Schunck.)

Inosic Acid. (*Inosinic Acid.*) $C_{10} H_7 N_2 O_{11} = C_{10} H_0 N_2 O_{10}, H O$ Readily soluble in water. (Liebig.) Almost insoluble in alcohol. Insoluble in ether.

Its alkaline salts are easily soluble in water; they crystallize out when alcohol is added to the concentrated aqueous solution. All the other salts are sparingly soluble in water. (Parrish's *Pharm.*, p. 381.)

Inosate of Baryta. $C_{10} H_8 Ba N_2 O_{11} + 7 Aq$ Effloresces in dry air. Soluble in 400 pts. of water at 15°, and more readily in hot water; but is less soluble in water at 100° than at 70°; if a solution saturated at 70° be boiled, a portion of the salt will be precipitated, with partial alteration. If a quantity of the salt which would dissolve in a certain quantity of water at 60° @ 70° be heated to the boiling-point with the same quantity of water, a portion of the salt will remain undissolved, and by continued boiling will even lose its power of dissolving in water of a lower temperature. (Liebig.) Insoluble in alcohol.

Inosate of Copper. Almost insoluble in water. Insoluble in acetic acid. Soluble in ammonia-water. (Liebig.)

Inosate of Potash. $C_{10} H_8 K N_2 O_{11} + 7 Aq$ Readily soluble in water. Insoluble in alcohol.

Inosate of Soda. Very easily soluble in water. Insoluble in alcohol.

Inosate of Silver. Sparingly soluble in water; less soluble in an aqueous solution of nitrate of silver. Readily soluble in ammonia-water and in nitric acid. (Liebig.)

Inosinic Acid. *Vid.* Inosic Acid.

Inosite. (*Phaseomannite.*) $C_{12} H_{12} O_{12} + 4 Aq$ Efflorescent. Soluble in 6.5 pts. of water at 24°; more soluble in hot water. Soluble in boiling dilute spirit; insoluble in cold spirit, or in ether. (Cloetta, *Ann. Ch. u. Pharm.*, **99.** 291.) Easily soluble in water, and in weak alcohol. Difficultly soluble or insoluble in absolute alcohol, or ether. After the water of crystallization has been removed by drying, the substance is less readily soluble in water, until by taking up water it regains its original properties. Soluble in cold concentrated sulphuric acid; but is partially decomposed if this solution is heated. (Vohl, *Ann. Ch. u. Pharm.*, **99.** 126.)

Inosite with Oxide of Lead. $C_{12} H_{12} O_{12}; 5 Pb O$ Insoluble in water, or spirit. (Cloetta, *loc. cit.*)

Insolinic Acid. (*Cumino Cyminic Acid.*) $C_{18} H_8 O_8 = C_{18} H_0 O_0, 2 H O$ Almost entirely insoluble in cold, sparingly soluble in boiling-water. Insoluble in alcohol. (Persoz.) Almost insoluble in alcohol. (Hofmann.) Insoluble in ether. Soluble in cold and in boiling concentrated sulphuric acid, from which it is precipitated unchanged on the addition of water. (Hofmann.) Insoluble in concentrated sulphuric acid, but after having been boiled with it for a few minutes it becomes soluble in water. (Persoz.)

Insolinate of Ammonia. Soluble in water.

Insolinate of Baryta. $C_{18} H_6 Ba_2 O_8$ Insoluble, or but sparingly soluble, in cold water.

Insolinate of Copper. Ppt.
$C_{18} H_6 Cu_2 O_8; Cu O, H O$

Insolinate of Lime. $C_{18} H_0 Ca_2 O_8 + 6 Aq$ Insoluble, or but sparingly soluble, in water.

Insolinate of Potash.
I.) *normal.* $C_{18} H_6 K_2 O_8$ Soluble in water. Insoluble, or but sparingly soluble, in strong alcohol.

II.) *acid.* $C_{18} H_7 K O_8$ Soluble in hot water.

Insolinate of Potash & of Soda. $C_{18} H_0 K Na O_8$ Soluble in water, from which it is precipitated on the addition of alcohol.

Insolinate of Silver. Ppt.
$C_{18} H_8 Ag_2 O_8$

Inulin. (*Dahlin. Alantin. Elecampin. Helenine. Menyanthin. Datiscin.*) $C_{12} H_{10} O_{10}$ & $+ 3 Aq$ Sparingly soluble in cold, readily soluble in hot water. It forms no paste with water. Insoluble in alcohol. Decomposed by hot dilute acids. Soluble in an aqueous solution of caustic potash.

Soluble in 600 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) Soluble in 200 pts. of water at 10°. Abundantly soluble in water at 66°. When the aqueous solution is heated for a long time to a temperature approaching 100°, the inulin is gradually converted into fruit-sugar. (Dubrunfaut, in *Wittstein's Handw.*)

IodAcetic Acid. Soluble in water.
$C_4 H_3 I O_4 = C_4 H_2 I O_3, H O$

IodAcetate of Ammonia. Permanent. Very soluble in water.

IodAcetate of Amyl. Insoluble, or but sparingly soluble in water.

IodAcetate of Baryta. Moderately soluble
$C_4 H_2 I Ba O_4$ in water, from which it is precipitated by alcohol.

IodAcetate of Ethyl. Insoluble, or but sparingly soluble in water. Soluble in alcohol.

IodAcetate of Lead. Soluble in water.

IodAcetate of Potash. Permanent. Very soluble in water. (Perkin & Duppa.)

IodAcetyl. *Vid.* Iodide of Acetyl; and also IodEthylene.

· Iodal. Insoluble in water.

IodAmyl. *Vid.* Iodide of Amyl.

IodAnilin. Very sparingly soluble in water,
$C_{12} H_6 I N = N \left\{ \begin{matrix} C_{12} H_4 I \\ H_2 \end{matrix} \right.$ though more soluble in hot than in cold. Soluble in alcohol, ether, wood-spirit, acetone, bisulphide of carbon, and the fatty and essential oils. (Hofmann, *J. Ch. Soc.*, **1.** 275.) Its salts are generally less soluble than those of anilin. (Hofmann.)

IodAnisic Acid. Almost insoluble in water.
$C_{16} H_7 I O_6 = C_{16} H_6 I O_5, H O$ Easily soluble in alcohol, and ether. (Griess.)

IodAnisate of Silver. Ppt.
$C_{16} H_6 I Ag O_6$

IodArseniate of *X*. *Vid.* Iodide of Arsenic with Iodide of *X*.

Iodic Acid.

a = anhydrous. Permanent, but deliquesces in
$I O_5$ moist air. (H. Davy.) Very soluble in pure water; less soluble in water acidulated with sulphuric or nitric acids.

Somewhat soluble in dilute alcohol, but is almost entirely precipitated from the aqueous solution by adding concentrated alcohol and allowing the mixture to stand for some time. (Sérullas, *Ann. Ch. et Phys.*, (2.) **45.** 281.) Tolerably readily soluble in alcohol of 35° B.; insoluble in absolute alcohol. (Millon, *Ann. Ch. et Phys.*, (3.) **9.** pp. 405, 406.) Soluble in ether. (Graham's *Elements.*) Soluble in concentrated sulphuric acid. (Millon.)

b = monohydrated. Soluble in all proportions
$I O_5, H O$ in water. Insoluble in absolute alcohol; very soluble in alcohol of 35° B., which dissolves nearly half its weight. (Millon, *Ann. Ch. et Phys.*, (3.) **9.** pp. 405, 406.)

c = trihydrated. Soluble in water. (Millon,
$3 I O_5, H O$ *loc. cit.*) Very sparingly soluble in alcohol. (Sérullas.) Insoluble in absolute alcohol; almost insoluble at ordinary temperatures in alcohol of 35° B.; only faint traces are dissolved by boiling alcohol. (Millon, *Ann. Ch. et Phys.*, (3.) **9.** pp. 405, 406.) Most of the metallic iodates are insoluble, or but sparingly soluble, in water. According to Dumas [*Tr.*], they are all insoluble in water, excepting the potash and soda salts. They are also all insoluble or very sparingly soluble in alcohol. (Gmelin's *Handbook.*)

Iodate of Alumina. Deliquescent. (Ber-
$Al_2 O_3, 3 I O_5$ zelius, *Lehrb.*, **3.** 479.)

Iodate of Ammonia. Soluble in 38.5 pts. of
$N H_4 O, I O_5$ water at 15°, and in 6.9 pts. at the temperature of boiling. (Rammelsberg.)

Iodate of Ammonia & of Cobalt Decomposed by water. Insoluble in alcohol. (Rammelsberg.)

Iodate of Baryta. Permanent. Very diffi-
$Ba O, I O_5 + Aq$ cultly soluble either in hot or in cold water. Soluble in 3333 pts. of water at 18°, and in 625 pts. of boiling water. (Gay-Lussac); in 1746 pts. of water at 15°, and in 600 pts. at the boiling temperature. (Rammelsberg.) The anhydrous salt is soluble in 3018 pts. water at 13.5°, and in 681 pts. at 100°. (Kremers, *Pogg. Ann.*, **94.** 271.) Insoluble in alcohol. Readily soluble in chlorhydric acid; difficultly soluble in warm nitric acid. (Filhol.)

Iodate of Bismuth. Insoluble in water.
$Bi O_3, I O_5$ Difficultly soluble in nitric acid.

Iodate of Brucin. Soluble in water, and alcohol. (Sérullas, *Ann. Ch. et Phys.*, 1830, (2.) **45.** pp. 275, 276). On adding an excess of strong iodic acid to a concentrated aqueous solution of iodate or chlorate of brucin a very acid iodate of brucin separates out, and may be entirely precipitated by adding strong alcohol; this acid salt undergoes alteration after a time, when exposed to the air. (*Ibid.*, pp. 277, 280.)

Iodate of Cadmium. Very sparingly soluble
$Cd O, I O_5$ in water; more readily soluble in ammonia-water, and nitric acid. Soluble in an aqueous solution of acetate of cadmium.

Iodate *of sesquioxide* of Chromium. Insoluble in water. (Berlin.)

Iodate of Cinchonin. Readily soluble in
$C_{40} H_{24} N_2 O_2, H O, I O_5$ water, and alcohol. (Regnault.) Soluble in water, and alcohol. (Sérullas, *Ann. Ch. et Phys.*, 1830, (2.) **45.** pp. 274, 276.) On adding an excess of strong iodic acid to a concentrated aqueous solution of iodate or chlorate of cinchonin, a very acid iodate of cinchonin separates out, and may be entirely precipitated by adding strong alcohol; this acid salt undergoes alteration after a time when exposed to the air. (*Ibid.*, pp. 277, 280.)

Iodate of Cobalt. Soluble in 148 [140] pts.
$Co O, I O_5 + Aq$ of water at 15°, and in 90 pts. at the temperature of boiling. (Rammelsberg.) Soluble in ammonia-water, from which alcohol precipitates a basic salt.

Iodate of Codein. Very soluble in pure water; less soluble in water acidulated with iodic acid. (Pelletier.)

Iodate of Copper. Soluble in 302 pts. of
$Cu O, I O_5 + \frac{1}{2} Aq$ water at 15°, and in 154.5 pts. at the boiling temperature. Easily soluble in ammonia-water, and in chlorhydric acid, with evolution of chlorine. (Rammelsberg.) Millon describes several other iodates of copper, as follows:—

1*st modification* (*probably hydrated*). Easily changed. Tolerably soluble in water. It undergoes a change and is precipitated on heating the solution. (Millon, *loc. cit.*, p. 424.)

2*d modif.* Completely insoluble in water. CuO, IO_5, HO

3*d modif.* Insoluble in water. $3CuO, IO_5, 2HO$

4*th modif.* Insoluble in water. (Millon, *Ann. Ch. et Phys.*, (3.) **9.** pp. 424–430.) $6CuO, 3IO_5, HO$

Iodate of Cupr(*ic*)*bi*amin. $N_2\{H_6.Cu, I + 3Aq$ Soluble in ammonia-water. Partially soluble in water. Insoluble in alcohol. (Rammelsberg.)

Iodate of Gold (AuO_3). Soluble in much water. (Pleischl.)

Iodate *of protoxide* of Iron. FeO, IO_5 Sparingly soluble in water. Readily soluble in an aqueous solution of protosulphate of iron; the solution undergoing decomposition when boiled. (Geiger.)

Iodate *of sesquioxide* of Iron.

I.) *normal.* $Fe_2O_3, 3IO_5$ Soluble in 500 pts. of cold water. On boiling the aqueous solution decomposition ensues, and a basic salt is precipitated. Readily soluble in an aqueous solution of sesquichloride of iron. (Geiger.)

II.) *bi.* $Fe_2O_3, 2IO_5 + 8Aq$ Sparingly soluble in nitric acid. (Rammelsberg.)

III.) *basic.* $3Fe_2O_3, 5IO_5 + 12Aq$ Soluble, with decomposition, in nitric and chlorhydric acids.

Iodate of Lead. PbO, IO_5 Very sparingly soluble in water. Difficultly soluble in nitric acid. (Rammelsberg.)

Iodate of Lime.

I.) *anhydrous.* CaO, IO_5 100 pts. of water dissolve 0.22 pt. of it at 18°, and 0.98 pt. at 100°, i. e. 1 pt. of the salt is soluble in 454.5 pts. of water at 18°, and in 102 pts. at 100°. (Gay-Lussac, in *Dumas's Traité*, **6.** 275.) Very sparingly soluble in water. (Sérullas, *Ann. Ch. et Phys.*, 1830, (2.) **45.** 279.) Readily soluble in chlorhydric acid.

II.) *hydrated.* $CaO, IO_5 + 5, \text{ or } 6, Aq$ Efflorescent. Soluble in 253 pts. of water at 15°, and in 75 pts. at the boiling temperature; it is much more readily soluble in nitric acid. (Rammelsberg.) Alcohol precipitates it from the aqueous solution. (O. Henry.)

Iodate of Lithia. LiO, IO_5 Soluble in 2 pts. of cold water; it is not much more soluble in hot water. Insoluble in spirit. (Rammelsberg.)

Iodate of Magnesia. $MgO, IO_5 + 4Aq$ Soluble in 9.43 pts. of water at 15°, and in 3.04 pts. at 100°. (Berzelius, *Lehrb.*, **3.** 444.) Very sparingly soluble in water. (Sérullas, *Ann. Ch. et Phys.*, 1830, (2.) **45.** pp. 279, 281, 275.) Very soluble in water. When heated to 240° @ 250° the salt passes into another modification, which is completely insoluble in water. By long-continued boiling with water, however, the insoluble modification itself undergoes change, and the salt is slowly dissolved. (Millon, *Ann. Ch. et Phys.*, (3.) **9.** 423.)

Iodate of Manganese. $MnO, IO_5 + Aq$ Soluble in 200 pts. of water. (Rammelsberg.)

Iodate *of dinoxide* of Mercury. Hg_2O, IO_5 Insoluble in water, and is not altered by boiling water. (Lefort.)

Very slightly soluble in water. Soluble in dilute chlorhydric, nitric, and iodic acids. (Pleischl.)

Iodate *of protoxide* of Mercury. HgO, IO_5 Entirely insoluble in water or alcohol. (Millon, *Ann. Ch. et Phys.*, (3.) **18.** 367.) Soluble in water. (Berzelius, *Lehrb.*, **3.** 901.) Soluble in dilute chlorhydric acid. (Rammelsberg.)

Iodate of *tetra*Methylammonium. $N(C_2H_3)_4O, IO_5$ Soluble in water. (Weltzien.)

Iodate of Nickel. $NiO, IO_5 + Aq$ Soluble in 120.3 pts. of water at 15°, and in 77.35 pts. at the boiling temperature. (Rammelsberg.)

Iodate of Nickel*bi*amin. (*Ammonio Iodate of Nickel.*) $N_2\{H_6.NiO, IO_5$ Soluble in ammonia-water. Insoluble in alcohol. (Rammelsberg.)

Iodate of Nicotine.

I.) *acid.* Soluble in water. Nearly insoluble in alcohol. (Henry & Boutron.)

Iodate of Palladium.

Iodate *of binoxide* of Platinum. Somewhat soluble in water. (Pleischl.)

Iodate of Potash.

I.) KO, IO_5 Permanent. 1 pt. of the anhydrous salt is soluble in 13 [13.45 (T.)] pts. of water at 14°. (Gay-Lussac.)

Soluble in	19.02	pts. of water at	+ 0.5°
"	14.85	"	9.4°
"	10.97	"	22.2°
"	5.95	"	45.8°
"	3.67	"	69.2°

(Kremers, *Pogg. Ann.*, **94.** 271.)

	I.	II.	III.		
Soluble in	19.17	21.11	21.22	pts. of water at	0°
"	11.65	12.29		"	20°
"	6.88	7.76		"	40°
"	4.37	5.40		"	60°
"		4.02		"	80°
"		3.10		"	100°

The results in column I. were determined immediately after the solution had fallen to the given temperatures. Those in column II. represent another series of experiments, in which the solutions were allowed to stand for an hour at the temperatures indicated, being frequently agitated the while; like the 1st series, they were cooled down from higher temperatures. Column III. is another series of experiments, in which the solutions stood at the given temperatures during 10 hours. The saturated aqueous solution boils at 102°. (Kremers, *Pogg. Ann.*, **97.** 5.) 100 pts. of water at 14° dissolve 7.43 pts. of it. (T.) 100 pts. of water at 15.5° dissolve 7.7 pts. of it. (Ure's *Dict.*) An aqueous solution of 1.0741 sp. gr. at 19.5°, contains 9.08 pts. of KO, IO_5 for every 100 pts. of water. (Kremers, *Pogg. Ann.*, **95.** 121.) More soluble in an aqueous solution of iodide of potassium than in water. Insoluble in alcohol of 0.81 sp. gr. Soluble, without decomposition of the iodic acid, in warm sulphuric acid. (Berzelius, *Lehrb.*)

II.) *bin.* $KO, HO, 2IO_5$ Soluble in 75 pts. of water at 15°. Insoluble in alcohol. (Sérullas.)

III.) *ter.* $KO, HO, 3IO_5$ Soluble in 25 pts. of water at 15°. (Sérullas.)

IV.) *basic.* Soluble in water. (Berzelius, *Lehrb.*, **3.** 150.)

***Bin*Iodate of Potash with *bi*Sulphate of Potash.** $KO, 2IO_5; KO, 2SO_3 + 2Aq$ More soluble in water than the biniodate of potash. (Sérullas.)

Iodate of Quinine. Tolerably easily soluble in water. Also soluble in alcohol. (Sérullas, *Ann. Ch. et Phys.*, 1830, (2.) **45.** pp. 274, 276.) On adding an excess of strong iodic acid to a concentrated aqueous solution of iodate, chlorate or acid-sulphate of quinine, a very acid iodate of quinine separates out, and may be entirely precipitated by adding strong alcohol; this acid salt undergoes alteration after a time when exposed to the air. (*Ibid.*, pp. 277, 280, 282.)

Iodate of Silver. Insoluble in water. Sparingly soluble in nitric acid. (Benckiser.) Easily soluble in ammonia-water. (Gay-Lussac.)
$Ag\,O, I\,O_5$

Iodate of Soda.

I.) *anhydrous.*
$Na\,O, I\,O_5$

Soluble in	39.75 pts. of water at		0°
"	11.03	"	20°
"	6.95	"	40°
"	4.79	"	60°
"	3.61	"	80°
"	2.95	"	100°

The saturated aqueous solution boils at 102°. (Kremers, *Pogg. Ann.*, **97.** pp. 5, 8.) 100 pts. of water at 14° dissolve 7.3 pts. of it. [T.] It is the most soluble of any of the iodates. (Millon, *Ann. Ch. et Phys.*, (3.) **9.** 418.) An aqueous solution of 1.0698 sp. gr., at 19.5°, contains 8.13 pts. of it for every 100 pts. of water. (Kremers, *Pogg. Ann.*, **99.** 444.) Less soluble than chloride of sodium in water. (Duflos, *Schweig.*, **62.** 390.) Insoluble in alcohol. Soluble in dilute acetic acid.

II.) *hydrated.* Millon (*loc. cit.*) thinks it probable that the following hydrates have different degrees of solubility.

$a = Na\,O, I\,O_5 + 2\,Aq$

$b = Na\,O, I\,O_5 + 6\,Aq$

$c = Na\,O, I\,O_5 + 10\,Aq$ Soluble in 13.8 pts. of water at 14.5°. Insoluble in alcohol. (Gay-Lussac.)

III.) *bi.* Soluble in water. The acid iodates of soda are extremely soluble in water. (Millon, *Ann. Ch. et Phys.*, (3.) **9.** 421.)
$Na\,O, 2\,I\,O_5$

Iodate of Soda with Iodide of Sodium.

I.) $Na\,O, I\,O_5; Na\,I + 20\,Aq$
II.) $2\,Na\,O, I\,O_5; 3\,Na\,I + 38\,Aq$
Soluble in cold water. Decomposed by hot water and by cold alcohol, which dissolves out the iodide. (Mitscherlich; Penny.)

Iodate of $\frac{2}{3}$ StannEthyl. Less soluble in alcohol than the iodide.

Iodate of $\frac{4}{5}$ StannMethyl. Similar to the salt of $\frac{2}{3}$.

Iodate of Strontia.

I.) *anhydrous.* Readily soluble in chlorhydric acid. (Rammelsberg.)
$Sr\,O, I\,O_5$

II.) *hydrated.* So difficultly soluble in water that it is precipitated, even from hot solutions, when solutions of iodate of soda and chloride of strontium are mixed. (Berzelius, *Lehrb.*, **3.** 389.) Soluble in 4 pts. of cold, and in 1.3[?] pts. of boiling water. (Wittstein's *Handw.*, **1.** 723.) 100 pts. of water at 15.5° dissolve 24 pts. of it. (Ure's *Dict.*)
$a = Sr\,O, I\,O_5 + Aq$

$b = Sr\,O, I\,O_5 + 6\,Aq$ Soluble in 416 pts. of water at 15°, and in 138 pts. of boiling water (Gay-Lussac); in 342 pts. of water at 15°, and in 110 pts. at the boiling temperature. Difficultly soluble in warm nitric acid. (Rammelsberg.)

Iodate of Strychnine. Very soluble in water. Also soluble in alcohol. (Sérullas, *Ann. Ch. et Phys.*, 1830, (2.) **45.** pp. 275, 276.) On adding an excess of strong iodic acid to a concentrated aqueous solution of iodate or chlorate of strychnine a very acid iodate of strychnine separates out, and may be entirely precipitated by adding strong alcohol; this acid salt undergoes alteration after a time when exposed to the air. (*Ibid.*, pp. 277, 280.)

Iodate *of protoxide* of Tin. Soluble in an aqueous solution of protochloride of tin. Insoluble in an aqueous solution of iodate of soda.
$Sn\,O, I\,O_5$

Iodate *of binoxide* of Tin.

Iodate *of protoxide* of Uranium. Insoluble in water; soluble in an aqueous solution of protochloride of uranium.

Iodate *of sesquioxide* of Uranium. Difficultly soluble in water. (Pleischl.) Insoluble in water. Difficultly soluble in nitric acid. (Berzelius, *Lehrb.*, **3.** 1111.)
$Ur_2\,O_3, I\,O_5 + 5\,Aq$

Iodate of Veratrin. Soluble in water, and alcohol. (Sérullas, *Ann. Ch. et Phys.*, (2.) **45.** pp. 275, 276.) On adding an excess of strong iodic acid to a concentrated aqueous solution of iodate or chlorate of veratrin a very acid iodate of veratrin separates out, and may be entirely precipitated by adding strong alcohol; this acid salt undergoes alteration after a time when exposed to the air. (*Ibid.*, pp. 277, 280.)

Iodate of Yttria. Soluble in 190 pts. of water. (Berlin.)

Iodate of Zinc. Soluble in 114 pts. of water at 15°, and in 76 pts. at the temperature of boiling. (Rammelsberg.) Soluble in nitric acid and in ammonia-water.
$Zn\,O, I\,O_5 + 2\,Aq$

IodAuric Acid. *Vid. ter*Iodide of Gold.

IodAurate of Ammonium. Deliquescent.

IodAurate of Barium. Soluble in an aqueous solution of iodide of barium.

IodAurate of Iron. Soluble in an aqueous solution of protiodide of iron.

IodAurate of Potassium. Soluble, with partial decomposition, in water. Soluble, in a dilute aqueous solution of iodide of potassium and in iodhydric acid. (Johnston.)
$K\,I, Au\,I_3$

IodAurate of Sodium. Deliquescent. Soluble in water. (Johnston.)
$Na\,I, Au\,I_3 + x\,Aq$

IodAurate of Strontium.

*Bin*IodEthylamin. Soluble in alcohol, and ether. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **40.** 478.)
$N_2\left\{\begin{matrix}C_4\,H_3\,I_2\\H_2\end{matrix}\right.$

IodEthylene. Insoluble in water. Very soluble in alcohol, and ether. (E. Kopp.) Unacted on by cold sulphuric, chlorhydric, or nitric (fuming) acids.
(*Iodide of Aldehydene. Iodide of Acetyl. IodAcetyl. Ethylene iodé.*)
$C_4\,H_3\,I$

Iodhydric Acid. Very soluble in water. As soluble as chlorhydric acid in water. (*Ot. Gr.*) Soluble in alcohol.
(*Hydriodic Acid.*)
$H\,I$

"Iodhydrate of Amylene." *Vid.* Iodide of Amyl.

Iodhydrate of AmylFurfurin. Difficultly soluble in water. (Davidson.)
$N_2 \{ C_{30} H_{11} (C_{10} H_{11}) O_6, HI$

Iodhydrate of AmylLepidin. Sparingly soluble in water.
$C_{20} H_6 (C_{10} H_{11}) N, HI$

Iodhydrate of AmylPiperidin. Soluble in water. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 99.)
$C_{20} H_{21} N, HI$

Iodhydrate of AmylQuinolein. *Vid.* Iodide of AmylQuinolein.

Iodhydrate of Anilin. Exceedingly soluble in water, and in alcohol; somewhat less soluble in ether. (Hofmann, *J. Ch. Soc.*, **1.** 271.)
$C_{12} H_7 N, HI$

Iodhydrate of Anisamic Acid. Soluble in water.
$C_{16} H_9 O_6, HI$

Iodhydrate of Aricin. Very sparingly soluble in water. More soluble in alcohol, especially if this be warm.
$C_{46} H_{26} N_2 O_6, HI$

Iodhydrate of Benzylene. *Vid.* Iodide of Toluenyl.

Iodhydrate of Bismuth. Decomposed by water. Soluble in an aqueous solution of iodide of potassium.
$Bi I_3, HI + 8 Aq$

Iodhydrate of Brucin. Sparingly soluble in cold, more soluble in warm water. More soluble in alcohol than in water.
$C_{46} H_{26} N_2 O_8, HI + 4 Aq$

Iodhydrate of Cajputene.

I.) *anhydrous.* Soluble in alcohol, and ether. Is not altered by boiling with an aqueous solution of caustic potash. (Max. Schmidl.)
$C_{20} H_{16}, HI$

II.) *hydrated.* Very deliquescent. Insoluble in water, and is not decomposed thereby. Very soluble in alcohol, and ether. (Schmidl.)
$C_{20} H_{16}, HI + Aq$

Iodhydrate of Caoutchin.

Iodhydrate of Caprylamin. *Vid.* Iodhydrate of Octylamin.

"*Proto*Iodhydrate of Carbon" (of Sérullas). *Vid.* Iodide of Methylene.

Iodhydrate of *di*CetylAnilin. Soluble in alcohol.

Iodhydrate of αCinchonin. Soluble in boiling water; much less soluble in water than the chlorhydrate. Readily soluble in cold alcohol.
$C_{40} H_{24} N_2 O_2, HI + 2 Aq$

Iodhydrate of βCinchonin. Easily soluble in water, and alcohol. (W. Schwabe, *Kopp & Will's J. B., für* 1860, p. 364.)

Iodhydrate of Cinebene. Insoluble, or but sparingly soluble, in water. (Hirzel.)
$2 C_{20} H_{16}, HI$

Iodhydrate of Codein. Soluble in about 60 pts. of cold water, much more soluble in hot water.
$C_{36} H_{21} N O_6, HI + 2 Aq$

Iodhydrate of Coniin. Very soluble in water, alcohol, and ether. (Blyth, *J. Ch. Soc.*, **1.** 353.)

Iodhydrate of Coniin with *prot*Iodide of Mercury. Insoluble in water or chlorhydric acid. (v. Planta.)

Iodhydrate of Cotarnin. Insoluble in cold, readily soluble in boiling water. (How.)
$N \{ C_{26} H_{13} O_6''', HI$

Iodhydrate of Cumidin. Is the most soluble of all the salts of cumidin. (Nicholson, *J. Ch. Soc.*, **1.** 9.)

Iodhydrate of CyanAnilin. Soluble in water, and alcohol; the solutions undergo decomposition when evaporated.

Iodhydrate of EthylAcetosamin. Soluble in water. (Natanson.)

Iodhydrate of Ethylamin.

Iodhydrate of Ethylamin,
Iodhydrate of *di*Ethylamin,
Iodhydrate of *tri*Ethylamin, } with *prot*Iodide of Mercury.

All these compounds are extremely soluble in alcohol, and ether. They are decomposed by water. (Sonnenschein.)

Iodhydrate of Ethyl*bi*BromAllylamin. Soluble in warm water. (Simpson.)

Iodhydrate of EthylBrucin. Insoluble in water. Readily soluble in boiling alcohol.
$N_2 \{ C_{46} H_{25} (C_4 H_5) O_8, HI + Aq$

Iodhydrate of EthylCaprylamin. *Vid.* Iodhydrate of EthylOctylamin.

Iodhydrate of EthylCodein. Readily soluble in cold water, less soluble in alcohol. (How, *J. Ch. Soc.*, **6.** 134.)
$C_{36} H_{20} (C_4 H_5) N O_6, HI$

Iodhydrate of EthylConiin.

Iodhydrate of EthylFurfurin. Soluble in alcohol. (Davidson.)

Iodhydrate of EthylLepidin.

Iodhydrate of EthylMorphine. Permanent. Readily soluble in boiling, less soluble in cold water. Difficultly soluble in absolute alcohol, more easily soluble in ordinary alcohol. (How, *J. Ch. Soc.*, **6.** 128.)
$C_{34} H_{18} (C_4 H_5) N O_6, HI + Aq$

Iodhydrate of EthylNaphthylamin. About as soluble as the bromhydrate. (Schiff.)

Iodhydrate of EthylOctylamin.
(Iodhydrate of EthylCaprylamin.)

$$C_{20} H_{24} N I = N \left\{ \begin{matrix} C_{16} H_{17} \\ C_4 H_5 \\ H \end{matrix} \right. . HI$$

Iodhydrate of *tri*EthylPhosphin.

Iodhydrate of EthylPhthalidin. Soluble in water. (Dusart, *Ann. Ch. et Phys.*, (3.) **45.** 338.)

Iodhydrate of EthylPicolin. *Vid.* Iodide of EthylPicolin.

Iodhydrate of EthylQuinine. Easily soluble in boiling, sparingly soluble in cold water. Soluble in alcohol. Insoluble in ether. Soluble in ammonia-water; but insoluble in potash-lye. (Strecker, *Ann. Ch. u. Pharm.*, **91.** 163.)
$N_2 \{ C_{40} H_{23} (C_4 H_5) O_4^{vi} \}, HI$

Iodhydrate of EthylQuinolein. *Vid.* Iodide of EthylQuinolein.

Iodhydrate of EthylStrychnine. Permanent. Soluble in about 170 pts. of water at 15°, and in from 50 to 60 pts. of boiling water. Soluble in alcohol. Less soluble in alkaline solutions than in pure water. (How.)
$N_2 \{ C_{42} H_{21} (C_4 H_5) O_4^{vi}, HI$

Iodhydrate of EthylThioSinamin. Soluble in water, alcohol, and ether. (Weltzien, *Ann. Ch. u. Pharm.*, **94.** 104.)
$C_{12} H_{12} N_2 S_2, HI$

Iodhydrate of EthylToluidin.
$N\left\{\begin{matrix}C_{14}H_7\\C_4H_5\\H\end{matrix}\right\}HI$

Iodhydrate of *di*EthylToluidin. Extremely soluble in water. Apparently decomposed by alcohol. Soluble in iodide of ethyl. (Morley & Abel, *J. Ch. Soc.*, **7.** 72.)
$C_{22}H_{17}N, HI$

Iodhydrate of Guanin. Sparingly soluble in pure water. Easily soluble in water acidulated with iodhydric acid.
$3(C_{10}H_5N_5O_2, HI) + 7 Aq$

Iodhydrate of Harmin.

Iodhydrate of IodAnilin. Soluble in water, and alcohol; more so than the chlorhydrate or bromhydrate. (Hofmann, *J. Ch. Soc.*, **1.** 276.)

Iodhydrate of Lophin. More soluble in alcohol, and ether, than the chlorhydrate. Very easily soluble in iodide of ethyl. (Gœssmann & Atkinson.)
$C_{42}H_{16}N_2; HI$

Iodhydrate of MelAnilin. Soon undergoes decomposition when exposed to the air. Soluble in boiling, less soluble in cold water. Soluble in alcohol. (Hofmann, *J. Ch. Soc.*, **1.** 294.)
$C_{26}H_{13}N_3, HI$

Iodhydrate of MeNaphthalamin. Very soluble in alcohol.

Iodhydrate of Mesitylene. *Vid.* Iodide of Mesityl.

Iodhydrate of MetAcrolein. Insoluble in water.

Iodhydrate of Methylamin. Very deliquescent. Very soluble in water, and alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 460.)
$N\left\{\begin{matrix}C_2H_3\\H_2\end{matrix}\right., HI$

Iodhydrate of *di*Methylamin.

Iodhydrate of *tri*Methylamin. Soluble in water. Somewhat soluble in alcohol. (Saenz-Diez, *Ann. Ch. u. Pharm.*, **90.** 301.)
$N(C_2H_3)_3, HI$

Iodhydrate of MethylCinchonidin. Soluble in boiling, less soluble in cold water. (Stahlschmidt, *Ann. Ch. u. Pharm.*, **90.** 221.)
$N_2\left\{C_{40}H_{23}(C_2H_3)O_2^{vi}, HI\right.$

Iodhydrate of MethylCinchonin. Easily soluble in boiling, less soluble in cold water. (Stahlschmidt, *Ann. Ch. u. Pharm.*, **90.** 219.)
$N_2\left\{C_{40}H_{23}(C_2H_3)O_2^{vi}, HI\right.$

Iodhydrate of Methylene. *Vid.* Iodide of Methyl.

Iodhydrate of MethylLepidin.

Iodhydrate of MethylLutidin. Very easily soluble in water, and alcohol. Nearly insoluble in ether. (Williams.)

Iodhydrate of MethylMorphine. Readily soluble in hot, less soluble in cold water. Its properties are similar to those of the ethyl salt. (How, *J. Ch. Soc.*, **6.** 130.)
$C_{34}H_{18}(C_2H_3)NO_0, HI + 2 Aq$

Iodhydrate of MethylPiperidin. Soluble in water. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 92.)
$C_{12}H_{13}N, HI$

Iodhydrate of MethylQuinine. Soluble in water, especially if this be hot. Soluble in ammonia-water. Insoluble in potash-lye. "Similar to the iodhydrate of ethylquinine." (Strecker.)
$N_2\left\{C_{40}H_{23}(C_2H_3)O_4^{vi}, HI\right.$

Iodhydrate of MethylThialdin. Soluble in water, and alcohol. Insoluble in ether.
$C_{14}H_{15}NS_4, HI$

Iodhydrate of Morphine. Tolerably soluble in water. (Winckler.)
$C_{34}H_{19}NO_0, HI + 3 Aq?$

Iodhydrate of Narcotin.

Iodhydrate of Nicotin with *prot*Iodide of Mercury. Sparingly soluble in cold, decomposed by boiling water. Sparingly soluble in alcohol.
$C_{20}H_{14}N_2; 2(HI, HgI)$

Iodhydrate of NitroHarmalin.

Iodhydrate of NitroHarmin.

Iodhydrate of Octylamin. Very soluble in water, especially if this be warm. (Cahours.)
$N\left\{\begin{matrix}C_{16}H_{17}\\H_2\end{matrix}\right., HI$

Iodhydrate of Papaverin. Readily soluble in boiling water. Somewhat soluble in alcohol, though only sparingly soluble in boiling absolute alcohol.
$C_{40}H_{21}NO_8, HI$

Iodhydrate of Phosphuretted Hydrogen. Soluble in water, with decomposition.
PH_3, HI

Iodhydrate of Picolin. Readily soluble in water, alcohol, and ether. Its solution is decomposed by evaporation, an acid salt being formed. (Unverdorben.)

Iodhydrate of Piperidin. Soluble in water, and alcohol.
$C_{10}H_{11}N, HI$

Iodhydrate of Platinum. *Vid.* IodoPlatinic Acid.
PtI_2, HI

Iodhydrate of Platosamin. *Vid.* Iodide of Platin(*ous*)ammonium.

Iodhydrate of Propylamin. Soluble in water.

Iodhydrate of Quinidin.

I.) *mono.* Soluble in 1250 pts. of cold water.

II.) *acid.* Soluble in 90 pts. of water at 15°.

Iodhydrate of Quinine.

I.) *normal.* Very sparingly soluble in cold, more soluble in boiling water. Readily soluble in alcohol.
$C_{40}H_{24}N_2O_4, HI$

II.) *acid.*
$C_{40}H_{24}N_2O_4, 2 HI + 5 Aq$

Iodhydrate of Silicon. Slowly decomposed by water. Soluble, without decomposition, in a large quantity of bisulphide of carbon. (Buff & Wœhler, *Ann. Ch. u. Pharm.*, **104.** 99.)
$Si_2I_3; 2 HI$

Iodhydrate of Strychnine. One of the least soluble of the salts of strychnine. Much more soluble in alcohol than in water. (Abel & Nicholson, *J. Ch. Soc.*, **2.** 246.)
$C_{42}H_{22}N_2O_4, HI$

Iodhydrate of Tellurium. Decomposed by water.

Iodhydrate of Terebene.

I.) *mono.*
(*BiIodhydrate of Terebene*(of Deville).)
$C_{20}H_{10}, HI$

II.) *basic.*
(*MonoIodhydrate of Terebene*(of Deville).)
$2 C_{20}H_{10}, HI$

Iodhydrate of Turpentine-Oil.
(*Iodhydrate of Camphene.*)
$C_{20}H_{10}, HI$

Iodhydrin. Insoluble in water; but dissolves $\frac{1}{3}$ of its own volume of water.
$C_{12}H_{11}IO_6$
Insoluble in water. Soluble in al-

cohol, even when this is weak, and especially soluble in ether. (Berthelot & De Luca, *Ann. Ch. et Phys.*, (3.) **43.** 280.)

Iodides. Almost all of the metallic iodides are soluble in water excepting those of mercury, lead, silver, bismuth, and copper (Cu_2I). (Persoz, *Chim. Moléc.*, p. 463.)

Iodide of “Acetyl” (Acetoyl). C_4H_3I *Vid.* IodEthylene.

Iodide of Acetyl. $C_4H_3O_2I$ Instantly decomposed by water and by alcohol. (Guthrie, *Ann. Ch. u. Pharm.*, **103.** 336.)

Iodide of Aldehydene. *Vid.* IodEthylene.

Iodide of Allyl. (*IodoPropylene. Tritylene-iodé. Allylhydriodic Ether.*) C_6H_5I Insoluble in water. Soluble in alcohol, and ether. (Berthelot & De Luca, *Ann. Ch. et Phys.*, (3.) **43.** 266.)

*Bin*Iodide of Allyl. $C_6H_5I_2$ Almost insoluble in cold, sparingly soluble in boiling ether. (Berthelot & De Luca.)

Iodide of *tetr*Allylium. $N(C_6H_5)_4I$ Soluble in water, and alcohol.

Iodide of Aluminum. Known only in solution. (Dumas, *Tr.*)

Iodide of Ammonium. NH_4I Extremely deliquescent. Very soluble in water, and alcohol.

Iodide of Ammonium & of Cadmium. $NH_4I, CdI + 2\,Aq$ Deliquescent. (Croft.)

Iodide of Ammonium & of Lead. Decomposed by much water. (Boullay, *Ann. Ch. et Phys.*, (2.) **34.** 372.)

Iodide of Ammonium & of Silver. $2\,NH_4I;\ AgI$ Deliquescent. Decomposed by water. (Poggiale.)

Iodide of Ammonium & of Mercury.

I.) NH_4I, HgI Known only in solution.

II.) $NH_4I, 2\,HgI + 2\,Aq$ Permanent. Decomposed by water, which dissolves out No. I. while protiodide of mercury is precipitated. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 355.) Soluble, without decomposition, in alcohol, and ether.

Iodide of Ammonium & of Tin. $NH_4I, 2\,SnI$ When treated with a small quantity of water, iodide of ammonium is dissolved out, leaving iodide of tin, but in a larger quantity of water it dissolves completely. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 376.)

Iodide of Ammonium & of Zinc. NH_4I, ZnI Extremely deliquescent. (Rammelsberg.)

Iodide of Amyl. (*Amylohydric Ether.*) $C_{10}H_{11}I$ Sparingly soluble in water. Easily miscible with alcohol, and ether.

Iodide of *tetr*AmylAmmonium. $N(C_{10}H_{11})_4I$ Sparingly soluble in water.

Iodide of AmylLepidin. $N\left\{\begin{matrix}C_{20}H_9'''\\C_{10}H_{11}\end{matrix}\right.\cdot I$ Difficultly soluble in water.

Iodide of AmylNicotin. Soluble in water, and spirit. (Stahlschmidt, *Ann. Ch. u. Pharm.*, **90.** 226.)

Iodide of AmylQuinolein. $N\left\{\begin{matrix}C_{18}H_7'''\\C_{10}H_{11}\end{matrix}\right.\cdot I$

*Ter*Iodide of Antimony. SbI_3 Decomposed by water, with formation of an oxyiodide and iodhydric acid. It is also decomposed by alcohol of 80%. Soluble in iodhydric acid. Soluble in chlorhydric acid, from which it is precipitated on the addition of water.

*Ter*Iodide of Antimony with *ter*Sulphide of Antimony. $SbI_3;\ SbS_3$ Decomposed by water, alcohol, and ether.

Iodide of ArgentAmmonium. $N\left\{\begin{matrix}H_3\\Ag\end{matrix}\right.\cdot I$

Iodide of Arsen*tetr*Allylium.

Iodide of Arsen*di*Ethyl. (*Iodide of Ethyl Cacodyl.*) $(C_4H_5)_2As, I$ Insoluble in water. Readily soluble in alcohol, and ether. (Landolt, *Ann. Ch u. Pharm*, **89.** 322.)

Iodide of Arsen*tri*Ethyl. $(C_4H_5)_3As, I_2$ Deliquescent. Readily soluble in water, and spirit. Very sparingly soluble in ether. Soluble in warm chlorhydric acid; separating out unchanged as the solution cools. Decomposed by nitric, and sulphuric acids. (Landolt, *Ann. Ch. u. Pharm.*, **89.** 329.)

Iodide of Arsen*tri*Ethyl & of ZincEthyl. $(C_4H_5)_3As, I_2;\ (C_4H_5)Zn, I$

Iodide of ArsenEthylium. $As(C_4H_5)_4, I$ Readily soluble in water and in common alcohol. Very sparingly soluble in pure ether, or in alcohol containing ether. It is, however, soluble to a considerable extent in ether which contains certain obscure arsenic compounds, which occur in its preparation. (Landolt, *Ann. Ch. u. Pharm.*, **89.** pp. 311, 316, 331.)

Iodide of ArsenEthylium & *teriodide* of Arsenic. $(C_4H_5)_4AsI;\ AsI_3$

Iodide of ArsenEthylium & of Zinc. $As(C_4H_5)_4I, ZnI$

*Ter*Iodide of Arsenic. AsI_3 Soluble, without residue, in a large quantity of water; but a small quantity of cold water decomposes it to a soluble acid, and a nearly insoluble basic, salt. (Plisson.) Soluble in boiling alcohol, from which a portion of it separates out again as the solution cools; but the alcohol retains in combination most of that which it has dissolved.

*Quinqui*Iodide of Arsenic? Soluble in water. (Plisson.)

*Ter*Iodide of Arsenic with Iodide of ArsenMethylium. $(C_4H_3)_4AsI;\ AsI_3$

Iodide of ArsenMethyl. C_2H_3As, I_2 Scarcely at all soluble in water. Easily soluble in alcohol, and ether.

Iodide of Arsen*tri*Methyl. $As\left\{(C_2H_3)_3\cdot I_2\right.$

Iodide of ArsenMethylAmylium. $As\left\{\begin{matrix}(C_2H_3)_2\\(C_{10}H_{11})_2\end{matrix}\right.\cdot I$

Iodide of ArsenMethylEthylium. $As\left\{\begin{matrix}(C_2H_3)_2\\(C_4H_5)_2\end{matrix}\right.\cdot I$

Iodide of ArsenMethylium. $As\left\{(C_2H_3)_4\cdot I\right.$ Soluble in absolute alcohol (Cahours); and in a mixture of alcohol and iodide of methyl. (Cahours & Riche.)

Iodide of ArsenMethylium & of Cadmium. $(C_2H_3)_4AsI;\ CdI$ Tolerably readily soluble in boiling alcohol. (Cahours.)

Iodide of ArsenMethylium & of Zinc. $(C_2H_3)_4AsI, ZnI$ Tolerably readily soluble in boiling alcohol. (Cahours.)

Iodide of Barium. BaI Very deliquescent. (O. Henry.) Slightly deliquescent. (Dumas, *Tr.*) Not deliquescent. (Gay-Lussac.) Decomposed by the carbonic acid of the air. (Berzelius, *Lehrb.*) Very soluble in water. (Gay-Lussac.) Easily soluble in alcohol. (O. Henry.)

1 pt. of the anhydrous salt is
soluble in 0.59 pt. of water at 0°
“ 0.48 “ 19.5°
“ 0.44 “ 30°
“ 0.43 “ 40°
“ 0.41 “ 60°
“ 0.37 “ 90°
“ 0.35 “ 106°
(Kremers, *Pogg. Ann.*, **103.** 66.)

A solution of sp. gr. (at 19.5°)	Contains pts. of the anhydrous salt dissolved in 100 pts. of water.
1.2157	27.0
1.4099	53.8
1.6186	85.8
1.7953	115.6
1.9535	146.0

(Kremers, *Pogg. Ann.*, **103.** 67.)

Iodide of Barium & of Mercury(Hg I).

I.) $Ba I; Hg I$ Soluble in water, without decomposition. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 352.)

II.) $Ba I; 2 Hg I$ Incompletely precipitated by water, No. I. remaining in solution while protiodide of mercury separates out. (*Ibid.*)

Iodide of Barium & of Tin(Sn I). “Very soluble.” (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 376.)

Iodide of Barium & of Zinc. Very deli-
$Ba I; 2 Zn I$ quescent.

Iodide of Bismuth.

I.) *normal.* While yet moist it is decomposed
$Bi I_3$ by warm water, which abstracts iodhydric acid, while an insoluble basic salt separates out. But after having become dry it is much more difficultly and less completely decomposed by boiling water. Soluble in nitric and in iodhydric acids, from which it is reprecipitated when the acid is diluted with water or alcohol. (Berzelius, *Lehrb.*) Partially decomposed by water. Soluble in aqueous solutions of iodide of potassium and of caustic potash. (Rammelsberg.)

II.) *acid.* Decomposed by water, with separa-
$Bi I_3, H I + 8 Aq$ tion of a basic salt. (Arppe.)

III.) *basic.* *Vid.* OxyIodide of Bismuth.

Iodide of Bismuth & of BismuthEthyl.
$Bi I_3 ; (C_4 H_5)_8 Bi_2, I_2$ Sparingly soluble in water. Easily soluble in alcohol, and ether.

Iodide of Bismuth & of Potash.

I.) $2 K I ; Bi I_3 + 4 Aq$ Soluble in a small quantity of water, without cloudiness, but is decomposed by much water.

II.) $4 K I ; Bi I_3$ Ppt.

III.) $4 K I; H I ; Bi I_3$ Completely soluble in a small quantity of water, but is decomposed by much water. (Arppe.)

Iodide of Bismuth*ter*Amin. Decomposed by
(*AmmonioIodide of Bismuth*) water. (Rammelsberg.)
$N_3 \{ H_9 . Bi, I_3$

Iodide of BismuthEthyl. Scarcely at all
$C_4 H_5 Bi, I_2$ soluble in water. Easily soluble in alcohol. Difficultly soluble in ether. (Duenhaupt.)

Iodide of Bismuth*tri*Ethyl. Scarcely at all
$Bi \{ (C_4 H_5)_3, I_2$ soluble in water. Easily soluble in alcohol. Difficultly soluble in ether.

Iodide of Benzoyl. Insoluble in water; by
$C_{14} H_5 O_2, I$ which, however, it is very slowly decomposed. Soluble in alcohol. (Liebig & Wœhler.)

Iodide of Benzyl. *Vid.* Iodide of Toluenyl.

Iodide of BisMethyl. Soluble in alcohol, with subsequent decomposition.

Iodide of *bi*BromoMethyl. Sparingly solu-
(*BromIodoform.*) ble in water. (Sérullas.)
$C_2 H Br_2, I$

Iodide of Brucin.
(*IodoBrucin.*)
$a = N_2 \{ C_{46} H_{26} O_8^{VI}, I_3$ Soluble in boiling alcohol, but does not separate out on cooling.

$b = 2(N \{ C_{46} H_{26} O_8^{VI}), I_3$ Ppt., in alcohol. (Pelletier.)

Iodide of Butyl. Insoluble, or nearly insol-
(*Iodide of Tetryl. ButylIodhydric Ether.*) uble, in water.
$C_8 H_9 I$

Iodide of Butyryl.
$C_8 H_7 O_2, I$

Iodide of Cacodyl.

I.) $(C_2 H_3)_2 As, I$ Insoluble in water. Easily soluble in alcohol, and ether. (Bunsen.)

II.) *basic.* Sparingly soluble in water. Very
$3 C_4 H_6 As I; C_4 H_6 As O$ readily soluble in alcohol, especially when this is hot. (Bunsen.)

Iodide of Cacoplatyl.

$\left.\begin{matrix}C_2 H_3 \\ C_2 H_2 Pt\end{matrix}\right\} As, I + 2 Aq$

Iodide of Cadmiumammonium. Decom-

$N \left\{\begin{matrix}H_3 \\ Cd\end{matrix}\right., I$ posed by water. (H. Rose.)

Iodide of Cadmium. Permanent. Readily
$Cd I$ soluble in water, and alcohol. Very sparingly soluble in boiling ether. (Stromeyer.)

Soluble in 1.08 pts. of water at 20°
“ 1.00 “ 40°
“ 0.93 “ 60°
“ 0.86 “ 80°
“ 0.75 “ 100°
(Kremers, *Pogg. Ann.*, **104.** 162.)

An aqueous solution of sp. gr. at (19.5°)	Contains pts. of the anhydrous salt dissolved in 100 pts. of water.
1.1681	21.4
1.3286	43.7
1.6139	88.5

(Kremers, *Pogg. Ann.*, **104.** 156.)

Iodide of cadmium which has been prepared at ordinary temperatures is readily soluble, with combination (to $N H_3 Cd I$), in warm ammonia-water. But after having been heated to 130°, it is no longer soluble therein, combining, however, to form ($Cd I, 3 N H_3$).

Iodide of Cadmium & of Ethyl. Decom-
$Cd I; C_4 H_5 I$ posed by water.

Iodide of Cadmium & of Mercury. Very soluble in water. (Berthemot.)

Iodide of Cadmium & of Potassium. De-
$Cd I, K I + 2 Aq$ liquescent. Very easily soluble in water. Slightly soluble in alcohol, and wood-spirit; less so than iodide of cadmium. (Croft.)

Iodide of Cadmium & of Sodium.
$CdI; NaI + 6Aq$

Iodide of Cadmium & of Strontium. Deliquesces in moist air, but effloresces in dry air. (Croft.)
$CdI; SrI + 8Aq$

Iodide of Cadmium*ter*amin. Decomposed by water. (H. Rose.)
$N_3\{H_9 . Cd, I$

Iodide of Cadmiumammonium. Decomposed by water. Soluble in warm, less soluble in cold, ammonia-water. (Rammelsberg.)
$N\left\{\begin{matrix}H_3\\Cd\end{matrix}\right., I$

Iodide of Calcium. Deliquescent. Very soluble in water. Soluble in absolute alcohol. (Gay-Lussac, *Ann. de Chim.*, **91.** 57, [*T.*].)
CaI

1 pt. of the anhydrous salt is

soluble in	0.52	pt. of water at	0°
"	0.49	"	20°
"	0.44	"	40°
"	0.35	"	43°
"	0.23	"	92°

(Kremers, *Pogg. Ann.*, **103.** 65.)

An aqueous solution of sp. gr. at (19.5°)	Contains pts. of the anhydrous salt dissolved in 100 pts. of water.
1.1854	24.3
1.3786	52.7
1.5558	82.4
1.6845	106.6
2.0065	190.4

(Kremers, *Pogg. Ann.*, **103.** 67; & **106.** 587.)

*Bin*Iodide of Calcium. Resembles the potassium compound.
CaI_2

Iodide of Calcium & of Mercury (Hg I).

I.) $CaI; HgI$ Soluble in water. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 353.)

II.) $CaI; 2HgI$ Incompletely precipitated by water, which dissolves No. I., and leaves insoluble protiodide of mercury. (*Ibid.*)

Iodide of Capryl. *Vid.* Iodide of Octyl.

Iodide of Carbon. *Vid.* Iodide of *bin*IodoMethyl.

*Din*Iodide of Carbon. Insoluble in water, acids, or alkaline solutions. Soluble in alcohol, and ether.
C_2I

*Ter*Iodide of Carbon. Sparingly soluble in water.
C_2I_6

Iodide of *tri*CaproylEthylammonium. Easily soluble in alcohol, and ether. (Petersen, *Ann. Ch. u. Pharm.*, **102.** 314.)
$N\left\{\begin{matrix}(C_{12}H_{13})_3\\C_4H_5\end{matrix}\right. . I$

Iodide of Cerium.

Iodide of Cetyl. Insoluble in water. Tolerably soluble in boiling, less soluble in cold alcohol. Readily soluble in ether. (Fridau.)
$C_{32}H_{33}I$

Iodide of *bi*ChlorMethyl. Sparingly soluble in water. Miscible with chloride of ethylene. (Sérullas.)
(*ChlorIodoform.*)
C_2HCl_2I

Iodide of ChloroNitroHarmadin or Harmin. Soluble in alcohol, — more so than the iodide of nitroharmin. Soluble in naphtha. (Fritzsche.)
$N_2\{C_{26}H_{10}Cl(NO_4)O_2^{vi}, I_2$

*Sesqui*Iodide of Chromium.

I.) *normal.* Soluble in water. When the solution is evaporated to dryness the residue does not dissolve in cold water, but is very easily soluble in warm water, and does not separate out again on cooling. (Berlin, in *Berzelius's Lehrb.*, **3.** 1071.)
Cr_2I_3

II.) *tris.* Soluble in water. (Ordway, *Am. J. Sci.*, **26.** 203.)

*Ter*Iodide of Chromium (?) Decomposed by water, to CrO_3 and HI. (Giraud.)
CrI_3 (?)

Iodide of Cinnamyl. Insoluble in water, but is decomposed thereby. Soluble, without decomposition, in alcohol, and ether. (Despan.)

Iodide of Cobalt. Deliquescent. Soluble in water. (Rammelsberg.) Soluble in alcohol. (Erdmann.)
CoI

Iodide of Cobalt*bi*amin. Soluble, with decomposition, in water. (Rammelsberg.) Soluble in ammonia-water.
$N_2\{H_6 . Co, I$

Iodide of Cobalt*ter*amin. Insoluble in ammonia-water.
$N_3\{H_9 . Co, I$

*Ter*Iodide of Codein. *Vid.* IodoCodein.

*Din*Iodide of Copper. Insoluble in water or alcohol. (Berthemot.) Very sparingly soluble in chlorhydric acid. (Buchner.) Sparingly soluble in ammonia-water when in contact with the air. Soluble in an aqueous solution of iodide of potassium. (Rammelsberg.)
Cu_2I

*Din*Iodide of Copper & of Potassium.

*Din*Iodide of Copper with Xanthogenamid. *Vid.* Hydrate of SulphoCarbonylEthylammonium with *din*Iodide of Copper.

Iodide of Cupr(*eous*)*bi*amin.
(*AmmoniodinIodide of Copper.*)
$N_2\{H_6 . Cu_2, I$

Iodide of Cupr(*ic*)*bi*amin. Sparingly soluble in cold water; the solution subsequently undergoing decomposition. Decomposed at once by boiling water. (Berthemot.) Decomposed by water. (Rammelsberg.) Insoluble in cold alcohol or ether; decomposed by boiling alcohol. Soluble in warm ammonia-water. (Berthemot.)
(*AmmonioprotIodide of Copper.*)
$N_2\{H_6 . Cu, I + Aq$

Iodide of Cyan*ter*amin.
$N_3\{H_9 . C_2N, I$

Iodide of Cyanammonium.
(*AmmonioIodide of Cyanogen.*)
$N\left\{\begin{matrix}H_3\\C_2N\end{matrix}\right. . I$

Iodide of Cyanogen. Easily soluble in water; more soluble in alcohol (Sérullas); and still more soluble in ether, and the volatile oils, like oil of turpentine; also soluble in the fixed oils. Soluble, without decomposition, in dilute sulphuric, nitric, and chlorhydric acids. (Wœhler, Van-Dyk.)
$I\bar{C}y = NC_2I$

Iodide of Ethyl. Sparingly soluble in water. Very soluble in alcohol, from which it is precipitated by water. Easily soluble in ether. (Gay-Lussac.)
C_4H_5I

Iodide of *tetra*Ethylammonium. Readily soluble in water. Soluble in alcohol. Insoluble in ether or in alkaline solutions. (Hofmann.)
$N(C_4H_5)_4I$

*Ter*Iodide of *tetra*Ethylammonium. Difficultly soluble in cold, readily soluble in boiling spirit. Soluble in aqueous solutions of the iodides of potassium, sodium, and ammonium; also in solutions of the ethylammoniums. (Weltzien, *Ann. Ch. u. Pharm.*, **91.** 37.)
$N(C_4H_5)_4I_3$

*Quinqui*Iodide of *tetra*Ethylammonium. $N(C_4H_5)_4I_5$ Soluble in boiling alcohol.

Iodide of *tetra*Ethylammonium & of Mercury(Hg I).

I.) $N(C_4H_5)_4I;\ 2\,HgI$ Sparingly soluble in water; more easily soluble in hot alcohol, from which it separates on cooling. (H. Risse.)

II.) $N(C_4H_5)_4I;\ 3\,HgI$ Not decomposed by water. Tolerably readily soluble in alcohol. (R. Mueller.)

III.) $N(C_4H_5)_4I;\ 5\,HgI$ Insoluble in water, alcohol, or ether. (Sonnenschein.)

Iodide of *tri*EthylAmylammonium. $N\left\{\begin{matrix}C_{10}H_{11}\\(C_4H_5)_3\end{matrix}\right.\cdot I$ Readily soluble in water, and alcohol. Insoluble in ether.

Iodide of *tri*EthylAmylPhosphonium. $P\left\{\begin{matrix}C_{10}H_{11}\\(C_4H_5)_3\end{matrix}\right.\cdot I$ Soluble in alcohol, from which it is precipitated on the addition of ether.

Iodide of EthylCacodyl. *Vid.* Iodide of ArsenEthyl.

Iodide of EthylCollidin.
$N\left\{\begin{matrix}C_{16}H_{11}'''\\C_4H_5\end{matrix}\right.\cdot I$

Iodide of *di*EthylConiin. Very readily soluble in water, and alcohol; less soluble in ether. (v. Planta & Kekulè, *Ann. Ch. u. Pharm.*, **89.** 146.)

Iodide of Ethylene. (*Iodide of Elayl. IodEtherin. Hydriodate of AcetylicIodide.) Faraday's Iodide of Hydrocarbon.*) $C_4H_4'',\ I_2$ Insoluble in water, acids, or alkaline solutions. Soluble in alcohol, but less readily than the chloride or bromide. (Regnault.) Also soluble in ether, and oils.

Iodidè of Ethyl*di*Ethylene*di*Phenyl*bi*ammonium. $C_{36}H_{23}N_2I = N_2\left\{\begin{matrix}C_4H_5\\(C_4H_4'')_2\\(C_{12}H_5)_2\end{matrix}\right.\cdot I$ Less soluble than the corresponding methyl compound in boiling water.

Iodide of EthylLepidin.
$C_{24}H_{14}NI = N\left\{\begin{matrix}C_{20}H_9'''\\C_4H_5\end{matrix}\right.\cdot I$

Iodide of EthylNaphtylammonium.
$N\left\{\begin{matrix}C_{20}H_8''\\C_4H_5\\H\end{matrix}\right.\cdot I$

Iodide of EthylNicotin. $N\left\{\begin{matrix}C_{10}H_7'''\\C_4H_5\end{matrix}\right.\cdot I$ Deliquesces in moist air. Extremely soluble in water. Sparingly soluble in alcohol or ether, though more soluble in hot than in cold. (v. Planta & Kekulè, *Ann. Ch. u. Pharm.*, **87.** 4.)

Iodide of Ethyl*tri*Phenylammonium. Soluble in alcohol.

Iodide of *tri*EthylPhenylammonium.

Iodide of *tetra*EthylPhosphonium. $P(C_4H_5)_4I$ Very soluble in water; less soluble in alcohol. Insoluble in ether. Sparingly soluble in an aqueous solution of caustic potash. (Hofmann & Cahours.)

Iodide of EthylPhthalamin. $NC_{20}H_{13}O_4,\ I$ Soluble in water, and alcohol.

Iodide of EthylPicolin. $C_{16}N_{12}NI = N\left\{\begin{matrix}C_{12}H_7'''\\C_4H_5\end{matrix}\right.\cdot I$ Very readily soluble in water, and alcohol. Sparingly soluble in ether. (Anderson.)

Iodide of *di*EthylPiperylammonium. $N\left\{\begin{matrix}C_{10}H_{10}''\\(C_4H_5)_2\end{matrix}\right.\cdot I$ Deliquescent. Soluble in all proportions in water. (Cahours, *Ann. Ch. et Phys.*, (3.) **38.** 97.)

Iodide of EthylPyridin. $N\left\{\begin{matrix}C_{10}H_5'''\\C_4H_5\end{matrix}\right.\cdot I$ Slightly deliquescent. Readily soluble in water, alcohol, and ether.

Iodide of EthylQuinolein. $N\left\{\begin{matrix}C_{18}H_7'''\\C_4H_5\end{matrix}\right.\cdot I$ More soluble in water than in alcohol. (Gr. Williams.)

Iodide of *tri*EthylToluenylammonium. $N\left\{\begin{matrix}C_{14}H_7\\(C_4H_5)_3\end{matrix}\right.\cdot I$ Soluble in water.

*Per*Iodide of Formyl. *Vid.* Iodide of *bin*IodoMethyl.

Iodide of Glucinum. Gl_2I_3 Soluble in water, with evolution of much heat. (Wœhler.)

*Prot*Iodide of Gold. AuI Insoluble in water. (Dumas, *Tr.*) Insoluble in cold, and only very difficultly soluble in boiling water. (Berzelius's *Lehrb.*) Unacted upon by cold water, but is decomposed by boiling water. (Pelletier; Fordos.) Slowly decomposed by alcohol. Partially soluble in aqueous solutions of iodide of potassium, and iodide of iron, also in hot iodhydric acid. Neither sulphuric nor nitric acids have any action upon this compound in the cold, but decompose it on boiling; — as is the case with boiling water, this decomposition is entirely due to the heat. (Pelletier; Fordos.) Only slightly acted upon by ammonia-water or by a solution of chloride of sodium even at 35°. (Fordos.) Instantly decomposed by a solution of caustic potash.

*Ter*Iodide of Gold. AuI_3 Insoluble in water. It is only decomposed to a trifling extent when washed with water. (Berzelius, *Lehrb.*) Soluble in aqueous solutions of iodide of potassium, and of the more soluble metallic iodides, like iodide of barium or of strontium. While yet moist it is soluble in iodhydric acid, from which solution a detonating compound is precipitated on the addition of ammonia-water. (Johnston.) Decomposed by alkaline solutions.

Iodide of HydrargAllyl, &c. *Vid.* Iodide of MercurAllyl, &c.

Iodide of HydroCarbon(*liquid*). *Vid.* Iodide of *bi*ChlorMethyl(ChlorIodoform).

*Bin*Iodide of Hydrogen. (*HydrIodous Acid.*) HI_2 Soluble in water; the solution slowly decomposing.

Iodide of *bin*IodoMethyl. (*Iodide of Formyl. Iodoform. Iodide of Methyl biiodé.*) $C_2HI_2,\ I$ Not perceptibly soluble in water, dilute acids, or alkaline solutions. Very readily soluble in alcohol, from which it is partially precipitated on the addition of water. Soluble in 80 pts. of cold alcohol, and in 25 pts. of alcohol of 23° B. at 35° C. (Sérullas.) Soluble in 7 pts. of ether; also readily soluble in the fixed and volatile oils. (Sérullas.) Soluble in chloroform. (Bouchardat.) Soluble in bisulphide of carbon.

*Bin*Iodide of Iridium. IrI_2 Insoluble in water or in acids. (Lassaigne.)

*Prot*Iodide of Iron. $FeI,\ \&\ +4\,Aq$ Exceedingly deliquescent. When recently prepared, it is freely and completely soluble in water; but by keeping it is partially decomposed. It is also soluble in an aqueous solution of sugar; and the solution thus prepared is much more stable than the aqueous solution. Freely soluble in glycerin. (Parrish's *Pharm.*, pp. 236, 520.) Soluble in alcohol. (Gmelin's *Handbook.*)

***Sesqui*Iodide of Iron.** Soluble in water.
$Fe_2 I_3$
The basic salts which contain five equivalents or less of sesquioxide of iron to one of iodhydric acid may be obtained dissolved in water. (Ordway, *Am. J. Sci.*, (2.) **26.** 202.)

***Prot*Iodide of Iron & of Mercury** Very deliquescent. Decomposed by much water. Soluble in alcohol and in strong acetic acid. (Berthemot.)

Iodide of Lead.

I.) *normal.* Completely soluble in water. $Pb I$ (Brandes.) Rather easily and completely soluble in boiling, much less soluble in cold water. (Joss, *J. pr. Ch.*, 1834, **1.** 137.) Soluble in 187 pts. of boiling water. (Berthemot); in 1235 pts. of water at the ordinary temperature, and in 125 [194 – 196] pts. of boiling water (Denot); in 579 pts. of cold and in 254 pts. of boiling water; the saturated cold solution containing 0.17% of it, and the saturated boiling solution 0.39%. (M. R. & P.) Soluble in 2400 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) In spite of the assertion of Henry, the addition of acetic acid does not increase its solubility in water at the ordinary temperature. (Denot.) Very sparingly soluble in cold water, easily soluble in boiling water, in acetic acid, and in alcohol, (Parrish's *Pharm.*, p. 540.) It appears to be slightly soluble in alcohol. (O. Henry.) Decomposed by boiling ether. (A. Vogel.)

Soluble in concentrated aqueous solutions of the iodides of potassium, sodium, barium, strontium, calcium, and magnesium; from these solutions it is precipitated on the addition of water. (Berthemot.) Soluble in an aqueous solution of chloride of ammonium, even in the cold, but the lead may be reprecipitated from this solution by adding an excess of caustic ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** pp. 97, 99.) Very soluble in an aqueous solution of iodide of potassium, which, however, does not appear to be capable of dissolving more than 2 equivs. of it for 1 equiv. of K I. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 367.) Abundantly soluble in a warm aqueous solution of iodide of ammonium, apparently with combination; crystals separate as the solution cools. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 365.) It is not precipitated when in presence of citrate of soda. (Spiller.) Soluble in an aqueous solution of caustic potash. (Berzelius, *Lehrb.*) By ammonia-water it is converted into a basic iodide. Soluble in alkaline liquids. (Melsens, *Ann. Ch. et Phys.*, (3.) **26.** 224.) Insoluble in cold, soluble, with decomposition, in boiling chlorhydric acid. (Labouré.)

II.) *basic.* *Vid.* OxyIodide of Lead.

III.) *acid.* Very easily decomposed when exposed to the air. (Guyot.) Decomposed by water.
$Pb I, 2 H I$

Iodide of Lead & of Potassium.

I.) $K I ; 2 Pb I$ Permanent. Completely decomposed when washed with water, iodide of lead remaining undissolved. Hot water precipitates only a portion of the iodide of lead, a compound K I, Pb I going into solution; on cooling this solution, the original salt K I, 2 Pb I crystallizes out. Unacted upon by cold alcohol; but hot alcohol decomposes it like hot water. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 369.)

II.) $2 K I ; Pb I$ Decomposed by water. Insoluble in alcohol. (Boullay, *Ibid.*)

Iodide of Lead & of Sodium.
$2 Pb I ; Na I$

Iodide of Lithium. Very deliquescent, and soluble in water. (Rammelsberg.)
$Li I + 6 Aq$

The anhydrous salt is

soluble in	0.66	pt. of water at	0°
"	0.61	"	19°
"	0.56	"	40°
"	0.50	"	59°
"	0.38	"	75°
"	0.23	"	80°
"	0.21	"	99°
"	0.17	"	120°

(Kremers, *Pogg. Ann.*, **103.** 65.)

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of the anhydrous salt dissolved in 100 pts. of water.
1.1611	23.4
1.1756	25.9
1.3171	49.3
1.3507	56.5
1.4700	78.3
1.5319	93.4
1.6278	112.5
1.6709	125.9
1.7495	142.1

(Kremers, *Pogg. Ann.*, **104.** pp. 155, 158.)

Iodide of LuteoCobalt. Difficultly soluble in cold, readily soluble in hot water. (Gibbs & Genth, *Smithson. Contrib.*, Vol. **9.**)
$6 N H_3 . Co_2, I_3$

Iodide of Magnesium. Deliquescent. Very soluble in water.
$Mg I$

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of the anhydrous salt dissolved in 100 pts. of water.
1.1121	14.2
1.2185	28.5
1.3563	48.6
1.4945	70.6
1.6623	100.5
1.9098	151.4

(Kremers, *Pogg. Ann.*, **104.** 156; & **106.** 587.)

The aqueous solution cannot be evaporated to dryness without losing some iodhydric acid.

Iodide of Magnesium & of Mercury (Hg I).

I.) $Mg I; Hg I$ Soluble in water. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 353.)

II.) $Mg I ; 2 Hg I$ Decomposed by water, which dissolves out No. I., and leaves insoluble protiodide of mercury. (*Ibid.*)

Iodide of Manganese. Deliquescent. Readily soluble in water. (Lassaigne.)
$Mn I$

Iodide of Mercur(*ous*)Allyl. Nearly insoluble in water. Sparingly soluble in cold, more soluble in hot alcohol. Easily soluble in hot ether. (Zinin.)
$C_6 H_5 Hg_2, I$

Iodide of Mercur(*ic*)ammonium.
$N \left\{ \begin{matrix} H_3 \\ Hg \end{matrix} \right. . I$

Iodide of Mercur(*ic*)ammonium & of Mercury. Decomposed by water, and by dilute acids. (Caillot & Corriol.)
$N \left\{ \begin{matrix} H_3 \\ Hg \end{matrix} \right. . I; Hg I$

Iodide of *di*Mercur(*ous*)ammonium. Soluble in an aqueous solution of iodide of potassium. Tolerably
$N \left\{ \begin{matrix} H_2 \\ 2 (Hg_2) \end{matrix} \right. . I$

soluble in warm chlorhydric acid. (Rammelsberg.)

Iodide of MercurAmyl.
(Iodide of HydrargAmyl.)

Iodide of Mercur(*ous*)Ethyl.
$C_4 H_5 Hg_2, I$

Scarcely at all soluble in water. Soluble in alcohol, and ether. Soluble in ammonia-water; also in a solution of caustic potash, with partial decomposition. (Strecker, *Ann. Ch. u. Pharm.*, **92.** 78.)

Iodide of Mercur(*ous*)Methyl.
$C_2 H_3 Hg_2, I$

Insoluble in water. Tolerably soluble in alcohol. Very soluble in ether and in iodide of methyl.

***Din*Iodide of Mercury.**
(Protiodide of Mercury. Green Iodide of Mercury.)
$Hg_2 I$

Very slightly soluble in cold water.

Insoluble in water, alcohol, or an aqueous solution of chloride of sodium. Soluble in ether. (Parrish's *Pharm.*, p. 560.) Soluble in more than 2375 pts. of water. (Saladin.) Somewhat soluble in aqueous solutions of iodide of potassium and of nitrate of dinoxide of mercury. (Berzelius's *Lehrb.*) Easily soluble in an aqueous solution of nitrate of protoxide of mercury. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 317.) Partially soluble in ammonia-water. (Wittstein.) Soluble in a hot or warm aqueous solution of chloride of ammonium, though less completely than protiodide of mercury. Nitrate of ammonia dissolves it less readily than chloride of ammonium. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 97.) Partially soluble, with separation of metallic mercury and formation of the protiodide, in a cold aqueous solution of iodide of potassium, and in hot solutions of the iodides of sodium, calcium, barium, strontium, magnesium, zinc, and ammonium, also in iodhydric acid, in warm solutions of the chlorides of potassium, sodium, and ammonium, and slowly in hot chlorhydric acid. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** pp. 358, 359, 360, 364. 365.) Decomposed to a slight extent, with formation of protochloride of mercury ($Hg\ Cl$), by aqueous solutions of the alkaline chlorides; this decomposition is greater in hot than in cold solutions, but the diniodide is one of the compounds of mercury which is least readily acted upon by the alkaline chlorides. (Mialhe, *Ann. Ch. et Phys.*, (3.) **5.** 177.) More readily acted upon by chlorhydric acid than by solutions of the alkaline chlorides. (Mialhe, *Ibid.*, p. 185.)

***Prot*Iodide of Mercury.**
(Biniodide of Mercury. Red Iodide of Mercury.)
$Hg\ I$

Insoluble in water. (Ot. Gr.) Not sensibly soluble in water. (Dumas, *Tr.*) Water only dissolves traces of it. (Wittstein.) Soluble in 150 pts. of water at 15°. (Saladin, cited by Kremers, *Pogg. Ann.*, **85.** 248.) Soluble in hot alcohol. Soluble in 36 pts. of alcohol (Saladin); from the alcoholic solution water precipitates it. (N. E. Henry.) Soluble in 120 pts. of cold, and in 12 pts. of boiling alcohol. Very easily soluble in an aqueous solution of iodide of potassium. (Wittstein's *Handw.*) Very easily soluble in alcohol. (Millon, *Ann. Ch. et Phys.*, (3.) **18.** 389.) Sparingly soluble in ether. Soluble in 77 pts. of ether. (Saladin.) Soluble in fixed oils. (Parrish's *Pharm.*, p. 635.) Freely soluble in glycerin. (*Ibid.*, p. 236.) Insoluble in cold, soluble in hot caoutchin. (Himly.) Soluble in warm caprylene.

Insoluble in strong acetic acid. (Berthemot.) Soluble in chlorhydric, and nitric acids, with partial decomposition. Abundantly soluble in iodhydric acid, especially when this is hot; a portion of the iodide is precipitated from this solution on the addition of water, but an abundance of it still remains dissolved, no matter how large a quantity of water may have been added. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 340.) Soluble in many dilute acids, as chlorhydric, iodhydric, &c.; also soluble in aqueous solutions of many ammoniacal salts, and in a solution of chloride of potassium. (Wittstein.) Easily soluble in an aqueous solution of chloride of ammonium. (Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 316.) Speedily dissolved by a lukewarm aqueous solution of chloride of ammonium; also soluble in a solution of nitrate of ammonia. (Brett, *Phil. Mag.*, 1837, (3.) **10.** 97.) Readily soluble in aqueous solutions of the alkaline chlorides, especially when these are hot. (Mialhe, *Ann. Ch. et Phys.*, (3.) **5.** 181.) Soluble in hot aqueous solutions of carbonate, and sulphate, of ammonia and in cold solutions of succinate and nitrate of ammonia, and chloride of ammonium.

Soluble in aqueous solutions of the iodides of potassium and of sodium; more readily in hot than in cold. When the solution of the alkaline iodide is concentrated 1 equivalent of it in hot solution can dissolve 3 equivalents of $Hg\ I$, but a portion of this separates immediately when the solution is cooled. Alcohol retards this precipitation, so that if a liquor containing more than 2 $Hg\ I$ to 1 equiv. of alkaline iodide is poured into warm alcohol no precipitate forms on cooling until after the lapse of considerable time, and the spontaneous evaporation of a portion of the alcohol. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** pp. 346, 347, 350.) Solutions of the iodides of barium and strontium also dissolve protiodide of mercury more readily when hot than when cold, probably taking up 3 equivs. of $Hg\ I$ in the former case. (*Ibid.*, p. 352.) Solutions of the iodides of calcium and magnesium also dissolve it, more abundantly when hot than when cold. (*Ibid.*, p. 253.) Abundantly soluble in a cold solution of iodide of zinc, and still more abundantly in a hot solution, 2 equivs. of $Hg\ I$ to 1 equiv. of $Zn\ I$ being dissolved in the last case. (*Ibid.*, p. 353.) Soluble in a cold solution of iodide of ammonium, and more abundantly in a hot solution, about 3 equivs. of $Hg\ I$ being dissolved by 2 equivs. of $N\ H_4\ I$ in the last case. (*Ibid.*, p. 354.) Abundantly soluble in hot aqueous solutions of the chlorides of potassium, sodium, and ammonium, but separates out again almost completely on cooling, and the trace of iodide which remains dissolved may be precipitated by diluting the solution with water. By direct experiment a solution containing 2 grms. of $K\ Cl$ dissolved 1.166 grms. of $Hg\ I$. Also soluble in hot chlorhydric acid, and in a hot solution of protochloride of mercury ($Hg\ Cl$) with combination. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** pp. 346, 360, 364, 365.) Soluble in aqueous solutions of iodide of potassium, protochloride of mercury, and nitrate of protoxide of mercury. (Warington, *Ann. Ch. et Phys.*, (3.) **7.** 416.) Soluble in hot chlorhydric acid, and in a boiling aqueous solution of protochloride of mercury ($Hg\ Cl$). (Colin.) Somewhat soluble in an aqueous solution of protochloride of mercury ($Hg\ Cl$), and very easily soluble in an alcoholic solution thereof. (Millon, *Ann. Ch. et Phys.*, (3.) **18.** 389.) Soluble in aqueous solutions of the salts of protoxide of mercury as the nitrate, and acetate, or protochloride of mercury. Soluble in an aqueous solution of iodide of stibmethylium ($Sb\ (C_2\ H_3)_4\ I$), — the red modification being converted into the yellow before entering into solution.

Very sparingly soluble in an aqueous solution of citrate of soda. (Spiller.) Soluble in an aqueous solution of hypochlorite of lime, the solution undergoing decomposition when boiled. (Rammelsberg.) Soluble in an aqueous solution of caustic potash. (Melsens, *Ann. Ch. et Phys.*, (3.) **26.** 222.) A solution of one grain of iodide of potassium in 6000 grains of water affords a manifest red precipitate on the addition of protochloride of mercury, but when dissolved in 10000 grains of water no cloudiness occurred. (Brandes, in *Berzelius's Lehrb.*)

II.) *acid.* Decomposed by water, with formation of *b*.
$a = HgI, 2HI$

$b = HgI, 4HI$ Soluble in water.

$c = HgI, 3HI(?)$ Decomposed by water, with separation of some insoluble iodide of mercury. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** pp. 340–342.)

III.) *basic.* *Vid.* OxyIodide of Mercury.

***Bin*Iodide of Mercury.** Soluble in a warm aqueous solution of chloride of sodium, from which it crystallizes on cooling. (Hunt, in *Berzelius's Lehrb.*)
HgI_2

***Din*Iodide with *protiodide* of Mercury.** Insoluble in water or alcohol. Partially soluble in an aqueous solution of iodide of potassium, passing first to the diniodide which is then decomposed; in boiling solutions of the chlorides of sodium and ammonium, but more slowly than the diniodide, and in hot chlorhydric acid, though very slowly. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** pp. 360–363.)
(*Yellow Iodide of Mercury.*)
$Hg_2I; 2HgI = Hg_4I_3$

***Prot*Iodide of Mercury & of *tetra*Methylammonium.**

I.) $N(C_2H_3)_4I; 2HgI$ Tolerably soluble in cold alcohol.

II.) $N(C_2H_3)_4I; 3HgI$ Decomposed by boiling water. Soluble in hot alcohol. (Risse.)

***Prot*Iodide of Mercury & of Nicotin.** Sparingly soluble in cold, decomposed by hot water. Sparingly soluble in alcohol. (Bœdeker.)
$C_{20}H_{14}N_2, 2HI, 2HgI$

***Prot*Iodide of Mercury & of Potassium.**

I.) $KI; HgI(?)$ Soluble in water. After having been evaporated to dryness, and then treated with water, a small quantity of Hg I separates out at first, but this soon redissolves on agitation. (Boullay, *Ann. Ch. et Phys.*, (2.) **34.** 349.) [Compare No. II.]

II.) $KI; 2HgI + 3Aq$ Deliquescent. Soluble in alcohol. (v. Bonsdorff, *Pogg. Ann.*, 1829, **17.** 266.) Permanent in dry air. Decomposed by water, which retains in solution a compound of one equivalent of each of the iodides (= K I, Hg I), while one equivalent of Hg I separates. (Boullay.) This solution is rather one of the salt K I, 2 Hg I in iodide of potassium, for when evaporated it yields crystals of each of these salts. (Souville, *J. Pharm.*, **26.** 475; Labouré, *Ibid.*, (2.) **4.** 300. [Gm.].) Soluble, without alteration, in alcohol, and ether. Decomposed by acids. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** pp. 347–349.) Decomposed by water. Soluble in strong alcohol, and ether, without decomposition, and in strong acetic acid. (Berthemot.)

***Prot*Iodide of Mercury & of Sodium.**

I.) $NaI; HgI$ Deliquescent. Soluble in water, and alcohol. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** pp. 350, 351.) Soluble in ether.

II.) $NaI; 2HgI$ Soluble, with partial decomposition, in water. Also soluble in alcohol. (*Ibid.*) Soluble in ether.

Iodide of Mercury & of StibEthylium.

$$\left.\begin{matrix} a = \mathrm{Sb}\left\{(C_4H_5)_4I; 3HgI\right. \\ b = 2\,\mathrm{Sb}\left\{(C_4H_5)_4I; 3HgI\right. \end{matrix}\right\}$$
Insoluble in water or ether. Difficultly soluble in boiling alcohol.

Iodide of Mercury & of StibMethyl*tri*Ethylium.

I.) $\mathrm{Sb}\left\{\begin{matrix}C_2H_3\\(C_4H_5)_3\end{matrix}\right. I; 2HgI$ Insoluble in water. Difficultly soluble in alcohol.

II.) $\mathrm{Sb}\left\{\begin{matrix}C_2H_3\\(C_4H_5)_3\end{matrix}\right\} I; 3HgI$ Insoluble in water. Sparingly soluble in alcohol, and ether. (Friedlænder.)

Iodide of Mercury & of Strontium.

I.) $HgI; SrI$ Soluble in water, without decomposition. (Berthemot; Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 352.)

II.) $SrI; 2HgI$ Incompletely precipitated by water, which dissolves out No. I., leaving protiodide of mercury. (Boullay, *Ibid.*)

Iodide of Mercury & of Zinc. Deliquescent. (Bonsdorff, *Pogg. Ann.*, **17.** 267.) Decomposed by water. (Boullay, *Ann. Ch. et Phys.*, (2.) **34.** 353.)

***Prot*Iodide of Mercury with Nicotin.**
$C_{20}H_{14}N_2; 2HgI$

***Prot*Iodide of Mercury with Nitrate *of protoxide* of Mercury.**

I.) $HgI; HgO, NO_5$ Decomposed by water and by alcohol. (Souville.)

II.) $2HgI; HgO, NO_5$ Permanent. Decomposed by boiling water, the nitrate being dissolved out. (Liebig.)

***Prot*Iodide of Mercury with *proto*Sulphate of Mercury.** Decomposed by water. Insoluble in alcohol. (Souville.)
$HgI; HgO, SO_3$

***Prot*Iodide of Mercury with Strychnine.** Difficultly soluble in water. (Abel & Nicholson, *J. Ch. Soc.*, **2.** 262.)

***Prot*Iodide of Mercury with Sulphide of Ethyl.**

I.) $HgI; C_4H_5S$ Sparingly soluble in boiling, less soluble in cold alcohol. (Lori.)

***Prot*Iodide of Mercury with Sulphide of Mercury.** Insoluble.
$HgI; 2HgS$

***Prot*Iodide of Mercury with Sulphide of Methyl.**
$HgI; C_2H_3S$

Iodide of Mesityl. Insoluble in water. (Kane.)
(*Iodhydrate of Mesitylene.*)
$C_6H_5I(?)$

Iodide of Methyl. Insoluble, or but sparingly soluble, in water. Easily soluble in wood-spirit, alcohol, and ether.
(*Methylic Iodide. Hydriodic Methyl-ether. Iodhydrate of Methylene.*)
C_2H_3I

Iodide of Methyl*bromé*, &c. *Vid.* Iodide of BromoMethyl, &c.

***Prot*Iodide of *tetra*Methylammonium.** Sparingly soluble in cold, more soluble in hot water. Much less soluble than its
$N(C_2H_3)_4I$

ethylic homologue. Almost insoluble in absolute alcohol. Insoluble in ether. Less soluble in alkaline liquors than in pure water.

*Ter*Iodide of *tetra*Methylammonium. $N(C_2H_3)_4 . I_3$ Somewhat more readily soluble in spirit than the quinquiodide. (Weltzien.)

*Quinqui*Iodide of *tetra*Methylammonium. $N(C_2H_3)_4 . I_5$ Decomposed by boiling with water. Soluble in dilute alcohol. (Weltzien, *Ann. Ch. u. Pharm.*, **91.** 41.)

*Dec*Iodide of *tetra*Methylammonium. $N(C_2H_3)_4 . I_{10}$

*Ter*Iodide of *tri*MethylAmylammonium. $N\left\{\begin{matrix}C_{10}H_{11}\\(C_2H_3)_3\end{matrix}\right. . I_3$ Nearly insoluble in water. Easily soluble in alcohol. (R. Mueller.)

Iodide of *tri*MethylAmylPhosphonium. $P\left\{\begin{matrix}C_{10}H_{11}\\(C_2H_3)_3\end{matrix}\right. . I$ Extremely soluble in water; somewhat less soluble in alcohol, and still less soluble in ether.

Iodide of Methylene. (*Protohydriodure de carbone*(of Sérullas).) C_2H_2'', I_2 Insoluble, or but sparingly soluble, in water. Soluble in alcohol. It is not attacked by potash-lye or by moderately concentrated boiling nitric acid. (Boutlerow, *Ann. Ch. et Phys.*, (3.) **53.** pp. 314 – 318.)

Iodide of Methyl*tri*Ethylammonium. $N\left\{\begin{matrix}(C_2H_3)\\(C_4H_5)_3\end{matrix}\right. . I$ Very soluble in water. Insoluble in alkaline liquors. (Hofmann.)

*Ter*Iodide of Methyl*tri*Ethylammonium. $N\left\{\begin{matrix}C_2H_3\\(C_4H_5)_3\end{matrix}\right. . I_3$

Iodide of *di*Methyl*di*Ethylammonium. $N\left\{\begin{matrix}(C_2H_3)_2\\(C_4H_5)_2\end{matrix}\right. . I$ Easily soluble in water, and alcohol. (Petersen.)

*Ter*Iodide of *tri*MethylEthylammonium. $N\left\{\begin{matrix}(C_2H_3)_3\\C_4H_5\end{matrix}\right. . I_3$ Decomposed by water. Soluble in hot, less soluble in cold alcohol. (R. Mueller.)

*Quinqui*Iodide of *tri*MethylEthylammonium. $N\left\{\begin{matrix}(C_2H_3)_3\\C_4H_5\end{matrix}\right. . I_5$ [Soluble in water ?]

Iodide of Methyl*di*EthylAmylammonium. $N\left\{\begin{matrix}(C_2H_3)\\(C_4H_5)_2\\C_{10}H_{11}\end{matrix}\right. . I$ Readily soluble in water.

Iodide of MethylEthylAmylPhenylammonium. Soluble in water. (Hofmann.)

Iodide of MethylEthylConiinammonium. $N\left\{\begin{matrix}C_{16}H_{14}''\\C_2H_3\\C_4H_5\end{matrix}\right. . I$ Readily soluble in water, and alcohol; much more soluble in these liquids when they are hot than when cold. Insoluble in ether or cold alkaline liquors. Soluble in a boiling solution of caustic potash, with partial decomposition; from this solution it is deposited on cooling. (v. Planta & Kekulè, *Ann. Ch. u. Pharm.*, **89.** 137.)

Iodide of Methyl*di*Ethylene*di*Phenyl*bi*ammonium. $C_{34}H_{21}N_2I = N_2\left\{\begin{matrix}C_2H_3\\(C_4H_4)_2\\(C_{12}H_5)_2\end{matrix}\right. . I$ Soluble in boiling water, and in dilute spirit.

Iodide of Methyl*tri*EthylPhosphonium. $P\left\{\begin{matrix}C_2H_3\\(C_4H_5)_3\end{matrix}\right. . I$

Iodide of *tri*MethylEthylPhosphonium. $P\left\{\begin{matrix}(C_2H_3)_3\\C_4H_5\end{matrix}\right. . I$ Readily soluble in boiling, less soluble in cold water.

Iodide of MethylLepidin. $C_{22}H_{12}NI = N\left\{\begin{matrix}C_{20}H_9'''\\C_2H_3\end{matrix}\right. . I$

Iodide of MethylLutidin. $N\left\{\begin{matrix}C_{14}H_9'''\\C_2H_3\end{matrix}\right. . I$ Extremely soluble in water, and alcohol. Almost insoluble in ether.

Iodide of MethylNicotin. $N\left\{\begin{matrix}C_{10}H_7'''\\C_2H\end{matrix}\right. . I$ Very easily soluble in water; less easily soluble in alcohol. Nearly insoluble in ether. (Stahlschmidt, *Ann. Ch. u. Pharm.*, **90.** 223.)

Iodide of *tetra*MethylPhosphonium. $P(C_2H_3)_4 . I$ Readily soluble in alcohol.

Iodide of *di*MethylPiperylammonium. $N\left\{\begin{matrix}C_{10}H_{10}''\\(C_2H_3)_2\end{matrix}\right. . I$ Soluble in alcohol. (Cahours.)

Iodide of MethylQuinolein. $N\left\{\begin{matrix}C_{18}H_7'''\\C_2H_3\end{matrix}\right. . I$

Iodide of MethylSelenious Acid. $C_2H_4ISe_2O_5 = Se_2(C_2H_3)O_4, I + Aq$

Iodide of MethylThialdin. $N\left\{\begin{matrix}C_{12}H_{13}S_4'''\\C_2H_3\end{matrix}\right. . I$ Soluble in water, and alcohol. Insoluble in ether. Ether precipitates it from the alcoholic solution; and it separates from the aqueous solution in the cold, on addition of a solution of caustic potash. (Hofmann, *J. Ch. Soc.*, **10.** 195.)

Iodide of MethylTungsten. $3(C_2H_3)W, I$ Insoluble in water. Tolerably soluble in alcohol; and still more soluble in ether. (Riche, *Ann. Ch. et Phys.*, (3.) **50.** 74.)

*Prot*Iodide of Molybdenum(*hydrated*). $Mo I$ Similar to the soluble protochloride. (Berzelius.)

*Bin*Iodide of Molybdenum(*hydrated*). $Mo I_2$ Perfectly soluble in water. (Berzelius.)

Iodide of Nickel.

I.) $Ni I, \& + 6 Aq$ Very deliquescent. Soluble in water. (Erdmann.)

II.) *basic.* Insoluble in water.

Iodide of Nickel*bi*amin. $N_2\left\}H_6 . Ni, I\right.$

Iodide of Nickel*ter*amin. (*AmmonioIodide of Nickel.*) $N_3\left\}H_9 . Ni, I\right.$ Very difficultly soluble in water. Soluble in ammonia-water, in which solution alcohol produces a precipitate. (Erdmann.)

*Prot*Iodide of Nitrogen.

I.) $N I$ Deliquescent. Soluble in water. Slowly soluble in absolute alcohol; more readily soluble in spirit. (Erdmann.) "Iodide of nitrogen" is readily soluble in an aqueous solution of ethylamin; this solution becomes turbid when treated with a small quantity of water, but clears up again when a large amount of water is added. (Gilm.)

II.) $N I + 6 Aq$ Deliquescent. Soluble in water. The solution is capable of dissolving much iodine. (Erdmann.)

*Ter*Iodide of Nitrogen. $N I_3$ Gradually soluble, with decomposition, in water.

Iodide of NitroHarmin. $N_2\left\}C_{26}H_{11}(NO_4)O_2^{vi}\left\{I_2\right.\right.$ Almost insoluble in cold water, alcohol, or ether.

Iodide of Octyl. (*Iodide of Capryl. IodCapryl. CaprylIodhydricEther.*) $C_{16}H_{17}, I$ Insoluble in water. Sparingly soluble in cold, more soluble in boiling alcohol. (Bouis, *Ann. Ch. et Phys.*, (3.) **44.** 131.)

Iodide of Pallad(*ious*)*bi*amin. $N_2\left\{H_6 . Pd', I\right.$ Decomposes in the air. Easily soluble in water.

Iodide of Pallad(*ious*)ammonium. $N\left\{\begin{matrix}H_3\\Pd'\end{matrix}\right. , I$ Permanent when dry.

Iodide of Palladium. Insoluble in water, alcohol, ether, or an aqueous solution of iodide of potassium. (Lassaigne.) Partially soluble in an aqueous solution of iodide of potassium. (H. Rose, *Tr.*) 1 pt. of iodide of potassium, when added to chloride of palladium, in presence of 5000 pts. of water, produces an immediate precipitate; with 50000 pts. of water a few flakes of Pd I separate after a while; with 500000 pts. of water no precipitate is produced (Baumann); with 400000 pts. of water a brown coloration is produced at once, and black flakes separate when the mixture is allowed to stand during 20 hours. (Lassaigne.) Permanent. Insoluble in water. Slightly soluble in solutions of various salts (as chloride of sodium, chloride of magnesium, chloride of calcium, etc.). Insoluble in dilute chlorhydric acid. (Fresenius, *Quant.*, p. 165.) Sparingly soluble in hot concentrated nitric acid. Soluble in aqueous solutions of sulphurous acid, chlorine, bromine, iodine, and cyanogen; also in solutions of cyanhydric acid and the metallic cyanides. Insoluble in dilute sulphuric, chlorhydric, phosphoric, nitric, or acetic acids, or in the normal potash, soda, or ammonia salts of these acids. Insoluble in aqueous solutions of the chlorides of calcium or zinc or of acetate of lead. Insoluble in an aqueous solution of bromide of sodium, excepting when heated therewith in presence of a free mineral acid, but not in presence of acetic acid. Insoluble in solutions of sugar, starch, uric acid, alcohol, ether, or oil of lemon. Somewhat soluble in urine. Easily soluble in ammonia-water, even dilute, with evolution of heat and decomposition. (Kersten, *Ann. Ch. u. Pharm.*, **87.** pp. 28, 32.)

$Pd\,I$

Iodide of Palladium & of Potassium. Deliquescent.
(IodoPalladite of Potassium.)

Iodide of Phenyl.
$C_{12}\,H_5, I$

Iodide of Phosphorus.

I.) $P\,I_2$ Decomposed by water. Easily soluble in bisulphide of carbon. (Corenwinder, *Ann. Ch. et Phys.*, (3.) **30.** 245.) "Iodide of phosphorus" is sparingly soluble in caoutchin. (Himly.)

II.) $P\,I_3$ Very deliquescent. Decomposed by water, with solution. Very soluble in bisulphide of carbon. (Corenwinder, *loc. cit.*, p. 249.)

Iodide of Piperin. Soluble in alcohol.
$C_{68}\,H_{38}\,N_2\,I_3\,O_{12} = 2\left(N \left\{ \begin{matrix} C_{10}\,H_{10}'' \\ C_{24}\,H_9\,O_6 \end{matrix} \right.\right), I_3$

Iodide of Platin(*ous*)*bi*amin. Soluble in water, but the solution is decomposed on boiling, iodide of platin(*ous*)ammonium being deposited. (Reiset, *Ann. Ch. et Phys.*, (3.) **11.** 425.)
(Iodhydrate of diPlatosobiamin. Ammonio protIodide of Platinum.)
$N_2 \left\{ H_6 \,.\, Pt', I \right.$

Iodide of Platin(*ous*)ammonium. Very sparingly soluble in water. Easily soluble in ammonia-water, with formation of iodide of platin(*ous*)*bi*amin. (Reiset, *Ann. Ch. et Phys.*, (3.) **11.** 425.)
(Iodide of Platosammonium.)
yellow modif. $N \left\{ \begin{matrix} H_3 \\ Pt \end{matrix} \right., I$

***Prot*Iodide of Platinum.** Permanent. Insoluble in water or alcohol. A cold aqueous solution of iodhydric acid of 1.038 sp. gr. gradually decomposes it, biniodide of platinum being dissolved out and metallic platinum left behind. A hot aqueous solution of iodide of potassium acts upon it in a similar manner. It is not acted upon by concentrated sulphuric, chlorhydric, or nitric acids, but is gradually decomposed by solutions of the caustic alkalies. (Lassaigne, *Ann. Ch. et Phys.*, 1832, (2.) **51.** pp. 118 – 121.)
$Pt\,I$

***Sesqui*Iodide of Platinum?** Unacted upon by water, alcohol, or ether; or by cold sulphuric, chlorhydric, or nitric acids. Soluble in iodhydric acid and in an aqueous solution of iodide of potassium, also in a solution of caustic potash; and in aqua-regia, with decomposition. (Kane.)
$Pt_2\,I_3$

***Bin*Iodide of Platinum.**

I.) *normal.* Insoluble in cold or hot water. Slightly soluble in alcohol of 88%, but the alcoholic solution is decomposed by evaporation. Neither dissolved nor decomposed by acids, but is slowly converted into the bichloride by the action of aqua-regia and of chlorine-water. Also dissolved by iodhydric acid, and by aqueous solutions of the basic iodides, with combination. (Lassaigne, *Ann. Ch. et Phys.*, 1832, (2.) **51.** pp. 122 – 129.)
$Pt\,I_2$

II.) *acid.* Hygroscopic. Very easily soluble in water. (Lassaigne, *loc. cit.*) When diluted with a very large quantity of water, and especially if the dilute solution be exposed to sunlight, biniodide of platinum is deposited after a while.
$Pt\,I_2, H\,I$

***Bin*Iodide of Platinum with Iodide of *X*.** *Vid.* IodoPlatinate of *X*.

***Bin*Iodide of Platinum with Oxide of Platin(*ic*)*bi*amin.** Insoluble in water. (Kane, *Phil. Trans.*, 1842, p. 299.)
$Pt\,I_2 ; N_2 \left\{ H_6 \,.\, Pt, O_2 \right.$

Iodide of Plumbammonium. Decomposed by water. (Labouré.)
(AmmonioIodide of Lead.)
$N \left\{ \begin{matrix} H_3 \\ Pb \end{matrix} \right. I$

Iodide of $\frac{3}{2}$ PlumbEthyl. Soluble in ether, the solution undergoing decomposition on being evaporated.

Iodide of Potassium. Deliquesces in very moist air. Very easily soluble in water, with reduction of temperature.
$K\,I$

Soluble in	0.735	pt. of water at	12.5°	
"	0.709	"	16°	(Baup.)
"	0.700	"	18°	
"	0.450	"	120°	(boiling-point of the saturated aqueous solution.) (Gay-Lussac.)

Or, 100 pts. of water at	12.5°	dissolve	136	pts. of it.
"	16°	"	141	" (Baup.)

(H. Schiff, *Ann. Ch. u. Pharm.*, 1859, **110.** 75.)

Soluble in 5.5 pts. of alcohol of 0.85 sp. gr. at 12.5°, and in 39 @ 40 pts. of absolute alcohol at 13.5°; a much larger quantity is dissolved by hot alcohol, from which solution it is deposited in needles on cooling. (Baup.) Soluble in commercial acetate of ethyl. (Casaseca, *C. R.*, 1850, **30.** 821.) Insoluble in strong acetic acid. (Berthemot.) Freely soluble in glycerin. (Parrish's *Pharm.*, p. 236.) An aqueous solution of iodide of potassium is capable of dissolving a considerable amount of iodine. (See under Iodine.)

IODIDE OF POTASSIUM & OF SILVER.

I.) $KI; AgI$ Soluble in hot alcohol, from which it crystallizes on cooling. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 379.)

II.) $2KI; AgI$ Decomposed by water, which dissolves out iodide of potassium, leaving iodide of silver. (Boullay, *Ibid.*, 377.)

IODIDE OF POTASSIUM & OF TIN. $KI; 2SnI$ When treated with a small quantity of water iodide of potassium dissolves, while iodide of tin remains; but when added in larger quantity, water dissolves it completely. More soluble in warm than in cold alcohol. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 374.)

IODIDE OF POTASSIUM & OF ZINC. $KI, 2ZnI$ Very deliquescent.

IODIDE OF POTASSIUM with OIL OF CINNAMON AND IODINE. $6C_{18}H_8O_2; 3I, KI$ Easily soluble in cold water. (Oswald.) Decomposed by water at ordinary temperatures, more slowly at 0°. (Apjohn, Despau.) Easily soluble in alcohol, and ether. (Apjohn, Oswald.)

IODIDE OF PROPYLENE.
(Iodide of Tritylene.)
C_6H_6'', I_2

IODIDE OF PTELEYL. *Vid. ter*IodoMesitylene.

*Sesqui*IODIDE OF RUTHENIUM. Ru_2I_3 Ppt. (Claus, *Beiträge*, p. 32.)

IODIDE OF SALICYL. *Vid.* IodoSalicylous Acid.

IODIDE OF SELENETHYL. C_4H_5Se, I Readily soluble in ammonia-water.

IODIDE OF SILVER. AgI When prepared in the moist way, it is insoluble in water or in dilute nitric acid, and scarcely at all soluble in ammonia-water. Somewhat difficultly decomposed by hot concentrated nitric or sulphuric acid. (Fresenius, *Quant.*, p. 165.) Soluble in concentrated aqueous solutions of the chlorides of potassium and sodium; of nitrate of protoxide of mercury. (Preuss; Wackenroder, *Ann. Ch. u. Pharm.*, **41.** 317); and of nitrate of silver, if it be hot and concentrated. Very slightly soluble in ammonia-water. (H. Rose.) Soluble in 2510 pts. of ammonia-water of 0.96 sp. gr. (Martini.) Soluble in an aqueous solution of cyanide of potassium. (Liebig.) Completely soluble, with combination, in a cold, and still more readily in a hot, aqueous solution of iodide of potassium; but one equivalent of the alkaline iodide does not appear to be capable of dissolving more than a single equivalent of it. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 377.) Abundantly soluble in aqueous solutions of the iodides of the alkalies and alkaline earths. (Wittstein's *Handw.*) Only very sparingly soluble in aqueous solutions of the soluble hyposulphites. (Herschel, *Edin. Phil. Journ.*, 1819, **1.** 397.) Soluble in a tolerably concentrated aqueous solution of nitrate of silver. (Bineau, *Ann. Ch. et Phys.*, (3.) **7.** 267.) Easily soluble in iodhydric acid when this is not too dilute. When the solution is concentrated by evaporation, 4 equivs. of iodine to 1 equiv. of the acid may be contained in it. This solution is decomposed by boiling and when diluted with water. (Bineau, *Ibid.*, pp. 267, 274.) Decomposed by concentrated sulphuric and nitric acids. Insoluble in dilute sulphuric, phosphoric (Brandes), or nitric acids. Readily soluble in an aqueous solution of caustic potash, especially if it be hot; from this solution it is precipitated on the addition of water or alcohol. Sparingly soluble in [an aqueous solution of?] pyrophosphate of ethyl. ($2\,C_4H_5O, PO_5$). A precipitate is formed when iodide of potassium is added to the solution of a silver salt, even when 30000 pts. of water are present. (Harting.)

IODIDE OF SILVER with NITRATE *of protoxide* OF MERCURY. Decomposed by water. (Preuss.)
$2\,AgI;\,2(HgO, NO_5) + Aq$

IODIDE OF SILVER with NITRATE OF SILVER. Decomposed by water. Neither decomposed nor dissolved by absolute alcohol. Its only solvent appears to be a concentrated aqueous solution of nitrate of silver. (Preuss; compare Weltzien, *Ann. Ch. u. Pharm.*, **95.** 127.)
$AgI;\,2(AgO, NO_5)$

IODIDE OF SODIUM.

a = anhydrous. Deliquesces in moderately moist air. 100 pts. of water dissolve 173 pts. of it at 14°. (Dumas, *Tr.*, **6.** 228.)
NaI

Soluble in 0.63 pt. of water at 0°
" 0.56 " 20°
" 0.48 " 40°
" 0.39 " 60°
" 0.33 " 80°
" 0.32 " 100°
" 0.31 " 120°
" 0.30 " 140°

(Kremers, *Pogg. Ann.*, **97.** 14.) The saturated aqueous solution boils at 141°. (*Ibid.*, p. 20.)

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of the anhydrous salt dissolved in 100 pts. of water.
1.1752	24.5
1.3362	50.2
1.4962	79.4
1.6659	115.6
1.8047	149.7

(Kremers, *Pogg. Ann.*, **103.** 67.) Very sparingly soluble in alcohol. (Gmelin.) Soluble in dilute alcohol. (Girault.) Soluble in alcohol. (Parrish's *Pharm.*, p. 481; Berzelius's *Lehrb.*, **3.** 215.) Soluble in commercial acetate of ethyl. (Casaseca, *C. R.*, 1850, **30.** 821.)

b = hydrated. Effloresces in dry air; deliquesces like the anhydrous salt in moist air. The crystals dissolve in 0.6 pt. of cold water. (Gay-Lussac.)
$NaI + 4\,Aq$

*Bin*IODIDE OF SODIUM. Soluble in water; this solution gives off iodine more readily than that of biniodide of potassium.
NaI_2

IODIDE OF SODIUM & OF TIN. Very soluble. When treated with a small quantity of water the iodide of sodium dissolves out, leaving the iodide of tin; but in a larger quantity of water it dissolves completely. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 375.)
$NaI, 2\,SnI$

IODIDE OF SODIUM & OF ZINC. Deliquescent.
$NaI, ZnI + 3\,Aq$

IODIDE OF SPIROYL. *Vid.* IodoSalicylous Acid.

IODIDE OF STANN(*ous*)*bi*AMIN.
(*AmmonioprotIodide of Tin.*)
$N\left\{H_6 . Sn, I\right.$

IODIDE OF STANNAMYL.

IODIDE OF *bi*STANNAMYL.

IODIDE OF $\frac{2}{2}$ STANNAMYL.

IODIDE OF $\frac{3}{2}$ STANNAMYL.

IODIDE OF $\frac{4}{2}$ STANNAMYL. Soluble in ether.
$(C_{10}H_{11})_4Sn_2I$

IODIDE OF STANNETHYL. Sparingly soluble in cold, decomposed by boiling water. More soluble in cold alcohol, and still more soluble in ether. It is readily soluble in boiling alcohol. (Frankland.)
C_4H_5SnI

*Din*IODIDE OF STANNETHYL.
$Sn_2(C_4H_5)_2 . I$

IODIDE OF *di*STANNETHYL. Sparingly soluble in water.
$C_4H_5Sn_2I$

IODIDE OF *di*STANN*tri*ETHYL. Very sparingly soluble in water. Readily soluble in dilute spirit. Miscible in all proportions with alcohol, and ether.
$(C_4H_5)_3Sn_2I$

IODIDE OF *tetra*STANN*quinqui*ETHYL. Similar to the $\frac{3}{2}$ compound.
$(C_4H_5)_5Sn_4I$

IODIDE OF *tetra*STANN*tri*ETHYL. Insoluble in water. Readily soluble in alcohol, and ether; less easily, however, than the $\frac{4}{4}$ compound. (Lœwig.)
$(C_4H_5)_3Sn_4I$

IODIDE OF *tetra*STANNETHYL. Completely insoluble in water. Easily soluble in alcohol, and ether. (Lœwig.)
$C_4H_5Sn_4I$

IODIDE OF STANNMETHYL. Tolerably soluble in water. More soluble in alcohol. Soluble in all proportions in ether. It is much more soluble in all these vehicles than its ethylic homologue. (Cahours & Riche.)
C_2H_3SnI

IODIDE OF *di*STANNMETHYL.
$(C_2H_3Sn)_2I$

IODIDE OF STIB*tri*AMYL. Insoluble in water. Soluble in alcohol, and ether.
$(C_{10}H_{11})_3Sb . I_2$

IODIDE OF STIB*tri*ETHYL.

I.) $(C_4H_5)_3Sb . I_2$ Soluble in water, without decomposition. Easily soluble in alcohol, and ether. (Lœwig & Schweizer.)

II.) (*Merck's iodide.*) Permanent. Soluble in water, and alcohol. (Merck.)
$(C_4H_5)_3Sb . I$

IODIDE OF STIB*tri*ETHYL & OF ZINCETHYL. Soluble in water, and alcohol. (J. P. Cooke, *Mem. Amer. Acad.*, 1855, (N. S.) **5.** 345.)
$Sb(C_4H_5)_3 . I;\,2(Zn(C_4H_5) . I)$

IODIDE OF STIBETHYLIUM.

I.) $Sb\left\{(C_4H_5)_4I, \& + 3\,Aq, \& 1\tfrac{1}{2}\,Aq\right.$ Easily soluble in water, and alcohol. (Landolt.) 100 pts. of water at 20° dissolve 19.01 pts. of the anhydrous salt; or, 1 pt. of it is soluble in 5.26 pts. of water at 20°; still more easily soluble in absolute alcohol, but less easily soluble in ether. (Lœwig.)

IODIDE OF STIBMETHYL*tri*ETHYLIUM. Soluble in 2 pts. of water at 20°. Easily soluble in alcohol. Insoluble in ether. (Friedlænder.)
$Sb\left\{\begin{matrix}C_2H_3\\(C_4H_5)_3\end{matrix}\right. . I$

IODIDE OF STIBMETHYLIUM. Soluble in 3.3 pts. of water at 23°. Very soluble in alcohol. Sparingly soluble in ether. (Landolt.)
$Sb\left\{(C_2H_3)_4 . I\right.$

IODIDE OF STRONTIUM. Readily soluble in water. (Gay-Lussac.)
SrI

Soluble in 0.61 pt. of water at 0°
" 0.56 " 20°
" 0.51 " 40°
" 0.40 " 70°
" 0.27 " 100°

(Kremers, *Pogg. Ann.*, **103.** 66.)

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of the anhydrous salt dissolved in 100 pts. of water.
1.2160	27·5
1.4329	58.4
1.6269	89.9
1.8349	127.9
1.9725	156.9

(Kremers, *Pogg. Ann.*, **103.** 67.)

Iodide of Strontium & of Tin (Sn I). "Very soluble." (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** 376.)

Iodide of Sulphur. Insoluble in water. Decomposed by alcohol, which dissolves out the iodine. Sparingly soluble in cold caoutchin, the solution decomposing when boiled.

Freely soluble in glycerin. (Parrish's *Pharm.*, p. 236.)

Iodide of TellurEthyl. Sparingly soluble
$C_4 H_5 Te, I$ in water. Readily soluble in hot alcohol. Soluble in ammonia-water.

*Prot*Iodide of Tellurium. Unacted upon
$Te I$ by water, even when this is boiling. (Berzelius.)

*Bin*Iodide of Tellurium.
(*Iodotelluric Acid.*)

I.) $Te I_2$ Scarcely at all acted upon by cold water. Partially soluble, with decomposition, in boiling water, and in alcohol, even absolute. Soluble in iodhydric acid; but only slightly soluble in aqueous solutions of the alkaline iodides. (Berzelius.)

II.) *basic.* Insoluble in water, and does not appear to be decomposed thereby. (Berzelius's *Lehrb.*)

*Ter*Iodide of Tellurium. Slowly and sparingly soluble in water.

*Bin*Iodide of Tellurium with Iodide of *X*. *Vid.* IodoTellurate of *X*.

Iodide of TellurMethyl. Sparingly solu-
$C_2 H_3 Te I$ ble in cold, much more soluble in warm water. Readily soluble in boiling, less soluble in cold alcohol. (Wœhler & Dean, *Ann. Ch. u. Pharm.*, **93.** 237.)

Iodide of Tetryl. *Vid.* Iodide of Butyl.

*Prot*Iodide of Tin. Sparingly soluble, with-
(*Iodo Stannous Acid.*) out decomposition, in water.
$Sn I$ (Henry.) More soluble in hot than in cold water; also soluble in aqueous solutions of protochloride of tin and of the iodides of potassium, sodium, ammonium, barium, and strontium, with combination, forming easily soluble salts. (Boullay, *Ann. Ch. et Phys.*, 1827, (2.) **34.** pp. 372–376.) Insoluble in an aqueous solution of iodide of potassium. Readily soluble in chlorhydric acid, and in an aqueous solution of caustic potash. (H. Rose, *Tr.*)

*Bin*Iodide of Tin. Decomposed by water
(*Iodo Stannic Acid.*) (Henry.) Soluble in absolute
$Sn I_2$ alcohol; from which solution water precipitates it. (Dœbereiner.)

Iodide of Toluenyl.
(*Iodide of Benzyl. Iodhydrate of Benzylene. Iodhydrate of Benzene.*)
$C_{14} H_7 I$

Iodide of Tritylene. *Vid.* Iodide of Propylene.

*Prot*Iodide of Uranium. Soluble in water.
$Ur I$ (Rammelsberg.)

Iodide of Valeryl.
$C_{10} H_9 O_2, I$

*Bin*Iodide of Vanadium. Soluble in water.
$V I_2$

Iodide of Yttrium. Deliquescent. Very
$Y I$ soluble in water, with evolution of heat. Slightly soluble in alcohol. (Berlin.)

Iodide of Zinc. Very deliquescent. Solu-
$Zn I$ ble in water, and alcohol. Soluble in an aqueous solution of carbonate of ammonia. (Parrish's *Pharm.*, p. 533.)

An aqueous solution of sp. gr. (at 19.5°)	Contains pts. of the anhydrous salt dissolved in 100 pts. of water.
1.1715	21.5
1.3486	46.4
1.5780	85.0
1.7815	126.3
1.9906	177.9
2.1853	232.0

(Kremers, *Pogg. Ann.*, **104.** 156; & **106.** 587.)

II.) *basic.* *Vid.* OxyIodide of Zinc.

Iodide of Zinc with Nitrate of Potash. Permanent. Easily soluble in water. Insoluble in alcohol. (Anthon, in *Berzelius's Lehrb.*, **3.** 676.)

Iodide of Zinc*bi*amin. Decomposed by
(*AmmonioIodide of Zinc.*) water. Readily solu-
$N_2 \left\{ H_6 . Zn, I \right.$ ble in ammonia-water. (Rammelsberg.)

Iodide of Zinc*ter*amin. Decomposed by
$N_3 \left\{ H_9 . Zn, I \right.$ water. Soluble in ammonia-water.

Iodine. Very slightly soluble in water. (Gay-
I Lussac, *Ann. de Chim.*, **91.** 7. [T.].) Soluble in 7000 pts. of water. In 3800 pts. of water at 15° (Basse, assistant of Otto, see *Otto's Lehrb.*); in 500 pts. of water at 20° (Jacquelain); in 7196.4 pts. at 18.75° (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8.** 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.)

Soluble in 10 @ 12 pts. of alcohol. (Wittstein's *Handw.*) Readily and abundantly soluble in alcohol. (Vauquelin.) The alcoholic solution gradually undergoes decomposition (Colin, Le Royer); iodine is precipitated from it on the addition of water. (Vauquelin.) Very soluble in ether, and chloroform; also in bromoform.

Soluble in wood-spirit (Playfair); abundantly in fusel-oil (hydrate of amyl). (Pelletan, Trautwein); and very readily in caprylic alcohol (hydrate of capryl). (Bouis, *Ann. Ch. et Phys.*, (3.) **44.** 103.) Abundantly soluble in hot, less soluble in cold naphtha. (Pelletier & Walter.) Soluble in about 8 pts. of hot rock-oil (from Amiano). (De Saussure.) Sparingly soluble in cold, more soluble in hot benzin. (Mansfield.) Readily soluble in benzin. (Moride, *Ann. Ch. et Phys.*, (3.) **39.** 452.) Readily soluble in cold oil of turpentine (Deville); but a violent explosion soon occurs. (Walker.) Soluble in oil of mandarin (Luca); in oil of arnica-root. (Zeller.) Very soluble in bisulphide of carbon; in lignone; in furfurol (Stenhouse); in hydride of valeryl (Trautwein); in caprylene (Bouis). Readily soluble in glycerin, without decomposition. (Pelouze.) Soluble in aldehyde (Liebig); in chloral; in warm retinole; in toluene, and in salicylous acid, without decomposition (Lœwig); in nitrate of ethyl; in salicylate of methyl; in butylic mercaptan (butylsulphydric acid); in cold sulphocarbamate of amyl (Johnson); largely in sulphydrate of ethyl (Zeise). Abundantly soluble in iodide of allyl (Berthelot & De Luca); in xanthic ether (disulphocarbonate of ethyl); in "protochloride of carbon" ($C_4 Cl_4$) at ordinary temperatures (Faraday); in chloride of sulphur (Solly); in chloride of iodine "to a certain extent" (Pelouze & Fremy, *Tr.*); in Gladstone's sulphoperChloride of Phosphorus ($P S_4 Cl_5$); in ($P H Cl_5$, $2 S O_2$) (Pelouze & Fremy); in pentasulphide of hydrogen; and in chlorochromic acid, without causing this to decompose. (Walter.) Readily soluble in valerate of amyl; and in valerianic acid, from which it is precipitated on the addition of water. (Trautwein.) Readily soluble in cold creosote. (Reichenbach.) Soluble in warm butyric acid; separating out again as the solution cools. (Pelouze & Gélis, *Ann. Ch. et Phys.*, (3.) **10.** 450.) Easily soluble in anilin, with subsequent decomposition. (Hofmann, *Ann. Ch. et Phys.*, (3.) **9.** 162.) Also soluble in ("leukol") quinolein. (*Ibid.*, p. 175.) Soluble, without alteration, in methylsalicylic acid. (Lœwig?) Soluble in oil of winter-green (methylsalicylic acid). (Cahours, *Ann. Ch. et Phys.*, (3.) **10.** 330.) Iodine is quickly soluble in the essential oils of dill (*oleum anethi*); of peppermint (*ol. menthæ crispæ* & *ol. menthæ piperitæ*); of sassafras (*ol. sassafras cort.*); and of tansy (*ol. tanaceti*); slowly soluble in oil of cinnamon (*ol. cassiæ*); oil of cloves (*ol. caryophylli*); oil of cajeput (*ol. cajeputi*); and oil of rue (*ol. rutæ*); it is decomposed by most of the other essential oils. (Parrish's *Pharm.*, p. 347.) Of the "empyreumatic oils," oil of amber (*ol. succini*) dissolves it slowly, as does also *oleum asphalti;* it is insoluble in *oleum petræ.* (*Ibid.*, p. 346.) Abundantly soluble, with combination, in caoutchin. (Himly.)

Soluble in iodhydric acid, even when this is dilute; and in aqueous solutions of those metallic iodides which are soluble in water. A solution of iodide of potassium, containing one part of the iodide in every one or two parts of water, can dissolve 2 parts of iodine, on adding more water to this solution some iodine is precipitated. On exposure to the air iodine is slowly evolved from these solutions, and when heated they readily give off iodine. (Baup.) Much more soluble in water charged with bromhydric acid than in pure water; but nevertheless, 10-hydrated bromhydric acid only dissolves 3 @ 4 % of it. (Bineau, *Ann. Ch. et Phys.*, (3.) **7.** 265.) Slightly soluble in chlorhydric acid.

Soluble in a dilute aqueous solution of sulphurous acid, with formation of iodhydric and sulphuric acids, water being decomposed; but when only a small quantity of water is present this solution does not occur, concentrated solutions of iodhydric acid and sulphuric acid mutually decomposing each other, with precipitation of iodine and evolution of sulphurous acid. Even when the solution of iodine in sulphurous acid is simply concentrated by evaporation iodine may be reprecipitated, while sulphurous acid is again formed and evolved. (Selmi, *L'Institut* (Section I.), 1844, **12.** 7.) As a rule, water which contains in solution salts, like chloride of ammonium or nitrate of ammonia, dissolves much more iodine than pure water.

Soluble, without alteration, in an aqueous solution of normal croconate of potash. (L. Gmelin.) When an excess of iodine is boiled in a very dilute aqueous solution of protochloride of mercury, a quantity of it dissolves; and on cooling this solution crystals separate out, the mother liquor from which still contains much iodine. (Selmi, *L'Institut* (Section I.), 1844, **12.** pp. 6, 412.) When a mixture of iodine and powdered arsenious acid is boiled with much water, the iodine dissolves, together with the arsenious acid, iodhydric and arsenic acids being formed. On concentrating this solution iodine is set free; and on the addition of chlorhydric acid iodine is precipitated. If, on the other hand, concentrated syrupy solutions of arsenic acid and of iodhydric acid are mixed, iodine is precipitated at once, and arsenious acid formed; but if this mixture is now turned into a large quantity of water the iodine rapidly dissolves, a solution behaving like that first mentioned being obtained. Hence, in presence of a small quantity of water, arsenic and iodhydric acids decompose each other; while in presence of much water they are recomposed. The precipitation of iodine by chlorhydric acid in the foregoing experiment appears to depend upon the affinity of the acid for water, the latter being thus removed, and the solution, as it were, rendered more concentrated. (Selmi, *loc. cit.*, p. 7.) A solution prepared by dissolving 6 pts. of tartar-emetic in 176 pts. of water is capable of dissolving 2.75 pts. of iodine, iodhydric acid being formed and tartrate of antimonous acid; if a solution of 6 pts. of tartar-emetic in 378 pts. of water be employed 4.12 pts. of iodine may be dissolved, the quantity of iodine dissolved being the amount which is necessary to transform the oxide of antimony into antimonous acid by the decomposition of water. When this solution is evaporated iodine is set free. (Selmi, *loc. cit.*, p. 7.)

Most metallic iodides are readily soluble in water. Several of them are soluble in ether.

"Iodous Acid." *Vid.* HypoIodic Acid.
$I O_4$

"Iodite of Ammonia"[?] Less efflorescent than the iodate. Soluble in a little more than half the quantity of water required to dissolve the iodate. (Sementini, *Phil. Mag.*, 1834, (3.) **4.** 393.)

Iodite of Soda. *Vid.* Iodate of Soda with Iodide of Sodium.

IodoBenzoic Acid. Very difficultly soluble
$C_{14} H_5 I O_4 = C_{14} H_4 I O_3, H O$
in boiling water, and separates out again almost completely as the solution cools. Exceedingly easily soluble in alcohol, and ether. (Griess, in *Kolbe's Lehrb.*, **2.** 77.)

IodoBenzoate of Silver. Ppt. (*Ibid.*)
$C_{14} H_4 I Ag O_4$

IodoBrucin. *Vid.* Iodide of Brucin.

IodoCamphor. Insoluble in water. Easily soluble in alcohol, and ether. (Claus.)

IodoCaoutchin. Nearly insoluble in water. Easily soluble in alcohol, and ether. (Himly.)

IodoChloroNitroHarmin. More soluble in
(Iodide of ChloroNitroHarmin.)
$N_2 C_{26} H_{10} Cl (N O_4) O_2 . I_2$
alcohol than iodonitroharmin; also soluble in naphtha. Largely soluble in warm, less soluble in a cold concentrated alcoholic solution of cyanhydric acid. (Fritsche.)

IodoCinchonin. Insoluble in cold, very sparingly soluble in boiling water.
(Iodide of Cinchonin.)
$N_2 C_{40} H_{24} O_2, I$
Soluble in alcohol, and ether. Less soluble in alcohol than the iodhydrate of cinchonin.

IodoCinnamic Acid. Easily soluble in hot
$C_{18} H_7 I O_4$
water, and in alcohol. (Herzog.)

*Bin*IodoCodein. Insoluble in water. Read-
$C_{36} H_{19} I_2 N O_6$
ily soluble in boiling, less soluble in cold alcohol. Soluble in chlorhydric acid. (Brown.)

IodoCodein. (*TerIodide of Codein. TerIodo Codein.*) $2\,N\,C_{36}\,H_{21}\,N\,O_6, 3\,I_2$ Insoluble in water, or ether. Soluble in alcohol. Insoluble in cold, soluble in warm, concentrated sulphuric acid. Slowly attacked by hot nitric acid. Decomposed by a boiling solution of caustic potash.

IodoForm. *Vid.* Iodide of *bin*IodoMethyl.

IodoMecone. $C_6\,H_4\,I_8\,O_0$ Insoluble in water or chlorhydric acid, even boiling. Soluble in alcohol, especially when boiling, and in ether. (Brown, *Phil. Mag.*, (4.) **8.** 206.)

IodoMeconin. (*IodOpianyl.*) $C_{20}\,H_9\,I\,O_8$ Scarcely at all soluble in water; more readily soluble in alcohol, and ether. Soluble in concentrated sulphuric acid. (Anderson.)

*Bin*IodoMelAnilin. Soluble in alcohol. $C_{20}\,H_{11}\,I_2\,N_3 = N_2\left\{\begin{matrix}C_{12}\,H_4\,(C_2\,N)\\ C_{12}\,H_3\,I_2\\ H_4\end{matrix}\right.$ (Hofmann, *J. Ch. Soc.*, **1.** 303.)

IodoMercurate of *X*. *Vid. prot*Iodide of Mercury with Iodide of *X*.

*Ter*Iodide of Mesitylene. (*Iodide of Pteleyl.*) $C_{18}\,H_9\,I_3$ Insoluble in water. Soluble in ether. (Kane.)

*Bin*IodoMethylamin. $N\left\{\begin{matrix}C_2\,H\,I_2\\ H_2\end{matrix}\right.$ Insoluble in water. Soluble, apparently with decomposition, in alcohol. (A. Wurtz, *Ann. Ch. et Phys.*, (3.) **30.** 455.)

IodoMethylSelenious Acid. $C_2\,H_3\,I\,Se_2\,O_4 + Aq$ Easily soluble in iodhydric acid and in an aqueous solution of iodide of potassium. Soluble in alcohol. (Wœhler & Dean, *Ann. Ch. u. Pharm.*, **97.** 8.)

IodoMorphine. $2\,(N\,C_{34}\,H_{19}\,O_6), I_3$ Insoluble in cold acids or alkaline liquors; but dissolves in them easily when heated.

IodoNicotin. $N_2\,C_{20}\,H_{14}, I_3$ Decomposed when boiled with water. Soluble in alcohol. Decomposed by a cold solution of caustic potash.

IodoNitroHarmin. $C_{20}\,H_{11}\,(N\,O_4)\,N_2\,O_2, I_2$ Almost insoluble in cold water, alcohol, ether, or coal-tar oil; and only sparingly soluble in these liquids when warm. Decomposed by boiling with alcohol, or dilute sulphuric acid. Soluble in hot concentrated acetic acid. Easily soluble in an alcoholic solution of cyanhydric acid, with combination. Soluble in chlorhydric acid, apparently with combination.

*Bin*IodoNitroPhenic Acid. $C_{12}\,H_3\,I_2\,(N\,O_4)\,O_2$

*Ter*IodoPapaverin. $N\,C_{40}\,H_{21}\,O_8\,I_3$ Insoluble in water. Soluble in boiling, less soluble in cold alcohol. Insoluble in dilute acids. Decomposed by ammonia-water and by an aqueous solution of potash.

*Quinqui*IodoPapaverin. $N\,C_{40}\,H_{21}\,O_8, I_5$ More soluble than teriodopapaverin in alcohol. Decomposed by ammonia-water.

IodoPhenylamin. *Vid.* IodAnilin.

IodoPhenylCitraconimid. (*CitraconIodAnil.*) $C_{22}\,H_8\,I\,N\,O_4 = N\left\{\begin{matrix}C_{10}\,H_4\,O_4''\\ C_{12}\,H_4\,I\end{matrix}\right.$ Sparingly soluble in water, though more soluble in hot than in cold water. Readily soluble in spirit. (Gottlieb.)

IodOpianyl. *Vid.* IodoMeconin.

IodoPlatinic Acid. *Vid. bin*Iodide of Platinum.

IodoPlatinate of Ammonium. $N\,H_4\,I\,;\,Pt\,I_2$ Permanent. Sparingly soluble in water. Insoluble in alcohol. (Lassaigne, *Ann. Ch. et Phys.*, 1832, (2.) **51.** 128.)

IodoPlatinate of Barium. $Ba\,I, Pt\,I_2$ Deliquescent; though less so than the soda salt which it resembles in other respects. (Lassaigne, *Ann. Ch. et Phys.*, (2.) **51.** 127.)

IodoPlatinate *of protoxide* of Iron. Deliquescent. Soluble in water.

IodoPlatinate of Potassium. $K\,I, Pt\,I_2$ Permanent. Soluble in water. Insoluble, or at least only very slightly soluble, in alcohol of 38°. Unacted upon by cold concentrated sulphuric acid. (Lassaigne, *Ann. Ch. et Phys.*, (2.) **51.** 126.)

IodoPlatinate of Sodium. $Na\,I\,;\,Pt\,I_2$ Deliquescent. Very soluble in water, and alcohol. (Lassaigne, *Ann. Ch. et Phys.*, (2.) **51.** 127.)

IodoPlatinate of Zinc. $Zn\,I\,;\,Pt\,I_2$ Deliquescent. Very soluble in water. (Lassaigne, *Ann. Ch. et Phys.*, (2.) **51.** 127.)

IodoPropylene. *Vid.* Iodide of Allyl.

IodoPyroMeconic Acid. $C_{10}\,H_3\,I\,O_6$ Sparingly soluble in cold, more readily soluble in hot water. Sparingly soluble in cold, readily soluble in hot alcohol. The presence of acids or alkalies increases its solubility in water. (Brown, *Phil. Mag.*, (4.) **8.** 203.)

IodoPyroMeconate of Baryta. $C_{10}\,H_2\,I\,Ba\,O_6 + Aq$ Sparingly soluble in water, and alcohol, either hot or cold. (Brown, *loc. cit.*)

IodoPyroMeconate of Lead. $C_{10}\,H_2\,I\,Pb\,O_0$ Sparingly soluble in water, and alcohol. Insoluble in acetic acid. (Brown.)

IodoQuinine. $N_2\,C_{40}\,H_{24}\,O_4, I$ Permanent. More soluble in water than sulphate of quinine. Very easily soluble in alcohol. Also soluble in ether.

IodoSalicylic Acid. $C_{14}\,H_5\,I\,O_6 = C_{14}\,H_3\,I\,O_4, 2\,H\,O$ Difficultly soluble in hot water. Easily soluble in alcohol, and ether. (Lautemann, in *Kolbe's Lehrb.*, **2.** 268.)

IodoSalicylate of Baryta.

I.) *acid.* Soluble in water.
$C_{14}\,H_4\,I\,Ba\,O_8$

II.) *normal.* Less soluble in water than the acid salt.

IodoSalicylate of Soda.

I.) *acid.* Easily soluble in water.

*Bin*IodoSalicylic Acid. $C_{14}\,H_4\,I_2\,O_0 = C_{14}\,H_2\,I_2\,O_4, 2\,H\,O$ Difficultly soluble in water. Soluble in alcohol. (Lautemann, *Ibid.*)

*Bin*IodoSalicylate of Baryta.

I.) *acid.* Difficultly soluble in water.
$C_{14}\,H_3\,I_2\,Ba\,O_0$

II.) *normal.* Still more difficultly soluble than the acid salt.

IodoSalicylate of Soda.

I.) *acid.* Soluble in water.

*Ter*IodoSalicylic Acid. $C_{14}\,H_3\,I_3\,O_0 = C_{14}\,H\,I_3\,O_4, 2\,H\,O$ Insoluble in water. Difficultly soluble in alcohol. (Lautemann, *Ibid.*)

TerIodoSalicylate of Soda.
I.) *acid.* Soluble in water.

IodoSalicylous Acid. Insoluble in water. Readily soluble in alcohol, and ether. (Lœwig.)
(*Hydride of Iodo Salicyl. Iodide of Spiroyl. Iodide of Salicyl. IodoSalicyl. Iodo Spiroyl.*)
$C_{14} H_5 I O_4$

IodoStrychnine. Insoluble in cold, and nearly insoluble in boiling water. Readily soluble in hot alcohol of 36° B. Insoluble in ether, or in a cold aqueous solution of bicarbonate of potash. Unacted upon in the cold; decomposed by boiling with dilute acids.
(*Iodide of Strychnine.*)
$2 (C_{42} H_{22} N_2 O_4), I_3$

IodoSulphide of Antimony. Decomposed by water, alcohol, and ether. (O. Henry.)
$Sb S_3 I_3$ (?)

IodoTellurate of Ammonium. Soluble in water, and in absolute alcohol. (Berzelius.)

IodoTellurate of Potassium. Easily soluble in water; partially decomposed by a large excess of water.

IodoTellurate of Sodium. Deliquesces in moist air. Very easily soluble in water, and alcohol. (Berzelius.)

IodoToluylic Acid. Difficultly soluble in water. Easily soluble in alcohol, and ether. (Griess, in *Kolbe's Lehrb.*, **2**. 220.)
$C_{16} H_7 I O_4 = C_{16} H_6 I O_3, H O$

IodoToluylate of Silver. Ppt.
$C_{16} H_6 I Ag O_4$

Ioduretted Hydriodic Acid. *Vid.* Hydriodous Acid.

Ipecacuanic Acid. Soluble in ether; more soluble in water, and alcohol.
$C_{28} H_{43} O_{14}$

Ipomic Acid. Sparingly soluble in cold, readily soluble in boiling water. Readily soluble in alcohol, and ether. (Mayer.) Its alkaline salts are soluble in water.
(*Isomeric, and perhaps identical with Sebacic Acid.*)
$C_{20} H_{18} O_8$

Ipomate of Baryta. Sparingly soluble in water, and alcohol.

Ipomate of Lime. Almost insoluble.

Ipomate of Silver. Insoluble in water; very difficultly soluble in alcohol, and ether. The other salts resemble the corresponding sebates.
$C_{20} H_{16} Ag_2 O_8$

Iridic Acid.
(*Teroxide of Iridium.*)
$a = Ir O_3$
$b =$ *ditto, hydrated.* While still moist it is easily soluble in chlorhydric acid. Somewhat soluble in alkaline solutions. (Berzelius.)

Iridiate of Potash.
I.) *basic.* Soluble in water and in chlorhydric acid. (Claus.)
II.) *acid.* Insoluble in water. Soluble in chlorhydric acid. (Claus.)

IridiCyanide of Potassium. Permanent. Easily soluble in water. Difficultly soluble in strong spirit. (Claus, *Beiträge*, p. 94.)
$C_{12} N_6 Ir_2 K_3 = 3 K Cy, Ir_2 Cy_3$

IridioCyanide of Potassium. Readily soluble in water. Insoluble in alcohol. Chlorhydric acid does not precipitate the aqueous solution. (Wœhler & Booth.)
$2 K Cy, Ir Cy$

Iridium. After having been strongly ignited it is insoluble in acids. When only gently heated, aqua-regia dissolves traces of it, and if it contains platinum or other metals a considerable amount of it is dissolved with these by aqua-regia. When prepared in the moist way as a fine powder, it is easily soluble in aqua-regia. (Berzelius, *Lehrb.*)
Ir

Iron. Permanent in dry air; it is not readily acted upon even in moist air, but oxidizes easily whenever, being exposed to the air, water is deposited upon it as a liquid. Unacted upon at the ordinary temperature by water free from air. Readily soluble in chlorhydric and dilute sulphuric acids, and in most other acids.
Fe

When treated with pure concentrated nitric acid of 1.512 @ 1.419 sp. gr., iron soon becomes covered with a bluish or black coating, apparently protoxide of iron, and when thus covered, the iron is no longer attacked by nitric acid of any strength, either dilute or concentrated, at the ordinary temperature, or at the temperature of a freezing mixture; but an action occurs when the acid is heated. Nor is iron attacked at the ordinary temperature by nitric acid of 0.401 sp. gr., or even that 1.04 which is a little weaker, though an action commences at once when the acid is heated. By very dilute nitric acid iron is attacked at the ordinary temperature (Millon, *Ann. Ch. et Phys.*, (3.) **6**. 100), the solution containing nitrate of ammonia and nitrate of protoxide of iron.

The action of nitric acid upon iron is curiously influenced by the presence of bichloride of platinum. If nitric acid containing 4.5 equivalents of water is weakened with 2 or 3 vols. of water, and then poured upon iron-turnings, the metal dissolves immediately with evolution of abundant nitrous fumes and production of a persalt of iron; but if to the same dilute acid a drop of bichloride of platinum be added, it no longer disengages nitrous gas, but hydrogen, when acting upon iron, while nitrate of protoxide of iron and nitrate of ammonia are formed. (Millon, *C. R.*, 1845, **21**. 47.)

Iron-turnings dissolve with tolerable rapidity in a mixture of 1 pt. monohydrated sulphuric acid and 12 pts. of water, and the addition of a few drops of a solution of bichloride of platinum renders the action extremely intense. The addition of arsenious acid, on the contrary, arrests completely the action of sulphuric acid on iron; the metal may even be preserved in this manner for months in sulphuric acid of the above-mentioned strength. When the iron has been well cleansed, a few drops of an aqueous solution of arsenious acid are sufficient to preserve it from the action of the sulphuric acid. Tartar emetic and protochloride of mercury (Hg Cl) diminish the force of the action of sulphuric acid on iron, but do not arrest it. Sulphate of copper strongly accelerates the action; sulphate of silver also accelerates it, but to a less extent. The addition of small quantities of metallic solutions to chlorhydric acid influences in a similar manner its action upon iron; and this influence may even be observed in the case of a tolerably concentrated acid, it being only necessary to dilute the fuming acid with 2 or 3 volumes of water. In some cases the addition of a small quantity of sulphate of copper suspended to a notable extent the action of chlorhydric acid upon iron, the latter becoming covered with metallic copper and remaining for several hours without evolving any hydrogen. But the reaction is not always like this, and it is not clear whether the difference depends upon the iron or acid. The addition of arsenious acid stops the action of chlorhydric acid completely. Weak acetic acid acts only very slowly upon iron; the addition of bichloride of platinum increases this action, while arsenious acid stops it completely; other metallic solutions appear to exert no influence. The action of tartaric and racemic acids is influenced alike, viz., increased action on the addition of bichloride of platinum, prevention of action if arsenious acid is added, and almost entire indifference on the part of other metallic solutions. When treated with a solution of oxalic acid, mixed with a few drops of bichloride of platinum, iron becomes covered, as in the preceding cases, with a black coating of platinum, but, instead of dissolving more rapidly, the iron is preserved precisely as if arsenious acid had been added, — the latter exerting its conservative influence in this as in the previous instances. Solutions of binoxalate and quadroxalate of potash, to which a little bichloride of platinum has been added, behave towards iron like the corresponding solution of oxalic acid. This exception, presented by oxalic acid and its compounds, is the only one which is encountered in studying the influence of bichloride of platinum upon the solution of iron and all the other metals. Saline solutions, and even distilled water, can dissolve iron, with evolution of hydrogen, when they are mixed with a small quantity of bichloride of platinum; but these actions are slow, and much less readily observed upon iron than upon zinc. (Millon, *C. R.*, 1845, **21.** pp. 45–47.) In connection with Millon's observations compare the remarks of Barreswil (*C. R.*, **21.** 292), who urges that these reactions may all be explained by reference to galvanic action: when the deposited metal forms an open, porous, spongy coating, decomposition is increased, the contact of the two metals forming a voltaic couple; but when, on the contrary, the deposited metal forms an adherent impermeable varnish upon the metal to be dissolved, the latter is completely protected from the influence of the acid, and further action ceases.

Soluble, with evolution of hydrogen, in concentrated aqueous solutions of the alkaline bicarbonates. (Berzelius, *Lehrb.*, **3.** 626.)

Isæthionic Acid. *Vid.* IsEthionic Acid.

Isamic Acid. Sparingly soluble in boiling water. Soluble in hot alcohol. Tolerably soluble in ether. Soluble in concentrated sulphuric acid, from which it is precipitated on the addition of water; also soluble in strong chlorhydric acid. (Laurent.)
(*Imasatic Acid. Rubindinic Acid. Isatinamic Acid. Isaminic Acid.*)
$C_{62} H_{13} N_3 O_6$

Isamate of Alumina. Ppt.

Isamate of Ammonia. Decomposed by warm water. Soluble in boiling alcohol.
$C_{62} H_{12} (N H_4) N_3 O_6$

Isamate of Baryta. Soluble in water.
$C_{62} H_{12} Ba N_3 O_6$

Isamate of Lead. Ppt.

Isamate of Lime. Appears to be soluble in water.

Isamate of Magnesia. Appears to be soluble in water.

Isamate of Mercury (Hg O). Ppt.

Isamate of Potash.

Isamate of Silver. Ppt.
$C_{32} H_{12} Ag N_3 O_6$

Isamid. Insoluble in cold water; but is decomposed when boiled for some time with water. Very slightly soluble in alcohol. Almost insoluble in ether. Very readily soluble, with decomposition, in concentrated sulphuric acid. Readily soluble in cold nitric acid, probably with decomposition. (Laurent.)
(*Isamamid. Amasatin. Isaminamid.*)
$C_{32} H_{14} N_4 O_6$

Isatan. Very sparingly soluble in boiling, less soluble in cold alcohol. (Laurent.)
$C_{32} H_{12} N_2 O_6$

Isatic Acid. Soluble in cold water; the solution undergoes decomposition when heated. (Erdmann.) *
$C_{16} H_6 N O_5, H O$

Isatate of Ammonia. Known only in solution, and this is decomposed by evaporation.

Isatate of Baryta. Sparingly soluble in water. Almost insoluble in alcohol. (Laurent.)
$C_{16} H_6 Ba N O_6$

Isatate of Copper. Sparingly soluble in water.

Isatate of Lead. Ppt. Incompletely soluble in boiling water. (Erdmann.)

Isatate of Potash. Soluble in water, and alcohol.
$C_{16} H_6 K N O_6$

Isatate of Silver. Soluble in boiling water, with slight decomposition; a portion of the salt separates out as the solution cools.
$C_{16} H_6 Ag N O_6$

Isathyde. Scarcely at all soluble in water. Very sparingly soluble in boiling alcohol or ether. (Laurent.)
$C_{16} H_6 N O_4$

Isatilim. Soluble in boiling alcohol, separating out as the solution cools. Readily soluble in a solution of caustic potash. (Laurent.)
$C_{48} H_{16} N_4 O_{10}$

Isatimid. Insoluble in water. Almost insoluble in boiling alcohol or ether. Tolerably readily soluble in a boiling alcoholic solution of ammonia. Also soluble in a boiling mixture of chlorhydric acid and alcohol. (Laurent.)
$C_{48} H_{17} N_5 O_8$

Isatin. Permanent. Sparingly soluble in cold, more soluble in boiling water. Readily soluble in alcohol, less soluble in ether. Largely soluble, without decomposition, in concentrated nitric acid, when this is gently heated; it is deposited again as the solution cools, but on boiling the solution decomposition occurs. Soluble in a cold aqueous solution of caustic potash, without decomposition at first, but after a time (immediately on boiling) the solution undergoes decomposition. Soluble, with combination, in ammonia-water. Soluble in Nordhausen sulphuric acid.
(*Isatylamid.*)
$N \left\{ \begin{matrix} C_{16} H_4 O_4'' \\ H \end{matrix} \right. = C_{16} H_5 N O_4$

Isatin with Ammonium.
(*Isatide of Ammonia.*)

Isatin with Argentammonium. Ppt.
$C_{16} H_4 (N H_3 Ag) N O_4$

Isatin with Cupr(*ic*)ammonium. Ppt.
$C_{16} H_4 (N H_3 Cu) N O_4$

Isatin with Potassium. Soluble in water; the solution undergoing decomposition when boiled.
$C_{16} H_4 K N O_4$

Isatin with Silver. Ppt.
$C_{16} H_4 Ag N O_4$

IsatoSulphurous Acid. Not known in a free state.
$C_{16} H_7 N S_2 O_{10}$

---

* No precipitate is produced when an aqueous solution of isatate of potash is added to solutions of the chlorides of calcium, strontium, magnesium, cadmium, cobalt, nickel, protochloride of mercury or protochloride of tin, of alum, or the salts of zinc; — on the other hand, precipitates are produced in solutions of nitrate of sesquioxide of uranium, acetate of lead, sesquichloride of iron, and nitrate of dinoxide of mercury.

IsatoSulphite of Ammonium. Slightly soluble in cold, very easily soluble in boiling water. (Laurent.)
$C_{16}H_6(NH_4)NO_6, 2SO_2$

IsatoSulphite of Potash. Tolerably readily soluble in water. Tolerably soluble in boiling, but very sparingly soluble in cold alcohol. (Laurent.)
$C_{16}H_6KNO_6, 2SO_2 + 6Aq$

IsEthionic Acid. Soluble in water. The salts of isethionic acid are more readily soluble in water than the ethylsulphates.
(*EthylHypoSulphuric Acid. Isomeric with EthylSulphuric Acid.*)
$C_4H_6S_2O_6 = C_4H_5S_2O_7, HO$

IsEthionate of Ammonia. Easily soluble in spirit. (Strecker, *Ann. Ch. u. Pharm.*, **91.** 100.)
$C_4H_5(NH_4)S_2O_6$

IsEthionate of Baryta. Readily soluble in water; more slowly in alcohol, though more soluble than ethionate of baryta in this menstruum. Less soluble in cold than in boiling alcohol. (Magnus.)
$C_4H_5BaS_2O_6$

IsEthionate of Copper. Permanent. Soluble in water. (Liebig.)
$C_4H_5CuS_2O_6 + 2Aq$

IsEthionate of Lead. Soluble in water. (Blondeau.)
$C_4H_5PbS_2O_8$

IsEthionate of Lime. Soluble in water. (Blondeau.)
$C_4H_5CaS_2O_8$

IsEthionate of Potash. Permanent. Easily soluble in water. Rather easily soluble in boiling; somewhat less soluble in cold alcohol. (Liebig.)
$C_4H_5KS_2O_6$

IsoCajputene. Insoluble in water or alcohol. Miscible in all proportions with ether, and oil of turpentine. (Max. Schmidl.)
$C_{20}H_{16}$

Isocetamid.
(*Isocetinamid.*)
$C_{30}H_{31}NO_2$

Isocetic Acid. Soluble in alcohol.
(*Isomeric, or identical with Behenic Acid.*)
$C_{36}H_{30}O_4$

Isocetate of Ethyl.
$C_{30}H_{29}(C_4H_5)O_4$

Isocetate of Silver. Sparingly soluble in water. Readily soluble in boiling alcohol.

IsoCyanuric Acid. Permanent. Readily soluble in water, alcohol, and ether. (Schischkoff.)
(*Fulminuric Acid.*)
$C_6H_3N_3O_6$

IsoCyanurate of Ammonia. Sparingly soluble in cold, readily soluble in boiling water. Insoluble in alcohol or ether. (Liebig, *Ann. Ch. u. Pharm.*, **95.** 286.)
$C_6H_2(NH_4)N_3O_6$

IsoCyanurate of Anilin. Soluble in water, and alcohol.

IsoCyanurate of Baryta. Sparingly soluble in boiling water. (Liebig.)
$C_6H_2BaN_3O_6 + 2Aq$

IsoCyanurate of Cupr(*ic*)*bi*amin. Permanent. Almost insoluble in water. Very sparingly soluble in ammonia-water. (Schischkoff.)
$C_6H_2(N_2H_6Cu)N_3O_6$

IsoCyanurate of Ethyl. Slightly soluble in water. Soluble in alcohol.

IsoCyanurate *of protoxide* of Iron.

IsoCyanurate of Lead.
I.) *basic.* Soluble in boiling, less soluble in cold water. (Liebig.)
$C_6H_2PbN_3O_6; PbO$

IsoCyanurate of Lime. Soluble in water, and alcohol. (Liebig.)

IsoCyanurate of Lithia. Soluble in water, and alcohol. (Liebig.)

IsoCyanurate of Magnesia. Soluble in water, and alcohol. (Liebig.)

IsoCyanurate of Potash. Soluble in 10 pts. of cold water, and in a much smaller quantity of hot water. Insoluble in alcohol or ether. (Schischkoff.) Still less soluble than the ammonia salt in cold water, but equally soluble with this in boiling water. (Liebig.)
$C_6H_2KN_3O_6$

IsoCyanurate of Potash with *prot*oxide of Mercury. Soluble in hot water.

IsoCyanurate of Silver. Very sparingly soluble in cold, tolerably easily soluble in boiling water. (Schischkoff.)
$C_6H_2AgN_3O_6$

IsoCyanurate of Soda. More soluble than the potash salt in water. Soluble in alcohol. (Schischkoff.)

IsoCyanurate of Urea.

IsoNitroPhenic Acid. Very easily soluble in water, alcohol, and ether.
(*Isomeric with NitroPhenic Acid.*)
$C_{12}H_5NO_6 = C_{12}H_4(NO_4)O, HO$

IsoNitroPhenate of Baryta.
I.) *normal.*
$C_{12}H_4BaNO_6 + 8Aq$
II.) *acid.*
$C_{12}H_4BaNO_6; C_{12}H_5NO_6 + 4Aq$

IsoNitroPhenate of Ethyl. Almost insoluble in water. Easily soluble in ether; less soluble in alcohol.
$C_{12}H_4(C_4H_5)NO_6$

IsoNitroPhenate of Silver.
I.) *normal.*
$C_{12}H_4AgNO_6; + 2Aq$
II.) *acid.*
$C_{12}H_4AgNO_6; C_{12}H_5NO_6 + 2Aq$
III.) "*purple.*"
$5(C_{12}H_4AgNO_6); C_{12}H_5NO_6$

Isoprene.
$C_{10}H_6$

IsoTartaric Acid. Very deliquescent. Soluble in water, and alcohol. (Fremy.) Its salts, of the metallic oxides, are insoluble in alcohol; they are decomposed by boiling water.
(Formerly "*Tartralic Acid*" (by Fremy). *IsoTartric Acid.*)
$C_6H_6O_{12}$

IsoTartrate of Ammonia. Deliquescent. Ammonia precipitates it. (Laurent & Gerhardt.)

IsoTartrate of Baryta. ("Impure," according to Laurent & Gerhardt.) Insoluble in water. (Fremy, *Ann. Ch. et Phys.*, (3.) **31.** 351.)

IsoTartrate of Copper. Alcohol precipitates it. (Laurent & Gerhardt.)
$C_8H_5CuO_{12}$

IsoTartrate of Lead. Insoluble in water; by which, however, it is soon decomposed. (Laurent & Gerhardt.)

IsoTartrate of Lime. Very soluble in cold water; entirely insoluble in cold alcohol. (Laurent & Gerhardt.)
$C_8H_5CaO_{12}$

IsoTartrate of Potash. Deliquescent. Insoluble in alcohol. (Laurent & Gerhardt.)
$C_8H_5KO_{12}$

IsoTartrate of Silver. Sparingly soluble in water. (Laurent & Gerhardt.)

IsoTartrate of Strontium. Insoluble in water. (Fremy, *Ann. Ch. et Phys.*, (3.) **31.** 351.)

IsoTartridic Acid. *Vid.* Tartaric Acid, (Anhydrous, — Soluble modification).

IsoTerebenthene.
$C_{20}H_{16}$

Itaconamic Acid. More soluble than citraconimid in water.
$C_{10}H_7NO_6$

Itaconamate of Ammonia. Very soluble in water.

ItaconAnilic Acid. *Vid.* PhenylItaconamic Acid.

ItaconAnilid. *Vid.* PhenylItaconamid.

Itaconanilide quintinitrée. *Vid.* NitroPhenylItaconamid.

Itaconic Acid. (*PyroAconitic Acid. Para PyroCitric Acid. Citricic Acid. PyroCitric Acid*(of Lassaigne).) $C_{10}H_6O_8$ Soluble in 17 pts. of water at 10°, and in 12 pts. at 20°. Its solubility augments rapidly as the temperature is increased. (Baup.) "More soluble than citraconic acid in water." (Baup.) [This statement has been called in question! it is, moreover, contradicted by Baup's own figures.]

Less soluble than citraconic acid in water. (Crasso.) Soluble in 4 pts. of alcohol of 88% at 15°. Also soluble in ether. (Baup.) Its salts are, in general, soluble in water, alcohol, and ether.

Itaconate of Ammonia.
I.) *normal.* Soluble in water.
$C_{10}H_4(NH_4)_2O_8$
II.) *acid.*
$a = C_{10}H_5(NH_4)O_8$ Permanent. Soluble in 1.25 pts. of water at 12°. (Baup.)
$b = C_{10}H_5(NH_4)O_8 + 2\,Aq$ Efflorescent.

Itaconate of Baryta.
I.) *normal.* More soluble than the lime salt.
$C_{10}H_4Ba_2O_8 + 2\,Aq$ (Baup.)
II.) *acid.* Permanent. Readily soluble in water; more in hot than in cold. (Baup.)
$C_{10}H_5BaO_8 + Aq$

Itaconate of Copper. Sparingly soluble in water. (Baup.)
$C_{10}H_4Cu_2O_8$

Itaconate of Ethyl. (Said to be identical with citraconate of ethyl.) $C_{10}H_4(C_4H_5)_2O_8$ Scarcely at all soluble in water, but is slowly decomposed by contact therewith. Soluble in all proportions in alcohol, and ether.

Itaconate of Lead. Soluble in aqueous solutions of nitrate of lead and of alkaline itaconates. (Baup.)
$C_{10}H_4Pb_2O_8 + 2\,Aq$

Itaconate of Lime.
I.) *normal.* Soluble in 45 pts. of water at 18°. No more soluble in hot than in cold water. Insoluble in alcohol. (Baup.)
$C_{10}H_4Ca_2O_8 + 2\,Aq$
II.) *acid.* Permanent. Soluble in 13 pts. of water at 12°. (Baup.)
$C_{10}H_5CaO_8 + 2\,Aq$

Itaconate of Magnesia.
I.) *normal.*
II.) *acid.* Very soluble in water. (Baup.)

Itaconate *of dinoxide* of Mercury. Ppt.

Itaconate of Manganese. Very soluble in water. (Baup.)

Itaconate of Nickel. Very soluble in water. (Baup.)

Itaconate of Potash.
I.) *normal.* Deliquescent. Soluble in water. Insoluble in alcohol. (Baup.)
$C_{10}H_4K_2O_8$
II.) *acid.* Permanent. Very soluble in water.
$C_{10}H_5KO_8$

Itaconate of Silver.
I.) *normal.* Almost insoluble in boiling water. Very soluble in ammonia-water. (Crasso.) Insoluble in itaconic acid. (Gottlieb.)
$C_{10}H_4Ag_2O_8$

Itaconate of Soda.
I.) *normal.* Deliquescent.
II.) *acid.* Very soluble in water. (Baup.)

Itaconate of Strontia.
I.) *normal.* Readily soluble in water. (Baup.)
$C_{10}H_4Sr_2O_8 + 2\,Aq$
II.) *acid.* Permanent. Easily soluble in water. (Baup.)
$C_{10}H_5SrO_8$

J.

"Jalapin." *Vid.* Convolvulin.

Jalapin(resin from *Convolvulus Orizabensis*). (*Resin of fusiform Jalap.*) $C_{68}H_{56}O_{32}$ Very sparingly soluble in water. Very readily soluble in alcohol, ether, wood-spirit, benzin, oil of turpentine, and in acetic acid, without decomposition. Soluble, with decomposition, in aqueous solutions of the caustic alkalies and alkaline earths, especially when these are warm. Slowly soluble, with decomposition, in concentrated sulphuric acid. Sparingly soluble in cold dilute chlorhydric and nitric acids; it is decomposed when heated therewith. (Mayer, *Ann. Ch. u. Pharm.*, **95.** 135.)

Jalapic Acid. Very hygroscopic. Readily soluble in water. Soluble in alcohol, and ether. (Mayer.) Soluble in alcohol, and in aqueous solutions of the alkalies. Slightly soluble in ether. (Parrish's *Pharm.*, p. 190.) Decomposed after a time by concentrated chlorhydric acid; also by sulphuric acid. Its salts are mostly soluble in water.
$C_{68}H_{59}O_{35}$

Jalapate of Baryta.
I.) *mono.*
$C_{68}H_{58}BaO_{35}$
II.) *tri.*
$C_{68}H_{56}Ba_3O_{35}$
III.) $C_{68}H_{58}BaO_{35}; 3(C_{68}H_{57}Ba_2O_{35})$
IV.) $C_{68}H_{57}Ba_2O_{35}; 3(C_{68}H_{58}BaO_{35})$
} All are soluble in water. (Mayer.)

Jalapate of Lead.
I.) Easily soluble in water, from which it is precipitated by alcohol.
II.) Less soluble in water.
III.) *very basic.* Insoluble in water. Very difficultly soluble in spirit. (Mayer.)

Jalapinol. Insoluble in cold, very sparingly soluble in boiling water. Readily soluble in alcohol, and ether.
$C_{32}H_{31}O_7$

Jalapinolic Acid. Soluble in hot, very sparingly soluble in cold spirit, or ether. Soluble in ammonia-water, with combination.
$C_{32}H_{30}O_6$

Jalapinolate of Ammonia. Soluble in water.
$C_{32}H_{29}(NH_4)O_6; C_{32}H_{30}O_6$

Jalapinolate of Baryta. Very difficultly soluble in boiling, and almost insol-
$C_{32}H_{29}BaO_6$

uble in cold water. Most readily soluble in a boiling mixture of water and spirit.

Jalapinolate of Copper. Insoluble in water; almost insoluble in spirit.

Jalapinolate of Lead. Insoluble in water or dilute spirit.
$C_{32} H_{29} Pb O_8$

Jalapinolate of Potash. Soluble in water, and spirit. (Mayer, *Ann. Ch. u. Pharm.*, **95.** 149.)

Jamaicin (from the bark of *Geoffroya Jamaicensis* (*Andira inermis*)). Soluble in water. Sparingly soluble in alcohol.
(*Jamaicinin. Cabbagin.*)

Japonic Acid. Insoluble in cold; soluble in boiling water. (Svanberg.) Insoluble in alcohol.
$C_{24} H_{10} O_{10}$

Japonate of Alumina. Ppt. Insoluble in cold dilute nitric acid.

Japonate of Baryta. Ppt. Insoluble in cold dilute nitric acid.

Japonate of Copper. Ppt.

Japonate of Glucina. Ppt. Insoluble in cold dilute nitric acid.

Japonate of Lime. Ppt. Insoluble in cold dilute nitric acid.

Japonate of Potash. Soluble in water. Insoluble in alcohol.

Japonate of Silver.

I.) *mono.*

II.) *bi.* Decomposed by a solution of caustic potash, but not by chlorhydric acid.
$C_{24} H_8 Ag_2 O_{10}$

Japonate of Yttria. Ppt. Insoluble in cold dilute nitric acid. (Svanberg.)

Jelly from **Pine-needles** (*Pinus sylvestris*). Insoluble in water, alcohol, or ether. Soluble only in dilute alkaline liquors. (Kawalier.)
$C_{16} H_{10} O_{10}$

Jelly from **Pine-bark** (*Pinus sylvestris*), *and from the green parts of Thuja occidentalis.* Soluble in alkaline liquors. (Kawalier.)
$C_{16} H_{12} O_{14}$

Jervin. Almost insoluble in water. Soluble in alcohol. Very sparingly soluble in ammonia-water. Some of its salts are soluble in water; most of them are soluble in alcohol.
(*Barytin.*)
$C_{60} H_{46} N_2 O_6$

Juglandin (from *Juglans regia*). Insoluble in water or alcohol.

K.

K. See also C.

Kæmpferid (from various species of *Kæmpferia*). Scarcely at all soluble in water. Soluble in 25 pts. of ether at 15°. Soluble in 50 pts. of cold, more soluble in hot alcohol. Soluble in warm acetic acid; in ammonia-water, and aqueous solutions of carbonate of potash and caustic potash.

Kakodyl. *Vid.* Cacodyl.

Katechin. *Vid.* Catechin.

Kermes-Mineral. *Vid.* Antimonite of Potash, with *ter*Sulphide of Antimony.

Kinic Acid. Becomes soft and sticky when exposed to the air. Slowly soluble in 2.5 pts. of water at 9°, and in much less boiling water. Very sparingly soluble in absolute alcohol; but readily soluble in ordinary alcohol. Almost entirely insoluble in cold ether. Most of its metallic salts are soluble in water, but insoluble in absolute alcohol.
(*Quinic Acid. Chinasæure.*)
$C_{28} H_{22} O_{22} + 2 Aq$

Kinate of Ammonia. Deliquescent.

Kinate of Baryta. Permanent. Very soluble in water. Very sparingly soluble in alcohol of 83%.
$C_{28} H_{20} Ba_2 O_{22} + 12 Aq$

Kinate of Cinchonidin (of Pasteur). Easily soluble in water, and spirit. (Leers, *Ann. Ch. u. Pharm.*, **82.** 161.)

Kinate of Cinchonin. Soluble in 0.5 pt. of water at 15°. Soluble in alcohol. When treated with warm alcohol, in quantity insufficient to dissolve the whole of it, it is decomposed; as this alcoholic solution cools another salt crystallizes out, which is permanent and very soluble in water. (Baup, *Ann. Ch. et Phys.*, 1832, (2.) **51.** 70.)

Kinate of Copper.

I.) *normal.* Efflorescent. Soluble in about 3 pts. of water at the ordinary temperature; the solution soon decomposes, especially if it be heated, the less soluble basic salt (No. 2) separating out. (Baup, *Ann. Ch. et Phys.*, 1832, (2.) **51.** 65.)
$C_{28} H_{20} Cu_2 O_{22} + 10 Aq$

II.) *basic.* Permanent. Soluble in 1150 @ 1200 pts. of water at 18°; more readily soluble in boiling water. (Baup, *loc. cit.*, p. 66.)
$C_{28} H_{20} Cu_2 O_{22}, 2 Cu O + 8 Aq$

Kinate *of sesquioxide* **of Iron.** Soluble in water.

Kinate of Lead.

I.) *normal.* Extremely soluble in water. Soluble in alcohol.
$C_{28} H_{20} Pb_2 O_{22} + 4 Aq$

II.) *basic.* Insoluble in boiling water. Soluble in an aqueous solution of subacetate of lead. (Compare Baup, *Ann. Ch. et Phys.*, (2.) **51.** 68.)
$C_{28} H_{18} Pb_4 O_{22}, 4 Pb O$

Kinate of Lime. Permanent. Soluble in 6 pts. of water at 16°; its solubility augments rapidly with the temperature. (Baup, *Ann. Ch. et Phys.*, (2.) **51.** 62.) Soluble in about 5 pts. of water at 12.7° [T.] 100 pts. of water at 15.5° dissolve 20 pts. of it. (Ure's *Dict.*) Almost insoluble in alcohol.
$C_{28} H_{20} Ca_2 O_{22} + 20 Aq$

Kinate of Magnesia. Very soluble in water.

Kinate of Manganese.

Kinate *of protoxide* **of Mercury.** Sparingly soluble in water.

Kinate of Nickel. Very soluble in water.

Kinate of Potash. Deliquescent.

Kinate of Quinine. Readily soluble in water; less soluble in alcohol.

Soluble in 3.5 pts. of water at 11°; and in 8 pts. of alcohol of 88%, at 11°. (Baup, *Ann. Ch. et Phys.*, 1832, (2.) **51.** 71.)

Kinate of Silver.
$C_{28} H_{20} Ag_2 O_{22} + 2 Aq$

Kinate of Soda. Soluble in 0.5 pt. of water at 15°. (Baup, *Ann. Ch. et Phys.*, (2.) **51.** 61.)
$C_{28} H_{20} Na_2 O_{22} + 8 Aq$

Kinate of Strontia. Efflorescent. Soluble in 2 pts. of water at 12°; and in much less hot water. (Baup, *Ann. Ch. et Phys.*, 1832, (2.) **51.** 64.)
$C_{28} H_{20} Sr_2 O_{22} + 20 Aq$

Kinate of Yttria. Soluble in water.

Kinate of Zinc.

Kinhydrone. *Vid.* HydroKinone with Kinone.

Kinonamid. Soluble in water; the solution being readily decomposed. (Woskresensky.)
(*Quinonamid. Chinonamid.*)
$N\left\{\begin{matrix}C_{12}\,H_4\,O_2{}''\\ H\end{matrix}\right.$

Kinonic Acid. *Vid.* Melanic Acid.

Kinone. Very sparingly soluble in cold, abundantly soluble in boiling water; more easily soluble in alcohol, and ether. Soluble in dilute chlorhydric, and nitric acids; also with decomposition in alkaline solutions. (Woskresensky.)
(*Chinone. Chinoyl. Quinone. Quinoile.*)
$C_{12}\,H_4\,O_4$

Quinone chloré. *Vid.* Chlorokinone, &c.

KinoTannic Acid. Hygroscopic. Easily soluble in water. Soluble in alcohol, and ether. More soluble than gallotannic acid in dilute acids. Its alkaline salts are insoluble in ether.
(*QuinoTannic Acid. Chinagerbsœure.*)
$C_{28}\,H_{18}\,O_{18} + Aq$

Kinonic Acid. Almost insoluble in cold water, and only very sparingly soluble in boiling water. Readily soluble in strong alcohol. Tolerably soluble in ether, and in the fatty and essential oils. Soluble in aqueous solutions of the caustic alkalies and in concentrated sulphuric acid.
(*Quinovic Acid. Quinovatic Acid. Chinovin. Quinova Bitter. Chinovasœure. Esculic Acid. Saponic Acid. Sapogenin. Chicoccic Acid.*)
$C_{48}\,H_{35}\,O_{11}$

Kinovate of Ammonia. Soluble in water, and alcohol.

Kinovate of Baryta. Insoluble in water. Soluble in spirit.

Kinovate of Copper. Insoluble in water. Soluble in spirit.

Kinovate of Lead. Sparingly soluble in water. Soluble in spirit.

Kinovate of Lime. Insoluble in water. Soluble in spirit.

Kinovate of Magnesia. Soluble in water.

Kinovate of Potash. Soluble in water, and alcohol.

Kinovate of Silver.

Kinovate of Soda. Soluble in water; less ? soluble in alcohol.

Kinovate of Strontia. Insoluble in water. Soluble in spirit.

Klumene. Soluble in 1 vol. of water at the ordinary temperature. (E. Davy.)
(*Acetylene.*)
$C_4\,H_2$

Korksœure. *Vid.* Suberic Acid.

Kossein. Insoluble, or but sparingly soluble in water. Soluble in alcohol, ether, and acids. (St. Martin.)

Krameric Acid(from *Krameria triandra*). (*Ratanhiaic Acid.*) Permanent. Soluble in water.

Kramerate of Ammonia.

Kramerate of Baryta.

I.) Soluble in 600 pts. of boiling water. Insoluble in alcohol.

II.) *basic.* Soluble in 450 pts. of [boiling ?] water.

Kramerate of Lime. Soluble in 450 @ 500 pts. of boiling water.

Kramerate of Potash. Permanent. Very soluble in water.

Kramerate of Soda. Efflorescent.

Kramerate of Strontia. Permanent. Sparingly soluble in water.

Kratinin. *Vid.* Creatinin.

Kreatin. *Vid.* Creatin.

Kreatinin. *Vid.* Creatinin.

Krystallin. *Vid.* Anilin.

Kyanethin. *Vid.* Cyanethin.

Kyanol. *Vid.* Anilin.

Kynurenic Acid. Insoluble in water. Insoluble in alcohol. Its pyro-acid is easily soluble in alcohol. Insoluble in ether. Soluble in chlorhydric acid. Readily soluble in boiling chlorhydric acid and in dilute sulphuric, and nitric acids, not appearing to be decomposed by the latter. Soluble, without decomposition, in cold concentrated sulphuric acid, the solution undergoing decomposition when heated. Readily soluble, with combination, in cold solutions of the caustic alkalies, and in hot solutions of the alkaline carbonates; also soluble in baryta-water and lime-water. (Liebig, *J. Ch. Soc.*, **6**. 113.)
(*Kyanurenic Acid. Cyanurenic Acid.*)

Kynurenate of Baryta. Sparingly soluble in water.

Kynurenate of Lime. Sparingly soluble in water.

Kynurenate of Silver. Insoluble in boiling water. (Liebig, *loc. cit.*)

L.

Lactamic Acid. Not isolated.
$C_{12}\,H_{13}\,N\,O_{10} = N\left\{\begin{matrix}(C_6\,H_5\,O_4)_2\\ H_2\end{matrix}\right. .\,O,\,H\,O$

Lactamate of Ammonia. Readily soluble in water. Abundantly soluble in alcohol. (Pelouze.)
"*Lactamide*"(of Pelouze).
$C_{12}\,H_{12}\,(N\,H_4)\,N\,O_{10}$

"**Lactamid**"(of Pelouze). *Vid.* Lactamate of Ammonia.

Lactamid. Very soluble in water, and alcohol.
$C_6\,H_7\,N\,O_4 = N\left\{\begin{matrix}C_6\,H_5\,O_4\\ H_2\end{matrix}\right.$

Lactic Acid(Anhydrous). Almost insoluble in water. Very soluble in alcohol, and ether. By long-continued ebullition in water, or by prolonged contact with cold water or moist air, it is converted into ordinary lactic acid; this transformation occurs instantly in solutions of the alkalies and alkaline earths. (Pelouze, *Ann. Ch. et Phys.*, (3.) **13**. 258.) Soluble in all proportions both in hydrated and absolute alcohol. (Engelhardt.)
(*Lactic Anhydride. Lactidic Acid.*)
$C_{12}\,H_{10}\,O_{10}$

Lactic Acid. Hygroscopic. Soluble in all proportions in water (Scheele), and alcohol. Sparingly soluble in ether. (Berzelius.) Soluble in all proportions in water, alcohol, and ether. (Engelhardt & Maddrell, *Ann. Ch. u. Pharm.*, 1847, **63**. pp. 88, 85.) Soluble in all proportions in water, and alcohol. (Pelouze, *Ann. Ch. et Phys.*, (3.) **13**. 258.) Easily soluble in ether, which even removes it from the aqueous solution. (Kolbe's *Lehrb.*, **1**. 790.)
$C_{12}\,H_{12}\,O_{12} = C_{12}\,H_{10}\,O_{10},\,2\,H\,O$

Most of the salts of lactic acid are difficultly soluble in cold water, and alcohol. Only a few of them are easily and abundantly soluble in boiling alcohol, but, in general, boiling water dissolves them very readily. They are all absolutely insoluble in ether. (Engelhardt & Maddrell, *loc. cit.*, p. 88.) All those which crystallize are permanent in the air.

Certain differences have been observed in the solubility, &c. of several salts of lactic acid, according as the acid contained in them has been obtained from animal fluids (juice of flesh, &c.) ["α lactic acid," called also *para-* or *sarco*-lactic acid], or been produced by the fermentation of sugar ["β lactic acid"], although the acids themselves, whether prepared from flesh or sugar, exhibit no differences when isolated. (Engelhardt, *Ann. Ch. u. Pharm.*, 1848, **65**. 360.)

Lactate of Alumina. A permanent gum. (Braconnot.) Hydrate of alumina is almost insoluble in lactic acid; but on decomposing a solution of sulphate of alumina with lactate of baryta, a solution containing much alumina is obtained. (Engelhardt & Maddrell, *Ann. Ch. u. Pharm.*, 1847, **63**. 101.)

Lactate of Ammonia. Deliquescent. Soluble in water, and alcohol. (Pelouze.) Very soluble in water, the solution undergoing decomposition when warmed. Insoluble in ether. (Engelhardt & Maddrell, *loc. cit.*, p. 116.) Soluble in less than 6 pts. of cold alcohol of 30° B. (Erdmann & Marchand.)

Lactate of Ammonia & of Magnesia. Permanent. Soluble in water. (Berzelius.)

Lactate of Antimony. Oxide of antimony is scarcely at all soluble in lactic acid, but when boiled with lactate of potash a considerable quantity dissolves. (Engelhardt & Maddrell, *loc. cit.*, p. 100.)

Lactate of Baryta.

I.) *normal.* Permanent. Easily soluble in water and in ordinary alcohol, especially when these are warm. Insoluble in cold, and only very slightly soluble in boiling absolute alcohol. Absolutely insoluble in ether. (Engelhardt & Maddrell, *loc. cit.*, pp. 116, 99.)

II.) *acid.* $C_{12}H_{11}BaO_{12}$ Permanent. Tolerably easily soluble in water. May be washed with ordinary alcohol, in which it is not very soluble. (Engelhardt & Maddrell, *loc. cit.*, p. 117.) Soluble in 21 pts. of cold water. (Braconnot.)

Lactate of Bismuth.

I.) $BiO_3, C_{12}H_{10}O_{10}$ Only slightly soluble in cold water, but much of it is dissolved by boiling water. Less soluble in very dilute alcohol than in water. Insoluble in ether. The hot aqueous solution deposits nothing on cooling; but on evaporating it crystalline crusts are formed, which are soluble in a small quantity, the solution becoming cloudy when more water is added. It would appear that by the action of boiling water, an acid, soluble salt is formed since the undissolved residue behaves like No. II. (Engelhardt, *Ann. Ch. u. Pharm.*, 1848, **65**. pp. 368 – 370.)

II.) $2\,BiO_3, C_{12}H_{10}O_{10}$ Insoluble in cold or boiling water, and is not decomposed by water. Insoluble in alcohol or ether. Difficultly soluble in lactic acid. (Engelhardt, *loc. cit.*, pp. 367 – 370.)

Lactate of Cadmium. $C_{12}H_{10}Cd_2O_{12}$ Permanent. The β salt is soluble in 10 pts. of cold, and 8 pts. of boiling water. Insoluble in cold or boiling alcohol, or ether. (Engelhardt & Maddrell, *loc. cit.*, p. 94.) Soluble in 8 @ 10 pts. of cold, and in 4 pts. of boiling water. (Lepage.)

Lactate *of sesquioxide* **of Chromium.** Easily soluble in water. (Gay-Lussac & Pelouze; Engelhardt & Maddrell, *loc. cit.*, p. 101.)

Lactate of Cobalt. $C_{12}H_{10}Co_2O_{12} + 6\,Aq$ Permanent. Soluble in 38 pts. of cold water. (Braconnot.) 100 pts. of water at 15.56° dissolve 2.6 pts. of it. (Ure's *Dict.*) The β salt is almost insoluble in cold, but tolerably easily soluble in boiling water. Insoluble in cold or boiling alcohol or ether. (Engelhardt & Maddrell, *loc. cit.*, pp. 106, 105.)

Lactate of Copper.

I.) *normal.* $C_{12}H_{10}Cu_2O_{12} + 3\,Aq(\alpha)\ \&\ 4\,Aq(\beta)$ Permanent. The α salt is soluble in 1.95 pts. of cold, and in 1.24 pts. of boiling water; and much more easily in alcohol. (Engelhardt, *loc. cit.*, **65**. 365.)

The β salt is soluble in 6 pts. of cold, and 2.2 pts. of boiling water; in 115 pts. of cold, and 26 pts. of boiling alcohol. (Engelhardt & Maddrell, *loc. cit.*, **63**. 92.)

II.) *basic.* $C_{12}H_{10}Cu_2O_{12}, 2\,CuO$ Extremely difficultly soluble either in cold or boiling water. (Engelhardt & Maddrell, *loc. cit.*, p. 93.)

Lactate of Ethyl. $C_{12}H_{10}(C_4H_5)_2O_{12}$ Miscible in all proportions with water, alcohol, and ether. It is, however, partially decomposed by water. (Strecker, *Ann. Ch. u. Pharm.*, **91**. 357.)

Lactate *of protoxide* **of Iron.** $C_{12}H_{10}Fe_2O_{12} + 6\,Aq$ Permanent. The β salt is difficultly soluble in cold, tolerably easily soluble in boiling water, and alcohol. Insoluble in ether. (Engelhardt & Maddrell, *loc. cit.*, p. 102.) Sparingly soluble in water. (Pelouze.) Soluble in 48 pts. of water at 10°, and in 12 pts. of boiling water (Wittstein); in 30 pts. of water at 18.75°. (Abl, from *Œsterr. Zeitschrift für Pharm.*, **8**. 201, in *Canstatt's Jahresbericht, für* 1854, p. 76.) Very sparingly soluble in weak, and not at all soluble in strong alcohol. (Wittstein.)

Lactate *of sesquioxide* **of Iron.** Deliquescent. Soluble in water. Insoluble in alcohol. (Berzelius.) Easily soluble in water. Soluble in alcohol. (Engelhardt & Maddrell, *loc. cit.*, pp. 100, 102.)

Lactate *of protoxide & of sesquioxide* **of Iron.** $C_{12}H_{10}Fe_2O_{12}; C_{108}H_{90}(Fe_2{}''')_6O_{108} + 24\,Aq$ Slowly deliquescent. Very easily soluble in water. (Wittstein.)

Lactate of Lead.

I.) *normal.* $C_{12}H_{10}Pb_2O_{12}$ Very soluble in water. Easily soluble in ordinary alcohol, especially when this is warm. Insoluble in cold, and only slightly soluble in boiling absolute alcohol. Insoluble in ether. (Engelhardt & Maddrell, *loc. cit.*, p. 99.)

II) *polybasic.* Sparingly soluble in cold, more easily soluble in boiling water. (Berzelius.)

Lactate of Lime.

I.) *normal.* (*When crystallized from alcohol, both salts contain* 10 *equivalents of water.*) $C_{12}H_{10}Ca_2O_{12} + 8\,Aq\,(\alpha),\ \&\ 10\,Aq\,(\beta)$ Permanent. Both salts are soluble in all proportions in boiling water, and ordinary alcohol; but the α salt requires 12.4 pts. of cold water for its solution, while the β salt dissolves in 9.5 pts. of cold water. (Engelhardt, *loc. cit.*, **65.** 361.) The β salt is soluble in all proportions in boiling ordinary alcohol, and water, since it melts in its water of crystallization at this temperature. Completely insoluble in cold spirit and apparently at all temperatures below the boiling-point of the spirit, at least only traces of it were dissolved at 50° in spirit. Insoluble in absolute alcohol. Insoluble in ether. (Engelhardt & Maddrell, *loc. cit.*, **63.** pp. 111, 85, 87.)

The 10 Aq. salt is soluble in 21 pts. of cold water (Braconnot); in 17.4 pts. of water at 24°, and in all proportions in boiling water. (Wackenroder.) Soluble at 20° in 490 pts. of 85% alcohol, and in 1.2 pts. at the temperature of boiling.

Lactate of lime is sparingly soluble in water. Abundantly soluble in alcohol, from which it is precipitated on the addition of ether. (Pelouze, *Ann. Ch. et Phys.*, (3.) **13.** 266.) Sparingly soluble in boiling absolute alcohol. (Corriol.)

II.) *acid.* Permanent. Soluble in water.
$C_{12}H_{11}CaO_{12} + 2\,Aq$ Soluble in boiling, less soluble in cold, absolute alcohol. Insoluble in ether. (Engelhardt & Maddrell, *loc. cit.*, p. 118.)

LACTATE OF LIME & OF POTASH. Slowly
$C_{12}H_{10}KCaO_{12}$ soluble in cold, easily soluble in hot water. (Strecker, *Ann. Ch. u. Pharm.*, **91.** 353.)

LACTATE OF LIME & OF SODA. Soluble in
$C_{12}H_{10}CaNaO_{12} + 2\,Aq$ water. (Strecker, *Ann. Ch. u. Pharm.*, **91.** 354.)

LACTATE OF MAGNESIA. Permanent. The
$C_{12}H_{10}Mg_2O_{12} + 8\,Aq\,(\alpha)$, & $6\,Aq\,(\beta)$ α salt is much more easily soluble in water, and spirit than the β salt. (Engelhardt, *loc. cit.*, **65.** p. 362.) The β salt is soluble in 28 pts. of cold, and in 6 pts. of boiling water. It is insoluble either in warm or cold, ordinary or absolute, alcohol. Alsd insoluble in ether. (Engelhardt & Maddrell, *loc. cit.*, **63.** pp. 109, 85.) The β salt is soluble in 30 pts. of cold water (Gay-Lussac & Pelouze); in 25 pts. of cold water. (Braconnot.)

LACTATE OF MANGANESE. Permanent. Tol-
$C_{12}H_{10}Mn_2O_{12} + 6\,Aq$ erably soluble in cold, and easily soluble in boiling water. Insoluble in cold, more easily soluble in boiling alcohol. Insoluble in ether. (Engelhardt & Maddrell, *loc. cit.*, p. 107.) Soluble in 12 pts. of cold water. (Braconnot.)

LACTATE *of dinoxide* OF MERCURY.

I.) *normal.* Permanent. Difficultly soluble in
$C_{12}H_{10}Hg_4O_{12} + 4\,Aq$ cold, or boiling water. It is decomposed by boiling. Insoluble in cold, and difficultly soluble in boiling alcohol; being decomposed by the latter. (Engelhardt & Maddrell, *loc. cit.*, p. 95.) Readily soluble in water. (Braconnot.)

LACTATE *of protoxide* OF MERCURY.

I.) *tetra.* Permanent. Very easily soluble both
$C_{12}H_{10}Hg_2O_{12}, 2\,HgO$ in cold and boiling water. Difficultly soluble in cold or boiling spirit, and is not decomposed by boiling. (Engelhardt & Maddrell, *loc. cit.*, p. 97.)

II.) Insoluble in water. (*Idem.*)

LACTATE OF NICKEL. Permanent. Almost
$C_{12}H_{10}Ni_2O_{12} + 6\,Aq$ insoluble in cold, but tolerably easily soluble in boiling water. Insoluble in cold or boiling alcohol or in ether. (Engelhardt & Maddrell, *loc. cit.*, p. 105.) Soluble in 30 pts. of cold water, and much more readily in boiling water. (Braconnot.)

LACTATE OF POTASH. Hygroscopic. Soluble in water, and alcohol. (Scheele; Engelhardt & Maddrell, *loc. cit.*, p. 116.) Insoluble in ether. (E. & M.)

LACTATE OF POTASH & OF ZINC. Soluble in water. (Strecker, *Ann. Ch. u. Pharm.*, **91.** 355.)

LACTATE OF QUININE. More soluble than sulphate of quinine in water.

LACTATE OF SILVER. Permanent. Soluble
$C_{12}H_{10}Ag_2O_{12} + 4\,Aq$ in 20 pts. of cold water. (Braconnot.) Almost completely insoluble in cold, easily soluble in warm alcohol. Partially decomposed by long-continued boiling of the aqueous or alcoholic solution. Insoluble in ether. (Engelhardt & Maddrell, *loc. cit.*, p. 89.)

LACTATE OF SODA. Deliquescent. Soluble in water, and alcohol. (Scheele.)

LACTATE OF SODA & OF ZINC. Readily solu-
$C_{12}H_{10}NaZnO_{12} + 2\,Aq$ ble in water. (Strecker, *Ann. Ch. u. Pharm.*, **91.** 354.)

LACTATE OF STRONTIA. Soluble in 8 pts. of
$C_{12}H_{10}Sr_2O_{12} + 6\,Aq$ cold water. (Braconnot.) Its properties are similar to those of the lime salt. (E. & M., *loc. cit.*, p. 115.)

LACTATE *of protoxide* OF TIN.

I.) *basic.* Permanent. Absolutely insoluble in
$C_{12}H_{10}Sn_2O_{12}, 2\,SnO$ cold water, but boiling water dissolves traces of it. Absolutely insoluble in cold or boiling alcohol. Easily soluble in chlorhydric acid, but acetic acid dissolves it only after long-continued boiling. (Engelhardt & Maddrell, *loc. cit.*, p. 97.)

LACTATE *of binoxide* OF TIN. Soluble in water. (E. & M., *loc. cit.*, p. 99.)

LACTATE *of sesquioxide* OF URANIUM. Abun-
$2\,Ur_2O_3, C_{12}H_{10}O_{10}$ dantly soluble both in cold and boiling water. The aqueous solution is decomposed by sunlight, with subsequent deposition of oxide of uranium. Absolutely insoluble in cold or boiling alcohol. (Engelhardt & Maddrell, *loc. cit.*, p. 99.)

LACTATE OF UREA. Slowly deliquescent. Easily soluble in water, and alcohol; less soluble in ether. (Cap & Henry.)

Does not exist, according to Pelouze. (*Ann. Ch. et Phys.*, 1842, (3.) **6.** 65.)

LACTATE OF ZINC. Permanent. The α salt is
$C_{12}H_{10}Zn_2O_{12} + 4\,Aq\,(\alpha)$, & $6\,Aq\,(\beta)$ soluble in 5.7 pts. of cold, and 2.88 pts. of boiling water; while the β salt is soluble in 58 pts. of cold and 6 pts. of boiling water. The α salt is soluble in 2.23 pts. of cold, and in almost as much boiling alcohol; while the β salt is almost insoluble in alcohol, either cold or boiling. (Engelhardt, *Ann. Ch. u. Pharm.*, 1848, **65.** 363; and E. & Maddrell, *Ibid.*, **63.** 103.) The β salt is soluble in more than 50 pts. of cold water, and in less hot water. (Braconnot.) Lactate of zinc is sparingly soluble in water. (Pelouze, *Ann. Ch. et Phys.*, (3.) **13.** 266.)

LACTID. Very sparingly soluble in cold wa-
(*Improperly "Anhydrous Lactic Acid."*)
$C_{12}H_8O_8$ ter; more soluble in boiling water, by

which it is converted into lactic acid. Readily soluble in acetone. (Gay-Lussac & Pelouze.) Much more readily converted into lactic acid by exposure to moist air or contact with water, than anhydrous lactic acid. Very soluble in lactone. (Pelouze, *Ann. Ch. et Phys.*, (3.) **13.** pp. 263, 266.)

Lactine. Soluble in 5 @ 6 pts. of cold, and in 2.5 pts. of boiling water. The saturated aqueous solution contains 4.7% of it. (Mussembrock, cited in *Ann. de Chim.*, **28.** 291.) Insoluble in cold alcohol or ether. More soluble in acid, and alkaline, solutions than in pure water. Acids convert it into [Pasteur's Lactose, then into] glucose, even in the cold, but especially when heated.
(Milk Sugar. Lactose.)
$C_{10}H_{10}O_{10}, 2HO$

Soluble in water, with elevation of temperature. Water which has been saturated at 10° by prolonged contact with an excess of it contains 0.1455 of its weight of the sugar, and the sp. gr. of the solution is 1.055. When this saturated solution is allowed to evaporate spontaneously in dry air at the temperature of 10°, it does not begin to deposit crystals until the sp. gr. of the solution has become equal to 1.063, in which case the water contains 0.2164 of its weight of the sugar, modified by solution. This fact, analogous to the phenomena of supersaturation which are so common among inorganic salts, corresponds to different powers of rotating light which are exhibited by sugar of milk recently dissolved, and by that which has been in solution for some time. Regarding the original crystallized sugar as normal, and that which has been some time in solution as modified, the solubility of the modified sugar is to that of the ordinary sugar as 3 : 2. (Dubrunfaut, *C. R.*, **42.** 229; also cited by Berthelot, *Ann. Ch. et Phys.*, (3.) **47.** 302, *note.*)

Lactin with Ammonia.

Lactin with Baryta.

Lactin with Lead.
I.) Soluble in water.
II.) Insoluble in water.

Lactin with Lime. Insoluble in alcohol.

Lactin with Potash. Very soluble in water. Insoluble in alcohol.

Lactin with Soda. Very soluble in water. Insoluble in alcohol.

LactoCaramel. Easily soluble in water. Insoluble in alcohol. (Lieben.)
$C_{12}H_{10}O_{10}$

LactoCaramel with Copper.
$C_{12}H_9CuO_{10} + 2Aq$

Lactone? Very sparingly soluble in water.
a = $C_{20}H_{16}O_8$
b = $C_{20}H_{16}O_8, 2HO$ Tolerably easily soluble in water. (Pelouze, *Ann. Ch. et Phys.*, (3.) **13.** 262.)

Lactose (of Pasteur). Crystallizes more readily than lactin.
(Altered Lactin.)
$C_{12}H_{12}O_{12}$

Lactucin. Soluble in 60 @ 80 pts. of cold water. Easily soluble in alcohol; less soluble in ether. More soluble in acetic acid than in water. (Buechner.)

Lactucone. Insoluble in water. Readily soluble in hot alcohol, from which a portion separates as the solution cools. Readily soluble in ether, and the fatty and essential oils. (Lenoir.)
$C_{80}H_{64}O_6$

LævoRacemic Acid. *Vid. left*Tartaric Acid.

LævoTartaric Acid. *Vid. left*Tartaric Acid.

"Lampic Acid." Was a mixture of Aldehyde and Acetic Acid.

Lantanuric Acid (of Schlieper). Easily soluble in water, and alcohol. (Schlieper, *Am. J. Sci.*, (2.) **6.** 373.)
(Probably identical with Allanturic Acid.)
$C_6H_4N_2O_6$

Lantanurate of Lead.
I.) $C_6N_2H_2Pb_2O_6$ Insoluble in cold, sparingly soluble in hot water. Insoluble in alcohol. Easily soluble in acetic acid, and in an aqueous solution of basic acetate of lead. (Schlieper, *loc. cit.*)
II.) *bi.* Easily soluble in water. Insoluble in alcohol. (Schlieper, *loc. cit.*)

Lantanurate of Potash.
I.) *normal.* Soluble in water. Alcohol precipitates it from the aqueous solution.
II.) *hyper acid.* Soluble in 8 @ 10 pts. of cold water. Much more readily soluble in hot water. The aqueous solution is rendered milky by the addition of alcohol. Insoluble in strong alcohol. (Schlieper, *loc. cit*, p. 371.)
$C_6N_2H_3KO_6, HO; C_6N_2H_4O_6 + 4Aq$

Lantanurate of Silver. Insoluble in boiling water. (Schlieper, *Am. J. Sci.*, (2.) **6.** pp. 366 – 373.)

Lanthanum. Slowly oxidized by cold, rapidly by hot water. (Mosander.)
La

Laricin. Forms a paste with boiling water. Easily soluble in alcohol, and in oil of turpentine. (Th. Martius.)
$C_{14}H_{12}O_4$

Lauric Acid. Readily soluble in strong alcohol; still more soluble in ether.
(LauroStearic Acid. PichurinoStearic Acid.)
$C_{24}H_{23}O_3, HO$

Laurate of Baryta. Soluble in 10864 pts. of water at 17.5°, and in 1982 pts. of boiling water; in 1468 pts. of ordinary alcohol at 15.5°, and in 24 pts. of the same alcohol at the boiling temperature.
$C_{24}H_{23}BaO_4$

Laurate of Ethyl. Almost entirely insoluble in water. Difficultly soluble in spirit. Soluble in all proportions in ether. (Delffs.)
$C_{24}H_{23}(C_4H_5)O_4$

Laurate of Glyceryl. Very sparingly soluble in cold water, or alcohol. Tolerably soluble in boiling absolute alcohol. Readily soluble in ether.
(LauroStearin.)
$C_{54}H_{52}O_{10} = C_6H_5O_3, HO, 2C_{24}H_{23}O_3$

Laurate of Lead.
$C_{24}H_{23}PbO_4$

Laurate of Lime.

Laurate of Silver. Easily soluble in ammonia-water.
$C_{24}H_{23}AgO_4$

Laurate of Soda. Easily soluble in water, and alcohol.
$C_{24}H_{23}NaO_4$

Laurin. Insoluble in water. Readily soluble in cold alcohol and in ether. Insoluble in solutions of the caustic alkalies.
$C_{44}H_{30}O_6$

Laurone. Soluble in alcohol.
(LauroStearone.)
$C_{46}H_{46}O_2 = \left.\begin{matrix} C_{24}H_{28} \\ C_{22}H_{23} \end{matrix}\right\} O_2$

LauroStearin. *Vid.* Laurate of Glyceryl.

Lauryl Alcohol. *Vid.* Hydrate of Lauricyl.

Lead. Permanent in dry air. Insoluble in water free from air. Rapidly dissolved by oxidizing acids. Unacted upon to any ex-
Pb

tent by dilute sulphuric acid. Acetic acid dissolves it when in contact with the air.

When in contact with distilled water. exposed to the air, but protected from carbonic acid, it becomes covered with crystalline scales of hydrate of lead; this reaction occurs only when the water is perfectly pure, for the presence of a trace of saline impurity prevents the formation of the hydrate, the nitrates alone being an exception, a very large quantity of any of these being necessary in order to prevent the formation of the hydrate. Almost completely insoluble in cold chlorhydric acid, and is only very feebly attacked by this acid when boiling. Completely soluble in nitric acid, especially when this is not too concentrated, but if the nitric acid contains sulphuric or chlorhydric acid, its solvent power is very slight. (H. Rose, *Tr.*) Granulated lead disengages hydrogen, in tolerable abundance, when treated with concentrated chlorhydric acid; and if a small quantity of a solution of bichloride of platinum is added, the reaction becomes very energetic; by means of this addition an evolution of hydrogen may even be excited with dilute chlorhydric acid, which by itself would have no action upon lead. (Millon, *C. R.*, 1845, **21.** 49; compare Barreswil, *Ibid.*, p. 292.) Cold concentrated sulphuric acid has little or no action upon it; when hot and very concentrated this acid slowly dissolves it with evolution of sulphurous acid, but the action is slight. Scarcely at all acted upon by boiling concentrated chlorhydric acid. Soluble in aqua-regia. Nitric acid is its best solvent, but in a mixture of nitric and sulphuric acid it is as good as insoluble; the presence of chlorhydric acid also diminishes the solvent power of nitric acid. (Berzelius, *Lehrb.*) Unacted upon by highly concentrated nitric acid. (*Gm.*) Alkaline solutions oxidize it when in contact with the air.

Unacted upon by perfectly pure water; but is very rapidly corroded by water containing nitrous acid, or nitrites, in solution; or ammonia or nitrogenous organic matter, from the decomposition of which nitrous acid may result. (Medlock, *Phil. Mag.*, (4.) **14.** 209.)

Those of the lead salts which are insoluble in water are, for the most part, soluble in nitric acid.

Lead & Potassium (alloy of). Slowly decomposed by water. (Sérullas.)

Lecanoric Acid. (*Lecanorin. Alpha Orsellic Acid. Beta Orsellic Acid.*) $C_{32}H_{14}O_{14}$ Very sparingly soluble in cold water. Less soluble than orsellic acid in water. (Schunck.) Soluble in 2500 pts. of boiling water, in 150 pts. of alcohol of 80% at 15.5°, and in 5.5 pts. of the same alcohol at boiling (Schunck); in 45 pts. of boiling alcohol (Schunck, in *Gmelin's Handbook*); in 80 pts. of ether at 15.5°. (Schunck.) Easily soluble, without alteration, in boiling, less soluble in cold acetic acid. Easily soluble in cold lime- or baryta-water. Decomposed by warm concentrated sulphuric acid. The alkaline lecanorates are soluble in water.

Lecanorate of Baryta. $C_{32}H_{13}BaO_{14}$ Much less soluble than orsellate of baryta in water. Soluble in boiling alcohol. (Stenhouse.)

Lecanorate of Copper. Ppt.

Lecanorate *of protoxide* **of Iron.** Appears to be soluble in water.

Lecanorate *of sesquioxide* **of Iron.** Ppt.

Lecanorate of Lead. Somewhat soluble in alcohol.

Lecanorate of Lime. Sparingly soluble in water, being much less soluble therein than orsellate of lime. Sparingly soluble in alcohol.

Lecanorate of Methyl. *Vid.* Orsellate of Methyl.

Lecanorate of Silver. Ppt.

Lecanoric Ether. *Vid.* Orsellate of Ethyl.

Lecanorin. *Vid.* Lecanoric Acid.

Legumin. (*Vegetable Casein. Amandin.*) Largely soluble in cold, but insoluble in hot water, being coagulated when the solution is heated nearly to the temperature of ebullition. Insoluble in alcohol or ether. Soluble in ordinary acetic acid. In contact with concentrated acetic acid it swells up to a mass which is readily soluble in boiling water, and the residue obtained on evaporating this solution is capable of being redissolved by water. Soluble in ammonia-water. Soluble in concentrated chlorhydric acid. Slowly and sparingly soluble in concentrated sulphuric acid. Soluble, with decomposition, in strong nitric acid. Soluble in aqueous solutions of the caustic alkalies. (Dumas & Cahours, *Ann. Ch. et Phys.*, (3.) **6.** 433; compare p. 424, *et seq.*) Insoluble in cold, partially decomposed by hot water. Not "soluble in water," as stated by Dumas. (Lœwenberg and others.) Insoluble in boiling alcohol or ether. Easily soluble in cold aqueous solutions of potash, soda, and ammonia; on boiling the solution obtained by potash or soda, decomposition ensues. With solutions of caustic lime, or baryta, it forms compounds insoluble in water; it is, however, decomposed when boiled with an excess of these bases. The alkaline solution of legumin is coagulated by all the acids; but when added in excess, the acids redissolve this precipitate. Easily soluble in tartaric, oxalic, malic, and citric acids, in concentrated chlorhydric and sulphuric acids, also, with decomposition, in nitric acid. From its aqueous solution it is precipitated, like casein, by acetic and phosphoric acids. Insoluble in concentrated acetic acid.

Leinœlic Acid. *Vid.* Olinic Acid.

Lepargic Acid. }
Lepargylic Acid. } Identical with Anchoic Acid, *q. v.*

Lepidin (of Leroux), (*from several species of Lepidium*). Permanent. Easily soluble in water, and alcohol. Sparingly soluble in oils. Insoluble in ether. (Leroux, *Wittstein's Handw.*)

Lepidin (of Williams).

$C_{20}H_9N = N \left\{ C_{20}H_9''' \right.$

Leptandrin. [*Impure resinoid from Leptandra Virginica.*] Soluble in alcohol when recently prepared, becoming less so by age. Soluble in aqueous solutions of caustic ammonia and potash. (Parrish's *Pharm.*, p. 192.)

Lethal. *Vid.* Hydrate of Lauricyl.

LeucAzolitmin.

Leucic Acid. $C_{12}H_{12}O_6 = C_{12}H_{11}O_5, HO$ Soluble in water. Easily soluble in alcohol, and ether.

Leucate of Ammonia. Soluble in water.

Leucin. (*Aposepedin. Thymin.*) $C_{13}H_{13}NO_4$ Sparingly soluble in cold water, but readily soluble in water at 60°. (Proust.) Soluble in 14 pts. of water at 22° (Braconnot); in 27.7 pts. of water at 17.5° (Mulder.) More soluble than tyrosin in cold water.

Very sparingly soluble in boiling alcohol. (Braconnot.) Sparingly soluble in ordinary alcohol, and very sparingly soluble in absolute alcohol. (Bopp.) Very sparingly soluble in absolute alcohol; soluble in 658 pts. of cold alcohol of 0.828 sp. gr.; the hot solution becomes turbid on cooling. (Mulder.) Soluble in 1040 pts. of cold alcohol of 96%, and in 800 pts. of warm alcohol of 98%. (Zollikofer.) Insoluble in ether, even when this is hot. (Proust; Mulder.) Insoluble in chloroform. The presence of acetate of potash or of acetic acid increases its solubility both in water and in alcohol. (Bopp.) Soluble, with combination, in weak acids.

Soluble in concentrated sulphuric acid (Mulder); readily soluble in dilute sulphuric acid, and the solution may be evaporated at a temperature of 100° without undergoing decomposition. (Bopp.) More readily soluble in chlorhydric acid than in water. (Braconnot.) Readily soluble, with combination, in nitric acid; also soluble in a solution of caustic potash. (Proust.) More soluble in ammonia-water than in water.

LEUCIN with COPPER. Readily soluble in a
$C_{12}H_{13}CuNO_5$ warm aqueous solution of leucin, from which it is deposited on cooling.

LEUCIN with LEAD.

I.) $C_{12}H_{13}PbNO_5$ Soluble in water.

II.) $C_{12}H_{13}PbNO_5, 8PbO$

III.) Insoluble in water.

LEUCIN with MERCURY. Readily soluble in
$C_{12}H_{12}HgNO_4$ an aqueous solution of leucin. (Gœssmann.)

LEUCONITRIC ACID. *Vid.* Nitrate of Leucin.

LEUCORCEIN.

LEUCORCEIN with ZINC. Insoluble in water.
$C_{18}H_{12}NO_8, 3ZnO + 2Aq$

LEUCOTURIC ACID. Generally admitted to be
$C_6H_3N_2O_6$ identical with Allanturic Acid; but according to Schlieper it is insoluble in cold water. Soluble in hot water.

LEUKOL. *Vid.* Quinolein.

LEVORACEMIC ACID. *Vid. left*Tartaric Acid.

LICHENIC ACID. *Vid.* Fumaric Acid.

LICHENIN. Sparingly soluble in cold water;
(*Starch of Moss.*) decomposed by long-continued
$C_{12}H_{10}O_{10}$ boiling with water. Insoluble in alcohol or ether. Decomposed by boiling dilute acids.

LICHEN-RED. *Vid.* Orcein.

LICHENSTEARIC ACID. Insoluble in water.
$C_{28}H_{24}O_6$ Easily soluble in alcohol, especially if this be warm. Soluble in ether and in volatile and fatty oils. Easily soluble in ammonia-water, and in solutions of the caustic alkalies. (Knop & Schnedermann.)

LICHENSTEARATE OF AMMONIA.

I.) *acid.* Soluble in water.

II.) *basic.* Insoluble in water.

LICHENSTEARATE OF BARYTA. Ppt.
$C_{28}H_{23}BaO_6$

LICHENSTEARATE OF LEAD.
$C_{28}H_{23}PbO_6$

LICHENSTEARATE OF POTASH. Soluble in pure water, and in boiling absolute alcohol.

LICHENSTEARATE OF SODA.

LICHENSTEARATE OF SILVER.

LIGHT-CARBURETTED HYDROGEN. *Vid.* Hydride of Methyl.

LIGNONE. Miscible in all proportions with
(*Xylit. Formosal.*) water, alcohol, oil of turpentine, and ether; from the latter water separates it. (Leopold Gmelin.)

LIGULIN (coloring matter of *Ligustrum vulgare*). Soluble in water, alcohol, and a mixture of alcohol and ether. Not altered by boiling for forty-eight hours with water, nor by digestion during six weeks with sulphurous acid. Insoluble in ether. (J. Nicklès, *Am. J. Sci.*, (2.) **29.** 326; *Rép. Chim. pure*, **1.** 496.)

LIGUSTRIN (from *Ligustrum vulgare*). Easily soluble in water and in dilute spirit. Insoluble in absolute alcohol, or in ether. (Polex.)

LILACIN. *Vid.* Syringin.

LIMACIN. Somewhat soluble in cold, more soluble in warm water. Soluble in boiling alcohol, in concentrated chlorhydric acid, and easily in alkaline liquors. (Braconnot, *Ann. Ch. et Phys.*, (3.) **16.** 319.)

LIME. *Vid.* Oxide of Calcium.

LIMETTIC ACID. Sparingly soluble in water.
$C_{22}H_8O_{12} = C_{22}H_6O_{10}, 2HO$ Readily soluble in alcohol. (Vohl.)

LIMETTATE OF SILVER. Sparingly soluble in
$C_{22}H_6Ag_2O_{12}$ water.

LIMONIN. Very sparingly soluble in water,
$C_{44}H_{26}O_{14}$ ammonia-water, or ether; somewhat more soluble in mineral acids. Easily soluble in alcohol, and acetic acid; still more readily soluble in solutions of the caustic alkalies. Soluble in concentrated sulphuric acid, from which it is precipitated by water. Soluble in boiling nitric acid, without decomposition.

LININ (from *Linum catharticum*). Insoluble in water, or oil of turpentine. Tolerably easily soluble in ether; but most easily soluble in alcohol, and in concentrated acetic acid. Insoluble in dilute acids. Soluble in concentrated sulphuric and nitric acids, and in alkaline solutions.

LINOLEIC ACID. Insoluble in water. Solu-
$C_{32}H_{28}O_4$ ble in alcohol, and ether. (Schueler, *Ann. Ch. u. Pharm.*, **101.** 256.)

LINOLEATE OF BARYTA. Sparingly soluble in alcohol. Easily soluble in ether. (Schueler.)

LINOLEATE OF LIME. Insoluble in water. Sparingly soluble in alcohol. Soluble in ether. (Schueler, *loc. cit.*)

LIPIC ACID. Tolerably soluble in cold water,
$C_{10}H_8O_8$ being more soluble therein than pimelic or adipic acids.

100 pts. of water at 18° dissolve 10.56 pts. of it. (Wirz, *Ann. Ch. u. Pharm.*, **104.** 280.) Soluble in boiling alcohol, and in ether. (Laurent.)

LIPATE OF AMMONIA. Soluble in water.

LIPATE OF COPPER.
$C_{10}H_6Cu_2O_8$

LIPATE OF LIME. Soluble in water. (Wirz.)
$C_{10}H_6Ca_2O_8 + 2Aq$

LIPATE OF SILVER.
$C_{10}H_6Ag_2O_8$

LIPATE OF SODA. Efflorescent. Soluble in
$C_{10}H_6Na_2O_8 + 12Aq$ water. (Wirz.)

LIRIODENDRIN (from *Liriodendron tulipifera*). Sparingly soluble in water. Very soluble in alcohol, and ether. Insoluble in dilute acids, or dilute alkaline solutions. Unacted upon by concentrated nitric acid; decomposed by concentrated sulphuric, and chlorhydric acids. (Emmet.)

Lithia. *Vid.* Oxide of Lithium.

Lithium. The salts of lithium are exceedingly deliquescent and soluble in water, being in general more soluble than the corresponding potash salts. (Troost.)
Li

LithiumEthyl with ZincEthyl.

Lithic Acid. *Vid.* Uric Acid.

Lithofellic Acid. Insoluble in water. Soluble in 29.4 pts. of absolute alcohol at 20°, and in 6.5 pts. at the temperature of boiling; in 444 pts. of ether at 20°, and in 47 pts. of boiling ether. Readily soluble in concentrated acetic acid, and in concentrated sulphuric acid. But in general acids precipitate it from its soluble salts. Readily soluble in solutions of caustic or carbonated ammonia, and on evaporating these solutions the acid is left free from ammonia. Also soluble in solutions of the fixed caustic alkalies.
(*Bezoaric Acid.*)
$C_{46}H_{36}O_8 = C_{40}H_{35}O_7, HO$

The alkaline lithofellates are soluble in water, alcohol, and ether.

Lithofellate of Ammonia. Soluble in water, but is decomposed when the solution is evaporated.

Lithofellate of Baryta. Soluble in water.

Readily soluble in alcohol. (Heumann.)

Lithofellate of Lead.

I.) *basic.* Sparingly soluble in water; somewhat more soluble in alcohol.

Lithofellate of Lime. Soluble in water.

Lithofellate of Potash. Soluble in water, alcohol, and ether. Insoluble in an aqueous solution of chloride of sodium.

Lithofellate of Silver. Soluble in alcohol.
$C_{40}H_{35}AgO_8$

Lithofellate of Soda. Soluble in water, alcohol, and ether. Insoluble in an aqueous solution of chloride of sodium.

Litmus, according to Gélis, contains

α

β Insoluble in water. Easily soluble in alcohol, ether, and alkaline solutions.

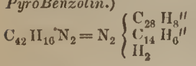
γ

δ Insoluble in water, alcohol, or ether. Soluble in solutions of the alkalies.

Lobelin (from *Lobelia inflata*). Gradually dissolves in water. Very soluble in alcohol, and ether; the latter removes it from the aqueous solution. Soluble in the fixed and volatile oils. Soluble in dilute acids, with combination. (Parrish's *Pharm.*, p. 417.)

Lobelate of Lobelin.

Lophin. Very sparingly soluble in water. Sparingly soluble in ether; more readily soluble in alcohol. (Atkinson & Gœssmann, *Ann. Ch. u. Pharm.*, **97.** 286.) Insoluble in boiling water. Very sparingly soluble in hot alcohol, ether, naphtha, or oil of turpentine, and still less soluble in these liquids when they are cold. (Laurent.) Insoluble in water, acids, or aqueous solutions of the alkalies. Sparingly soluble in cold, more readily soluble in hot alcohol. (Fownes.)
(*Lophyl. PyroAmarin. PyroBenzolin.*)



$$C_{42}H_{16}N_2 = N_2\begin{cases} C_{28}H_8'' \\ C_{14}H_6'' \\ H_2 \end{cases}$$

Its best solvent is a boiling concentrated alcoholic solution of caustic potash, in which it dissolves without alteration. Easily soluble in iodide of ethyl. Most of its salts are insoluble in water; they are sparingly soluble in alcohol.

Lophin with Nitrate of Silver.

I.) $C_{42}H_{16}N_2; AgO, NO_5$ Soluble, without decomposition, in cold alcohol. Decomposed by boiling alcohol.

II.) $2C_{42}H_{16}N_2; 3(AgO, NO_5)$ Sparingly soluble in alcohol.

III.) $2C_{42}H_{16}N_2; AgO, NO_5$ Easily soluble in alcohol. (Gœssmann & Atkinson, *Ann. Ch. u. Pharm.*, **97.** 292.)

Lophyl. *Vid.* Lophin.

Luchonin. *Vid.* Glairin.

Lupinin (from *Lupinus albus*). Deliquescent. Easily soluble in water and in dilute spirit. Insoluble in alcohol or ether. (Cassola.)

Lupulin. Soluble in 20 pts. of hot water. Easily soluble in alcohol. Insoluble in ether.
(*Humulin. Bitter principle of Hops.*)

LuteoCobalt. Its salts are in general more soluble in water than the corresponding compounds of roseocobalt; they are very stable in the presence of most acids. Neutral or alkaline solutions are readily decomposed by boiling.
$6NH_3 . Co_2O_3$

Luteolin. Soluble in 14000 pts. of cold, and in 5000 pts. of boiling water; in 37 pts. of alcohol; and in 625 pts. of ether.
(*Luteolic Acid.*)
$C_{46}H_{14}O_{18}$

Almost entirely insoluble in dilute acids, especially in the cold. Tolerably easily soluble in concentrated sulphuric acid, from which it is precipitated unchanged on the addition of water. Very sparingly soluble in concentrated chlorhydric acid. Soluble in hot, sparingly soluble in cold, concentrated acetic acid. Soluble, with decomposition, in warm nitric acid. Soluble in aqueous solutions of the caustic and carbonated alkalies, and in ammonia-water. (F. Moldenhauer, *Ann. Ch. u. Pharm.*, **100.** 186.)

Luteolin with Baryta. Soluble in water, from which it is precipitated on the addition of alcohol.

Luteolin with Copper. Ppt.

Luteolin with Lead.

Luteolin with Potash.

Lutidin. Sparingly soluble in cold, less soluble in hot water. Its salts are mostly very soluble in water. (Anderson.)
(*Isomeric with Toluidin.*)
$N\left\{C_{14}H_9'''\right.$

Lycoresin. Insoluble in cold, exceedingly sparingly soluble in boiling water. Abundantly soluble in alcohol, and ether. Very sparingly soluble in cold solutions of the caustic or carbonated alkalies; these solutions are decomposed on heating. (Kamp, *Ann. Ch. u. Pharm.*, **100.** 303.)
$C_{38}H_{32}O_4$

LycoStearone. Insoluble in cold, somewhat soluble in boiling water. Sparingly soluble in cold, more soluble in hot, alcohol or ether. Sparingly soluble in cold concentrated sulphuric acid. Easily and abundantly soluble in solutions of the caustic or carbonated alkalies. (Kamp, *Ann. Ch. u. Pharm.*, **100.** 302.)
(*Isomeric with Behenic Acid.*)
$C_{36}H_{30}O_4$

M.

MADARIN. *Vid.* Mudarin.

MAGNESIA. *Vid.* Oxide of Magnesium.

MAGNESIUM. Permanent in dry air. Very slowly oxidized by pure cold water, but very quickly attacked by acidulated water, being dissolved by dilute acids. Difficultly soluble in strong sulphuric acid. It takes fire in concentrated chlorhydric acid. Most of the magnesium salts are soluble in water; those insoluble in water are generally soluble in chlorhydric acid.
Mg

MALAMIC ACID. *Vid.* Aspartic Acid.

MALAMID.
(*Isomeric with dry Asparagin.*)
$C_8H_8N_2O_6 = N_2\left\{\begin{matrix}C_8H_4O_6''\\ H_4\end{matrix}\right.$

MALAMID(*active*) with (*right*)TARTRAMID. 100 pts. of water at 20° dissolve 18.01 pts. of it. (Pasteur, *Ann. Ch. et Phys.*, (3.) **38.** 466.)

MALAMID(*active*) with (*left*)TARTRAMID. Much more soluble than the preceding compound [of (right)tartramid]; requiring less than 3 pts. of water to dissolve it at 19°. (Pasteur, *Ibid.*, p. 467.)

MALAMATE OF ETHYL. Soluble in alcohol, sparingly soluble, or insoluble in ether. (Demondesir.)

MALAMYLIC ACID. *Vid.* Amylmalic Acid.

MALANIL. *Vid.* PhenylMalimid.

MALANILIC ACID. *Vid.* PhenylMalamic Acid.

MALANILID. *Vid.* PhenylMalamid.

MALIC ACID. Soluble in water, spirit, and ether. Slightly soluble in caoutchin; but is decomposed when boiled with it for some time. (Himly.)
(*Solanic Acid. Fungic Acid. Menispermic Acid. Cocculinic Acid.*)
$C_8H_6O_{10} = C_8H_4O_8, 2HO$

There are two modifications of malic acid: α "*active*," and β "*inactive*." The active modification is deliquescent and very soluble in water, and alcohol. The inactive modification is not deliquescent. It is, however, very soluble in water, though less soluble than the active modification. (Pasteur, *Ann. Ch. et Phys.*, (3.) **34.** 47.) Most malates are soluble in water; some being deliquescent; but few are soluble in alcohol; those insoluble in alcohol dissolve in nitric acid. (Wittstein's *Handw.*)

MALATE OF ALUMINA.

I.) *normal.* Permanent. Readily soluble in water.

II.) *basic.* Sparingly soluble in water. (Braconnot.)

MALATE OF AMMONIA.

I.) *normal.* Deliquescent. Very soluble in water. (Braconnot.)
$C_8H_4(NH_4)_2O_{10}$

II.) *acid.*

$a = C_8H_5(NH_4)O_{10} = (x)$ The α salt is permanent. 100 pts. of water at 15.7 dissolve 32.15 pts. of it; or 1 pt. of the salt is soluble in 3.11 pts. of water at 15.7°. (Pasteur, *Ann. Ch. et Phys.*, (3.) **34.** 50.) Soluble in 8 pts. of cold, and in much less hot water. (Liebig.) Insoluble in absolute alcohol or in ether. (Braconnot.) Very slowly soluble in dilute spirit. (Liebig.) Crystallizes from its solution in nitric acid.

$b = C_8H_5(NH_4)O_{10} = (\delta)$ More soluble in water than the preceding.

$b' = C_8H_5(NH_4)O_{10} + 2\,Aq$ Crystallizes from the mother liquor of *b*.

MALATE OF AMMONIA & OF ANTIMONY. Soluble in water.

MALATE OF AMMONIA & OF LEAD. Soluble in water. (Braconnot.)

MALATE OF AMMONIA & OF LIME. Soluble in water. (Braconnot.)

MALATE OF AMMONIA & OF ZINC. Soluble in water.

MALATE OF AMMONIA with SULPHATE OF COPPER. Permanent.

*Bi*MALATE(α)OF AMMONIA with (*right*)*bi*TARTRATE OF AMMONIA. 100 pts. of water at 15° dissolve 8.436 @ 8.515 pts. of this double salt; it is partially decomposed by recrystallization. (Pasteur, *Ann. Ch. et Phys.*, (3.) **38.** 463.)
$C_8H_5(NH_4)O_{10};\ C_8H_5(NH_4)O_{12}$

MALATE OF AMMONIUMCHLOROPLATIN(*ous*)-AMMONIUM. Somewhat soluble in water. (Gros, *Ann. der Pharm.*, 1838, **27.** 256.)
(*Gros's Malate.*)

MALATE OF ANTIMONY & OF POTASH.

MALATE OF BARYTA.

I.) *normal.*

$a = C_8H_4Ba_2O_{10}$ The anhydrous salt is absolutely insoluble in water, even when this is boiling; but is easily soluble in acids. Water containing a trace of nitric acid readily dissolves it. (Liebig.)

$b = C_8H_4Ba_2O_{10} + 2\,Aq$ Easily soluble in water.

$c = C_8H_4Ba_2O_{10} + 4\,Aq$ Permanent. Easily soluble in water. (Braconnot.)

II.) *acid.* More soluble than the normal salt (*c*) in water. (Braconnot.)

MALATE OF COPPER.

I.) *normal.* Permanent. Readily soluble in water. (Luck.)
$C_8H_4Cu_2O_{10} + 2\,Aq$

II.) *acid.* Soluble in water.
$C_8H_5CuO_{10} + 2\,Aq$

III.) *tris.*

$a = C_8H_4Cu_2O_{10}, CuO + 4\,Aq$ Insoluble in water or malic acid. (Liebig.)

$b = C_8H_4Cu_2O_{10}, CuO + 5\,Aq$ Soluble in water, the solution undergoing decomposition in the course of a few days. Insoluble in alcohol.

$c = C_8H_4Cu_2O_{10}, CuO + 6\,Aq$

MALATE OF COPPER with SULPHATE OF AMMONIA. Permanent. More soluble than sulphate of copper in water. (Schulze.)

MALATE OF ETHYL.

I.) *normal.* Very easily decomposed by water.
$C_8H_4(C_4H_5)_2O_{10}$

II.) *acid* *Vid.* EthylMalic Acid.
$C_8H_5(C_4H_5)O_{10}$

MALATES OF IRON. Permanent. Very soluble in water, and alcohol. (Scheele, Braconnot.) Oxide of iron is not
normal & acid.

precipitated when caustic alkalies are added to the aqueous solution. (H. Rose.)

Malate of Lead.
