The Alphabetical Index to Components Identified in Tobacco, Tobacco Smoke, and Tobacco Substitute Smoke

The forerunner of the Index was initiated in the mid-1950s (2270, 2292a, 3245) and subsequently updated periodically (3224, 3252, 3253, 3301–3304) as the identifications of more and more tobacco and tobacco smoke components were reported. The Index was originally created in its present form for two purposes. The first was to capture in one site all the basic information on the identified tobacco and tobacco smoke components subsequently discussed in the chapters of this book. The components in the Index are listed alphabetically. Secondly, the Index may permit the reader to easily retrieve or search for information on a specific tobacco and/or smoke component or class of components so that further study will be facilitated. To achieve these goals, the Index was constructed to include the following:

1. The CAS No. for many of the components.
2. An indication of the component identification in tobacco, tobacco smoke, or both.
3. The structure of many of the components.
4. The table number and chapter in which the component is not only referenced but its properties are described, particularly if they are considered adverse.
5. For multifunctional components, several chapters and table numbers are cited.

As with the First Edition, Taylor & Francis/CRC Press of Boca Raton, FL, has provided the index on a compact disc (read-only memory) (CD-ROM). Hopefully, the searchable format of the CD-ROM will aid the reader in retrieving any desired information.

The updated Index comprises almost 9600 components completely or partially identified in tobacco, tobacco smoke, and tobacco substitute smoke. It includes not only identified components but also several hundred compounds not identified in tobacco or tobacco smoke but reported by Doull et al. (1053) as tobacco ingredients used in the United States and by Baker et al. (172a, 174b) as tobacco ingredients used outside the United States and in a summary by Rodgman (3266) and in our Chapter 24. Because the transfer from a tobacco product to smoke of very few of the added ingredients has been examined, they primarily are listed as tobacco components. Exceptions include several humectants used in tobacco products for many years. However, it should be noted that the detailed pyrolysis study by Baker and Bishop (172a) indicated that many such added ingredients would transfer in part to MSS during the tobacco smoking process.

In some instances, the reader may wonder about the peculiar nature of the component listing. For example, a tobacco smoke component initially reported as 2-butene was later shown to be present in the smoke as *cis*- and *trans*-2-butene. Thus, three items are listed in the Index for 2-butene, namely, 2-butene (CAS No. 107-10-7), 2-butene, (*Z*)- (CAS No. 590-18-1), and 2-butene, (*E*)- (CAS No. 624-64-6). In the appropriate chapter and table, Chapter 1, Table 1.11, references to the identification of each are provided. 2-Butenedioic acid is similarly listed in Chapter 4, Table 4.3, as 2-butenedioic acid (CAS No. 6915-18-0), 2-butenedioic acid, (*Z*)- (maleic acid) (CAS No. 110-16-7), and 2-butenedioic ac id, (*E*)- (fumaric acid) (CAS No. 110-17-8).

The reader will also find in the Index certain broad classifications of components, like oxidases and free radicals. These and similar examples in the Index are not there to confuse the reader, as many of the individual components in the broad classifications have specific CAS numbers.* Generally, the references associated with these classes of components (found within the chapters noted in the Index) will provide the reader with information of a common nature. In nearly all cases, individual components such as ascorbate oxidase, choline oxidase, cytochrome oxidase, and glycolate oxidase follow after the broadly classified component, oxidase. Likewise, specific free radicals such as methyl-acyl radical, ethyl-acyl radical, and propyl-acyl radical {two isomers} may be found in the Index. For some components in the Index, several partially identified isomers exist, their number noted, and included in the total number of components identified in tobacco and/or smoke.

While the number of enzymes, genes, and nucleotides listed in the Index is fewer than 600, their known number, as noted in Chapter 21, exceeds many thousands. The paltry number of enzymes, genes, and nucleotides listed in Table 21.2, was never intended to represent the total biological agents operating in the plant. Those selected for inclusion were from texts, research manuscripts, and patents where active research was conducted in the past in attempts to better understand the physiology and biochemistry of tobacco. As future genetic research develops, it is envisioned that the identity and function of hundreds of thousands of additional chemicals will be published.

The authors hope that the format of the Index and accompanying CD-ROM will help the reader to reach a better understanding of the components of tobacco and tobacco smoke.

* Each CAS Registry Number used throughout the Alphabetical Components Index and the various preceding chapters is a Registered Trademark of the American Chemical Society.

Alphabetical Index to Chemical Components in Tobacco, Tobacco Smoke, and Tobacco Substitute Smoke

	CAS No.	S	T	ST	Name (per CA Collective Index)	Selected Structures	Chapter Table

9389.	7440-67-7	1	1	1	Zirconium	Zr	20.5
9390.	11126-30-0	0	1	0	Zirconium chloride		18.4, 20.6
	Totals	**6**	**5**	**–**	**9390**		
		0	**5**	**2**			
		1	**9**	**2**			
		0	**5**	**1**			
				5			

There were 292 partially identified isomers listed in the preceding index. Thus, the number of identified/partially identified components in tobacco and tobacco smoke totals **9582 (9390 + 292 – 100)**.

At the end of our Index on the last page of our published book, the totals and assessment were as follows:

Totals	**5**	**4**	**–**	**8430**
	3	**9**	**1**	
	1	**9**	**8**	
	5	**4**	**7**	
			9	

There were 292 partially identified isomers listed in the index for the First Edition. Thus, the number of identified/partially identified components in tobacco and tobacco smoke totaled **8622 (8430 + 292 – 100).**

Note: S, tobacco smoke component; T, tobacco component; ST, component of both S and T.

Sequence of CAS Registry Numbers for Components Identified in Tobacco, Tobacco Smoke, and Tobacco Substitute Smoke

After the publication of our initial catalog and the Alphabetical Index of the chemical components of tobacco and tobacco smoke, several items were noted in the scientific literature. Whenever there was a substantial list of chemical compounds with specific properties, a list other than an alphabetical one was also generated, namely, a listing of the chemical compounds in the sequence of their CAS Registry Numbers. A classical example, of course, is the Merck Index which in one catalog lists the chemical compounds alphabetically, each with its CAS No., and in a second catalog lists the chemical compounds in the sequence of their CAS Nos. Another such list was by Acree and Arn (5095a), a listing of 738 chemical components noted for their flavor. Comparison of the Acree–Arn list with our CAS No. sequence of tobacco and/or tobacco smoke components indicates that many of the compounds classified as flavors by Acree and Arn are components of tobacco and/or its smoke.

Another example of the sequential listing of chemical compounds by CAS Nos. beginning with 1, 2, 3, or 4, etc., may be found at:

http://msds.chem.ox.ac.uk/cas1.html
http://msds.chem.ox.ac.uk/cas2.html
http://msds.chem.ox.ac.uk/cas3.html

These lists are linked to safety/hazard data for the listed compounds. Because of the magnitude of our Alphabetical Index on tobacco and tobacco smoke components and the considerable interest in those components categorized as tobacco additives or flavor formulation ingredients, a second tabulation, based on the sequence of CAS Nos., has been prepared. The sequential tabulation, which follows the Alphabetical Index, is divided into three parts: The first and lengthy one, comprising over 8350 entries, is the listing of the chemical components of tobacco and tobacco smoke arranged in their CAS No. sequence. Components with more than one CAS No. appear in the list for each of their assigned CAS Nos. In this list, as in the Alphabetical Index, each component is designated as a tobacco component or a tobacco smoke component or both.

The authors hope that this CAS Registry Number sequence together with the format of the Alphabetical Index will not only help the reader in his/her search for a particular component but also provide a better understanding of the components of tobacco and tobacco smoke.

Chemical Abstract Number Sequence for Identified Chemical Components in Tobacco, Tobacco Smoke, and Tobacco Substitute Smoke

CAS No.	S	T	ST	Component
50-00-0	1	1	1	Formaldehyde
50-06-6	0	1	0	2,4,6(1*H*,3*H*, 5*H*)-Pyrimidinetrione, 5-ethyl-5-phenyl- {phenobarbital}
